Oxidation-reduction equilibrium of metallic manganese. Shin-ichi Aoyama and Yoshiyaga Oka. *Science Repts. Tôhoku Imp. Univ.*, First Ser. 22, 824-34 (1933).—The oxidation-reduction equil. of metallic  $\text{Mn}$  was measured in  $\text{H}$  atm., which was satd. by  $\text{H}_2\text{O}$  vapor corresponding to several low temps. The linear relation holds between  $\log [\text{H}_2]/[\text{H}_2\text{O}]$  and  $1/T$ . The occurrence of the reaction  $\text{Mn} + \text{H}_2\text{O} = \text{MnO} + \text{H}_2$  was confirmed. For the reaction  $\text{Mn} + \frac{1}{2}\text{O}_2 = \text{MnO}$  at  $298^\circ\text{K}$ :  $\Delta H_{298} = -96,680$  cal.,  $\Delta F_{298} = -96,240$  cal. C. B. Jenni

Stability of sodium hypobromite solutions. John Palmén. *Finska Kemistisamfundets Medd.* 42, 48-63 (1933).—The stability of 0.5, 1.0 and 2.0  $N$   $\text{NaBrO}$  solns. contg. 50, 75 and 100% excess  $\text{NaOH}$  was investigated at  $18^\circ$ ,  $32^\circ$ ,  $62^\circ$  and  $92^\circ$ . More than 50% excess  $\text{NaOH}$  was found unnecessary. The half-life values of the solns. (0.5, 1.0 and 2  $N$ , resp.) are as follows:  $17-18^\circ$  53, 23, 10 days;  $30-5^\circ$  100, 84, 20 hrs.;  $60-6^\circ$  6, 5.5, 0.8 hrs.;  $90-5^\circ$  0.6, 0.5, 0.4 hrs. H. C. Duus

Diffusion film and the rate of solution of particles. Nobuo Moriguchi. *J. Chem. Soc. Japan* 54, 859-61 (1933).—Criticism of the work of Miyamoto (*C. A.* 27, 3873) and of Roller (*C. A.* 26, 3420). Their results are explained by diffusion theory without denying the existence of a diffusion layer. T. Katsurai

The decomposition of complex molecules at high pressures. C. C. Coffin and A. L. Geddes. *J. Chem. Physics* 2, 47 8 (1934).—In an investigation of the homogeneous thermal decompn. of gaseous paraldehyde (*C. A.* 26, 5482) the velocity of the reaction slowly diminished as the initial pressure increased. A possible mechanism is suggested which may apply generally to the 1st-order decompn. of complex mols. Allen S. Smith

Reaction rates of the hydrogen isotopes. M. Polanyi. *Nature* 133, 26-7 (1934).— $\text{H}^1$  does not always react faster than  $\text{H}^2$ . Quantum mech. leakage of energy through the barriers favors  $\text{H}^1$ , but the zero-point energy effect at times suffices to reverse the relation. Gregg M. Evans

The dissolving of aluminum in alkali. Gerhard Schickorr. *Mitt. deut. Materialprüfungsanstalt.*, Sonderheft 22, 16-22 (1933); cf. *C. A.* 26, 361.—The reaction between  $\text{Al}$  and  $\text{NaOH}$  soln. occurs in 3 stages: (1)  $2\text{Al} + 2\text{NaOH} + 4\text{H}_2\text{O} = 2\text{Al}(\text{OH})_3\text{ONa} + 3\text{H}_2$ ; (2) the reaction is practically at a standstill; (3)  $\text{Al}(\text{OH})_3\text{ONa} + \text{H}_2\text{O} = \text{Al}(\text{OH})_3 + \text{NaOH}$ . The  $\text{Al}(\text{OH})_3$  is cryst. In  $\text{Na}_2\text{CO}_3$  soln. only the 1st stage was observed. Small amts. of  $\text{H}_2\text{SiO}_4$  lengthened the 2nd stage; with large amts., the reaction went to completion in the 1st stage. The soln. velocity was higher at higher temps. Stirring raised the soln. velocity only slightly. The soln. velocity was affected considerably by the  $\text{NaOH}$  concn. Com. and 99.5%  $\text{Al}$  dissolved with practically equal velocity in 0.1  $N$   $\text{NaOH}$ . The "difference effect" in the soln. of  $\text{Al}$  in  $\text{NaOH}$  is approx. equal to the current intensity. The progress of the reaction was observed by the evolution of  $\text{H}_2$ . At  $20^\circ$ , in 0.1  $N$   $\text{NaOH}$ , the 3rd period started 29-46 hrs. after the start of the expt. Gerald M. Petty

The thermal reaction between chlorine trioxide and ozone. G. K. Rollefson and A. C. Byrns. *J. Am. Chem. Soc.* 56, 364-7 (1934).—The reaction of  $\text{ClO}_3$  with  $\text{O}_3$  at  $0^\circ$  and  $20^\circ$  was studied kinetically. The rate of decompn. was proportional to the  $\text{O}_3$  pressure at the start, but was gradually inhibited by the  $\text{O}_3$  formed.  $\text{Cl}_2$  and  $\text{N}_2$  had similar effects. From the temp. coeff. of the reaction a heat of activation of 10.9 kJ. was calcd. L. P. Hall

Effect of nonelectrolytes on the velocity of ion reactions. Árpád Kiss, I. Bossányi and P. Vass. *Acta Lit. Sci. Univ. Hung. Francisko-Josephinae, Sect. Chem. Mineral. Phys.* 3, 20-35 (1933) (in German).—The velocity of reaction of monobromoacetate with thiosulfate ion was measured between 0.0025 and 0.010 ion concn. at  $25^\circ$  in nonelectrolytes of various concns. such as  $\text{EtOH}$ ,

$^1$   $\text{PrOH}$ ,  $\text{Me}_2\text{CO}$ , urea. The validity of the equation of Debye-Hückel is discussed and the probable causes of deviations are explained. The role of  $\text{H}^+$ -ion catalysis is detailed. S. S. de Finály

Neutral salt effect in the hydrolysis of acetic anhydride. Á. Kiss and E. A. Kocsis. *Acta Lit. Sci. Univ. Hung. Francisko-Josephinae, Sect. Chem. Mineral. Phys.* 3, 50-65 (1933) (in German text).—The velocity of hydrolysis of  $\text{Ac}_2\text{O}$  was measured at  $25^\circ$  in solns. of  $\text{LiCl}$ ,  $\text{NaCl}$ ,  $\text{KCl}$ ,  $\text{MgCl}_2$ ,  $\text{BaCl}_2$ ,  $\text{LiNO}_3$ ,  $\text{NaNO}_3$ ,  $\text{KNO}_3$ ,  $\text{Mg}(\text{NO}_3)_2$ ,  $\text{KBr}$ ,  $\text{KI}$ ,  $\text{NaClO}_4$ ,  $\text{Li}_2\text{SO}_4$ ,  $\text{Na}_2\text{SO}_4$ ,  $\text{K}_2\text{SO}_4$  and  $\text{MgSO}_4$ . The components of neutral salt effect are discussed and explained in detail. The pure-medium effect follows a simple regularity, i. e., the log of velocity const. has a linear connection with the salt concn. S. S. de Finály

The velocity of decomposition of diazo compounds in water. XIII. E. Yamamoto, R. Goshima and J. Hashima. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 29-33 (1934); cf. *C. A.* 28, 702<sup>a</sup>.—The decompn. velocities of 2-sulfonaphthalene-1-diazonium chloride, 1-sulfonaphthalene-2-diazonium chloride and 7-sulfonaphthalene-2-diazonium chloride between  $0^\circ$  and  $60^\circ$  are reported. Karl Kantermeyer

Kinetics of the reaction of the thiosulfate ion with the ions of brominated malonic and succinic acids. M. H. Bedford, R. Burgess Mason and C. E. Morrell. *J. Am. Chem. Soc.* 56, 280-3 (1934).—The velocities of the reactions of the esters and the alkali salts of monobromomalonic acid and of monobromosuccinic acid with thiosulfate ion were measured over a range of concns. Brönsted's theory alone does not account for the results but LaMer and Kammer's theory of oriented ionic collisions (cf. *C. A.* 25, 5075) does. P. H. Emmett

The role of oxygen as an inhibitor for the photosynthesis of hydrogen chloride. K. B. Krauskopf and G. K. Rollefson. *J. Am. Chem. Soc.* 56, 327-33 (1934).—The rate of formation of  $\text{HCl}$  and  $\text{H}_2\text{O}$  in illuminated mixts. of  $\text{H}$ ,  $\text{Cl}$  and  $\text{O}$  was measured for high concns. of  $\text{O}$ . As the ratio  $\text{O}/\text{Cl}$  increases the ratio of the products  $\text{H}_2\text{O}/\text{HCl}$  approaches a limit between 1 and 2. This limit proves that the Nernst chains must be ended by a reaction  $\text{H} + \text{O}_2 = \text{HO}_2$  rather than by  $\text{Cl} + \text{O}_2 = \text{ClO}_2$ . P. H. Emmett

Kinetics of the methane-oxygen reaction. G. L. Frear. *J. Am. Chem. Soc.* 56, 305-7 (1934).—The effect of contact time, pressure and packing upon the oxidation of a 76:22  $\text{CH}_4\text{-O}$  mixt. in  $\text{SiO}_2$  tubes at  $600^\circ$  was studied by a flow method. In the absence of packing a chain mechanism predominates, the apparent reaction order being 3.5 at 450-575 mm. pressure and increasing rapidly with pressure. In the packed tube the reaction is approx. 1st order and apparently heterogeneous; its rate exceeds that of the reaction in the unpacked tubes at pressures of 300 mm. or lower. P. H. Emmett

Unimolecular film in heterogeneous reactions. E. J. Aynsley and P. L. Robinson. *Nature* 132, 894-5 (1933). The combination of  $\text{H}$  with  $\text{S}$  in Pyrex glass was studied at a pressure of 3 mm. of  $\text{H}$  ( $343^\circ$ ). Two reactions occurred simultaneously and independently: (1) the ordinary homogeneous gas reaction and (2) a reaction on the Pyrex surface. The initial velocity of the latter is independent of  $\text{S}$  concn. over a wide range, and proportional to  $\text{H}$  pressure and the area of the glass surface. The latter reaction ceases completely when it has produced an amt. of  $\text{H}_2\text{S}$  sufficient to cover the surface with a unimol layer. The surface reaction is between  $\text{S}$  already present and bombarding  $\text{H}$  mols. The mols. in the film are likely to be specifically oriented. Frank Urban

The effect of traces of oxygen on the thermal decomposition of acetaldehyde vapor. Letort. *Compt. rend.* 197, 1042-4 (1933).—Traces of  $\text{O}$  catalyze strongly the decompn. of  $\text{AcH}$  at  $477^\circ$ . For 6 vols.  $\text{O}$  per 100,000 vol  $\text{AcH}$  the effect stops when 17.8%  $\text{AcH}$  is decomposed.

Compounds of aluminum and silver. F. E. Tishchenko. *J. Gen. Chem. (U. S. S. R.)* 3, 549-57 (1933).—A thermal analysis of the system  $\text{Al-Ag}$  shows that at  $771^\circ$   $\text{AlAg}_2$  is formed. This compd. undergoes a transformation from  $\beta$  to  $\beta_1$  at  $606^\circ$  on cooling, in agreement with the x-ray

investigation of Westgren and Bradley (*C. A.* 22, 4055). The  $\beta$ -modification of  $\text{AlAg}$  forms a solid soln. with Al, reaching a max. satn. of 10.2% Al at 723°. Solv. of Al in  $\text{AlAg}$  decreases with fall in temp.  $\beta_1$ - $\text{AlAg}$  does not dissolve Al. At 723° a eutectic consisting of a combination of  $\text{AlAg}$  and mixed crystals of  $\beta$ - $\text{AlAg}$  with 10.2% Al, seps. The compd.  $\text{Al}_3\text{Ag}$  is stable in the interval 752-711°, while below 711° it can exist only in the metastable state. The stable state below 711° is a mixed crystal of  $\gamma_1$  which is a solid soln. of Al in  $\text{AlAg}$ , reaching satn. at 14.33% Al. A complete transformation of the metastable  $\text{Al}_3\text{Ag}$  into the mixed crystal  $\gamma_1$  occurs only on prolonged heating. In the interval 711-400° crystals of  $\gamma_1$  (solid soln. of Ag in  $\text{AlAg}$ ) and  $\beta$  coexist. Below 400° crystals of  $\text{AlAg}$  and  $\text{Al}_3\text{Ag}$  coexist. Five figures and 24 photomicrographs. S. L. Madorsky

Equilibria in saturated solutions of water-potassium nitrate-potassium chloride-potassium sulfate at 25°. I. Krichewski and E. Goldmann. *Z. anorg. allgem. Chem.* 214, 307-8 (1933).—The compns. of the ppts. are followed by the concns. of  $\text{KNO}_3$ ,  $\text{KCl}$  and  $\text{K}_2\text{SO}_4$ , resp., in g. per 100 g.  $\text{H}_2\text{O}$ :  $\text{KNO}_3 + \text{KCl}$ , 23.84, 35.23, 0.70;  $\text{KNO}_3 + \text{K}_2\text{SO}_4$ , 29.77, 12.57, 2.66;  $\text{KCl} + \text{K}_2\text{SO}_4$ , 12.48, 35.82, 1.45;  $\text{KNO}_3 + \text{KCl} + \text{K}_2\text{SO}_4$ , 21.63, 31.22, 1.38. F. L. Browne

Field of saturation of potassium and sodium chlorides in quinary sea-salt systems. II. D. Langauer. *Roczniki Chem.* 13, 201-12 (1933); cf. *C. A.* 27, 3660.—The solubilities of  $\text{KCl}$  and  $\text{NaCl}$  in solns. of a const. concn. of  $\text{MgCl}_2$  and a variable concn. of  $\text{MgSO}_4$ , and vice versa, were detd. at 83°, 90° and 100°. B. C. A.

The boiling-point curves of the systems  $\text{TiCl}_4$ - $\text{CCl}_4$ ,  $\text{TiCl}_4$ - $\text{SiCl}_4$  and  $\text{TiCl}_4$ - $\text{SnCl}_4$ . Nobuyuki Nasu. *Science Repts. Tôhoku Imp. Univ.*, First Ser. 22, 987-96 (1933); cf. *C. A.* 27, 5236.—The b.-p. curves were detd. at 760 mm. pressure. The liquid and vapor curves showed no max. or min. P. T. Newsome

Melting-point and solidifying-point curve of  $p$ -phenetidine with  $p$ -chloroaniline. S. Aoyama, J. Eguchi and C. Iashiro. *J. Pharm. Soc. Japan* 53, 661-4 (1933).— $p$ - $(\text{O}_2\text{NC}_6\text{H}_4\text{OEt})$  (I) prepd. from  $p$ - $(\text{O}_2\text{NC}_6\text{H}_4\text{Cl})$  contains some of the mother substance as an impurity. Therefore  $p$ - $(\text{OC}_6\text{H}_4\text{NH}_2)$  (II) obtained by reduction of I contains also  $p$ - $\text{H}_2\text{NC}_6\text{H}_4\text{Cl}$  (III). To facilitate the detn. of purity of II, m.-p. and solidifying-p. curves of a mixt. of II and III were constructed. Two kinds of II were used, i. e., one prepd. by reduction of  $p$ - $(\text{O}_2\text{NC}_6\text{H}_4\text{OH})$  with Fe and HCl, and the other obtained by decomn. of  $p$ - $\text{AcHNC}_6\text{H}_4\text{OEt}$ . The products were purified by converting to sulfate and distg. twice. These 2 products m. 4.5°. If the product contained 10%  $\text{H}_2\text{O}$ , the m. p. was 2.55° so that Schneider's product (Beilstein) probably contained 10%  $\text{H}_2\text{O}$ . The m. p. of III was 70.15° and its solidifying p. 69.9°, agreeing with literature. In the mixt. of II and III, if II predominates (70-100%), the m. p. is sharp, while if III predominates the solidifying p. is sharp, but not the m. p. With a mixt. of 65-75% II and 35-25% III, the detn. of these pts. was difficult. The data and curves are given. The eutectic p. occurs when II is 67.5% of the mixt. and its solidifying p. at -19°. Nao Uyei

Acid catalysis in nonaqueous solvents. I. The rearrangement of  $N$ -bromoacetanilide. Ronald P. Bell. *Proc. Roy. Soc. (London)* A143, 377-99 (1934).—The monomol. transformation of  $N$ -bromoacetanilide to  $p$ -bromoacetanilide is catalyzed by acids in several solvents. The catalytic power of 40 acids (picric acid excepted) in chlorobenzene increases in the same order as the disocn. consts. in water, but more slowly. A similar relation exists with benzene as the solvent. Expts. in 6 other solvents show that the medium has little effect upon the catalytic const. The temp. coeffs. for catalysis by 5 acids in chlorobenzene show the reaction velocity to be  $10^{-4}$ - $10^{-5}$  the value detd. from the simple collision formula. Calvin Brous

Atomic heats, heats of fusion and heats of transition for gallium, indium and thallium. W. A. Roth, Ingrid Meyer and Hans Zeumer. *Z. anorg. allgem. Chem.* 214,

209-20 (1933).—The sp. heats of the solids and liquids and the heats of fusion were detd. for Ga, In and Tl and the heat of transition for Tl. The In and Tl were very pure but the Ga contained a slight impurity. The result for Ga, however, agrees with data by previous workers. The change in entropy on melting is not a const. for these 3 metals. Correction. *Ibid.* 216, 303-4. F. L. Browne

## 3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

W. ALBERT NOYES, JR.

**Address of the president.** Frederick Gowland Hopkins. *Proc. Roy. Soc. (London)* B114, 181-210(1934).—Includes a review of recent work in at. physics, and on H isotopes, vitamin C (ascorbic acid), anthocyanins and the modern application of physical methods in chemistry.

Joseph S. Hepburn

**The symmetric states of atomic configurations.** F. Seitz and Albert Sherman. *J. Chem. Physics* 2, 11-19 (1934).—The expectation that the wave function for the lowest electronic energy-state will be invariant under the group which expresses the symmetry of the at. configuration is fulfilled in all cases considered. A general method for the derivation of such symmetric states is set forth. Several applications of the method are made including the case of 8 identical orbits, centered at the corners of a cube, and 8 orbits possessing tetrahedral symmetry, as in  $\text{CH}_4$ . The vector model is discussed and applied to the cases considered.

Allen S. Smith

**Relativistic treatment of the Fermi atom.** H. Jensen. *Z. Physik* 82, 794-802(1933).

G. G.

**Theory of free radicals of organic chemistry.** Erich Huckel. *Trans. Faraday Soc.* 30, 40-52(1934).—See C. A. 28, 4141.

E. R. Rushton

**The theory of the structure of methane and related molecules.** III. J. H. Van Vleck. *J. Chem. Physics* 2, 20-30(1934); cf. C. A. 27, 3140.—Use of Johnson's (C. A. 26, 1511) formulas for  $sp^3$  levels in conjunction with existing expl. data indicate that the  $^3\text{S}$  state of the C atom is probably 5-8 v. above the ground state although 1.6 v. cannot be definitely excluded. The valence states of C and the relative energies of  $\text{CH}_3$  and  $\text{CH}_4$  are considered. A crit. comparison is given of the Slater-Pauling theory of directed valence and the nondirectional Heitler-Rumer theory based on a  $^3\text{S}$  state of the C atom. The assumption of electron pairing, made in C. A. 27, 3140, is shown to be justified in  $\text{CH}_4$ . The energies of  $\text{CH}_3$  and  $\text{CH}_4$  are compared with theory.

Allen S. Smith

**Potassium superoxide and the three-electron bond.** Edward W. Neuman. *J. Chem. Physics* 2, 31-3(1934).—The highest oxide of K is shown to be paramagnetic, with a susceptibility corresponding to the formula  $\text{KO}_2$ . The crystals are supposed to contain  $\text{O}^-$  ions in a  $^3\text{H}$  state, and the electronic structure  $:\text{O}::\ddot{\text{O}}:-$  is proposed for the superoxide ion. Prepn. of the oxide is described. Since the usual name seems unsatisfactory, it is suggested that the substance be called K superoxide rather than tetroxide.

Allen S. Smith

**Magnetic moment of the proton.** I. Estermann, R. Frisch and O. Stern. *Nature* 132, 109-70(1933).—Since the spin of the proton has the same value as that of the electron, the magnetic moment of the proton is  $1/1840$  Bohr magneton or 1 nuclear magneton. The only available method for the detn. of this moment is the deflection of a beam of H mols. in an inhomogeneous magnetic field. In the H mol., the spins of the 2 electrons are anti-parallel and cancel out. Thus the magnetic moment of the mol. has 2 sources: the rotation of the mol. as a whole and the magnetic moment of the 2 protons. In para-hydrogen, the spins of the 2 protons are anti-parallel, their magnetic moments cancel out, and only the rotational movement remains. At low temp., practically all the mols. are in the zero rotational state, and therefore nonmagnetic. At higher temp., a certain proportion are in a higher quantum state, mainly 2. The deflection expts. with para-hydrogen at room temp. allow, therefore, the detn. of the rotational moment, which has been found to be between 0.8 and 0.9 nuclear magneton per unit quantum no. With ortho-hydrogen, the lowest rotational quantum state possible is 1. Therefore, even at low temp. the rotational magnetic moment is superimposed on that because of the 2 protons with parallel spin. Since the rotational moment is known from the expt. with pure para-hydrogen, the moment of the protons can be detd. from deflection expts.

with ortho-hydrogen or with ordinary H. The value obtained is 5 nuclear magnetons for the 2 protons in the ortho-hydrogen mol., i. e. 2.5 (and not 1) nuclear magnetons for the proton. This is correct within a limit of less than 10%.

Albert L. Henne

**Mass transport in the luminous arc and in flames.** Optical determination of alkali atom radii. L. A. Ginecl. *Arch. neerland. sci.* IIIA, 285-333(1933).—The concn. of electrode metal vapor in the normal and glimmering arc was detd. by measurement of the intensity of the emitted lines. With decrease in concn. the degree of ionization of the metal atoms and the intensity of the  $\text{N}_2$  bands is strongly decreased. In the normal arc between a metal anode and C cathode the influence of the elec. field on the mass transport is negligible in comparison to transport by the air current and by diffusion. Reduction of the oxide layer on the anode by means of H caused a strong decrease in the metal vapor concn. Measurement of the intensities of the resonance lines, and for K and Na also of the continuous background, gave the following values for the diffusion constant in a gas flame: Li 5.50, Na 3.20, K 2.70 Rb 2.40 and Cs 1.90. The corresponding atom radii calcd. from gas-kinetic theory are 2.3, 2.7, 3.0, 3.1 and 3.5, and compare well with the values calcd. by Kramers from quantum theory.

P. S. Roller

**The crystal photoeffect.** Anne Joffé and A. F. Joffé. *Nature* 132, 168-9(1933).—An expt. and a discussion substantiating C. A. 27, 4161.

Albert L. Henne

**Determination of the molecular structure of acetone, methyl ether, formic acid and formaldehyde by diffraction of electrons.** Luis Bru Villaseca. *Rev. acad. cienc. Madrid* 30, 580-620(1933); cf. C. A. 26, 4217; 27, 1260.

L. E. Gilson

**Transformation of metals by secondary electron emission.** Kazuma Hayakawa. *Science Repts. Tôhoku Imp. Univ.*, First Ser., 22, 934-58(1933).—The transformation of metals was studied by detg. (1) the secondary electron emission and (2) the ionization current in H at various temps. Abrupt changes in current occur at the allotropic transformation points of Fe and Co. In the magnetic transformation of Fe, Ni and Fe-Ni alloys, the variation of electron emission or of ionization current with temp. is quite continuous.

P. T. Newsome

**Diffusion of positive ions of salts through copper, silver, and gold at high temperature.** Analysis of the ions emitted with the aid of a mass spectrograph. Jean Chockci. *Ann. Phys.* 20, 478-517(1933); cf. C. A. 27, 894.—Folded sheets of Cu, Ag or Au contg. various salts emit at high temp. simple metal ions of the salt and smaller amts. of complex ions and ions of the sheet metal. The time for max. emission at const. temp. is proportional to the thickness of the sheet, an indication of diffusion through the metal. An energy loss shown by the ion was explained by a hypothesis of large ion emission.

L. Goldman

**Ionization potentials and dissociation energies of non-polar molecules.** Jean Savard. *Arkiv Mat. Astron. Fysik* 24B, No. 3, 5 pp.(1933); cf. C. A. 28, 694<sup>a</sup>.—An energy cycle, based upon the assumption that the binding electrons are not affected by the remaining electrons, shows that the energy of dissocn. of the mol. is:  $D = 2n(I_m - I_a)$ , in which  $2n$  is the no. of binding electrons, and  $I_m$  and  $I_a$  are the ionization potentials of the mol. and atom. The energy of dissocn. of the ion is  $(2n - 1)(I_m - I_a)$ . The method is extended to mols. of the type,  $\text{AB}_n$ . Ionization potentials can be calcd. with precision that exceeds that of the direct expl. detn.

S. Bradford Stone

**The formation of matter from the ether.** V. Poscappel. *Compt. rend.* 198, 59-61(1934).

A. B. F. Duncan

**The effective diameters of the radioactive nuclei.** G. Gamov and S. Rosenblum. *Compt. rend.* 197, 1620-2(1933).—By using wave mechanics a relationship is set up between the decay const., velocity of  $\alpha$ -particle emitted,

at. no. and the radius of the nucleus undergoing disintegration. From this equation it is calcd. that the effective diams. of the radioactive nuclei lie between  $12 \times 10^{-13}$  and  $17 \times 10^{-13}$  cm.

Oden E. Sheppard

A suggested explanation of  $\beta$ -ray activity. M. N. Saha and D. S. Kothari. *Nature* 133, 99(1934); cf. *C. A.* 28, 705<sup>4</sup>.—This interpretation offers a soln. to Bohr's paradox, that, though the nucleus contains only pos. particles, a  $\beta$ -ray can be created within it and expelled at high velocity.  $\alpha$ - or  $\beta$ -Radiation is mainly due to the leakage of  $\alpha$ -particles through the potential barrier. *Electrofusion* of a quantum into an electron and a positron differs from the reverse process of the conversion of radiant energy into mass.

Gerald M. Petty

Atomic transmutation and stellar temperatures. T. E. Sterne. *Nature* 132, 893(1933); cf. *C. A.* 28, 705<sup>4</sup>.—(Simov and Landau (*C. A.* 28, 1601<sup>1</sup>)) suggest either that 1.1 of mass 7 can be present only occasionally on a star's surface, or that no regions with temp. of more than several millions of degrees can exist in the interior of a star. S. points out that, if elements are being made as well as disintegrated, the difficulty of over-stability is avoided. (Or, Li may be assumed to have been present from the beginning in the star's atm.

Frank Urban

Combination of proton and neutron. D. E. Lea. *Nature* 133, 24(1934).—In expts. on neutron scattering,  $\gamma$ -radiation of  $4 \times 10^6$  e. v. reflected at  $120$ – $80^\circ$  was observed. This is explained as being the result of the combination of a neutron and a proton to form  $H^2$ . The no. of short tracks to be expected from such heavy particles is estd. to be as high as  $1/4$ .

Gregg M. Evans

Positive electron tracks. D. Skobel'tzyn. *Nature* 133, 214(1934).—Two pairs of photographs (stereoscopic) are reproduced showing pairs of oppositely curved electron tracks. In 3 of 4 cases in which the energies were calcd., the energy ratio  $e^+/e^-$  lies between 2 and 4; in the 4th case it is about 0.66. Calcs. indicate that the ratio no. pairs/no. of Compton electrons, is proportional to the at. no. In the 2nd pair of photographs is shown a pair of electrons of rather low energy ( $10^6$  e. v.) produced by a  $\beta$ -particle, also showing evidence of the nuclear recoil. An "annihilation radiation" is to be expected from an x-ray-tube anticathode when electron energies of  $10^6$  e. v. are attained.

Gregg M. Evans

Stopping of fast particles with emission of radiation and the birth of positive electrons. W. Heitler and P. Sauter. *Nature* 132, 892(1933).—Dirac's theory of the electron has been used to calc. the probability that a fast electron, passing through matter, emits a quantum of radiation of energy comparable to its own, and also the probability that a quantum of radiation, colliding with a nucleus, gives birth to a pos. electron.

Frank Urban

Experimental proof of the annihilation of positive electrons. F. Joliot. *Compt. rend.* 197, 1622-5(1933).—When 80 millicuries of  $^{210}\text{Po}$  as a source of pos. electrons was placed between 2 magnetic poles in the marginal region of a nonuniform magnetic field (Thibaud, *C. A.* 28, 38<sup>2</sup>) and the pos. electrons were allowed to strike a Pb or Al radiator placed above a Geiger-Muller counter, the radiation emitted was independent of the nature of the radiator, and the photons emitted had an energy of about  $0.5 \times 10^6$  e. v. and were approx. twice as numerous as the incident pos. electrons. These expts. confirm Dirac's theory that a pos. electron may disappear when it meets a free neg. electron and that 2 photons of energy  $0.5 \times 10^6$  e. v. are emitted in opposite directions.

Oden E. Sheppard

The annihilation of positrons on contact with matter and the radiation which results. Jean Thibaud. *Compt. rend.* 197, 1629-32(1933); cf. *C. A.* 28, 960<sup>1</sup>.—A method is developed for distinguishing between the photons of annihilation of pos. electrons by contact with matter and photons arising from neg. electrons. These expts. present for the first time exptl. evidence showing the destruction of matter and its conversion into radiation.

O. E. S.

The transformation of electron pairs. F. Joliot. *Compt. rend.* 198, 81-3(1934).—A positron may disappear with an electron giving two photons, the sum of their energy being  $10^6$  e. v. This will take place after the

positron has been absorbed by dense matter and is moving slowly. Or a positron may disappear with a nuclear electron, giving a single photon of  $10^6$  e. v. The no. of photons per positron was found experimentally to be between 1.6 and 3, but should be known with more precision. Some of the slow positrons may combine with an electron to give a photon and an assocn. of positron and electron (zero mass and energy equal to the photon). In the latter case the ratio photons to positrons should be between one and two. The mean life of the positron cannot be approximated at present. A. B. F. Duncan

Interaction of hard  $\gamma$ -rays with atomic nuclei. C. Y. Chao and T. T. Kung. *Nature* 132, 709(1933).—The ratio of the no. of electrons emitted by Pb to the no. emitted by Al when bombarded by primary  $\gamma$ -rays rises by 16% when the wave length drops from 0.8 to 4.7 X. U. This shows that Pb nuclei are disintegrated by  $\gamma$ -quanta.

Louis Goldman

Disintegration of lithium under proton bombardment. P. I. Dec. *Nature* 132, 818-19(1933).—The short-range particles (of range less than 2 cm.) emitted by Li under proton bombardment were investigated by allowing the proton beam to pass through a mica window into an expansion chamber, where it fell upon a thin target of  $\text{Li}_2\text{O}$ . In the majority of cases particles were emitted in opposite pairs. The ranges of the particles could not be detd. with certainty because of the finite thickness of the target; hence the products of disintegration are not known.

Helen S. Hopfield

The equilibrium among the three hydrogens. D. Rittenberg, Walker Bleakney and Harold C. Urey. *J. Chem. Physics* 2, 489(1934). The equil. consts. for the reaction  $H_2 + H_2 \rightleftharpoons 2H_2^+$  were obtained from a mass-spectrographic analysis of the relative abundances of the 3 mols. The exchange reaction does not take place rapidly, as shown by the fact that the consts. are those characteristic of the temp. of prepn. 21 days before analysis. In each case the observed equil. const. agreed closely with the calcd. values (*C. A.* 27, 1811). The agreement gives reasons for confidence in the mass-spectrographic method of analysis.

Allen S. Smith

Experiments on heavy hydrogen. A. Farkas and L. Farkas. *Nature* 132, 894(1933).—The equil. const.  $K = [H_2][H_2]/[H_2H_2]$  was found to be about  $1/4$  at temps. higher than room temp., and independent of temp. The gas diffusing from a thin Pd tube at  $150^\circ$  has a higher  $H_2:H_2^+$  ratio than the original gas. At higher temps. the diffusing gas becomes heavier. The formation of the equil. mixt. from  $H_2$  and  $H_2^+$  proceeds in the homogeneous phase above  $600^\circ$ . It takes place not only by the mechanism involving the atoms, i. e.,  $H + H_2 = HH + H$  and  $H + H_2 = HHH + H$ , but perhaps also by the mol. exchange reaction  $H_2 + H_2 = 2H_2H$ . The reaction involving the atoms has an activation energy of the same order as that of the thermal ortho-para-H conversion. The formation of  $HH^2$  does not occur at  $-195^\circ$  on charcoal.

Frank Urban

Separation and properties of the isotopes of hydrogen. Harold C. Urey. *Science* 78, 566-71(1933).— $H_2O$  contg. various percentages of deuterium oxide was prepd. by the electrolysis of KOH solns. in cells consisting of glass vessel with Ni tubing electrodes, cooled by running  $H_2O$  to  $20^\circ$  and operated at 25 amp. current. The electrolysis was carried out in 5 stages and yielded  $H_2O$  contg. 1-40% deuterium oxide at a cost of about \$15-20 per g. The refractive index method was used for analysis of the samples of  $H_2O$ . The thermodynamic, phys., kinetic and physiological properties of protium and deuterium oxides are discussed and their properties as observed by previous investigators are tabulated.

M. McMahon

Electrolytic concentration of deuterium. R. P. Bell and J. H. Wolfenden. *Nature* 133, 256(1934).—With 1% NaOH Ni was a better cathode than Pt or Cu; on Ni 1% NaOH was better than 8%. Increase of temp. assisted as did decrease in c. d.

Gregg M. Evans

The activity of materials exposed to a natural electrica field. Hubert Garrigue. *Compt. rend.* 197, 1619-21(1933).—A Zn cylinder  $20 \times 70$  mm. forming part of a

lightning rod struck by lightning showed an activity equal to 934 ions per cc. per sec. in a closed gold-leaf electroscope about an hr. after being struck. A piece of brass, a bunch of grass and a piece of schist exposed on a limestone cliff during a distant elec. storm showed marked activity to a decreasing extent in the order given. The decay curves indicate that the activity is due chiefly to Ra elements.

Oden E. Sheppard

Experiments on evolution of helium from radioactive minerals and rocks. V. Khlopin, E. Herling and E. Ioffé. *Nature* 133, 28(1934).—Loss of He from a mineral is greater in an atm. of H than in a vacuum and is in general proportional to the pressure of H, even above atm. pressure.

Gregg M. Evans

The  $\gamma$ -rays of radium B + C and of thorium C + C'. C. D. Ellis. *Proc. Roy. Soc. (London)* A143, 350-7 (1934); cf. *C. A.* 27, 2874.—A remeasurement of the Ra B + C spectrum and other measurements on the Th C + C' spectrum were made in order that the data would be comparable with those available for the energy of long-range  $\alpha$ -particles, both of which, especially through comparison, contribute information regarding the nuclear level system of radioactive substances. Calvin Brous

Radioactivity and composition of the waters, minerals and rocks in Lurisia. Luigi Francesconi and Renato Bruna. *Ann. chim. applicata* 23, 534-46(1933).—Samples from 10 springs in the Lurisia region were examined. Analyses are given for the spring with highest radioactivity (1000 millimicrocuries or 2700 Mache units per l.). In addn. to *autumite*, *torbernite* is also found in this region. Its compn. is:  $P_2O_5$  13.43,  $As_2O_5$  2.83,  $UO_2$  58.77,  $CuO$  11.39,  $H_2O$  13.55 (99.97). The rocks surrounding these active deposits possess induced radioactivity decreasing in activity to a distance of 20 m. from the active minerals. These rocks can thus, in themselves, be a valuable source of radioactive material.

A. W. Contieri

Quantum mechanics and the benzene problem. I, II. G. Elsen. *Chem. Weekblad* 30, 310-17, 322-8(1933).—A review of recent work.

B. C. A.

Anomalous absorption of  $\gamma$ -rays. Possibility of the quantum jump of the rest mass of an electron. H. Arakatsu. *Mem. Faculty Sci. Agr. Taihoku* 5, 163-8 (1932).—Theoretical.

B. C. A.

Anomalous dispersion and absorption of x-rays. E. J. Williams. *Proc. Roy. Soc. (London)* A143, 358-70 (1934).—The anomalous dispersion of x-rays is calcd. from exptl. data for photoelec. absorption. The results for Fe and Cu are compared with expt. The relation between the oscillator strength calcd. from the exptl. data for absorption and the quantum-mech. oscillator strength for the H-like electrons is discussed. The K continuum of oscillators, whose observed strength is about 1.3, is given particular attention.

Calvin Brous

The N- and O-series and N-absorption edge of x-spectra. V. Dolejšek. *Nature* 132, 443-4(1933).

Albert L. Henne

X-ray K- and L-spectra of aluminum. Manne Siegbahn and Torsten Magnusson. *Nature* 132, 895(1933).—Al metal gives a  $K\beta$  line, corresponding to a transition from the free electron levels to the K-level, with a sharp edge at the side of the short wave lengths. It is not formed by the oxide. The same characteristic differences appear in the L-series. Manne Siegbahn and Harald Karlsson. *Ibid.* 895-6.—In order to verify further a previous interpretation of the L-series of Si, Al and Mg, the structure of the L-line of a nonconducting compd. ( $Al_2O_3$ ) was studied.

Frank Urban

The fine structure of x-ray absorption by molecular gases. H. Petersen. *Arch. neerland sci.* IIIA, 165-218 (1933); cf. *C. A.* 27, 2378.—Equations are derived for the absorption, and the functions tabulated numerically. For  $Cl_2$ , a min. is calcd. at 6.5 v. from the principal limit with a max. variation of 25%; expt. of Lindh gave 7.8 v. The fine structure permits calcn. of the internuclear distance, and applies to light elements where diffraction fails because of the rapid decline in intensity. P. S. Roller

X-ray diffraction by gaseous benzene derivatives. W. C. Pierce. *J. Chem. Physics* 2, 1-5(1934).—Previous

work (*C. A.* 27, 1871) has been extended with results of a more quant. nature. App. is described. The Debye method for the detn. of interat. distances in single mols. is applied to *o*- and *p*-dichlorobenzene. Results with monochlorobenzene are used to correct the scattering curves so as to isolate the Cl-Cl scattering. The resulting Cl-Cl curves agree well with theoretical curves constructed for distances of 3.0 and 6.35 Å., resp. The measurements indicating a plane hexagonal benzene mol. with the Cl atom lying in or near the plane.

Allen S. Smith

Focusing methods in the analysis of crystalline powders. Horia Hulubei. *Compt. rend.* 198, 79-80(1934).—A point source of x-rays irradiates the powder placed on the circumference of a circle, the plane of which is perpendicular to the line joining its center to the source. The diffracted rays will focus on the extension of this line.

Victor Hicks

Focusing of diffuse x-rays by plane crystalline sheets. Y. Cauchois. *Compt. rend.* 198, 76-8(1934); cf. *C. A.* 27, 2022.—Math. expressions are given for the dispersion of a spectrograph consisting of a slit coincident with the circumference of a circle placed adjacent to a plane crystal. The advantages are narrow lines and short exposures.

Victor Hicks

The thermal expansion of bismuth by x-ray measurements. A. H. Jay. *Proc. Roy. Soc. (London)* A143, 465-72(1934); cf. *C. A.* 28, 408<sup>2</sup>.—X-ray powder photographs of Bi were taken over the temp. range 18.5-268° and the lattice dimensions calcd. for each temp. of observation. The lattice expansions are compared with those detd. by optical methods. A small increase in expansion coeff. in the region 70-80° is assocd. with an allotropic transition point around 75°. Immediately below the m. p. the coeff. falls; possible explanations are presented.

Both phenomena are reversible.

Calvin Brous

Series of alkali atoms in an electric field. Edoardo Amaldi and Emilio Segrè. *Nature* 132, 444-5(1933). Preliminary description of photographs of the absorption spectra of K and Na vapor in an elec. field.

A. L. H.

The Zeeman effect in the infra-red krypton I lines. Béla Pogány. *Z. Physik* 86, 729-37(1933).—See *C. A.* 28, 708<sup>2</sup>.

Egon Bretschneider

The mechanical moment of the nucleus of cesium. A. Jackson. *Proc. Roy. Soc. (London)* A143, 455-61 (1934).—The mech. moment of the Cs nucleus is detd. as  $7/2$ . This corresponds to an intensity ratio of the doublet components equal to 1.28; the exptl. value was 1.27  $\pm$  0.02. The doublets studied were  $\lambda$  4555 and  $\lambda$  4593. The effect of self-absorption, for which a small correction was applied, was almost eliminated through the use of very low Cs vapor pressures in the light source.

C. Brous

The resonance excitation of the thallium spectrum in the vapors of its halides. G. G. Neyzhim. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1933, 212-14.—The following Tl lines were observed: 2768, 3519-29 Å. from the level  $3^2D$  (4.4 V.), 2580, 3230 Å. from  $3^2S$  (4.8 V.), 2380, 2915 Å. from  $4^2D$  (5.1 V.), 2316, 2826 Å. from  $4^2S$  (5.2 V.) and 2238, 2709-11 Å. from  $5^2D$  (5.5 V.). The results are discussed.

A. A. Bochtling

A method for the production of the spectrum of atomic nitrogen (N I). D. Seferian. *Compt. rend.* 198, 68-9 (1934).—A low-voltage arc (110 v. 20-50 amp.) was maintained in  $N_2$  between W electrodes. Only arc lines of N and W appear.  $N_2$  bands are absent. A continuum not due to the electrodes was considered due to either at N or W.

A. B. F. Duncan

Continuous absorption of light in cesium vapor. H. J. J. Braddick and R. W. Ditchburn. *Proc. Roy. Soc. (London)* A143, 472-81(1934); cf. *C. A.* 27, 1821.—The absorption of light in Cs vapor, measured from the series limit ( $\lambda$  3184) to  $\lambda$  1935, is directly proportional to the pressure at all wave lengths and decreases from the limit to  $\lambda$  2750, from which it rises monotonically to  $\lambda$  1935. The absorption is concluded to be photoelec., and in the farther ultra-violet was proportional to the vapor pressure of Cs, this makes the rise appear to be of at. origin. Adsorbed films of Cs on the windows are shown to play no appreciable part.

Calvin Brous

The absorption spectra of the sulfides of zinc, cadmium and mercury from  $\lambda 7000$  to  $1900$ , and the heat of dissociation of sulfur. P. K. Sen-Gupta. *Proc. Roy. Soc. (London)* A143, 438-54(1934); cf. *C. A.* 27, 4733.—The absorption spectra of ZnS, CdS and HgS were studied in the region  $\lambda 7000-1900$ . The vapors of all 3 decomp. photochemically. There is absorption corresponding to the formation of: (1) two normal atoms (S in the  $^1P$  state), (2) a normal metal atom and S in the  $^1D_2$  state, and (3) (for HgS only) a normal metal atom and S in the  $^1S_0$  state. The differences  $^1P \rightarrow ^1D_2$  and  $^1D_2 \rightarrow ^1S_0$  for S are, resp., 1.3 and 1.5 v. The sulfides are considered to be ionic in the gaseous state, of the type  $M^+S^{2-}$ . On the passage of light two normal atoms are formed. The possibility that a single electron is transferred causing the formation of  $Zn^+S^-$  is discussed. The heat of dissociation of  $S_8$  into S atoms is indirectly detd. to be 102.9 cal.

The band spectrum of tin oxide. F. C. Connelly. *Proc. Phys. Soc. (London)* 45, 780-91(1933).—The spectrum of SnO was produced in a flame source which offered a considerable no. of advantages over the arc previously used by Mahanti (*C. A.* 25, 4792). The absorption spectrum was also obtained. Exptl. evidence was secured proving that the emitting mol. is SnO. Approx. values of the vibrational consts. were calcd. from the band-head data. The lower electronic level of this system was shown to be the ground state. It is doubtful whether the B and C systems described by M. actually exist as sep. systems.

The carbon-halogen bond energy and the molecular structure as related to halogen alkyls. Y. Fukumoto. *J. Chem. Physics* 2, 46(1934).—Data obtained from an investigation of the continuous absorption spectrum of about 50 halogen alkyls (*C. A.* 27, 4170) reveal the following facts: (1) the energy of the C-halogen bond increases with decrease in at. wt.; (2) it decreases successively as the H atom is substituted by the halogen atom; (3) it is modified more or less as the length of the chain is varied; and (4) no regularity is detected among the energies of the C-halogen bond of normal, iso, secondary and tertiary compds. of one halogen alkyl.

Spectrum of sulfur chloride. H. W. Thompson. *Nature* 132, 896(1933).—The spectrum was studied with pressures of 1-100 mm. with an absorbing column of 50 mm. and over the range 5000-2000 Å., and indicated certain features not unlike those reported in the case of Cr oxychloride. A complete description of the spectrum is given.

Quantized molecules formed of excited mercury atoms and methane molecules. Geo. Glockler and F. W. Martin. *J. Chem. Physics* 2, 46-7(1934).—Diffuse bands similar to those shown by the complex structures formed from excited Hg and rare gases (cf. Oldenberg, *C. A.* 22, 1729) were found in CH<sub>4</sub>-Hg mixts. These bands must be due to quantized states of a Hg complex with CH<sub>4</sub>.

Vibrational energy levels of hydrogen cyanide. A. Adel and E. F. Barker. *Nature* 133, 29(1934).—The following infra-red bands with their positions (in cm.<sup>-1</sup>) and characters were observed in HCN vapor:  $\nu_2 + \nu_3$ , 4005.6, perpendicular;  $\nu_2 + 2\nu_1$ , 4993.9, perpendicular;  $\nu_1 + \nu_3$ , 5405.0, parallel;  $2\nu_1$ , 6523.5, parallel. The band at 5405 is inaccurate, on account of H<sub>2</sub>O-vapor absorption. The complete vibrational energy level diagram of the normal mol. can now be constructed with high precision.

The influence of foreign gases on the intensity of infra-red absorption. Paul C. Cross and Farrington Daniels. *J. Chem. Physics* 2, 6-10(1934); cf. *C. A.* 27, 1824.—To obtain a quant. measure of the effect of nonabsorbing gases on the intensity of the max. absorption of certain unresolved bands in the infra-red, measurements were made on the effect of He, A, O, N, C<sub>2</sub>H<sub>4</sub>, CO<sub>2</sub> and H on the max. absorption by N<sub>2</sub>O, CO and EtBr. Relative "optical" collision diams., calcd. on the postulate that the mean free paths are equal in gas mixts. having the same relative absorption coeffs., show a linear relationship with the gas-

kinetic diams. as detd. by viscosity measurements. The data show that Beer's law is applicable to the infra-red absorption spectra of complex substances of high mol. wt. but that it is applicable to simple diat. and triat. gases only when the total pressure is sufficiently great.

Infra-red absorption spectra of monohalogen derivatives of saturated aliphatic hydrocarbons. Jean Lecomte. *Compt. rend.* 198, 65-7(1934).—Derivs. contg. 2-7 C atoms were studied in the region 490-1450 cm.<sup>-1</sup>. Excellent agreement was found with Raman data when these were available. Data are given for the propyl halides. The halogen vibrations are independent of the chain length.

Study of the absorption spectra of benzene derivatives near 1.0  $\mu$  with the aid of a registering spectrometer. R. Freymann and A. Naheriac. *Compt. rend.* 197, 829-31(1933).—By using 20.3 and 70.0 cm. thicknesses of C<sub>6</sub>H<sub>6</sub> and its derivs. the structure of the complex weak band near 1.0  $\mu$  was detd. The most intense lines are: C<sub>6</sub>H<sub>6</sub>, 1.0220, 1.0593; PhI 1.0189, 1.0542; PhBr 1.0160, 1.0520; PhCl 1.0139, 1.0503; PhNO<sub>2</sub>, 1.0067, 1.0419; PhMe 1.0171, 1.0626  $\mu$ . Thus besides the very intense bands (CH=) at 0.87 and 1.14 (*C. A.* 26, 1188; 28, 970) corresponding to bands at 0.9 and 1.2 of satd. hydrocarbons and bands at 1.09 and 1.11 (C=C as found in Cl<sub>2</sub>C=CCl<sub>2</sub>) there is a weak band at 1.0  $\mu$  analogous to the intense band near 1.0  $\mu$  of the satd. compds.: CHCl<sub>3</sub>, 1.0160, 1.0665; CH<sub>2</sub>Cl<sub>2</sub>, 1.0213, 1.0497; MeOH 1.0073, 1.0697; C<sub>2</sub>H<sub>5</sub>, 1.0347, 1.0966  $\mu$ . This does not appear for Cl<sub>3</sub>CCl<sub>3</sub> or Cl<sub>3</sub>C=CCl<sub>2</sub> and must be attributed to the CH linking. As with the 0.87 and 1.14 bands introduction of electroneg. groups shifts the bands toward the short wave lengths.

Spectral absorption of methylated xanthenes and constitution of the purine nucleosides. J. M. Gulland and E. R. Holiday. *Nature* 132, 782(1933).—The ultra-violet absorption spectra of xanthine (I), 1-(II), 8-(III), 9-(IV) monomethylxanthenes, 3,9-dimethylxanthine and 1,3,9-trimethylxanthine show 2 bands in alk. soln. 3-(V) and 7-monomethylxanthenes, 1,3-(VI), 1,7-, 3,7-dimethylxanthenes and 1,3,7-trimethylxanthine (VII) show one band in acid or alk. soln. Me in position 7 seems to inhibit the appearance of the 2nd band. In V and VI the H of the imino group must be attached at 7, in I, II and III at 9, the reverse of the usual assignment, i. e., the formulas of I and "isoxanthine" would be interchanged. The spectrum of xanthosine (xanthine riboside from guanosine from yeast nucleic acid) has 2 maxima corresponding to those of IV, i. e., the carbohydrate is attached at 9. The spectra of synthetic theophylline *d*-glucoside and *l*-arabinoside show one band identical with VII. The sugar must be at 7. These conclusions are opposed to those of Gulland and Macrae (*C. A.* 27, 4232) but seem to be based on more satisfactory evidence.

Infra-red absorption spectra of some plant pigments. R. Stair and W. W. Coblenz. *Bur. Standards J. Research* 11, 703-11(1933)(Research Paper No. 617).—The infra-red absorption spectra to about 15  $\mu$  of chlorophyll, carotene, xanthophyll, Et chlorophyllide, phytol, pheophytin and Cu pheophytin were obtained with a mirror spectrometer, vacuum thermopile and iron-clad galvanometer. Percentage transmission is plotted against wave length. A table of the wave lengths and nos. for the principal absorption bands is given. Max. at 3.43, 4.3, 6.86, 7.3, 9.6 and 10.4  $\mu$  which were previously obtained for simpler compds. having CH<sub>3</sub> and CH<sub>2</sub> groups, and at 2.95, 5.9 and 8.6  $\mu$  found for compds. contg. COC-, NH- or -OH bonding appear in these spectra, also (cf. Publication 35 Carnegie Inst. of Washington, 1905). The spectrum of carotene changes on oxidation. In general, there is intense absorption in the short wave lengths and many small bands in the infra-red as in the case of some of the aniline dyes.

Absorption of ultra-violet rays by several organic substances. J. Dabrowski and L. Marchlewski. *Bull. soc. chim.* 53, 946-50(1933).—The absorption spectra of isatin (max. 244.5, 299.0, 410.0 m $\mu$ , min. 226.3, 267.5, 340.0

$\mu\mu$ ), *N*-ethylisatin (displaced slightly to red), *O*-Me ether (max. 235.9, 403.0  $\mu\mu$ , min. 305.0  $\mu\mu$ ), and the *O*-Me ether after some time (max. 245.7, 310.0, 458.0  $\mu\mu$ , min. 226.3, 288.6, 378.5  $\mu\mu$ ) are given. The spectra of isatin and its *N*-Et deriv. are similar and differ essentially from that of the pure *O*-ether. These results agree with those of Hartley and Dobbie, not with Morton and Rogers (cf. *C. A.* 20, 418). The *O*-Me ether is very unstable and after a short time gives a spectrum which approaches that of isatin. Janet E. Austin

**The Raman spectrum of water.** J. Cabannes and J. de Riols. *Compt. rend.* 198, 30-2(1934).—The band whose center is at 3450 has 3 maxima, 3224, 3436 and 3625  $\text{cm}^{-1}$ , all polarized. 3625 does not exist in ice. The first 2 maxima are due to polymers of water, the last (which appears also in vapor) to single mols. The band at 1650 represents sym. motion, is polarized and is not displaced by dissolved salts. It exists neither in ice nor in hydrates. A. B. F. Duncan

**Raman spectrum of heavy water.** R. W. Wood. *Science* 78, 578; *Nature* 132, 970(1933).—The Raman spectrum of heavy  $\text{H}_2\text{O}$ , prepd. electrolytically, has been obtained by excitation with 2536 Å. line of Hg. Two Raman bands were obtained with an intensity ratio of 1:4; the new band extended from 2694 to 2721 Å. with max. intensity at 2711 Å. This value is more nearly correct than the value 2713 given previously. M. McMahon

**The Raman OH band of nitric acid.** Louis Medard and Therese Petitpas. *Compt. rend.* 198, 88-9(1934); cf. *C. A.* 28, 1273<sup>9</sup>.—The band at 3100  $\text{cm}^{-1}$  found in solns. of  $\text{NH}_4\text{NO}_3$  in  $\text{HNO}_3$  was found also in pure  $\text{HNO}_3$  extending from 3215 to 3485  $\text{cm}^{-1}$ . The structure is not sym., but more intense on the side of high wave no. Similar bands are found in solns. of  $\text{KNO}_3$  in  $\text{HNO}_3$ , and the shift of other Raman lines in various concns. in these solns. is given. A. B. F. Duncan

**Raman spectra of some acetylenic alcohols.** B. Grédy. *Compt. rend.* 198, 89-91(1934); cf. *C. A.* 27, 5052. —The presence of the radical  $\text{C}\equiv\text{C}\cdot\text{OH}$  attached to the triple bond does not modify essentially the 2 characteristic frequencies found in the hydrocarbons. The secondary group  $-\text{CHOHMe}$  modifies these frequencies. Data are given for 2-octin-1-ol, 2-nonin-1-ol, 4-cyclohexyl-2-buten-1-ol, 3-phenyl-2-propin-1-ol, 3-nonin-2-ol, 3-decin-2-ol, 5-cyclohexyl-3-pentin-2-ol, 4-phenyl-1-buten-2-ol. A. B. F. Duncan

**Raman effect of organic substances. I. Raman effect of a series of esters of benzoic acid and phenyl esters of fatty acids.** Kichimatsu Matsuno and Kwan Han. *Bull. Chem. Soc. Japan* 8, 333-65(1933).—Raman spectra of the following compds. were obtained by means of the Dadiou and Kohlrausch method (*C. A.* 23, 4621): *H*-OMe, *Bz*OMe, *Bz*OPr, *Bz*OBu, isopropyl, isobutyl, isopentyl, cyclohexyl, *o*-tolyl, *n*-octyl benzoates, *Bz*Cl, *Ac*OPh, *Ph* butyrate, *o*-tolyl acetate. The usual line 615  $\text{cm}^{-1}$  for the benzene ring is shifted to 592  $\text{cm}^{-1}$  for *o*-tolyl acetate and seems characteristic of an *o*-compd. Both 616 and 586  $\text{cm}^{-1}$  appear for *o*-tolyl benzoate. Between 2850 and 2980  $\text{cm}^{-1}$  lines attributed to the aliphatic CH linkage appear. The line at 1452  $\text{cm}^{-1}$  (not present for *Bz*Cl) increases in breadth and intensity with the no. of  $\text{CH}_2$  groups and is attributed to the transverse vibration of H in  $\text{CH}_2$ . The frequencies 1720, 1270 and 670  $\text{cm}^{-1}$  possibly arise from the  $-\text{COO}$  group. The following frequencies agree with the shifts calcd. for the bonds C-O 1110, C-C 1110, O Me 1078, C Cl 760, Ph-O 810  $\text{cm}^{-1}$ . Frequencies between 810 and 863  $\text{cm}^{-1}$  are attributed to valency frequencies between the acid residue and the adjacent  $\text{CH}_2$  group and to the free rotation of the alkyl group. The valency and deformation frequencies have been calcd. by assuming that a system of 3 atoms or atom groups gives rise to the Raman lines and that a mol. is made up of these systems. Janet E. Austin

**Raman effect of furan and furfural.** Geo. Glockler and B. Wiener. *J. Chem. Physics* 2, 47(1934).—Lines found for furan and furfural are reported. The results favor the centric formula for furan since no double bond is found.

<sup>1</sup>  $\alpha$ -Substitution causes the appearance of a double bond C=C within the ring. Allen S. Smith

**The photodecomposition of gaseous ammonia.** Richard A. Ogg, Jr., Philip A. Leighton and Francis W. Bergstrom. *J. Am. Chem. Soc.* 56, 318-23(1934); cf. *C. A.* 27, 2881. —The photochem. decompn. of  $\text{NH}_3$  by short ultra-violet light at 20° and pressures of 1-8 atms. occurred with a quantum efficiency of 0.14, which is independent of the pressure of  $\text{NH}_3$  and of the wave length of light. It increased 4-fold between 20° and 400°. Photolysis of  $\text{NH}_3$ - $\text{N}_2\text{H}_4$  mixts. contg. less than 0.3%  $\text{N}_2\text{H}_4$  showed that the decompn. of the latter was photosensitized by the  $\text{NH}_3$ ; the quantum efficiency of the  $\text{N}_2\text{H}_4$  decompn. was 1.28. P. H. Emmett

**[Photochemical] reaction between potassium oxalate and iodine and the relation between intensity and velocity.** W. V. Bhagwat. *J. Indian Chem. Soc.* 10, 649-54(1933). cf. *C. A.* 26, 5848. —White light and light of 5200-6300, 6280-7200, 8500 Å. were used. The relation between intensity and velocity was not const., but steadily increased as the velocity of the reaction decreased.

Frank Urban

**Formaldehyde in the upper atmosphere.** N. R. Dhar and Atrna Ram. *Nature* 132, 819-20(1933). —All samples of rain water contain  $\text{CH}_2\text{O}$ , in amts. varying from 0.00015 to 0.00012 g. per l. The amt. is not increased by lighting, but is greater when the rainfall is preceded by some sunny days.  $\text{CH}_2\text{O}$  in the atm. is probably formed from  $\text{CO}_2$  and  $\text{H}_2\text{O}$  by the action of light of wave length 2550 Å, which has not all been absorbed by the  $\text{O}_3$  layer. De-compn. of  $\text{CH}_2\text{O}$  is produced by 2660 Å., but this reaction is hindered by the presence of H in the upper atm.

Helen S. Hopfield

**Artificial production of the blue fluorescence of fluorite**  
<sup>5</sup> H. Haberlandt, Berta Karlik and K. Przibram. *Nature* 133, 99-100(1934). —The rare-earth lines shown in fluorite under cathodo- and thermo-luminescence and phosphorescence are usually inconspicuous in fluorescence excited by filtered ultra-violet light. The fluorescence usually has 3 bands, in the red, green and blue-violet. The capacity to emit these bands is destroyed by heating and regenerated by Ra rays. Synthetic materials indicate that the blue band is probably due to Eu; it certainly is not due to Cr, Pr, Nd or Sm, and probably not to Tb, Dy or Ho. A synthetic fluorite with 0.1% Eu gave a purple fluorescence after heat and Ra treatment; prolonged exposure to ultra-violet light gave a blue light which duplicated that of the best English fluorite. Gerald M. Petty

**The photoluminescence of sodium and potassium hydroxides.** A. Grumbach and M. Ribailleur. *Compt. rend.* 198, 70-2(1934). —This is shown to be due to small amts. of formate which changes partly to carbonate and oxalate on heating. A. B. F. Duncan

**Thermoluminescence spectra of fluorites. III. Thermoluminescence spectra of fluorites from Wilberforce**  
Enchi Iwase. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 23, 153-61(1934); cf. *C. A.* 28, 1275<sup>8</sup>. —The thermoluminescence of 3 differently appearing specimens from Wilberforce was spectroscopically investigated. The thermoluminescence spectra of the natural specimens and of those exposed to x-rays after previous heat treatment to eliminate natural thermoluminescence are almost the same with respect to the position of the 11 bands observed. Bands above 0.384  $\mu$  are ascribed to Tb, those below to Gd. The intensity ratios of two adjacent bands (0.338  $\mu$  and 0.384  $\mu$ ), due to Tb and Gd, resp., remain in the same sequence for the 3 specimens regardless of heat treatment. The difference in intensity ratio is attributed to a difference in concn. ratio. Bands of long wave length are more intense in restored than in natural thermoluminescence. From the intensity ratios of the 3 specimens it is probable that the specimen with the lowest ratio may arise from the specimen with the 2nd lowest ratio as a result of bleaching due to prolonged insolation. Calvin Brous

**The effect of ultra-violet rays on nicotine.** V. A. Grant. *J. Pharmacol.* 49, 408-27(1933). —Ultra-violet light destroys nicotine (I) and its salts with the formation of

colored oxidation products of nicotinic acid. When irradiation has destroyed all titratable basicity of I, some I still remains as nicotinate or malonate. The acidity first formed is destroyed by further irradiation, giving a colorless product contg. no I. The decompn. of I is an oxidative process probably due to nascent O, the rate of which is increased by H<sub>2</sub>O. The destruction can be avoided by abs. exclusion of ultra-violet rays or O. T. ## 4—ELECTROCHEMISTRY

COLIN G. FINK

The fundamental formula for the design of electric furnaces. Goro Harada. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 9-10(1933).—A formula for the most favorable electrode diam. is developed on the assumption that  $CV = \text{const.}$ , where  $C = \text{c. d., amp./sq. cm.}$ , and  $V = \text{actual voltage between electrode tip and top.}$  This const. depends upon the kind of material processed and the reaction temp. in the furnace; it is 355 for gray pig iron (1500-1550°). The assumption does not hold for extreme cases. The formula is  $r = \sqrt{KW/1000/355} \times 3\pi$  where  $r = \text{electrode radius in cm.}$  and  $KW = \text{furnace capacity in kw.}$  Karl Kammermeyer

Some points in electric steel making. Victor Stobie. *Foundry Trade J.* 50, 83-4(1931).—A review. D. S.

Temperature regulation in the electric furnace. Nobuo Moriguchi. *J. Chem. Soc. Japan* 54, 882-6(1933). The relation between temp. fluctuation of the thermostat and the sensitivity of the regulator is discussed. The temp. variation in the furnace depends not only on the sensitivity of the regulator but also on the ratio between the continuous current for heating and the intermittent current for regulation. A device for temp. regulation using a lever driven by a time synchronous motor is described. A plate composed of a tightly united metal and insulator is used for contact. When the temp. is too high the lever touches the metallic part and the current is diminished. When the temp. is too low the lever touches the insulated part and the current is increased. The lever touches the contact every 30 sec. T. Katsurai

Decomposition voltages of fused salts. II. Magnesium chloride and magnesium sulfate. Yoshio Konishi. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 11 5(1934); cf. *C. A.* 28, 1605<sup>4</sup>.—Voltages for MgCl<sub>2</sub> between 548° and 908° gave a temp. coeff. of  $-0.000646 \text{ v./}^\circ\text{C.}$ , from which the decompn. voltage at room temp. was calcd. = 3.257 v., agreeing well with 3.275 v. as calcd. from the heat of formation of 151,000 cal. for MgCl<sub>2</sub>. MgSO<sub>4</sub> (856° 968°) gave a temp. coeff. of  $-0.00171$  and a calcd. decompn. voltage of 4.543 v. at room temp. Karl Kammermeyer

Industrial electrolysis of water. Antonino Scornio. *Giorn. chim. ind. applicata* 15, 494 9(1933).—A review of Italian practice. A. W. Contieri

Theoretical aspects of the electrolytic formation of metallic coatings. J. Salauze. *Bull. soc. franç. élec.* 3, 836 58(1933); *Chimie & industrie* 30, 1359.—See *C. A.* 27, 2385. A. Papineau-Couture

The use of acids in the preparation of steel for plating. Walter S. Barrows. *Monthly Rev. Am. Electroplaters' Soc.* 20, No. 3, 12-18(1933).—B., in attempting to det.

whether any connection exists between the pickling acid used and the breakdown of plated coatings, used H<sub>2</sub>SO<sub>4</sub> and HCl under various exptl. conditions and with various subsequent treatments but was unable to distinguish between the various plated specimens by their failure under atm. corrosion. H<sub>2</sub>SO<sub>4</sub> is advocated for its low cost and reliability, a 25% soln. being suitable for various steels, while a weaker soln. should be used for cast iron. Practical details for the successful pickling of steel, in 25% H<sub>2</sub>SO<sub>4</sub>, prior to plating are dealt with at some length. Edward B. Sanigar

Electrochemistry of chromium. IV. O. S. Fedorova. *J. Gen. Chem. (U. S. S. R.)* 3, 636 40(1933); cf. *C. A.* 27, 667. —Review of lit. on the theory of deposition of Cr from aq. solns. S. L. Madorsky

Chrome-plating at low temperature with low current density. A. Guérillot and J. Pierson. *Bull. soc. franç. élec.* 3, 859-66(1933); *Chimie & industrie* 30, 1359.—The effects of the constituents of the bath were studied. Na<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> gives slightly dull coatings at 15° and under 3-5 amp. per sq. dm. Org. acids (particularly tartaric) give very bright coatings; their salts are less satisfactory. Cold plating can be carried out with certain sulfates, but the coating is not as bright as with hot plating. A. Papineau-Couture

Impurities in nickel-plating solutions with reference to pitting of electrodeposited nickel. F. J. Liscomb. *Monthly Rev. Am. Electroplaters' Soc.* 20, No. 4, 6-15 (Dec., 1933).—A practical discussion of the pitting of electrodeposited Ni and its elimination on the removal of org. and other impurities by Fe(OH)<sub>3</sub> pptn. in the plating soln. The possible sources of impurities causing pitting are reviewed. Edward B. Sanigar

Factors contributing toward quality of (nickel) plated zinc die castings. Carl Hussner. *Monthly Rev. Am. Electroplaters' Soc.* 20, No. 4, 15-23(1933).—The standards which should be maintained to obtain satisfactory products, for the material of the Zn die casting, the casting itself and the preliminary finishing and machining as well as the cleaning and plating of the casting, are reviewed. Results are given to show that, other things being equal, the life of a plated casting is in proportion to the thickness of the Ni plate, while other results show that the thickness of the Ni plate is not the only factor to be considered. The discrepancies observable between the life of a plated part under the salt-spray test and in actual service are noted. Edward B. Sanigar

Barrel nickel-plating of fabricated sheet zinc parts. Albert Hirsch. *Monthly Rev. Am. Electroplaters' Soc.* 20, No. 5, 31-3(Jan., 1934). See *C. A.* 27, 2385, 4485. Edward B. Sanigar

The influence of the composition and acidity of the electrolyte on the characteristics of nickel deposits.

D. J. Macnaughtan, G. E. Gardam and R. A. F. Hammond. *J. Electrodepositors' Tech. Soc.* 9, 1-26 (1934).—See C. A. 27, 5007.

Edward B. Sanigar

The effect of annealing on the microstructure and mechanical properties of electrodeposited nickel. G. E. Gardam and D. J. Macnaughtan. *J. Electrodepositors' Tech. Soc.* 9, 27-36 (1934).—See C. A. 27, 5038.

Edward B. Sanigar

Cadmium plating on full automatic machines. F. L. Greenwald. *Monthly Rev. Am. Electroplaters' Soc.* 20, No. 3, 19-26 (Nov., 1933).—A review dealing with the practical operations, soln. maintenance and prepn. of the work for the mass plating of springs and small parts entirely automatically, or semiautomatically, by means of barrels.

Edward B. Sanigar

Throwing power of zinc-plating solutions. I. Relation between current density and current efficiency of zinc sulfate solutions. Masami Nakajima. *J. Electrochem. Assoc. (Japan)* 2, 19-25 (1934).—The  $p_H$  values of 0.5, 1.5 and 2.5  $N$   $ZnSO_4$  solns. have been detd. and compared with each other. The colorimetric method gave in general higher values than the electrometric method. The effect of  $p_H$  on the cond. becomes greater with decreasing concn. of  $ZnSO_4$ . The estn. of the current efficiency verified the existence of basic salt in the deposit when  $p_H$  was 5.4 and 4.4. In 0.5  $N$  soln., a considerable amt. of basic salt was found at higher  $p_H$  values and lower c. d., and the current efficiency was rapidly lowered with lowering  $p_H$ ; while in 1.5 and 2.5  $N$  solns. the content of basic salt was less and the lowering of  $p_H$  did not greatly affect the current efficiency; an increase in c. d. gave about the same current efficiency, and almost the same values for 2.5  $N$  soln. On the basis of quality of deposit and current efficiency, 1.5-2.5  $N$   $ZnSO_4$  soln. at 3.4  $p_H$  and 1-3.5 amp./sq. dm. is recommended.

K. Konda

Electrodeposition of shellac. Narasimha Murty and M. Sreenivasaya. *Chemistry & Industry* 1934, 35-6.—A preliminary notice. During electrolysis of an alkaline soln. of shellac it was observed that a shellac micelle can carry a neg. charge. Shellac was deposited on a Pt anode from various alk. solns. In the presence of  $Cl^-$  and  $SO_4^{--}$  polymerization took place. J. H. M.

Electrolytic preparation of sodium perborate. II. Fumikazu Kawamura and Hiromu Mohri. *J. Electrochem. Assoc. (Japan)* 2, 10-14 (1934); cf. C. A. 28, 1278.—In the electrolytic prepn. of  $NaBO_3$  from an electrolyte contg. alkali borate and carbonate, the cathodic reduction is diminished by the addn. of  $KCl$ ,  $H_2SiF_6$  and  $Na_2SiO_3$ . A small quantity of  $Na_2CrO_4$  and a few drops of Turkey-red oil lessened the cathodic reduction, but the addn. of Turkey-red oil had no effect when  $KCl$  or  $H_2SiF_6$  was used. The superposition of a. c. upon d. c. did not favor the formation of  $NaBO_3$ . The optimal temp. was 10-12° and the optimal c. d. was 10-15 amp./sq. dm. at 6 v.

K. Konda

Electrochemistry of the system aluminum bromide-cuprous bromide in toluene. V. A. Plotnikov and Z. A. Yankelevich. *J. Gen. Chem. (U. S. S. R.)* 3, 208-13 (1933); *Chimie & industrie* 30, 857.—A study of the conditions of electrodeposition of  $Cu^+$  as a dense coating from solns. which have hitherto been considered unsuitable for this purpose. A complex is formed when  $CuBr$  is dissolved in a  $C_7H_8$  soln. of  $AlBr_3$ . This is confirmed by the following facts:  $CuBr$  is insol. in  $C_7H_8$ , but dissolves to a considerable extent in the presence of  $AlBr_3$ , a satd. soln. contg. 1  $CuBr$  for 1  $AlBr_3$ . Addn. of  $CuBr$  to the  $AlBr_3$  soln. generates a considerable amt. of heat, and the color of the soln. changes from light yellow to deep green. The  $C_7H_8$  soln. of the complex conducts electricity; the max. cond. ( $4.86 \times 10^{-3}$  ohm $^{-1}$ ) corresponds to 36.1%  $AlBr_3$  and 10.3%  $CuBr$ , i. e., to 2  $AlBr_3$  and 1  $CuBr$ . The soln. contains possibly a compd. such as  $Al_2Br_3 \cdot CuBr \cdot nC_7H_8$ . On the other hand, a  $C_7H_8$  soln. of  $AlBr_3$  has a very low elec. cond., while  $CuBr$  itself is insol. in  $C_7H_8$ . When the soln. is electrolyzed with a Pt anode, Cu is deposited on the cathode and Br liberated at the anode. When a Cu anode is used, re-

fining of the Cu takes place; the Cu deposits on the cathode from univalent ions. In order to obtain a dense coating, a Cu cathode must be used. The decompn. potential of the complex corresponds to 1.40 v. A. P.-C.

The role that the chemical nature of electrolytes plays in the surface-energy changes at the interface: metal-mineral oil-aqueous salt solutions. II. Electrochemical oil removal from iron. M. S. Golombik, Dz. S. Lev and N. N. Petin. *J. Gen. Chem. (U. S. S. R.)* 3, 279-90 (1933); cf. C. A. 27, 3377.—The bath consisted of an aq. soln. of  $Na_2PO_4 + NaOH$ . The electrodes were iron articles covered with oil from the stamping press. The temp. coeff. of the rate of removal of oil by the electrochem. method is found to be the same as that obtained by the chem. method. The rate is directly proportional to the concn. of  $PO_4$  ions and to the concn. of  $OH$  ions, but approaches a limiting value. It is also directly proportional to c. d. and becomes sufficiently rapid even at room temp. at a d. of several thousandths of an amp./sq. cm. of electrode surface. It makes little difference whether the oily article is the anode or the cathode. However, best results are obtained when the current alternated every 3, 5, 10 min. A 50-cycle current had slight effect on oil removal at room temp. These facts support the view that the chem. and electrochem. processes of oil removal are identical.

S. L. Madorsky

Liquid-junction potentials. I. J. B. Chloupek, V. Z. Daneš and B. A. Danešova. *Collection Czechoslov. Chem. Communications* 5, 469-78 (1933).—The junction potentials of  $Hg|HgCl, 0.1 N KCl$  (junction soln.)  $0.1 N HCl, HgCl|Hg$  were measured. As junction solns. types of strong electrolytes (e. g.,  $Na, K, NH_4$  chlorides, nitrates and sulfates,  $ZnCl_2, MgCl_2, K_2CrO_4$  and  $K_4Fe(CN)_6$ ) were chosen where the influence of valency and degree of symmetry would show clearly in the results, the chief variable being concn. The free-diffusion type of liquid junction was used (C. A. 26, 5818). The junction tubes (of cylindrical symmetry) were water-jacketed on both sides to allow of the detn. of temp. coeffs. of the junction potentials, these coeffs. forming an important basis for the treatment of the exptl. results. Discussion of results is reserved for a future paper.

Edward B. Sanigar

Polarographic studies with the dropping-mercury cathode. XXXIV. Suppressive effect of certain alkaloids on the maximum of current due to electroreduction of oxygen. Riji Hamamoto. *Collection Czechoslov. Chem. Communications* 5, 427-35 (1933).—H. uses the concept (cf. C. A. 26, 3443) of taking as a measure of the degree of adsorption of a compd. at the dropping-Hg cathode that molar diln. of the compd. (dissolved in  $10^{-3} N KCl$  soln.) which reduces the atm. O max. on polarographic curves to  $1/2$  its original height. H. assumes that adsorption on the Hg drop reaches equil. before the drop falls and forms a unimolecular layer on the drop, this justifying the application of Freundlich's isothermal adsorption equation in the form  $(I - I') = \alpha C^n$ , where  $I'$  and  $I$  are the heights of the max. with and without an adsorbable compd. present. If  $\log (I - I')$  is plotted against  $\log C$ , a straight line is obtained from which the concn. for  $1/2$  max. height can be read. The reciprocal of this value, i. e.,  $1/C_{\alpha} = V_{\alpha}$ , is an electrochem. adsorbability coeff. the diln. being expressed as 1 mole adsorbable compd. in  $n \times 10^4$ ,  $n$  being then taken as the electrochem. adsorbability coeff. As so detd., the following values of  $n$  are given: atropine sulfate 23.98, quinine-HCl 16.98, papaverine-HCl 16.67, strychnine nitrate 13.04 and morphine-HCl 7.92. XXXV. Electrolysis of aqueous solns. of beryllium salts. W. Kemula and M. Michalski. *Ibid.* 436-42.—The normal deposition potential of Be ions at the dropping-Hg cathode is  $-1.70$  v. against the  $N$  calomel electrode, when measured with a galvanometer of sensitivity  $1 \times 10^{-8}$  amp./mm. Because of hydrolysis, the current-voltage curves of Be salt solns. show an increase due to H deposition before the increase due to Be deposition. Owing to the proximity of the Be and Al deposition potentials ( $-1.70$  v. and  $-1.66$  v., resp.), and their similarity of electrochem. behavior, the joint increase in the current-voltage curve due to the presence

of both metals in soln. could not be resolved. **XXVI.** Catalysis of the electrodeposition of hydrogen due to the presence of the platinum metals. P. Herasymenko and I. Stendyk. *Ibid.* 479-96.—The catalytic effect of Pt has been reported previously (cf. *C. A.* 26, 5854; 27, 467). Traces of Ru, Rh, Pd, Ir and Pt at the cathode surface produce a considerable decrease in H overvoltage, and they produce, in general, 3 stages in the catalytic deposition of H: (1) at  $-1.2$  v., (2) at  $-0.9$  to  $-1.05$  v. and (3) at  $-0.5$  to  $-0.7$  v. from the *N* calomel zero. The exact values of these potentials depend on the concn. of the catalyst and of H ions. Pt and Pd show only stage 1. The occurrence of the 3 stages of catalyzed H deposition is explained by the formation of 3 types of catalytic centers having different catalytic activities due to aggregation of atoms of catalyst into polyat. complexes at the Hg surface. The total catalytic effect, measured by the sum of the limiting currents of all catalytic stages, depends on the position of the catalyst in the periodic system: Pt is the weakest catalyst in the series Ru-Rh-Pd, while Pt is less active than Ir. The development of the various catalytic stages depends upon time; by varying the rate of Hg-dropping the catalytic effects of stages 1 or 2 can be either intensified or suppressed. The limiting current of the catalyzed H deposition greatly increases with increasing concn. of H ions up to about  $0.05$  *N*; further increase in H-ion concn. produces a slow increase of the limiting current toward a max. **E. B. S.**

The potentials of the lead oxide electrodes in alkaline solution. Lyle V. Andrews and D. J. Brown. *J. Am. Chem. Soc.* 56, 388-90(1934).—The potentials of the two electrodes  $PbO(s)$ ,  $Pb_2O_4(s)$ ,  $OH^-$  and  $Pb_2O_4(s)$ ,  $PbO_2(s)$ ,  $OH^-$  were found by expt. to be  $+0.2488 \pm 0.0005$  and  $+0.295 \pm 0.001$  v., resp. The Hg,  $HgO(s)$ ,  $OH^-$  electrode was used as a reference electrode. From these values the e. m. f. of the  $PbO_2(s)$ ,  $PbO(s)$ ,  $OH^-$  electrode was calcd. to be  $+0.280 \pm 0.001$  v. **John R. Hill**

The alkaline storage battery. V. The alkali zincate storage battery. 1. Shosaburo Tanaka and Kohei Iwasaki. *J. Electrochem. Assoc. (Japan)* 2, 4-9(1934); cf. *C. A.* 28, 1279f.—When the cathode plate filled with Cd,  $Cd(OH)_2$  or  $CdO$  is used, the charging and discharging voltage in general shows a rapid rise and fall. The Cd-plated cathode also shows a rapid rise of the charging voltage, holds a high discharging voltage for a brief period and then shows a sharp voltage drop. A  $Cd(OH)_2$ -filled cathode which has been subjected to the cathodic treatment in an alk. soln. is easily reduced in 2-3 hrs.; while a  $CdO$ -filled cathode is hardly reducible and results in the slow deposition of Zn. The reduction proceeds slowly, and thereafter the reversible reaction  $Cd \rightleftharpoons Cd(OH)_2$  during charge and discharge proceeds smoothly. The inclusion of  $HgO$  in the filling mixt. is effective, while that of Fe is very harmful for the deposition of Zn. The soln. velocity of Zn in the course of storage (shelf test) is lowest with the cathode filled with flocculent Cd and highest with the Cd-plated cathode. The deposition of Zn on the Cd-plated cathode is similar to that on a Ni-mesh cathode; amalgamation does not affect it as much as the latter; the av. discharging voltage is high, and it is superior to the filled type for a rapid-charging cathode. **K. Konda**

Weston standard cells submitted to the International Bureau of Weights and Measures. A. K. Kolosov, V. V. Muller and Mme. E. S. Churaeva. *Vsesoyuznii Nauch.-Issledovatel. Inst. Metrol. Standartizatsii* No. 127, 31-5 (in French), 107-10 (in Russian) (1933).—In 1930 it was proposed that each national lab. place in the International Bureau of Wts. and Measures a group of standard cells to compose an international standard. The group of cells so deposited by the Inst. of Metrology and Standardization of the U. R. S. S. is described. **E. R. Smith**

Determination of the electromotive force of the international Weston standard cell by the silver coulometer method. A. K. Kolosov. *Vsesoyuznii Nauch.-Issledovatel. Inst. Metrol. Standartizatsii* No. 127, 8-17 (in French), 83-94 (in Russian) (1933).—The mean value of  $E_{20} = 1.018254 \pm 8$  microv. was obtained for standard cells

measured at the Inst. of Metrology and Standardization of the U. R. S. S. between Oct., 1930, and Dec., 1932. **E. R. Smith**

Dry cells from a solid radioactive electrolyte and ionized air. L. Boushet. *Compt. rend.* 197, 1598-9(1933).—Zn and brass were the best electrodes found for dry cells made with solid radioactive materials. Zn and brass washers were sepd. by a mica ring. The hole contains the U nitrate. The entire cell is then sealed in ozocerite. The initial e. m. f. varied from  $0.610$  to  $0.700$  v., usually  $0.65$ - $0.68$  v. and finally steadied at about  $0.54$  v. **Oden E. Sheppard**

Oxidation of nitric oxide to nitrogen pentoxide by means of ozone in the silent electric discharge. N. I. Kobzev, M. Temkin and S. Fraiberg. *J. Gen. Chem. (U. S. S. R.)* 3, 534-9(1933).—With a Berthelot ozonizer connected to a  $10,000$  v. transformer, a study was made of the reaction:  $2NO + 3O_3 = N_2O_5 + 3O_2$ . A rate of  $0.30$ - $0.32$  l./min. of air through the ozonizer resulted in an  $O_3$  content of  $0.5\%$  by vol. The NO was mixed with  $N_2$  in the ratio  $10:90$  and the mixt. passed into the ozonized air at a rate of  $10$  cc./min. In this case the  $O_3$  was in excess of the theoretical amt. required and the reaction was almost instantaneous,  $99\%$  of the NO being oxidized. The ratio between  $O_3$  and the  $HNO_3$  obtained varied between  $1.220$  and  $1.91$  and was, on the av.,  $1.48$ . Hence the rate of decompn. of  $O_3$  in the presence of  $N_2O_5$  was too slow to be effective. By using the same rates of gases, but introducing the NO +  $N_2$  mixt. into the air before it was ozonized,  $NO_2$  was found in the resulting mixt., but not  $O_3$  or  $N_2O_5$ . However, when the ratio  $NO:N_2$  was changed from  $10:90$  to  $1:99$ , and the mixt. was introduced into the air before it passed through the ozonizer (the rates of all gases were the same as above),  $O_3$  and  $N_2O_5$  but not  $NO_2$  were found in the resulting mixt. When the rates of NO +  $N_2$  mixt. and of air were so adjusted that the amt. of  $O_3$  was less than theoretical, and the NO +  $N_2$  mixt. was introduced into the air after it passed through the ozonizer,  $NO_2$  alone or together with  $N_2O_5$ , depending on the amt. of  $O_3$  in the air, was found.  $O_3$  had no effect on  $N_2O_5$ . **S. I. Madorsky**

Gaseous combustion in electric discharges. IX. The cathodic water-gas equilibrium. G. I. Finch, B. W. Bradford and R. J. Greenshields. *Proc. Roy. Soc. (London)* A143, 482-6(1934); cf. *C. A.* 26, 382.—An investigation of the water-gas equil. in the cathode zone of an elec. discharge shows that the equil. position varies with the final gas pressure. The conclusion is that equil. is approached from the CO side in 2 ways, pressure being favorable to the one but unfavorable to the other. **Calvin Brous**

Electric discharges in gases ionization and excitation. 7. Lewi Tonks. *Elec. Eng.* 53, 239-43(1934).—A survey dealing with the nature of the free charges, how they arise from the normally discharged atoms and mols. of a gas, and their relation to light radiation. **W. H. Roynton**

Stopping layer of rectifiers. W. Ch. van Geel. *Nature* 132, 711(1933).—Rectification is possible for a thickness of the stopping layer of  $10^{-4}$ - $10^{-6}$  cm. A volt-ampere characteristic for a rectifier is given. **Louis Goldman**

The mechanism of magnesium-copper sulfide rectifiers. J. Cayrel. *Compt. rend.* 198, 64-5(1934); cf. Anastasiades, *C. A.* 28, 1280<sup>1</sup>.—CuS plays the principal part in the rectification and not  $Cu_2S$ . This latter determines secondary phenomena, such as reversed polarity at low voltages. **A. B. F. Duncan**

Silicon steel with alternating-current and direct-current excitation. R. F. Edgar. *Elec. Eng.* 53, 318-22(1934).

Magnetic tests on Si-steel at 60-cycles with superposed d.-c. excitation are described. Results are shown in a series of curves. A bibliography is appended. **W. H. Boynton**

**Primary batteries.** Imperial Chemical Industries Ltd. Fr. 756,083, Dec. 4, 1933. One electrode is made of a homogeneous Zn alloy contg. about 0.2% of Hg.

**High-tension primary-cell batteries.** Alexander R. Pappadakis and Noel J. Sivess. Brit. 400,600, Oct. 25, 1933.

**Dry batteries.** Konrad Bud. Fr. 756,013, Dec. 4, 1933. The depolarizing mass is surrounded by a cloth which is wound more than once round the mass. No fastening string is used.

**Storage batteries.** Soc. de l'accumulateur Fulmen. Fr. 755,572, Nov. 27, 1933. Means for reducing free liquid to a min. is described. Fr. 755,573. Construction of plates is given.

**Storage batteries.** Soc. anon. des piles et accumulateurs Eler. Fr. 755,602, Nov. 28, 1933. A product which absorbs and retains liquids, and is particularly suitable as a separator between storage battery plates, is made by subjecting wooden boards, preferably of long fibers, to high pressure, e. g., by passage between rollers in the general direction of the fibers, and soaking in water. The product is also suitable as a packing between fragile objects.

**Storage battery.** Svenska Ackumulator Aktieföretaget Jungner (E. G. H. Eriksson and G. G. Ljunggren, inventors). Swed. 78,448, Sept. 26, 1933. Structural features of an alk. cell.

**Low-voltage storage battery.** Rufus N. Chamberlain & Gould Storage Battery Corp.). U. S. 1,944,065, n. 16. About 0.9-1.5% of  $\text{NiSO}_4$  is incorporated with the active material used for pasted plate electrodes employed with a  $\text{H}_2\text{SO}_4$  electrolyte. The  $\text{NiSO}_4$  serves to reduce the required charging voltage. U. S. 1,944,066 relates to a similar use of Co sulfate.

**Storage batteries with soluble cathodes.** Kurt Giebel. Brit. 400,424, Oct. 26, 1933. Structural features.

**Storage-battery covers.** Accumulatoren-Fabrik A.-G. (to Britannia Batteries Ltd.). Brit. 400,561, Oct. 26, 1933.

**Storage-battery plates.** Accumulatoren-Fabrik A.-G. (to Britannia Batteries Ltd.). Brit. 398,397, Sept. 14, 1933. The plate consists of a pasted grid covered with perforated Pb (alloy) or other conductive material which is coated on its outer side with a non-conducting firmly adhering substance, e. g., rubber, which is also perforated. Cf. C. A. 28, 7157.

**Active material for positive electrodes in alkaline storage batteries.** B. S. Groth. Swed. 79,113, Dec. 5, 1933. The material consists of oxygen compds. of Ni and (or) Co and in addn. contains an amt. of an oxide or hydroxide of one or more of the metals Zr, Th, Ce, La, Pr, Nd, Sm, Gd, Er and Y.

**Electrodeposition of iron.** Ernst Kelsen and Edgar

1 Ausnit. Brit. 400,264, Oct. 23, 1933. In refining Fe electrolytically a salt of a metal forming an insol. sulfate is added to the electrolyte as a precipitant for any sulfate ion introduced from Spentg. anodes, e. g., cast Fe scrap, or otherwise. The electrolyte may consist of a soln. of  $\text{FeCl}_2$  and  $\text{NaCl}$  with  $\text{BaCl}_2$ . Salts of addnl. metals may be added for the deposition of alloys.

**Electroplating.** Le Syndicat Jacquemin. Belg. 396,085, June 30, 1933. The article is first cleaned in a bath of suitable salts through which is passed a high current at low voltage. The anode consists of a metal that is insol. in the bath and the article to be treated forms the cathode. Belg. 396,275. The metal required for coating the articles is derived solely from the anode and not from the metal salts contained in the bath.

**Portable electrode for plating by direct application** Alfred E. Newey. Brit. 400,510, Oct. 26, 1933.

**Coating objects with metals.** Le Syndicat Jacquemin Fr. 755,713, Nov. 29, 1933. To protect objects of glass, wood, paper, porcelain, etc., against the atm. of other destructive agents, they are made conductive to electricity by treatment with a varnish, paraffin or wax contg. graphite and are then covered with Zn, Pb, Cu, Sn, Cd, Co, Cr, Ni, Au or Ag electrolytically.

**Electrolytic condensers.** N. V. Philips' Gloeilampen fabrieken. Brit. 400,490, Oct. 26, 1933.

**Supply meters.** Ernst Krämer. Brit. 400,221, Oct. 13, 1933. An electrolytic meter or recording app., wherein the disengaged gases automatically effect operation and are recombined by a catalyst, is provided with a regenerating chamber, situated above the electrolyte and contg. the catalyst, the chamber being filled initially with 1 of the gases generated.

**Electrolytic cells for the deposition of sheet metal,** e. g., sheet iron for magnetic purposes. Ernst Kelsen and Edgar Ausnit. Brit. 400,591, Oct. 23, 1933.

**Electrolytic cells.** Erich Garkisch. Ger. 588,835, Nov. 28, 1933 (Cl. 21b. 14.01). The energy yield of cells is increased by using as electrolyte a fused carbonate.

**Electrolytic cells.** David J. Evans. Brit. 400,247, Oct. 20, 1933. The electrodes consist of rectangular graphite slabs, spaced to form a vertical gap through which the whole of the liquid passing through the cell flows.

**Electrolytic cell for water decomposition with unipolar electrodes.** De Nordiske Fabrikker De. No. Fa. A. S. and C. F. Holmboe. Norw. 52,648, June 12, 1933. Structural features.

**Acetylene.** I. G. Farbenind. A.-G. Brit. 397,987, Sept. 7, 1933. See Fr. 750,521 (C. A. 28, 7174).

**Alkali and alkaline earth metals.** Justin F. Watt. Fr. 755,875, Dec. 1, 1933. A molten compd. of the metals is passed through an electrolyzing zone at a speed beyond that of decompn., to recover a mixt. of free metal and compd. The molten mass may consist of 2 compds. of the metal, having different decompn. potentials so that decompn. of only one takes place. The metal may pass directly to a zone for reaction with a gaseous fluid, e. g., for the production of  $\text{NaOH}$ . An app. is described.

**Alumina.** Gino Gallo. Ger. 588,583, Nov. 20, 1933 (Cl. 12m. 6). Pure  $\text{Al}_2\text{O}_3$  is obtained by the electrolysis of the sol. products obtained by decomposing material such as leucite contg.  $\text{Al}_2\text{O}_3$  and alkali, with  $\text{H}_2\text{SO}_4$ . The electrolysis is continued till the  $\text{Al}_2\text{O}_3$  and alkali form an alkali aluminate, and other substances present, such as Fe, Ca, Mg, are pptd. as hydroxides. The aluminate soln. is sepd. and worked up to pure  $\text{Al}_2\text{O}_3$  and alkali salt by the usual methods. Examples are given.

**Fireproof stone, etc.** Feldmühle, Papier- und Zellstoffwerke A.-G., Friedrich Klein and Karl Bechtel. Ger. 588,805, Nov. 27, 1933 (Cl. 80b. 24.04). Crystl. metal oxides such as  $\text{Al}_2\text{O}_3$  or  $\text{MgO}$  are fused in an elec. furnace and allowed to set. The resulting block is cut to desired shape by high-speed cutting tools.

**Anodic coating of aluminum.** Aluminium Colors Inc. Fr. 755,890, Dec. 1, 1933. The temp. is maintained practically const. at all points of the electrolyte by bubbling air therethrough.

**Electrode for the production of aluminum or other metals or alloys by electrolytic reduction in fused electrolyte.** Det Norske Aktieselskab for Elektrokemisk Industrie. Norw. 53,308, Nov. 20, 1933. The furnace is manipulated through openings in the electrode in order to prevent or eliminate the anode effect.

**Ammonium sulfate by electrolysis.** W. C. Holmes & Co. Ltd. Ger. 590,230, Dec. 28, 1933 (Cl. 12k. 7). See Brit. 356,757 (C. A. 27, 2637).

**Electrolysis with mercury cathode.** K. W. Palmaer. Swed. 76,580, Feb. 28, 1933. Metals less electropositive than alkali or alk. earth metals, particularly one or more of the metals of the eighth group of the periodic system, are pptd. by electrolysis by means of a cathode of flowing Hg which is made to flow over a previously amalgamated metallic body.

**Beryllium.** Beryllium Development Corp. Ger. 581,690, Sept. 22, 1933 (Cl. 40c. 6.03). See Brit. 377,858 (C. A. 27, 3408).

**Direct production of iron and other metals that unite with carbon.** H. G. E. Cornelius (H. G. Flodin and E. G. T. Gustafsson). Swed. 78,447, Sept. 26, 1933. High-C and low-C ore briquets are charged into an elec. furnace together or in succession in such ratio that the desired C content in the resulting product is attained.

**Metallic magnesium.** Alfred C. Jessup and Maurice N. Lucell. U. S. 1,943,916, Jan. 16. In a cyclic process for the production of Mg from fused  $MgCl_2$  by electrolysis, Cl liberated at the anode is brought into contact with a carbonaceous lute at an elevated temp. and water and steam are simultaneously added to obtain HCl gas; the latter is caused to react with an acid-sol. basic compd. of Mg such as partially hydrated  $MgCl_2$  for producing  $MgCl_2$  which, after dehydration, is used in the electrolysis.

**Metallic magnesium.** Maurice N. Lucell. U. S. 1,943,920, Jan. 16. In a cyclic process for Mg production by electrolysis of fused  $MgCl_2$ , Cl from the anode, together with O, is brought into contact with a carbonaceous material such as coal or coke at a sufficiently high temp. to form phosgene, water is added to the phosgene thus formed to produce HCl gas and the HCl is reacted with a Mg compd. such as partially hydrated  $MgCl_2$  to form addnl.  $MgCl_2$ .

**Production of metallic magnesium.** Fritz Hansgurg (to American Magnesium Metals Corp.). U. S. 1,943,601, Jan. 16. Mg in finely divided form is extd. from its compds. such as MgO (suitably by use of C in an elec. furnace) and the Mg thus obtained is then distd. under reduced pressure in contact with an inert gas such as H. An arrangement of app. is described.

**Stainless steel.** Frederick M. Becket (to The Electro Metallurgical Co. of Canada Ltd.). Can. 336,774, Oct. 11, 1933. Chrome ore, Ni mat and a Si-contg. reducing agent are ground to pass an 8-mesh screen. The reducing and reducible materials are well mixed, and lime or other fluxes, as fluorspar, are added. The mixt. is charged into an open-arc elec. furnace and a fluid bath of slag is maintained at all times. A low-C steel bath may be placed in the furnace before smelting or alternatively steel scrap may be incorporated with the smelting charge. A stainless steel is produced.

**Electric furnaces.** Soc. anon. des manufactures des glaces et produits chimiques de St. Gobain, Chauny & Cuy. Brit. 400,020, Oct. 19, 1933. Fusion of a moving charge having a high m. p. is effected by radiant heat from a fixed C resistance supported independently of and out of contact with the furnace walls. An inert gas is supplied by suction created by a chimney. In mfg. transparent quartz from granulated rock crystal the charge is moved to and fro and is fed from alternate sides. In making  $SiO_2$  plates a 2nd heater is arranged on the underside of the plate, and the plate is molded by suction in a mold moving with the plate. Rotary horizontal containers with fixed axial resistances are used for melting metals and glass and for making glass tubes.

**Electric furnace.** C. E. Cornelius. Swed. 78,205, Aug. 29, 1933. In an electrode furnace the fused bath surrounding the electrodes serves as the resistance, the

material being heated or melted in a crucible placed upon a support above the resistance bath. Structural features.

**Electric salt-bath furnace.** A. G. E. Hultgren. Swed. 76,330, Jan. 24, 1933. In an elec. furnace for the heating of tools, the heat is supplied by elec. current passing through a salt bath between electrodes arranged in couples and placed in the furnace in such a way that a sufficiently large free space is obtained that is free from direct elec. currents.

**Alternating-current furnace for the melting of glass, water glass, cement and similar materials.** Aktiebolaget Surte-Liljedahl (C. E. Cornelius, inventor). Swed. 78,914, Nov. 14, 1933. The fused material serves as elec. resistance between electrodes having a large heat-accumulating capacity. Structural features.

**Coreless electric induction furnace.** Edw. F. Northrup (to Ajax Electrothermic Corp.). U. S. 1,943,802, Jan. 16. Various details of operation are described.

**Electric resistance furnace.** Allmanna Svenska Elektriska A.-B. (L. Hogel, inventor). Swed. 78,521, Oct. 3, 1933.

**Electric resistance furnace for annealing and other heat treatment of metals.** N. G. Elfstrom. Swed. 79,037, Nov. 28, 1933.

**Electric resistance furnaces of the tilting type for melting aluminum.** Emil F. Russ. Brit. 400,521, Oct. 26, 1933.

**Electric-furnace metallurgy.** E. G. T. Gustafsson. Swed. 79,274, Jan. 3, 1934. In a furnace with movable electrodes, during the larger part of the melting or charging period the elec. current is applied with such a high voltage between the electrodes and the metal bath in proportion to the amt. of energy applied per electrode that the elec. resistance is not less than 0.03 ohm per electrode, the depth and compn. of the slag bath being so adjusted that a considerable part of the heat required for the reduction and (or) melting of the charge is developed at the surface of the slag bath by elec. arcs between the electrodes and the slag bath at the same time that a substantial amt. of heat is developed through resistance in the slag.

**Electric-furnace operation as in the reduction of materials.** Paul L. J. Miguet and Marcel P. Perron. U. S. 1,944,521, Jan. 23. A charge is provided consisting of a contiguous mass of a conductive mixt. of raw materials which are regularly interspersed with portions of a relatively non-conductive raw material which serves to stabilize the mean cond. of the charge.

**Furnace for carrying out endothermic reactions.** Buffalo Electric Furnace Corp. Ger. 588,652, Nov. 21, 1933 (Cl. 18a. 19).

**Continuous operation of electric furnaces with hollow electrodes.** Kinar Lund. Norw. 52,356, March 27, 1933. The level of the charge within the hollow electrode is kept nearly const., the electrode being given a rotary or up-and-down motion.

**Resistor units for electric furnaces.** The Electric Furnace Co. Brit. 400,605, Oct. 24, 1933.

**Electric resistance baking and other ovens.** George R. Baker and Baker Perkins Ltd. Brit. 400,219, Oct. 11, 1933.

**Device for tightening of electrodes against the furnace.** Flodinjern A.-B. (H. G. Flodin, inventor). Swed. 79,242, Dec. 28, 1933. Mech. features.

**Suspension device for self-burning electrodes.** Det Norske Aktieselskab for Elektrokemisk Industrie. Norw. 53,200, Oct. 23, 1933.

**Electric gas cleaner.** Aloys Schirp. Ger. 588,707, Nov. 24, 1933 (Cl. 12c. 5).

**Electrical precipitation apparatus.** The English Electric Co. Ltd., The Whessoe Foundry & Engineering Co. Ltd., Wilfrid Donnelly and Alexander G. Grant. Brit. 400,719, Nov. 2, 1933.

**Cooled tubular electrode support for electrofilter.** Siemens-Lurgi-Cottrell Elektrofilter-Ges. m. b. H. fur Forschung und Patentverwertung. (Wilhelm Hoss, inventor). Ger. 590,308, Dec. 29, 1933 (Cl. 12c. 5).

**Electric ozone generator.** John R. Fischer and Joseph

- G. Sola (to Sola Corp.). U. S. 1,943,426, Jan. 16. Various elec. details are described.
- Testing the voltage resistance of protector block assemblies. George H. Brodie (to Western Elec. Co.). U. S. 1,944,211, Jan. 23. Various details of elec. testing are described.
- Inductance coils. Marconi's Wireless Telegraph Co. Ltd. and Francis E. Robinson. Brit. 400,277, Oct. 23, 1933. An inductance coil having a negligible external magnetic field is made by filling a wound coil with a mixt. of latex and dust of magnetic material, e. g., Fe dust 80 and latex 20 parts, and then solidifying the latex, e. g., by vulcanization.
- Loaded electrical conductors. Walter Marion Bishop (to Electrical Research Products, Inc.). Brit. 400,271, Oct. 23, 1933. See U. S. 1,844,114 (C. A. 26, 1806-7).
- Spark-gap apparatus, suitable for converting direct into alternating current, or vice versa, in which the electrodes are enclosed in a chamber filled with gas under pressure. Erwin Marx. Brit. 400,934, Oct. 23, 1933.
- Cooling devices for the anodes of metal-vapor rectifiers. Allmänna Svenska Elektriska Aktiebolaget. Brit. 400,083, Oct. 19, 1933; Swed. 79,118, Dec. 5, 1933. Addn. to 348,367 (C. A. 27, 2889).
- Metallic-vapor rectifiers. Allgemeine Elektrizitäts-Gesellschaft (to International General Electric Co., Inc.). Brit. 400,994, Nov. 6, 1933.
- Mercury-vapor rectifier. Allmänna Svenska Elektriska A.-B. (U. Lamm, inventor). Swed. 79,053, Nov. 28, 1933.
- Flashlight lamp. Johannes A. M. van Liempt (to N. V. Philips' Gloeilampenfabrieken). U. S. 1,944,854, Jan. 23. A lamp arranged for elec. ignition contains material such as Al foil and O which on ignition enters into a reaction with high actinic effect, Na azide being employed on the lamp wires in order to improve the actinic effect for photography.
- Flashlight lamps. Mituyoshi Igari. Brit. 400,476, Oct. 26, 1933. Structural features of a lamp for photographic or signaling purposes, comprising a glass bulb contg. Al, Ce, Ni, Mg, etc., foil and O at less than atm. pressure, are described.
- Lamp for producing and screening ultra-violet rays. Richard A. S. Paget (to Thermal Syndicate Ltd.). U. S. 1,943,877, Jan. 16. Various details are described of a lighting unit suitable for approximating daylight effect.
- Thermionic cathode lamp. Albert W. Hull (to General Elec. Co.). U. S. reissue 19,057, Jan. 23. A reissue of original pat. No. 1,929,143 (C. A. 27, 5658).
- Arc lamps. Reginald H. Cricks, Philip Rigby and Robert Rigby Ltd. Brit. 400,692, Nov. 2, 1933. One electrode is fed by gearing, including means for regulating the rate of feed, and means is also provided for moving both electrodes simultaneously to adjust the position of the arc.
- Discharge lamps. Claude Neon Electrical Products Corp. Ltd. Brit. 400,320, Oct. 26, 1933.
- Discharge lamps. N. V. Philips' Gloeilampenfabrieken. Brit. 400,388, Oct. 26, 1933. The spacing of the electrodes in an arc lamp having a filling of Na and Ne is so small that the pos. column is eliminated.
- Discharge lamps. Patent-Treuhand-Gesellschaft für elektrische Glühlampen m. b. H. (to The General Electric Co. Ltd.). Brit. 400,756, Nov. 2, 1933. Lamps giving light, including infra-red rays, approximating to daylight are filled with a mixt. of a rare gas, e. g., Ar, Ne, and Cs or Rb vapor and are operated so that the vapor pressure rises above 0.02 mm. corresponding to a temp. of 150°.
- Discharge lamps. N. V. Philips' Gloeilampenfabrieken. Brit. 400,835, Nov. 2, 1933. A lamp is divided into 2 or more channels, contg. gases or vapors giving light of different colors, by a longitudinal partition formed of a material, e. g., black glass, not transparent to the light produced in the channels.
- Gas-filled discharge lamps for electric lighting installations. N. V. Philips' Gloeilampenfabrieken. Brit. 401,086, Nov. 9, 1933.
- Neon-filled glow-discharge lamp, containing sodium, for use in photophones. Marconi's Wireless Telegraph Co. Ltd., George M. Wright and George F. Brett. Brit. 400,275, Oct. 23, 1933.
- Electric incandescent lamp. Theodore Millner (to General Elec. Co.). U. S. 1,944,825, Jan. 23. A gaseous fluoride such as SiF<sub>4</sub>, BF<sub>3</sub>, or PF<sub>5</sub> is used in lamps, in order to prevent blackening of the bulb.

## 5 -PHOTOGRAPHY

E. P. WIGHTMAN

- The Knapp method of development. C. Popineau. *Phot.-Rev.* 45, 276 7(1933). -The Knapp method consists in alternate immersions of the film in developing soln. and in plain water. It is stated that better results are obtained by using 3% Na<sub>2</sub>SO<sub>3</sub> soln. in place of plain water as the second bath. P. W. Vittum
- Rapid fine-grain development. A. Seyewetz. *Bull. soc. franç. phot.* 20, 177-83(1933); cf. C. A. 27, 5261. -Several formulas for rapid fine-grain developers are presented which are claimed to give superior graininess. Good results were obtained with the following formula: elon 5 g., *p*-phenylenediamine 10 g., Na<sub>2</sub>SO<sub>3</sub> (dry) 60 g., Na<sub>2</sub>PO<sub>4</sub> 3.5 g., KBr 1 g.; water to 1 l. Time of developing was 7 min. at 18°. The resultant negatives are thin. S. finds that if such developers are used for fine-grained emulsions (Micro Lumière), there is no diminution in graininess, and he concludes that in all cases the final image is formed after the Ag halide is dissolved by the developer, which then acts as a phys. developer. R. B. Atkinson
- Physicochemical investigation of the role of sodium sulfite in photographic development. K. Madhusudan Pandalai and G. Gopala Rao. *Z. anorg. allgem. Chem.* 215, 23 32(1933). -Na<sub>2</sub>SO<sub>3</sub> appears to play the role of acceptor in an induced reaction such as photographic development, the org. developing agent being the inducer. The Na<sub>2</sub>SO<sub>3</sub> alone does not cause reduction, and the reduction by the org. substance alone is not great. The sulfite speeds up the reduction considerably. The reduction of AgCl in the presence of Na<sub>2</sub>SO<sub>3</sub> appears to be a homogeneous reaction, while in its absence the reaction is heterogeneous. The mechanism of the primary and secondary reactions are discussed. E. P. Wightman
- History of the photographic developer. O. Schlenk. *Phot. Korr.* 69, 171-2(1933).
- History of the pyrocatechol developer. J. M. Eder. *Phot. Korr.* 69, 172 3(1933). -Cf. preceding abstr.
- Metol-hydroquinone developers: the influence of the proportion of mixtures and of the  $p_H$  value. W. Reindt and M. F. C. Beukers. *Phot. J.* 74, 78-82(1934)
- Metol alone works as a powerful developer at a  $p_H$  value at which hydroquinone alone does not cause any reduction. With the former development is possible at  $p_H$  6, whereas with the latter it begins only at a  $p_H$  above 9. However, the velocity of development with the latter increases more rapidly with increasing  $p_H$  than with metol. The velocity is about the same at a  $p_H$  about 10.5-11. The increase of developing power when metol is mixed with hydroquinone is much greater than would be expected, i. e., it is greater than the sum of the two separate effects. This is attributed to the fact that with hydroquinone alone, the first growth of the Ag germ is uncommonly slow, but as soon as these germs are made somewhat larger, as they are with metol, the reduction goes on very rapidly. metol shortens the induction period of hydroquinone. The best mixt. of the 2 developers consists of 1 metol to 3 hydroquinone by wt. Metol and *p*-aminophenol do not work together in the same way. E. P. Wightman

**Theory of the photographic elementary process and of the latent image.** G. Schwarz. *Phot. Korrr. Suppl.* 69, 27-34 (1933).—Expts. bearing on an explanation of sensitivity and the latent image (cf. Schwarz and Urbach, *C. A.* 26, 4545) independent of the Ag nucleus theory have been continued.

**The intermittency effect in photographic exposure.** Julian M. Blair and Malcolm C. Hylan. *J. Optical Soc. Am.* 23, 353-8 (1933).—The intermittency effect is explained by means of the Blair and Leighton equation for the formation of the latent image plus an addnl. hypothesis of a photochem. lag. A few measurements are presented showing intermittency effects of great magnitude. For the most part the explanation is applied to the results obtained by R. Davis (*Bur. Standards Sci. Paper* 21, 95-139 (1926)).

**Photographic properties of silver sulfide. II. The print-out effect—chemical aspect. III. The print-out effect—photographic aspect.** K. C. D. Hickman and W. J. Weyerts. *J. Franklin Inst.* 216, 683-706, 591-627 (1933).—Ag<sub>2</sub>S exhibits a "photographic effect." Pptd. Ag<sub>2</sub>S suspended in solns. contg. the Ag salt of a reducing acid acquires a coating of metallic Ag when strongly illuminated. The action is produced by light of all wave lengths from the ultra-violet to 1.4  $\mu$ ; it is repressed by gelatin, an alkali, an Fe salt, etc., but it can proceed slowly with well-shaded photographic images of Ag<sub>2</sub>S. Images converted to sulfide can be intensified in light under solns. of Ag in NaNO<sub>2</sub> or Ag in Na<sub>2</sub>SO<sub>4</sub>.

**Intensification with mercuric iodide.** R. Namias. *Phot.-Rev.* 45, 342-3 (1933).—Solns. for HgI<sub>2</sub> intensification are usually prepd. by dissolving HgI<sub>2</sub> in aq. KI contg. a trace of Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub>. Because the intensified images obtained with this soln. are not stable and turn yellow rapidly, N. prefers formulas in which larger amts. of hypo are used. Good results are claimed to have been obtained with the following formula: HgI<sub>2</sub> 10 g., KI 20 g., hypo 20 g., water to make 1 l.

**The photographic emulsion: sensitization by sodium sulfite.** Burt H. Carroll and Donald Hubbard. *Bur. Standards J. Research* 11, 743-64 (1933) (Research Paper No. 622).—Na<sub>2</sub>SO<sub>3</sub>, in quantities sufficient to reduce a few tenths of 1% of the AgBr of a photographic emulsion, may act as a powerful sensitizer only slightly inferior to the natural sensitizers in gelatin. It acts as such only after digestion with the emulsion; this insures that it has reacted with the AgBr. The sensitivity nuclei thus formed are of metallic Ag, in amts. similar to the Ag<sub>2</sub>S nuclei of normal emulsions. The rate of change of sensitivity increases with increasing alkyl and decreases with increasing bromide-ion concn. Sulfite may be added to the emulsion before washing; it sensitizes only on digestion after washing. There was no indication of panchromatic sensitization (Capstaff effect).

**New procedure for reducing negatives.** G. Schweitzer and M. Rancurel. *Phot.-Rev.* 45, 305-7, 323-5 (1933).—A method is described for effecting local reduction in the highlights of overdeveloped negatives. The process involves the following steps: treatment of the emulsion side of the negative with dichromate soln., drying, exposing the back of the negative to daylight, thus hardening the gelatin in the shadow portions, and finally, brief treatment with hypochlorite soln., which removes part of the gelatin and Ag deposit from the highlights, and does not attack the shadows where the gelatin has been hardened.

**Fine-line etchings.** K. Dulik. *Klmschs Jahrbuch* 1934, 125-8.—A pyro-silver intensifier is used with wet collodion negatives for fine-line work. Exposure must be correct. To transfer any design from existing printing forms to lithography a proof in fatty ink on transfer paper is rolled onto a dry counter-etched Zn plate, the paper is moistened and removed, the plate is washed with water, coated with bichromated albumin and dried. Without exposing to light the ink is removed by scrubbing with benzene. The plate is then rolled up and developed, like a normal albumin print, with water, etc. The result is said to be superior to the transparency method.

**Flashlight lamp** (U. S. pat. 1,944,854) 4.

**Eder, Josef M.:** *Rezepte, Tabellen und Arbeitsvorschriften für Photographie und Reproduktionstechnik.* 14-15 ed. Halle: W. Knapp. 487 pp. M. 8.80; bound, M. 9.60.

**Isert, Gerhard:** *Infrarot-Photographie.* Berlin: Photokino-Verlag. 48 pp. M. 1.50.

**Color photography.** Tru Colour Film Ltd. Brit. 400,251, Oct. 23, 1933. See Fr. 738,190 (*C. A.* 27, 1583).

**Color photography.** Frederick Beckert. Brit. 400,214, Oct. 20, 1933. Two processes are described for obtaining color sepn. negatives from pattern screen negatives by means of a stop-out screen, the processes being contrasted with that of Brit. 380,778 (*C. A.* 27, 2892). In 1 process a stop-out screen is photographically produced on a slow Ag-emulsion plate which is not bichromated; the image is developed (but not fixed), washed and resensitized with bichromate; and the resensitized plate is exposed under the screen-negative, registered therewith and developed, fixed and washed, a reversed sepn. negative of 1 color being obtained. In the 2nd process the slow Ag emulsion is applied to a plate coated with plain gelatin; the stop-out screen image is printed, developed, fixed and washed; the plate is resensitized with bichromate, printed under the registered screen-negative, washed to remove unexposed bichromate and then dyed with a suitable dye, e. g., pinatype black or nigrosine, to obtain a grainless dye negative.

**Color photography.** Dufaycolor Ltd. Fr. 755,675, Nov. 28, 1933. The emulsion lying on the upper face of the colored screen of a photographic film, of the multi-color screen type, is protected against the action of the dyes of the screen by a layer of synthetic resin, between the colored screen and the emulsion. The resin may contain a plastifying agent such as linseed oil and may be applied in the form of a soln. in benzene.

**Color cinematography.** Humphrey D. Murray and Douglas A. Spencer. Brit. 400,264, Oct. 23, 1933. Pos. images corresponding alternately to neg. selection records of 2 primary colors are recorded on 1 side of a double-coated film, and images corresponding to a neg. selection record of the 3rd primary color on the other side. All the images on 1 side are toned in 1 color and all on the other side in another color, and successive frames of the film are projected through 2 filters which are additively complementary and of such color and so appropriated to the frames that each filter will absorb those rays of light that are transmitted by the primary color a record of which is absent from the frame. The coloring of the images may be effected by the process of Brit. 377,706 (*C. A.* 27, 2892).

**Photographic color filter.** Carl L. Gregory (to Kislyn Corp.). U. S. 1,944,230, Jan. 23.

**Photographic materials.** Kalle & Co. A.-G. (Maximilian P. Schmidt, Wilhelm Neugebauer and Robert Franke, inventors). Ger. 590,107, Dec. 23, 1933 (Cl. 57b. 12.05). Sensitive layers for diazotype photography comprise a diazo compd. derived from an amine of any of the formulas XCONHRNH<sub>2</sub>, NH<sub>2</sub>RNHCONHR'NH<sub>2</sub>, and NH<sub>2</sub>RNHCSNHR'NH<sub>2</sub>, where R and R' are aryl radicals and X is an alkyl, aryl or aralkyl radical. Development may be effected in a bath of an azo dye component, or the component may be included in the layer and development effected with NH<sub>3</sub>. Examples are given. Cf. *C. A.* 27, 922.

**Photographic sensitive layers.** Michele Martinez. U. S. 1,944,293, Jan. 23. A support such as paper carries a layer capable, by heat development, of having relief images formed in it and comprising a colloid such as gelatin and substances yielding in aq. soln. carboxyl and ferric ions such as ferric NH<sub>4</sub> citrate and oxalic acid, the ratio of carboxyl content (calcd. as CO) to the ferric content being greater than 1.5.

**Photographic sensitizers.** I. G. Farbenind. A.-G. Brit. 400,401, Oct. 26, 1933. Ag halide emulsions are sensitized by a thiocyanine, thiopseudocyanine or thioisocyanine dye derived from a thiazole compd. having a

system of 3 or 4 condensed rings, particularly anthracene, phenanthrene, acenaphthene, fluorene, chrysene, carbazole and diphenylene oxide ring systems, fused onto the thiazole nucleus. The dyes are sensitive to wave lengths of about 200-620  $\mu$ . The sensitizing properties of 1,1'-diethyl-2,2'- $\alpha$ -anthrathiopseudocyanine iodide, 1-methyl-1'-ethyl-2,4'- $\alpha$ -anthrathiocyanine bromide, 1,1'-diethyl-2,2'-acenaphthenethiopseudocyanine iodide, 1,1'-dimethyl- $\alpha$ -anthrathiocyanine chloride, 1,1'-diethyl-2,4'-(carbazole-6'-methoxy)thioisocyanine iodide, 1,1'-diethyl-2,2'-(diphenyleneoxide-6'-methoxy)thiopseudocyanine iodide, etc., are described. Cf. C. A. 28, 56<sup>9</sup>.

**Photographic sensitizers.** I. G. Farbenind. A.-G. Brit. 400,951, Oct. 30, 1933. Ag halide emulsions are sensitized by the addn. of benzothiocarbocyanine, benzothiocyanine, benzoselenocyanine, benzothiopseudocyanine, benzoselenopseudocyanine, benzothioisocyanine or benzoselenoisocyanine dyes in which the  $C_6H_5$  nucleus attached to the thiazole or selenazole ring contains a substituted or unsubstituted amino group. Suitable substituents are Me, Et, Ac or Pr. The dyes are added to the emulsion as alkyl sulfoalkylates or halides. Among suitable dyes are (1) 1,1'-diethyl-5,5'-bis(diethylamino)benzothiocyanine iodide, (2) 1,1'-diethyl-2,2'-(5-benzamidobenzothioquinol)cyanine iodide, prep'd. by boiling 6-benzamido-2-methylbenzothiazole diethyl sulfate with 2-iodoquinoline-EtI with addn. of alc. KOH, and (3) 1,1'-diethyl-5-diethylamino-6'-methoxybenzoselenopseudocyanine iodide, obtained by boiling 2-methyl-6-diethylaminobenzoselenazole-EtI and 2-iodo-6-methoxyquinoline with addn. of NaOEt.

**Orthochromatic collodion-emulsion photographic dry plates.** Theodor Freundorfer and Roman Freundorfer. U. S. 1,943,380, Jan. 16. Preservatives such as glycerol and protective colloids such as gelatin or albumin are added to a strongly alk. Ag soln., and the treated soln. is applied to a collodion emulsion layer contg. a Ag salt in suspension and also contg. a color-sensitizing dye.

**Polychrome images.** I. G. Farbenind. A.-G. Fr. 755,705, Nov. 29, 1933. In prep. polychrome images in which several partial images are disposed in a single photographic layer, after producing the first partial image the layer for the taking of the other partial image and which

1 still contains unsensitized Ag halide is resensitized by treating it with reducing agents. The layers sensitized to different spectral regions are colored, with a dye capable of being eliminated or destroyed, to a color complementary to its region of sensitivity.

**Softening cinematographic films before application of the lettering.** Filmindustri. Norw. 52,455, April 18, 1933. The film is softened with an aq. soln. of  $Na_2CO_3$  or formaldehyde or a mixt. of both.

**Diazo prints.** Kalle & Co. A.-G. (Maximilian P. Schmidt, Oskar Siis and Robert Franke, inventors). Ger. 588,994, Dec. 1, 1933 (Cl. 57b. 12.05). Prints are obtained by using azo components of the general compn.  $R.CO.CH_2.CO.NXY$ , where R represents aryl, alkyl or aralkyl and X and Y represent H, aryl, alkyl, aralkyl, acyl or hydrogenated cyclic residues, alone or mixed with other azo components, in the light-sensitive layer or in the developing soln. Thus, paper is given a layer contg. tartaric or citric acid,  $H_3BO_3$ ,  $Al_2(SO_4)_3$ , Na naphthalene-trisulfonate, thiourea, the  $ZnCl_2$  salt of the diazo comp'd. of 1-diethylamine-3-ethoxy-4-aminobenzene, cyclohexyl-acetoacetic acid amide, phloroglucine and water. The paper is exposed under an original and developed by gaseous  $NH_3$  or an alk. liquid.

**Photogelatin printing plates.** Jacob A. Fleischmann, Walton W. Sullivan and Frank O. Sullivan (to Gardner Abbott). U. S. 1,944,123, Jan. 16. A plate such as Zn or Al is grained to take a coating, the grained surface is coated with a gelatin and dried; a second coating of gelatin contg. a sensitizer of the  $K_2Cr_2O_7$  type is applied, the coated plate is baked at about 32° for about 3 hrs., exposed without the interposition of a screen to high-intensity actinic rays from a carbon arc projected directly through a transparent image for a period of minutes, and the light-struck plate is developed in flowing water.

**Photogravure printing surfaces.** Niels Ludvigsen. U. S. 1,944,354, Jan. 23. An acid-resisting gram is provided upon the smooth face of a metal plate such as Zn so that the grain has uniform dots regularly disposed, the grained surface is thereafter coated with a light-sensitive material, and a grain is provided on the sensitive surface having uniform dots regularly disposed, this being followed by photographing, developing and etching.

## 6--INORGANIC CHEMISTRY

A. R. MIDDLETON

**Addition reactions of hydrogen and oxygen atoms at low temperatures.** K. H. Geib and P. Harter. *Trans. Faraday Soc.* 30, 131-4 (1934).—See C. A. 28, 983<sup>9</sup>.

E. R. Rushton

**Magnetochemical investigations. IX. The constitution of the higher chromium-oxygen compounds.** Wilhelm Klemm and Hermann Werth. *Z. anorg. allgem. Chem.* 216, 127-31 (1933); cf. C. A. 27, 2073.—The magnetic susceptibility of "red K perchromate" shows that the Cr is not hexavalent as stated by Schwarz and Giese (C. A. 27, 1838) but is probably quinquivalent. In "blue K perchromate" Cr is hexavalent. Robert Schwarz and Hermann Giese. *Ibid.* 132.—The chem. evidence permits Cr in the red salt to have a valence of 5 but not 7. J. B. Austin

**New view of the nature of the covalent linkage and the formation of free radicals.** Morris W. Travers. *Trans. Faraday Soc.* 30, 100-2 (1934).— $B_2H_6$  condenses, a little above 100° to form a mixt. of hydroborons, mainly  $B_3H_9$ . A similarity to the pyrolysis of  $C_2H_6$  is shown. The applicability of ordinary formulas to mols. in free space is questioned.

E. R. Rushton

**The  $(ClO_2)_2$  radical.** M. Gomberg and H. R. Gamrath. *Trans. Faraday Soc.* 30, 24-30 (1934).—When  $AgClO_4$  in 2% soln. in anhyd.  $Et_2O$  is treated with 1 equiv. of 1, 2 concurrent reactions take place: (1) the iodination of the  $Et_2O$ ,  $HClO_4$  being the by-product (Birckenback and Goubeau, C. A. 26, 3198); (2) the liberation of the inorg. radical  $(ClO_2)_2$ , to the extent of 25-50%, as measured by 2 independent methods.

E. R. Rushton

**Lower degrees of oxidation of rhenium.** E. Turkiewicz. *Roczniki Chem.* 12, 589-97 (1932).— $Re^{VII}$  ( $KReO_4$ ) is reduced by  $Cr^{II}$  to  $Re^{IV}$ ; the reaction is catalyzed by 1  $ReO_3 \cdot xH_2O$ , pptd. by alkalis from the reduced solns., yields  $K_2[ReO(CN)_4OH]$  on boiling with concd. aq.  $KCN$ , in acid solns. this salt yields the ion  $[Re(CN)_4(OH)]^{II}$ . B. C. A.

**Bromine fluoride,  $BrF$ .** Otto Ruff and Alfred Braida. *Z. anorg. allgem. Chem.* 214, 81-90 (1933).— $BrF$  results from the interaction of F and Br, but is not stable. It is better to make it from Br and  $BrF_3$  or Br and  $BrF_5$ . It decomposes spontaneously into Br,  $BrF_3$  and  $BrF_5$ . At 50°, the decompn. is so fast and complete that  $BrF$  is no longer detectable. Gaseous  $BrF$  is red-brown, the liquid is red and the crystals have the color of dichromate.  $BrF$  m. about -33°, b. about 20°. The Br fluorides are sol. in each other in all proportions, but only partially sol. in Br. Albert L. Henne

**Bromine trifluoride.** Otto Ruff and Alfred Braida. *Z. anorg. allgem. Chem.* 214, 91-3 (1933); cf. C. A. 26, 3974.— $BrF_3$ , b. 127°, vapor curve  $\log p = 8.41054 - (2220.2/T)$ , heat of evaporation 10 large calories per mol., Trouton constant 25.8, crit. temp. about 327°. The molecules are associated in the liquid. A. L. Henne

**Determination of the total hydration of the ions of calcium chloride.** F. Bourion and E. Rouyer. *Compt. rend.* 198, 175-8 (1934); cf. C. A. 27, 4154, 5623.—From cryoscopic studies it is calcd. that for 0.5 M  $CaCl_2$  and 0.25 M  $CaCl_2$  the corresponding hydrates are  $CaCl_2 \cdot$

$27\text{H}_2\text{O}$  and  $\text{CaCl}_2 \cdot 30.6\text{H}_2\text{O}$ . "It is seen that the Ca ions are hydrated more than the K, Na and, above all,  $\text{NH}_4$  ions studied previously."

**Chloride of lime.** V. Macri. *Boll. chim.-farm.* 72, 327-8 (1933).—Possible sources of error in Tarugi's (C. A. 27, 1586) and Neumann and Hauck's (C. A. 20, 880) detns. of the formula for bleaching powder are discussed.

B. C. A.

**Compounds of calcium oxide and phosphoric acid.** II. 1. Structural chemistry of apatite groups. 2. Characteristic sensitiveness of  $\alpha$  and  $\beta$  compounds of tricalcium phosphate with calcium oxide and water vapor. M. A. Bredig, H. H. Franck and H. Fuldner. *Z. Elektrochem.* 39, 959-69 (1933); cf. C. A. 26, 2666.—In apatites such as  $\text{Ca}_{10}(\text{PO}_4)_6\text{X}_2$ , by substituting a bivalent radical,  $\text{Ca}_{10}(\text{PO}_4)_m\text{X}_{2m}\text{O}_n$  ( $m \geq 0.3-0.5$ ;  $n = 1 - m$ ) can be obtained. That apatites with such radicals as carbonate can be prepd. is shown by the Röntgen diagram. Cyanamide, aluminate and ferrite apatites are synthesized by substituting the univalent radical. The conversion of tricalcium phosphates is very sensitive to the  $\text{CaO}$  and  $\text{H}_2\text{O}$  present. The  $\alpha$ -comps. are converted to the  $\beta$  at  $1000^\circ$  only in vacuum. The stability of hydroxyl- or of hydroxyl-oxy-apatites is explained.

L. Marsh

**Magnesium thiosulfate.** R. Portillo. *Rev. acad. cienc. Madrid* 30, 577-85 (1933).— $\text{SrSO}_4$  and  $\text{MgSO}_4$  solns. were allowed to react, and the filtrate was evapd. at low temp. Rhombic crystals of  $\text{MgSO}_4 \cdot 6\text{H}_2\text{O}$  (I) were obtained. They were stable when exposed to the air. When heated to  $60^\circ$   $\text{MgSO}_4 \cdot 3\text{H}_2\text{O}$  (II) was formed, and at higher temps. decompn. occurred. When II was exposed to the air it absorbed water and was reconverted to I. The mol. heat of soln. for I is  $-3400$  cal.; for II  $+6870$  cal.; I,  $d_4^{25} = 1.741$ ; II,  $d_4^{25} = 2.054$ . A soln. satd. at  $0^\circ$  contains 56.19% of I; at  $40.5^\circ$ , 65.11%.

L. E. Gilson

**The thermal dissociation of normal manganese carbonate and cobalt carbonate.** J. Krustinsons. *Z. Elektrochem.* 39, 936-9 (1933).—Repeated heatings of normal  $\text{MnCO}_3$  result in a min. dissoen. temp. of  $400^\circ$  at 760 mm.  $\text{CO}_2$  pressure. For  $\text{CoCO}_3$  the dissoen. temp. is  $341^\circ$ . The decompn. of  $\text{MnCO}_3$  appears to form a solid soln., while that of  $\text{CoCO}_3$  occurs in steps. The method of prep. the compn. affects the dissoen. temp. Dissoen. curves are given for each compn.

L. Marsh

**The decomposition of mercurous iodide into mercury and mercuric iodide.** Maurice Francois. *Ann. chim.* 20, 285-303 (1933).—Contrary to the statements usually found,  $\text{Hg}_2\text{I}_2$  (I) is pure yellow and is well crystd. It can be prepd. in the pure state as follows: Dissolve 125 g.  $\text{Hg}_2(\text{NO}_3)_2$  in 2 l. of cold  $\text{H}_2\text{O}$  contg. 20 cc.  $\text{HNO}_3$ . Slowly add with stirring a soln. of 50 g.  $\text{KI}$  in 100 cc.  $\text{H}_2\text{O}$ . Let stand 24 hrs. in the dark. Wash, filter and dry at  $50^\circ$ . Keep dark at all times. The greenish tint of the com. salt is due to the presence of dispersed  $\text{Hg}$ , which can be removed by treatment with  $\text{N KI}$  satd. with  $\text{HgI}_2$  (II) or by  $\text{HNO}_3$  ( $36^\circ\text{Be.}$ ).  $\text{C}_6\text{H}_5\text{NH}_2$  (III) acts on I to give  $\text{Hg}$  and II in soln. A cryst. pale-yellow compd.  $2(\text{C}_6\text{H}_5\text{NH}_2) \cdot \text{HgI}_2$  (IV) is also formed. IV can be prepd. in a pure state as follows: Heat 500 g. III and 250 g. II to boiling on a sand bath. After slow cooling add 20 g. I and boil the soln. 5 min. more. Decant the liquid into a filter heated to  $170^\circ$ . Let cool to  $50^\circ$  but not below, whereupon IV seps. out. Avoid sunlight throughout. Filter off the crystals rapidly and wash when cold with a mixt. of alc. and  $\text{Et}_2\text{O}$ . The yield is about 6 g. I is decompd. by  $\text{C}_6\text{H}_5\text{NH}_2$ , phenols, 95% alc., abs. alc., satd. solns. of  $\text{KI}$  and  $\text{HI}$  to give  $\text{Hg}$  and II. All the reactions are reversible. Heat also decomp. I. With  $\text{NH}_3$  it forms a black compd. which is white  $\text{HgI}_2 \cdot 2\text{NH}_3$  and  $\text{Hg}$ . The soly. of II in 100 g. 95% alc. is 0.867 g. at  $15^\circ$  and 4.32 g. at  $79.9^\circ$ . In abs. alc. it is 1.780 g. at  $12^\circ$  and 5.750 g. at  $78.4^\circ$ . J. B. A.

**Sulfur monoxide.** Heinrich Cordes and Peter W. Schenk. *Trans. Faraday Soc.* 30, 31-3 (1934); cf. C. A. 27, 5670.—The prep. and properties of  $\text{SO}$  are described. It may be kept for some days in dry vessels. At  $180^\circ$  it decomposes completely in 1 min. It reacts vigorously with metals, forming sulfides. At room temp., it does not react with  $\text{O}_2$ ; it reacts with water,  $\text{S}$  sepg., and, with aq.

alkalies it forms a soln. of sulfoxylate or hyposulfite which decolorizes indigo. In the short ultra-violet, a photochem. decompn. sets in.  $\text{SiO}_2$  gel also causes decompn. The ready spectroscopic detection of  $\text{SO}$  permits the investigation of a no. of reactions with regard to its formation.

R. R. Rushton

**The behavior of ferrous salt solutions when oxidized with bromine.** V. Rodt and K. Charisius. *Mitt. deut. Materialprüfungsanstalt.*, Sonderheft 22, 43-5 (1933).—The oxidation of  $\text{Fe}^{++}$  to  $\text{Fe}^{+++}$  by  $\text{Br}$  was studied. By oxidizing a warm  $\text{HCl}$  soln. of  $\text{FeCl}_2$  with  $\text{Br}$  water, and evapg. the excess  $\text{Br}$  the  $\text{Fe}$  is made trivalent. The I titration gives the correct value. The oxidized  $\text{Fe}$  is a mixt. of  $\text{FeCl}_2$  and  $\text{FeBr}_3$ . By drying the salts in the air the  $\text{Br}$  content approaches an amt. indicated by  $\text{FeBr}_3$ , and the  $\text{FeCl}_2$  changes to a basic salt; about 75% of the mixt. remains trivalent. When a ferrous salt is oxidized in warm  $\text{HBr}$  soln., on evapn. of the excess  $\text{Br}$  there is a partial decompn. of  $\text{FeBr}_3$  to  $\text{FeBr}_2$ , with a sepn. of free  $\text{Br}$ . If the  $\text{FeBr}_3$  is dried at  $100^\circ$  in air, it is rapidly converted into  $\text{FeBr}_2$ . There was no evidence that on evapn. of its soln.  $\text{FeBr}_3$  is converted to  $\text{Fe}_2\text{Br}_4$ . G. M. Petty

**The action of brown hydrated ferric oxide ( $\text{Fe}_2\text{O}_3 \cdot x\text{aq.}$ ) and of yellow hydrated ferric oxide ( $\text{O}=\text{Fe}-\text{OH}$ ) on a metallic hydroxide in alkaline solution.** V. Rodt. *Mitt. deut. Materialprüfungsanstalt.*, Sonderheft 22, 49-56 (1933).—Brown hydrated ferric oxide ( $\text{Fe}_2\text{O}_3 \cdot x\text{aq.}$ ) in alk. soln. does not form any compds. with  $\text{Na}_2\text{O}$  or  $\text{Ag}_2\text{O}$ ; it combines with  $\text{MgO}$  in  $\text{NH}_3$  soln. The  $\text{MgO}$  content of the compd. increases with the  $\text{MgO}$  and the  $\text{NH}_3$  concn. of the soln. Yellow hydrated ferric oxide ( $\text{O}=\text{Fe}-\text{OH}$ ) does not form a compd. with  $\text{Na}_2\text{O}$ ; with an excess of  $\text{Ag}_2\text{O}$  in  $\text{NaOH}$  soln. it forms  $\text{O}=\text{Fe}-\text{OH} \cdot \text{AgOH}$ . The structural formula of the compd. is  $\text{O}=\text{Fe}-\text{O}-\text{Ag}$ . With  $\text{MgO}$  in  $\text{NH}_3$  soln.,  $\text{O}=\text{Fe}-\text{OH}$  forms a ppt. The  $\text{MgO}$  content of the ppt. increases with the  $\text{MgO}$  and the  $\text{NH}_3$  concn. of the soln.; there were 0.084-8.0 mols. of  $\text{MgO}$  per mol. of  $\text{Fe}_2\text{O}_3$ . The structural formula is probably  $\text{O}=\text{Fe}-\text{O}-\text{Mg}-\text{O}-\text{Fe}-\text{O}$ .

Gerald M. Petty

**The synthesis of yellow hydrated ferric oxide ( $\text{O}=\text{Fe}-\text{OH}$ ) from iron sulfides.** V. Rodt. *Mitt. deut. Materialprüfungsanstalt.*, Sonderheft 22, 56-9 (1933).— $\gamma$ -Hydrated ferric oxide ( $\text{O}=\text{Fe}-\text{OH}$ ) was prepd. by drying hydrated  $\text{FeS}$  and  $\text{FeS}_2$  in air at temps. up to  $220^\circ$ .  $\text{S}$  and  $\text{FeS}_2$  were also present in the residual mixt. The hydrated oxide absorbs  $\text{H}_2\text{O}$  rapidly; it acts as a carrier in the combustion process. There are kinks in the temp.- $\text{H}_2\text{O}$  content curve at  $180^\circ$  and  $210^\circ$ . These kinks are probably caused by the strong  $\text{H}_2\text{O}$  absorption of the  $\gamma$ -ferric oxide.

Gerald M. Petty

**The origin of ferroso-ferric oxide ( $\text{Fe}_3\text{O}_4 \cdot x\text{aq.}$ ) in aqueous solution.** V. Rodt. *Mitt. deut. Materialprüfungsanstalt.*, Sonderheft 22, 45-4 (1933).—Ferroso-ferric oxide ( $\text{FeO} \cdot \text{Fe}_2\text{O}_3 \cdot \text{aq.}$  or  $\text{Fe}_3\text{O}_4 \cdot \text{aq.}$ ) was synthesized by the action of an excess of a soln. contg.  $\text{FeO}$ ,  $\text{NH}_3$  and  $\text{NH}_4\text{Cl}$ , on brown hydrated  $\text{Fe}_2\text{O}_3$ . Under the same conditions, yellow hydrated  $\text{Fe}_2\text{O}_3$  gave  $3\text{FeO} \cdot 2\text{Fe}_2\text{O}_3 \cdot \text{aq.}$ ; however, it is unstable, and  $\text{FeO} \cdot \text{Fe}_2\text{O}_3$  is formed by the removal of the excess  $\text{FeO}$ . The ferroso-ferric oxide is readily and thoroughly oxidized by air.

Gerald M. Petty

**Ferrous ferrites. II. Constitution and ferromagnetism of the ferrous ferrites and the autoxidation of ferrous hydroxide.** Alfons Krause and J. Tulecki. *Z. anorg. allgem. Chem.* 213, 292-300 (1933).—For the prep. of  $\text{Fe}^{II}$  ferrite from  $\gamma\text{-Fe}(\text{OH})_2$  an excess of  $\text{Fe}(\text{OH})_2$  is required, since part of the latter is oxidized with the simultaneous formation of  $\text{H}_2\text{O}_2$ . The constitutional formula of the ferrite is similar to that of spinel, but not all the cation positions are occupied. The ferromagnetism of the compd. is explained by the presence of  $\text{Fe}(\text{O}_2) \cdot \text{Fe}$  groups. The ferrites produced from  $\alpha\text{-Fe}_2\text{O}_3$  are formed by the substitution of  $\text{FeO}$  for the coordinately combined  $\text{H}_2\text{O}$ .  $\text{Fe}_3\text{O}_4$  prepd. by gentle ignition of  $\gamma\text{-Fe}(\text{OH})_2$  or by strong ignition of  $\alpha\text{-Fe}_2\text{O}_3$  adsorbs up to 0.5 mol.  $\text{FeO}$  per mol. of  $\text{Fe}_3\text{O}_4$ .  $\text{BaSO}_4$  accelerates oxidation of  $\text{Fe}(\text{OH})_2$  in air, probably because of the formation of a  $\text{Ba}$  salt of ferrisulfuric acid.

B. C. A.

A note on the reducing action of anhydrous hydrogen iodide. R. Q. Brewster. *Trans. Kansas Acad. Sci.* **36**, 111-12(1933).—Thirty g. iodide, 40 g. rosin and 60 g. sand were heated. The gas evolved was passed over red P, then  $P_2O_5$  and liquefied in a bath of  $CHCl_3$ ,  $CCl_4$  and solid  $CO_2$ .  $PhNHNH_2$  was reduced by adding 5 g. dropwise to 23 g. of the liquid  $HI$ , while the mixt. was kept cold in a bath of solid  $CO_2$ . The excess  $HI$  was allowed to evaporate and the solid residue steam distilled. The distillate was made alk. and steam distilled. The yield was 3 g.  $PhNH_2$ . Reduction of  $PhNHIOH$  by this method was practically quantitative. The method is limited to those compounds easily reducible. W. A. Moore

Hydroxo compounds. H. Brintzinger and J. Wallach. *Angew. Chem.* **47**, 613(1934).—Compounds in solutions of amphoteric hydroxides in strong bases were examined by determination of the ionic weights. The dialysis method of Brintzinger was used, as it permits the presence of large excesses of strong bases.  $CrO_4^{2-}$  was used as standard, and it was found that the antimonite ion was equal to  $[Sb(OH)_3]^-$ . Based upon both  $CrO_4^{2-}$  and  $[Sb(OH)_3]^-$  the following ionic formulas were determined: antimonite ion =  $[Sb(OH)_3]^-$ , germanate ion =  $[Ge(OH)_4]^-$ , aluminate ion =  $[Al_2(OH)_5]^-$ , gallate ion =  $[Ga_2(OH)_5]^-$ , zincate ion =  $[Zn_2(OH)_5]^{2-}$  and the beryllate ion = about  $[Be_3(OH)_6]^{2-}$ . Exptl. data and 6 references are given. Karl Kammermeyer

Structure of silicates. L. H. Borgström. *Finska Kemistumsfundets Medd.* **42**, 69-72(1933).—A résumé. H. C. Duus

System: nickel oxide-oxygen-water. M. Le Blanc and R. Müller. *Z. Elektrochem.* **39**, 204-9(1933).—By the action of aq.  $K_2CO_3$  and  $Br$  in aq.  $KBr$  on aq.  $NiCl_2$ , an unstable black ppt. of variable composition,  $NiO \cdot xO_2 \cdot yH_2O$ , where  $x$  may be as high as 0.9, is obtained. The extra  $O$  liberates  $I$  from  $HI$  and is evolved on treatment with acid or heating in vacuum at  $360^\circ$ . The peroxide has no definite dissociation pressure of  $O_2$  or  $H_2O$ , and no crystal structure can be detected by the x-ray method. B. C. A.

Complex compounds. A. A. Grinberg. *Ann. inst. platine* No. 10, 47-64(1932).—The results of physicochemical research on the coordination compounds of the Pt group are discussed. B. C. A.

Complex platinum compounds. I. I. Chernyaev. *Ann. inst. platine* No. 10, 33-46(1932).—The work of the Institute since 1918 is reviewed. B. C. A.

Complex compounds formed by certain amino acids in the presence of mercuric chloride and alkali. Hubert B. Vickery and Wm. G. Gordon. *J. Biol. Chem.* **103**, 543-7(1933).—Addition of 1.5-2 mols.  $HgCl_2$  to a solution of amino acid at  $pH$  9.8 gave precipitates in which the ratio  $Hg:N$  was 3:2, and which also contained  $Cl$  and alkali metal. The latter is not present simply as contaminant, since in many of the compounds it was also present in simple integral ratio. An exception is made by lysine, whose precipitate has a  $Hg:N:Cl$  ratio of 4:4:3, and contains no alkali metal. K. V. T.

Structure of ultramarines. I. Technical ultramarines as basic materials for research. M. Dominikiewicz. *Roczniki Chem.* **12**, 913-24(1932).—Common ultramarines are solid solutions of ultramarine ( $Na_{41}Al_3Si_{138}O_{384}S_4$ ,  $Na_7Al_4Si_{138}O_{384}$  and isomorphous

$Na_{41}Al_3Si_{138}O_{384}S_4$ , or  $Na_7Al_4Si_{138}O_{384}$ ) and isomorphous Na kaolinite,  $Na_2Al_2Si_2O_{10}$  (0-40%). B. C. A.

Structural and stereochemical relationships among the disulfines and diammines of platinum and palladium. H. D. K. Drew and G. H. Wyatt. *J. Chem. Soc.* **1934**, 56-62.—The previous view of Angell, Drew and Wardlaw on the relationship between the  $\alpha$ - and  $\beta$ -disulfines of Pt is revised (*C. A.* **24**, 2000), it being now evident that migratory change occurs in the transformation  $\beta \rightarrow \alpha$ -disulfine.

The  $\alpha$ -disulfines of Pt are trans planar forms and correspond stereochemically and structurally with the  $\alpha$ -diammines and not with the  $\beta$ -diammines as was supposed by Werner. The  $\beta$ -disulfines of Pt are cis compounds, corresponding with the  $\beta$ -diammines of Pt; 2 structural types appear possible. The disulfines and diammines of Pd, which occur in only 1 form, correspond with the  $\alpha$ -forms of their Pt analogs, unless a chelate group is present, in which case they correspond with the  $\beta$ -forms. In the following en =  $(CH_3NH_2)_2$  (I), es =  $(CH_3SEt)_2$  (II). Pt es  $Cl_2$  in aq. I at room temp. (1 day) or on the water bath, or Pt en  $Cl_2$  in aq. II on the water bath (2 hrs.) give (ethylenediamino)-ethylenediethyldisulfineplatinous chloride, which becomes yellow at  $150^\circ$ ; it usually separates as the monohydrate; with dil.  $HCl$  there results I.  $HCl$  and Pt es  $Cl_2$ ; platy salt,  $[Pt(en)_2PtCl_4]$ , salmon-pink needles, decomposed by warm aq. solvents or in the dry state about  $130^\circ$ ; with aq. tetramminoplatinous chloride it gives Magnus's green salt on warming; boiling  $H_2O$  or dil.  $HCl$  gives about equimolar proportions of Pt es  $Cl_2$  and Pt en  $Cl_2$ . Pallado salt,  $[Pt(en)_2PtCl_4]$ , orange-brown; in hot  $H_2O$  there result about equimolar proportions of Pd es  $Cl_2$  and Pt en  $Cl_2$ ; aq.  $HCl$  gives Pt es  $Cl_2$  and  $(en)_2PdCl_4$ , deep red prisms with blue reflex, which gives Pd en  $Cl_2$  with boiling  $H_2O$ .  $\beta$ -Pt- $(Et_2S)_2Cl_2$  in aq. I gives  $[Pt(Et_2S)_2en]Cl_2$ ; evapn. at room temp. over  $P_2O_5$  gives ethylenediaminomono(diethylsulfine)platinous chloride, which also results from Pt en  $Cl_2$  in aq.  $Et_2S$ ; platy salt,  $[Pt(Et_2S)enCl]_2PtCl_4$ , sepg. as the monohydrate; it decomposes on keeping or more rapidly on boiling with  $H_2O$ , giving a red soln. from which a yellow solid separates, contg.  $Pt(Et_2S)_2Cl_2$ ,  $Pt(Et_2S)Cl_2$  and Pt en  $Cl_2$ . Ethylenediaminobis(diethylsulfine)platinous chloroplatinate,  $[Pt(Et_2S)_2en]PtCl_4$ , brick-red prisms;  $[Pt(NH_3)_4]Cl_2$  gives Magnus's green salt; the aq. soln. deposits a yellow solid, contg. Pt en  $Cl_2$ ,  $Pt(Et_2S)Cl_2$  and  $Pt(Et_2S)_2Cl_2$ ; the mother liquor contains  $[Pt(Et_2S)enCl]Cl_2$ . A preliminary study shows that  $Et_2S$  and Pd en  $Cl_2$  give  $[Pd(en)_2]Cl_2$  and  $Pd(Et_2S)_2Cl_2$ ; es and Pd en  $Cl_2$  give Pd es  $Cl_2$  and Pd en  $Cl_2$ ; es and  $Pd(NH_3)_2Cl_2$  give Pd es  $Cl_2$  and  $[Pd(NH_3)_4]Cl_2$ ; es and Pd  $(Et_2S)_2Cl_2$  give Pd es  $Cl_2$  and  $Pd(Et_2S)_2Cl_2$ ; en and Pd es  $Cl_2$  give  $[Pd(en)_2]Cl_2$  and Pd es  $Cl_2$ . C. J. West

## 7—ANALYTICAL CHEMISTRY

W. T. HALL

Standardization of volumetric solutions. Julius Grant. *Chemistry & Industry* **1934**, 767.—A practical solution is offered of the problem of properly standardizing all solutions used in the analytical lab. with the use of a single ultimate standard. Cf. Hinks, *C. A.* **24**, 2687. W. T. H.

Standardization of thiosulfate solution with potassium dichromate as a standard. Zinziro Nakai. *Bull. Fishery Expt. Sta. Gov. Gen. Chosen*, Ser. D, No. 3, 1-24(1933) (abstracts in English).—A study of the errors involved in the standardization of  $Na_2S_2O_3$  solutions against  $K_2Cr_2O_7$

leads to the following conclusions: The wt. of  $KI$  used should be less than  $11 \times$  the wt. of  $K_2Cr_2O_7$  taken, and the wt. of  $HCl$  less than  $51 \times$  the wt. of  $K_2Cr_2O_7$ . The  $KI$  content should be at least 0.09%; the  $HCl$  greater than 3% and the liberated  $I_2$  about 0.08%. The titration should take place below  $30^\circ$  and in diffused sunlight. Nao Uyei

Use of complex formers and of buffer substances in iodometric determinations. J. d'Ans. *Z. anal. Chem.* **96**, 1-6(1934).—Chromate, permanganate or bromate

can be titrated iodometrically in the presence of  $\text{Fe}^{+++}$  if  $\text{H}_2\text{PO}_4$  or  $\text{H}_2\text{P}_2\text{O}_7$  is added to convert the  $\text{Fe}^{+++}$  into an undissoc. complex. The quant. oxidation of  $\text{Br}^-$  to  $\text{BrO}_3^-$  by  $\text{ClO}^-$  is dependent upon a low concn. of  $\text{H}^+$ , and  $\text{NaH}_2\text{PO}_4$  suitably buffers the soln. except when considerable  $\text{Ca}^{++}$  is present, in which case  $\text{Na}_2\text{HPO}_4$  is better. To accomplish the iodometric titration of  $\text{Ti}^{+++}$   $\text{NaOAc}$  has been found a suitable buffer; it presents the reduction of  $\text{Ti}^{++++}$  which takes place with  $\text{HI}$  in acid solns. The iodometric titration of phenols depends upon keeping the concn. of  $\text{H}^+$  low. Dissolve 2-4 g. of  $\text{Na}_2\text{HPO}_4 \cdot 12\text{H}_2\text{O}$  in 100-150 cc. of water, add a measured vol. of 0.1  $N$   $\text{I}_2$  soln. and then the phenol soln. which has been made as nearly neutral as possible. Cover, allow to stand 15-30 min., make acid and titrate the excess  $\text{I}_2$  (which should correspond to about 5 cc. of 0.1  $N$  soln.) with  $\text{Na}_2\text{S}_2\text{O}_3$ . Salicylic acid can be titrated similarly.

W. T. H.

**The detection of cations with resorufin.** Hermann Eichler. *Z. anal. Chem.* 96, 22(1934).—To the neutral or slightly acid soln. add a few drops of a soln. contg. 0.2 g. resorufin in 5 cc. of  $\text{NH}_4\text{OH}$  and 100 cc. of water. Ppts. are obtained with  $\text{Cu}^{++}$ ,  $\text{Cd}^{++}$ ,  $\text{Fe}^{+++}$ ,  $\text{Al}^{+++}$ ,  $\text{Cr}^{+++}$ ,  $\text{Ni}^{++}$ ,  $\text{Zn}^{++}$ ,  $\text{Ba}^{++}$  and  $\text{Sr}^{++}$ , and a soln. free from  $\text{NH}_4$  salt gives characteristic violet ppts. with  $\text{Mg}^{++}$ ,  $\text{Ag}^+$  and  $\text{Pb}^{++}$ . Ferrous salts and hyposulfites reduce resorufin and must be removed.

W. T. H.

**Universal comparison solutions and best lines for the determination of traces of elements in ore and rock minerals by emission spectral analysis.** H. Moritz. *Chem. Erde* 8, 321-38(1933).—The following mixed solns. in concns. between 1% and 0.01 to 0.0001% are recommended: (1)  $\text{Ag} + \text{Bi} + \text{Hg} + \text{Pb}$ , (2)  $\text{As} + \text{Sb} + \text{Sn}$ , (3)  $\text{Au} + \text{Bi} + \text{Ga} + \text{Ge}$ , (4)  $\text{Ba} + \text{Ca} + \text{K} + \text{Li} + \text{Mg} + \text{Na} + \text{Sr}$ , (5)  $\text{Ce} + \text{La} + \text{Nd} + \text{Pr}$ , (6) yttria, (7)  $\text{Cr} + \text{Mo} + \text{W}$ , (8)  $\text{Mn} + \text{V} + \text{Ti}$ , (9)  $\text{Ni} + \text{Co} + \text{Cu}$ , (10)  $\text{Pb} + \text{Zn} + \text{Cd} + \text{Cu}$ , (11)  $\text{Pt} + \text{Pd} + \text{Ir} + \text{Rh} + \text{Ru} + \text{Os} + \text{Au}$ . For each of the elements the best wave lengths, their sensitivities, and possible interferences are tabulated. Spectrally pure carbons are preferable to the unpurified.

P. S. Roller

**Confining liquids for gas analysis.** Alfonz Nahoczky. *Bunyász. Kohász. Lapok* 66, 332-5(1933).—The data of Passauer (*C. A.* 26, 2934) were tested and confirmed for paraffin oil and concd.  $\text{Na}_2\text{S}_2\text{O}_3$  solns.  $\text{MgCl}_2$  soln. absorbed 20.2 cc.  $\text{CO}_2$  per 100 cc. soln.

S. S. de Finály

**Micro gas analysis and its application to biological purposes in particular.** H. Schwarz and R. Rappaport. *Mikrochemie* 13, 235-73(1934).—A carefully prepd. outline with abundant bibliography.

W. T. H.

**Qualitative analysis of insoluble residues.** Arnaldo Foschini. *Ann. chim. applicata* 23, 522-7(1933).—The usual scheme of qual. analysis is outlined. The sepn. and identification of  $\text{AgBr}$  and  $\text{AgI}$  are simplified by oxidizing the  $\text{Na}_2\text{S}_2\text{O}_3$  soln. of the halides with strong  $\text{H}_2\text{O}_2$  before acidifying. In this way pptn. of S is prevented.

A. W. Contieri

**Eupitnone, as indicator.** K. Brund and Eduard Peruche. *Pharm. Zentralhalle* 75, 8-13(1934).—This condensation product of 4-hydroxy-3,5-dimethoxy-1-methylbenzene (1 mol.) with pyrogallol dimethyl ether (2 mols.) may be used in the estn. of mineral and org. acids, of picric acid, of alkali and alk. earth hydroxides as well as alkali carbonates and bicarbonates, of  $\text{NH}_3$  and certain amines. The alkali salts of eupitnone are sensitive to  $\text{CO}_2$ , unaffected, however, by its combinations with mineral acids. Eupitnone possesses no marked advantage over other indicators now in common use.

W. O. E.

**Selenium as a reduction-oxidation indicator in the determination of arsenite ions by means of potassium bromate.** László Szabellédy and Károly Schick. *Magyar Gyógyszerészud. Társaság Értesítője* 9, 449-54(1933).—The  $\text{KBrO}_3$  titration of  $\text{As}^{III}$  can be made without indicators in bright sunlight, but an indicator is necessary for working by artificial light. A colloidal red modification of Se as a reversible reduction-oxidation indicator can show the end of the reaction instead of the irreversible methyl orange. Add 5 g.  $\text{NaBr}$  to the arsenite-contg. soln.,

1 dil. to 35 cc., add 25 cc. concd.  $\text{HCl}$ , heat to 55-60° and add 1 cc.  $M$   $\text{H}_2\text{SeO}_3$ . A dark-red colloidal Se is formed in the soln., which serves as an indicator. Results obtained by this method agree well with those obtained by potentiometric titration.

S. S. de Finály

**The system mercuric cyanide-chromic thiocyanate as an indicator (by turbidity, in acid-alkali titrations).** R. Uzel. *Collection Czechoslov. Chem. Communications* 5, 457-65(1933)(in French).—The chromithiocyanate ion,  $\text{Cr}(\text{CNS})_3$  (from the system mercuric cyanide-chromic thiocyanate) is a sensitive indicator of  $\text{H}^+$ -ion concn.: at  $p_H$  lower than 4.0 a turbidity due to  $\text{Hg}_2[\text{Cr}(\text{CNS})_3]_2$  results, which disappears at greater  $p_H$ .  $\text{K}_2\text{Cr}(\text{CNS})_6$  is prepd. according to Mahr's method (*C. A.* 27, 40) from  $\text{CrCl}_3$  and  $\text{KCNS}$ , and recrystd. twice from  $\text{EtOH}$ . It must be kept dry, since it slowly decomp. in aq. and alc. solns. For the indicator to be sensitive, the  $\text{K}_2\text{Cr}(\text{CNS})_6$  should contain no excess  $\text{CNS}$ . A stock soln. is made by dissolving 6 g. pure  $\text{Hg}(\text{CN})_2$  and 1 g.  $\text{NH}_4\text{NO}_3$  (add to prevent decompn. of  $\text{Cr}(\text{CNS})_3$  by sudden rise in alkyl. during titration) in water and making to 100 g. Before titration, about 0.02 g.  $\text{K}_2\text{Cr}(\text{CNS})_6$  is dissolved in 10 cc. of stock soln. to make the indicator, 1 cc. of which is taken per 25 cc. titration soln. The violet indicator soln. can be kept about 3 days without deterioration. The new indicator may be used for the titration of strong acids and strong bases. It can be used in colored solns. and those which include compds. destructive to colored indicators, not being affected by  $\text{HNO}_3$  or small amts. of free  $\text{Cl}$  or  $\text{Br}$ . It cannot be used in the presence of iodides, thiosulfates or other than small amts. of bromides and thiocyanates, or for the detn. of cyanides, since the turbidity does not result until after the equivalence point has been reached. It can be used for the titration of chromic and phosphoric acids (as strong monobasic acids) and for the detection and detn. of small amts. of free chromic acid in bichromate solns.

Edward B. Sanigar

**Elimination of the effect of the phosphate radical in qualitative analysis.** IV. Saburo Ishimaru. *J. Chem. Soc. Japan* 54, 887-93(1933); cf. *C. A.* 27, 5679.—A review of the work of Remy (*C. A.* 14, 1795), Charmandarjan (*C. A.* 24, 1052) and T. B. Smith (*C. A.* 27, 5023). The methods are ranked in the order Smith, 6 Charmandarjan, Remy.

T. Katsurai

**Errors in determining aluminum.** Rudolf Rinne. *Chem.-Ztg.* 57, 992(1934).—In pptg.  $\text{Al}(\text{OH})_3$  with  $\text{NH}_4\text{OH}$  there should not be more than 3 g. of  $\text{NH}_4\text{Cl}$  in 100 cc. of soln. The addn. of 5 cc. of concd.  $\text{HCl}$  to the soln will furnish sufficient  $\text{NH}_3$  salt on neutralization. The soly. of the ppt. in excess  $\text{NH}_3$  is not as serious a cause for error as has been assumed. Boiling 30 sec. is sufficient to remove unnecessary excess. The ppt. dissolves with difficulty in dil.  $\text{HCl}$  and the filter is likely to clog, so that when a double pptn. is made, it is best to wash the ppt. back into the beaker before attempting to dissolve it in hot, dil. acid.

W. T. H.

**Use of photoelectric comparator in the determination of minute quantities of arsenic.** A. Sevaux. *Compt. rend. soc. biol.* 115, 377-80(1934).

L. E. Gilson

**Sensitive spot test for copper.** A. S. Komarovskil and N. S. Poluektov. *Z. anal. Chem.* 96, 23-5(1934).—Place a drop of a satd. soln. of 8-hydroxyquinoline in 80%  $\text{AcOH}$  upon filter paper. In the middle of the resulting damp spot, place a drop of the soln. to be tested. After the latter has been well absorbed by the paper, and  $\text{Cu}$  hydroxyquinolate has been pptd. in its pores, add another drop of the reagent to the middle of the spot and follow this with a drop of 25%  $\text{KCN}$  soln. If  $\text{Cu}$  is present, a raspberry-red color is produced. The test is caused by the  $\text{Cu}$  ppt. dissolving in the  $\text{KCN}$  soln. whereby  $[\text{Cu}(\text{CN})_4]^{--}$  and  $(\text{CN})_2$  are formed. The latter reacts with the reagent to form a red compd. The test is very sensitive and will detect 0.0004 mg. of  $\text{Cu}$ . If  $\text{UO}_2^{++}$  or  $\text{Fe}^{+++}$  is present, it is necessary to add an excess of  $\text{NH}_3$  to the original soln. and filter off the resulting ppt. as  $\text{UO}_2^{++}$  gives a brown spot in the test and  $\text{Fe}^{+++}$  a black one; 0.002 mg. of  $\text{Cu}$  can be detected in the presence of 400 times as much  $\text{Fe}$ .

W. T. H.

**Magneto-optic Nicol rotation method for the quantitative analysis of copper.** Edna R. Bishop, Irene G. Otto and Louis Baisden. *J. Am. Chem. Soc.* **56**, 408(1934).—The possibility of using the magneto-optic Nicol rotation method for detg. Cu is shown. No preliminary sepn. is necessary and good results are to be expected in detg. small quantities of Cu. A calibration curve must be made by the observer. W. T. H.

**Detection of copper by means of *p*-phenylenediamine.** R. J. McIlroy. *Analyst* **59**, 103(1934).—Take a few drops of the ammoniacal soln. obtained after the removal of Bi in the conventional scheme of qual. analysis, add 5 ml. of satd. KCNS soln. and 2-3 drops of a soln. of *p*-phenylenediamine in water. A black ppt. of Cu thiocyanate-phenylenediamine compd. is formed when 1 part of Cu is present in 100,000 of soln. The black compd. contains 25.08% Cu. W. T. H.

**Rapid determination of copper in bearing metals by direct precipitation in the presence of tin, antimony, lead, etc.** E. Azzarello and A. Accardo. *Ann. chim. applicata* **23**, 483-90(1933).—Weighing the Cu as Cu salicylaldehyde is advocated. A. W. Contieri

**Electrolytic determination of lead as peroxide.** M. Bertaux. *Documentation sci.* **2**, No. 13, 72-5(March, 1933); *Chimie & industrie* **30**, 1041.—The anodic deposition of PbO<sub>2</sub> from HNO<sub>3</sub> solns. is described. A. P.-C.

**Microdetermination of magnesium as the triple ferrocyanide of magnesium, calcium and hexamethylenetetramine.** L. Dehucquet and L. Velluz. *Bull. soc. chim.* **53**, 1291-2(1933). See C. A. **27**, 4189. G. G.

**Loss of magnesium in systematic qualitative analysis.** L. J. Curtin and N. Mermelstein. *Rec. trav. chim.* **53**, 34 G(1934).—In the ordinary qual. procedure, there are appreciable losses of Mg in the pptn. of the Fe-Al group and of the alk. earths. W. T. H.

**Potentiometric determination of manganese in iron castings.** A. M. Zanko and V. F. Stefanovskii. *Domes* **1933**, No. 8, 27-31.—The best conditions for detg. Mn by reduction of MnO<sub>4</sub><sup>-</sup> with Fe<sup>++</sup> in the presence of K<sub>2</sub>F<sub>2</sub> are described (cf. Miller and Wahle, C. A. **17**, 3306; **18**, 363). S. L. Madorsky

**The quantitative separation of metals by hydrogen sulfide. I. Quantitative separation of nickel and zinc by hydrogen sulfide.** Hisaji Katô. *J. Chem. Soc. Japan* **54**, 867-86(1933).—Within *p*<sub>H</sub> 2.0-3.0 ZnS can be pptd. by H<sub>2</sub>S without pptg. NiS. T. K.

**Colorimetric determination of potassium.** S. N. Rozanov and Valentina Alexandrovna Kazarinova. *Z. anal. Chem.* **96**, 26-9(1934).—The following test depends upon the formation of a ppt. of K<sub>2</sub>NaCo(NO<sub>2</sub>)<sub>6</sub> from the nitrite content of which a yellow azo dye, tropoeolin, can be formed. Take exactly 1 cc. of soln. contg. 0.025-0.1 mg. of K<sub>2</sub>O, acidulate with 1-2 drops of 3 N AcOH and treat with 1 cc. of Na<sub>2</sub>Co(NO<sub>2</sub>)<sub>6</sub> reagent in a centrifuge tube. Shake, allow to stand 4 hrs. or longer, and centrifuge 15-20 min. at 2000-3000 r. p. m. With the aid of a capillary, remove the supernatant soln. and wash the ppt. with 2-cc. portions of water and 5-6 min. rotation in the centrifuge until a perfectly clear wash liquid is obtained. Dissolve the ppt. in 5 cc. of 0.1 N NaOH, heating on the water bath, and disregard any Co(OH)<sub>2</sub> ppt. that may result. Transfer the alk. soln. to a 100-cc. measuring flask and dil. with 50-60 cc. of water. Now add 2 cc. of a mixt. of equal parts 10% HCl and sulfanilic acid + phenol reagent (1 g. sulfanilic acid dissolved in 100 cc. of hot, satd. NH<sub>4</sub>Cl soln., and mixed with 1.5 g. of phenol and 100 cc. of water), mix and allow to stand 15 min. Then make alk. with 10% NH<sub>3</sub> soln. and fill with water to the 100-cc. mark. Compare the color of 15-30 cc. of the soln. with colors produced similarly with known quantities of standard nitrite soln. Since the compn. of the ppt. does not correspond exactly to the compn. K<sub>2</sub>NaCo(NO<sub>2</sub>)<sub>6</sub>, it is important to make sure that the conditions are absolutely the same in the standardization and analysis. W. T. H.

**Detection of tungsten in minerals.** J. Versluys and H. L. J. Zermatten. *Proc. Acad. Sci. Amsterdam* **36**, 868-70(1933).—Fuse the powd. mineral in a bead of

<sup>1</sup> NaPO<sub>3</sub> in the reducing flame. Dip the hot bead in a few drops of 5 N HCl. The presence of W is indicated by a violet film over the bead and in the cracks. With Zn powder the liquid turns a deep violet. The HCl soln. of a bead with Ti turns pale violet when treated with Zn, with Mo brownish yellow, with Ch grayish blue.

A. M. Brant  
**Application of the polarographic method to the analysis of synthetic phosphorescents and a note on the estimation of palladium.** Shinichirô Hakomori and Takashi Tashiro. *J. Electrochem. Assoc. (Japan)* **2**, 15-18(1934).—A discussion showing the practical application of the polarographic method. A polarogram of [P<sub>2</sub>-(NH<sub>4</sub>)<sub>4</sub>]Cl<sub>2</sub> is given. K. Konda

**New method for the gravimetric and volumetric determination of mercury.** G. Spacu and P. Spacu. *Z. anal. Chem.* **96**, 30-4(1934).—The method depends upon the formation of HgIO<sub>3</sub>. The ppt. can be weighed as such or the excess of KIO<sub>3</sub> detd. by titration. *Gravimetric procedure.*—To the hot neutral or faintly acid soln. of HgNO<sub>3</sub> (about 50 mg. Hg in 60-80 cc.) add 0.21-28 g. of KIO<sub>3</sub>. Filter after 60-90 min., wash with water, then with 90% alc. and finally with ether, dry in a vacuum and weigh. *Volumetric procedure.*—To the filtrate from the well-washed HgIO<sub>3</sub> ppt. add 0.5-1 g. of KI, 0.5 cc. of 2 N HCl or H<sub>2</sub>SO<sub>4</sub> and some starch indicator soln. <sup>4</sup> Titrate the liberated I<sub>2</sub> with 0.1 N Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>. The results were accurate to within 0.1 mg. The soly. product of HgIO<sub>3</sub> was found to be about 3.4 × 10<sup>-13</sup> at 15.5°.

W. T. H.  
**Determination of chloride in potassium iodide.** V. M. Peshkova and E. S. Przhivalskii. *J. Gen. Chem. (U. S. S. R.)* **3**, 519-23(1933).—Berg's method for detg. small amts. of Cl in KI soln. is inaccurate. The following modification gives better results: Dissolve 1 g. of KI in 50 cc. of H<sub>2</sub>O and 5 cc. of H<sub>2</sub>SO<sub>4</sub> (d. 1.1), add 4 cc. of 5% KMnO<sub>4</sub> soln. and shake vigorously. Add 5-6 drops of 30% H<sub>2</sub>O<sub>2</sub> and again shake well. Make up to 60 cc., filter and use half of the filtrate. Ext. the free I<sub>2</sub> in a sepg. funnel with benzene. Transfer the colorless aq. soln. to a 150 cc. Erlenmeyer flask, dil. to 100 cc. and titrate with 0.1 N AgNO<sub>3</sub> soln. S. L. Madorsky

**Determination of molybdenum and lead by Fajans' method.** Tz. Raikhiinshteyn and N. N. Korobov. *J. Gen. Chem. (U. S. S. R.)* **3**, 531-3(1933); cf. C. A. **27**, 2396.—A comparison between the methods of Fajans, Wiley, Sacher, Chindler and Alexander and Wiley, Ambrose and Bowers, for the detn. of Mo and Pb, showed that Fajans' method is the most rapid and accurate.

S. L. Madorsky  
**Use of aqueous ammonia as a reagent for chlorine and bromine in the presence of iodine.** M. P. Babkin. *J. Gen. Chem. (U. S. S. R.)* **3**, 134-6(1933); *Chimie & industrie* **30**, 1046.—The old method of distinguishing between AgCl, AgBr and AgI by their varying soly. is explained. A. Papineau-Couture

**New colorimetric method for determining nitrogen.** Richard v. der Heid, Jr. *Z. anal. Chem.* **96**, 7-16(1934).—The method is based upon the well-known procedure of Kjeldahl with Hg as a catalyst. The Hg, however, is not introduced as such but in the form of HgSO<sub>4</sub> soln. After the digestion, Nessler soln. is produced in the soln. by careful neutralization and addn. of KI soln. equiv. to the Hg present. The necessary solns. are: (1) A clear filtered soln. of 14.8 g. HgSO<sub>4</sub> in warm 10% H<sub>2</sub>SO<sub>4</sub> diluted with water to 100 cc. (2) A filtered soln. of 33.2 g. KI in 100 cc. (3) Conc'd. HCl. (4) 0.2 g. of diamond fuchsin in 100 cc. of distd. water. (5) NaOH free from NH<sub>3</sub> of d. 1.35. (6) Gum arabic soln. prep'd. by heating 250 g. of the gum with 750 cc. of water on the water bath, with frequent shaking, until all the gum has dissolved; to the soln. add bone char and filter through a Seitz pressure filter. If this filter is not available, prep. a 12.5% soln. of gum arabic and filter through fritted glass. (7) Dissolve 4.177 g. of pure (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> in 1 l. of water to which a little dil. H<sub>2</sub>SO<sub>4</sub> has been added to prevent the formation of mold. *Procedure.*—Take sufficient material to yield 2-7 mg. of N. Weigh into a dry Kjeldahl flask which is

marked in the neck to indicate 250 cc., add 2 cc. of the 1%  $\text{H}_2\text{SO}_4$  soln. followed by 10 cc. of pure, concd.  $\text{H}_2\text{SO}_4$ . Digest with a small flame till the liquid is clear and then 10-15 min. longer. Cool, carefully add 100 cc. of distd. water, cool again, add 5 cc. of concd.  $\text{HCl}$ , shake well and add 0.2 cc. of the fuchsin soln. To accomplish the neutralization, place a funnel in the neck of the flask with its stem reaching to the bottom of the flask, add the  $\text{NaOH}$  so that it reaches the bottom of the liquid. About 10 cc. of the base will be required. First add about 30 cc., shake carefully, cool and complete the neutralization at  $15^\circ$ . To the cold, neutralized soln. add 10 cc. of 25% gum arabic soln. and mix well. In a small flask, mix 2 cc. of the  $\text{KI}$  soln. with about 15 cc. of  $\text{NaOH}$  and introduce this mixt. all at once into the Kjeldahl flask, rotating the contents well. Fill to the mark, mix and measure the color after 30 min. Each day prep. a soln. contg. 5 mg. of N in the same vol. for the colorimetric comparison.

W. T. H.

**Investigation of semimicro Kjeldahl methods.** J. A. Scarrow and C. F. H. Allen. *Can. J. Research* 10, 73-6 (1934).—Several methods of preliminary reduction, recommended for certain types of compds., were found difficult to adapt to semimicro work. A method of reduction, involving the use of  $\text{HI}$  and  $\text{P}$ , was developed for many such compds.

J. W. Shipley

**Nephelometry. II. Determination of phosphorus in steels and arsenic in arsenical copper.** Luigi Belladen, Ugo Scazzola and Renato Scazzola. *Ann. chim. applicata* 23, 517-21 (1933); cf. *C. A.* 28, 2083<sup>2</sup>.— $\text{P}$  in steel is detd. according to Kober and Egerer (*C. A.* 9, 2855) with a strychnine-molybdic acid precipitant, best prepd. as follows: Dissolve 6 g. of  $\text{Na}_2\text{CO}_3$  in 140 cc. of  $\text{H}_2\text{O}$ , gradually add 19 g. of  $\text{MoO}_3$  and heat till dissolved. Then add 50 cc. of concd.  $\text{HCl}$  and 20 cc. of 2% strychnine sulfate soln. This reagent remains stable for a long time. Det. As in alloys by the method of Kleiman and Pangritz (*C. A.* 22, 1743), but use the strychnine-molybdic acid reagent instead of the cocaine deriv.

A. W. Contieri

**Improvements on Winkler's method for determining oxygen in sea water.** Zinziro Nakai. *Bull. Fishery Expt. Sta. Gov.-Gen. Chosen.*, Ser. D, No. 3, 25-42 (1933).

The chief improvements are the use of 100-cc. samples obtained by dissolving  $\text{Mn}(\text{OH})_2$  ppt. by  $\text{HCl}$ , the use of reagents of standard strength and vol. for standardizing  $\text{Na}_2\text{S}_2\text{O}_3$  soln. and the use of a table for conversion of titrated values to O values. A comparison of different methods of standardizing  $\text{Na}_2\text{S}_2\text{O}_3$  soln., showed that Volhard's method gave a variation of 4-7%, while those of Winkler-Bjerrum, Krogh or of N. gave only 0.4% variation. Some experiments on Winkler's method for determining oxygen in sea water. *Ibid.* 43-8.—A few helpful suggestions are given. Method of determining oxygen in sea water adopted in our station. *Ibid.* 49-62. A detailed description of the method.

Nao Uyey

**Phenanthroline-ferrous ion. III. A silver reductor.** The direct determination of iron in the presence of vanadium. Geo. H. Walden, Jr., Louis P. Hammett and Sylvan M. Edmonds. *J. Am. Chem. Soc.* 56, 350 3 (1934); cf. *C. A.* 28, 1302<sup>8</sup>.— $\text{Ag}$  in  $M$   $\text{HCl}$  produces  $\text{Fe}^{++}$  and  $\text{V}^{++}$  without reducing  $\text{Ti}^{+++}$ . The  $\text{Fe}^{++}$  can then be titrated in 5  $M$   $\text{H}_2\text{SO}_4$  with  $\text{Ce}(\text{SO}_4)_2$  soln., phenanthroline-ferrous ion being used as indicator.

L. P. H.

**Titration of 30% hydrogen peroxide.** M. Travers. *Mém. comm. corrosion aéro.* 1930-31, 225 6; *Chimie & industrie* 30, 791-2.—A detailed description of the technique of its titration by the  $\text{KMnO}_4$  method.

A. P.-C.

**Properties of the chlorides of sulfur. VI. Chemical analysis.** A. Herbert Spong. *J. Chem. Soc.* 1933, 1547 51; cf. *C. A.* 25, 2615.—An iodometric method for total Cl in mixts. contg.  $\text{S}_2\text{Cl}_2$  is described which is fairly accurate. Free Cl is removed by  $\beta$ -naphthyl ethyl ether. The following disoccn. occurs:  $2\text{SCl}_2 \rightleftharpoons \text{S}_2\text{Cl}_2 + \text{Cl}_2$ . However,  $\text{S}_2\text{Cl}_2$  is itself disoccd. possibly as follows:  $3\text{S}_2\text{Cl}_2 \rightleftharpoons \text{S}_3\text{Cl}_2 + \text{S}_2\text{Cl}_2$ .

M. McMahon

**Detection of nitrate, nitrite and nitrosylsulfuric acid by the formation of resorufin, orcinol and indophenols.** Hermann Richler. *Z. anal. Chem.* 96, 17-21 (1934).—

By treating a nitrate or nitrite with concd.  $\text{H}_2\text{SO}_4$ , nitrosylsulfuric acid is formed which gives strongly colored compds. with phenols such as resorcinol, phenol or thymol. To a small quantity of the nitrate or nitrite, add 1-2 cc. of a soln. of 0.5-0.6 g. resorcinol in 100 g. of  $\text{H}_2\text{SO}_4$  which is free from nitrosylsulfuric acid, and then, when any effervescence is over, heat till a violet coloration results or  $\text{SO}_2$  vapors are involved. Cool, dil. with 5-10 cc. of water and neutralize with  $\text{Na}_2\text{CO}_3$ . Instead of the resorcinol, 0.4-0.5 g. of orcinol can be used and a red coloration will result.  $\text{Fe}^{+++}$ , sulfides and oxidizing agents interfere with the test. In such cases it is best first to heat for some time with concd.  $\text{H}_2\text{SO}_4$ , add solid resorcinol to the cold acid until a blue coloration is produced and then heat until the violet color results. In some cases, the oxidizer can be removed by pptg. with  $\text{Pb}(\text{OAc})_2$  soln. To detect nitrate in the presence of nitrite, make the  $\text{pH}$  about 3, evap. to dryness (with  $\text{NH}_4\text{Cl}$  if necessary) and test the residue as above. The test may also be used to detect nitrosylsulfuric acid in com.  $\text{H}_2\text{SO}_4$ . 0.02 mg. of  $\text{NaNO}_2$  gives the test.

W. T. H.

**Rapid method for the accurate determination of minute quantities of nitrite.** G. Gopala Rao and K. Madhusudan Pandalai. *Analyst* 59, 99 100 (1934). Place 20 ml. of the nitrite soln. in a 250-ml. flask contg. about 4 g. of  $\text{NaHCO}_3$ , 5 ml. of 10%  $\text{KI}$  soln. and a little starch soln. Pass pure  $\text{CO}_2$  through the reaction mixt. to remove all dissolved O and to free the flask from O. Then, after about 10 min., add 10 ml. of 5 N O-free  $\text{H}_2\text{SO}_4$  and titrate the liberated I with freshly prepd. 0.002 N  $\text{Na}_2\text{S}_2\text{O}_3$  soln.

W. T. H.

**A simple microincineration method and determination of calcium in organs.** József Erdős. *Magyar Gyógyszerésztud. Társaság Értesítője* 9, 391-6 (1933).—The use of fuming  $\text{HNO}_3$ , satd.  $\text{NH}_4\text{NO}_3$  and 30%  $\text{H}_2\text{O}_2$  is advocated for destroying the org. matter in 0.2-0.3 g. of organ pulp or 40-80 mg. of dry material. The indirect detn. of Ca as oxalate by titration with  $\text{KMnO}_4$  or by adding an excess of the latter and detg. the excess iodometrically is explained.

S. S. de Finály

**Determination of antimony in viscera and excreta.** Frank Bamford. *Analyst* 59, 101-2 (1934).—To the finely cut material in a  $\text{SiO}_2$  dish, add sufficient  $\text{MgO}$  to make the reaction basic. Cover with a satd. soln. of  $\text{Mg}(\text{NO}_3)_2$  (35-40 ml. for 100 g. of sample). Heat on the sand bath until the stirred mass is well charred and has begun to whiten. Crush with a pestle and heat until perfectly white. If necessary mix the ash with  $\text{NH}_4\text{NO}_3$  and heat again. Moisten the cold ash with water and add sufficient  $\text{HCl}$  to dissolve the  $\text{MgO}$  and give a distinctly acid reaction. Dil. with water and sat. with  $\text{H}_2\text{S}$ . Filter, wash as usual and dissolve the  $\text{Sb}_2\text{S}_3$  ppt. in concd.  $\text{HCl}$ . Dil. with water and filter again if necessary. Add 1 ml. of 5% gum arabic soln. to each 100 ml. of soln. and make up to a definite vol. Pass  $\text{H}_2\text{S}$  through the soln. and compare the orange color in a Duboscq colorimeter with that of a standard  $\text{Sb}$  soln. of approx. the same concn.

W. T. H.

**General method for determining sulfur in organic materials.** Ernest Kahane and Marcelle Kahane. *Compt. rend.* 198, 372-5 (1934).—The method depends upon oxidizing the S to sulfate by means of  $\text{HClO}_4$ ,  $\text{HNO}_3$  and a little  $\text{HIO}_3$ . Thus for 0.1-0.2 g. of material 2 cc. of a mixt. of 2 parts  $\text{HClO}_4$  (d. 1.61) and 1 part  $\text{HNO}_3$  (d. 1.35) was used. A long-necked Kjeldahl flask is recommended for the digestion. In the top of the flask there is provided a ground-glass connection with a bubble tube contg.  $\text{HIO}_3$ . During the digestion, the bubble tube rests in a bath of cold water. The  $\text{HIO}_3$  serves to absorb and oxidize any volatile S compd. such as  $\text{H}_2\text{S}$  that might otherwise be lost. After the oxidation has been accomplished, the bubble tube is rotated  $180^\circ$  and its contents is thereby caused to flow into the flask. The mixt. in the flask is then heated until fumes of  $\text{HClO}_4$  are evolved,  $\text{HIO}_3$  is then reduced by  $\text{NaI}$ , hydrazine or formalin, most of the acid is neutralized with soda and the sulfate is pptd. by adding  $\text{Ba}^{++}$ . The method is said to give good results with such diverse substances as  $\text{ZnS}$ , free S,  $\text{Na}_2\text{S}_2\text{O}_3$ ,

$\text{NH}_4\text{CNS}$ , sulfanilic acid, camphorsulfonic acid, saccharin, thiourea, allylthiourea, *p*-tolyl sulfide, triphenylphosphine sulfide, cysteine, sulfonal, triethylthionium chlorides, tritylthionium chloride and rubber. W. T. H.

**Modified micro method of determining methoxyl and ethoxyl groups.** Homi Ruttonji Nanji. *Analyst* 59, 96-8 (1934).—The method, for which a specially designed app. is shown, depends in the first place upon the formation of alkyl iodide by heating the allyloxyl compd. with HI. The alkyl iodide is then treated with Br water, whereby  $\text{HIO}_3$  is formed. The excess Br is removed by means of phenol, the iodate is caused to react with KI soln. and the liberated I is titrated with 0.01 N  $\text{Na}_2\text{S}_2\text{O}_3$  soln. The procedure was tested with vanillin, grape fruit pectin, com. citrus pectin and hydrated quinine and found to give good results. W. T. H.

**Determination of the methoxy groups in pectin.** Giovanni Romeo. *Ann. chim. applicata* 23, 530-4 (1933).—The MeO content of pectin may be detd. rapidly as follows: Dissolve 1.0 g. of pectin in 250 cc. water; heat to hasten soln. Replace  $\text{H}_2\text{O}$  lost by evapn., cool to  $20^\circ$ , neutralize with 0.5 N NaOH with phenolphthalein as indicator. Add 20 cc. 0.5 N NaOH, stir, let stand 15 min. Then add 20 cc. 0.5 N  $\text{H}_2\text{SO}_4$  and titrate excess acid with NaOH. 1 cc. 0.5 N NaOH corresponds to 0.0155 g. MeO. The results agree very well with those obtained by the Zeisel method. A. W. Contieri

**Detection of nitrobenzene and of phenol by the formation of resorufin.** Hermann Eichler. *Z. anal. Chem.* 96, 21-2 (1934).—Heat a little of the substance with resorcinol and  $\text{H}_2\text{SO}_4$  to a violet coloration or until  $\text{SO}_2$  fumes are evolved. Cool, dil. with water and neutralize with  $\text{Na}_2\text{CO}_3$ . Phenol, when heated with nitrobenzene in concd.  $\text{H}_2\text{SO}_4$ , also yields resorufin. W. T. H.

**Reactions of certain phenols with antimony pentachloride.** Lad. Ekkert. *Pharm. Zentralhalle* 75, 49-50 (1934).—The essential colors developing on the addn. of a  $\text{CHCl}_3$  soln. of  $\text{SbCl}_5$  are: with PhOH, orange red; *o*-cresol, rusty brown; *m*-cresol, orange red; *p*-cresol, red brown; thymol, brownish yellow to rusty brown; carvacrol, brown red to garnet red; guaiacol, light brown to olive brown, deep green, blue green and finally deep blue; creosote, garnet to deep wine red; creosotal-Heyden, yellowish to brownish flesh color; guaiacol carbonate, lemon to S-yellow; K sulfoguaiacolate, no color; pyrocatechol, deep blue; resorcinol, orange to yellow brown; hydroquinone, faint yellow; orcinol, brownish yellow to rusty brown; pyrogallol, carmine red to deep garnet; phloroglucinol, no color;  $\alpha$ -naphthol, carmine red to deep red, reddish brown and almost black;  $\beta$ -naphthol, brownish red; morphine, brownish red; apomorphine, wine to ruby red. W. O. E.

**Reactions of certain phenols with alkali arsenate in concentrated sulfuric acid.** Lad. Ekkert. *Pharm. Zentralhalle* 75, 50-1 (1934).—The reagent K or Na arsenate in concd.  $\text{H}_2\text{SO}_4$  gives with PhOH no change but on heating, brown; *o*-cresol, bright rose to flesh color and gray, on heating liver red to brown; *m*-cresol and *p*-cresol same as *o*-cresol; thymol, scarlet to deep rose red and violet; carvacrol, red to rusty brown; guaiacol, greenish blue to blue, on warming deep green; creosote, deep olive green, on warming garnet brown; pyrocatechol, deep blue; resorcinol, bright yellow to brown; hydroquinone, rose to flesh color, olive brown and deep green on heating; orcinol, pale yellow, on warming yellow to bright brown; pyrogallol, golden yellow; phloroglucinol, lemon yellow to deep green;  $\alpha$ -naphthol, grass green fading with heat, deep green on cooling;  $\beta$ -naphthol, saffron to dichromate yellow, after 10-15 min. liver color; morphine, blue to violet or green; apomorphine, codeine and Et morphine, dark blue. W. O. E.

**Detection and estimation of methyl mercaptan and carbon disulfide in air containing hydrogen sulfide.** J. F. Reith. *Rec. trav. chim.* 53, 18-23 (1934) (in English).—In studying the gas drawn from the spinning rooms of a rayon factory, a study was made of methods for detg.

1  $\text{CH}_3\text{SH}$  and  $\text{CS}_2$  in air contg.  $\text{H}_2\text{S}$ . It was found necessary first to carry out a sepn. by means of solid  $\text{Pb}(\text{OAc})_2$ . The gas is drawn through a series of 4 wash bottles. The first 2 are Jena wash bottles with glass filter No. 83 G. 1 and contain 20 cc. of 0.5 N NaOH. The next 2 are very small with gas dispersers and each contains 2 cc. of NaOH in EtOH. After the absorption, unite the contents of the first 2 wash bottles, add 4 cc. of 25% HCl and connect to the app. for detecting mercaptan. This consists of 2 tubes (20 X 9 cm.) connected with a ground joint. The first contains  $\text{CaCl}_2$  and the second contains fine  $\text{Pb}(\text{OAc})_2$  (about 20 g.). This second tube is connected with a small wash bottle contg. 1 cc. of isatin- $\text{H}_2\text{SO}_4$  (10 mg. in 100 cc.  $\text{H}_2\text{SO}_4$  prepd. fresh every day). Draw air slowly through the app. for 30 min. The  $\text{H}_2\text{S}$  is absorbed by the Pb salt and the mercaptan colors the isatin reagent a grass green. If desired the quantity of mercaptan can be estd. colorimetrically (0.005-0.1 mg. with an accuracy of about 0.01 mg.). Pour the contents of wash bottles 3 and 4 of the first app. into a beaker and rinse them out with 2.5 cc. of 4 N AcOH, then with 10 cc. of  $\text{Cu}(\text{OAc})_2$  soln. (0.92 mg. in 250 cc. of soln.). After at least 2 hrs. filter off the cuprous xanthogenate ppt. in a 3 G 4 glass filtering crucible and wash with not over 25 cc. of water. The formation of the yellow ppt. is proof of the presence of  $\text{CS}_2$ . The quantity present can be calcd. by detg. its Cu content iodometrically as follows: Place the crucible contg. the ppt. on a 25-cc. fractionating flask, add 0.5 cc. of 4 N AcOH and 4 drops of fresh satd. aq.  $\text{Br}_2$  to the ppt. and cover with a watch glass. After 5 min. connect with suction, add 4 drops more of aq.  $\text{Br}_2$  and filter after 5 min. This serves to dissolve the yellow ppt. Wash the filter till the total vol. of filtrate is 10 cc. and mix with 0.5 cc. of 5% phenol soln. to remove excess  $\text{Br}_2$ . After 5 min. add 2.5 cc. of N KI and titrate the liberated  $\text{I}_2$  with 0.01 N  $\text{Na}_2\text{S}_2\text{O}_3$ , of which 1 cc. = 1.52 mg. of  $\text{CS}_2$ . W. T. H.

**Determination of tyrosine by bromination.** Michele Bonicatti. *Boll. ufficiale staz. sper. seta* 3, 66-9 (1933).—The method of Millar (cf. Brown and M., *J. Chem. Soc.* 89, 145 (1906)) is modified as follows: To the acidified (HCl) soln. contg. tyrosine add 5 cc. of 20% NaBr soln. and 0.1 N  $\text{NaBrO}_3$  soln. until a distinct yellow color is reached. Let stand 2 hrs., add an excess of KI, and titrate the liberated  $\text{I}_2$  with  $\text{Na}_2\text{S}_2\text{O}_3$ . The reaction is disturbed by the presence of tryptophan and phenylglycine. G. A. Bravo

**Titrimetric determination of hydroxylamine salts.** László Urbanek. *Mezőgazdasági Kutatások* 6, 334-7 (1933).—Dissolve 0.1-2 g. salt in water, add 1-2 cc. neutral acetone and titrate with 0.05 N NaOH with methyl red as indicator. S. S. de Finály

**Detection of Pb (Harwood, Brophy) 11B. Reaction for Be in minerals and rocks (Zermatten) 8. Rotatory dispersion of sparteine in aq. soln. [detn. of sparteine] (Lapp, Zalc) 10.**

## 8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIKER

**Photophosphorescence in minerals.** W. L. Brown. *Univ. Toronto Studies, Geol. Ser. No. 35*, 19-35 (1933).—Luminescent properties were tested by exposure to sunlight, ultra-violet and infra-red (heat) radiations. Fluorescence under ultra-violet and photophosphorescence from sunlight proved to be sep. phenomena. Photophosphorescence reached a max. at definite exposure times, and the greater the percentage of longer wave lengths the shorter the time. The relative intensity of phosphorescence in fluorite is dependent on distribution of spectral energy but is modified by selective absorption. The wide range of wave lengths producing photophosphorescent activity and the continuity of photophosphorescence and thermoluminescence are indicated. The fluorescent colors of a no. of minerals are listed. A. M. Brant

**A reaction for beryllium in minerals and rocks.** H. L. J. Zermatten. *Proc. Acad. Sci. Amsterdam* 36, 899-900 (1933).—The powd. mineral is fused in a bead of NaKCO<sub>3</sub> which is then powdered in a black drop-plate. It is dissolved in 3 drops 5 N HCl, and 1 drop of satd. MeOH soln. of morin (C<sub>18</sub>H<sub>10</sub>O<sub>7</sub>·2H<sub>2</sub>O) is added. Four drops of 5 N NaOH produce a clear yellow-green fluorescence if Be is present. On a white background the color is chromate yellow. The color disappears when the soln. is slightly acidified with 5 N HCl or 30% AcOH, or changes to a blue-green fluorescence indicating Al, Mg, Li, Ca, Sr, Ba, Ti, Zr, La, Dy, Ce, Y and Th react neg. to the above test for Be. A. M. Brant

**Structure of hessite.** László Tokody. *Matematik. Természettud. Értesítő* 49, 325-34 (1932).—A hessite from Transylvania contained: Ag 59.41, Au 4.73, Te 35.97, Fe trace, sum 100.11%. Two modifications were observed, the monoclinic stable state becoming cubic at 150°. Its structure shows the monoclinic symmetry. S. S. de Finály

**Colusite, a new mineral of the sphalerite group.** Robert E. Landon and A. H. Mogilnor. *Am. Mineral.* 18, 328-33 (1933).—Colusite occurs in Cu veins at Butte, Montana, assocd. with pyrite, tetrahedrite, bornite, chalcocite and quartz. It is a sulfide in which Cu, Fe, Sn, Mo and Zn are isomorphous, and As, Te and Sb are isomorphous with S. Colusite has a bronzy color; hardness = 3 to 4; sp. gr. = 4.2. Av. compn. is: Sn 6.64, Cu 35.82, Sb 0.58, As 2.50, Zn 0.90, Te 2.97, Mo 8.80, Fe 18.37, S 24.20, Cr and W trace, Mn none, sum 100.78%. The closely assocd. tetrahedrite and colusite have a texture which is the result of unmixing. A. M. Brant

**X-ray examination of colusite (Cu,Fe,Mo,Sn)<sub>4</sub>(S,As,Te)<sub>3</sub>.** W. H. Zachariassen. *Am. Mineral.* 18, 534-7 (1933).—X-ray examn. shows that colusite is cubic with the edge of the unit cube 5.304 ± 0.001 Å. The at. arrangement is essentially that of sphalerite with about a fourth of the S atoms removed at random. A. M. Brant

**Vein-like masses of pyrrhotite in chalcopyrite from the Waite-Ackerman-Montgomery mine, Quebec.** John S. Stevenson. *Am. Mineral.* 18, 445-9 (1933); cf. *C. A.* 26, 5879. —Narrow hair-like areas of pyrrhotite have the appearance of veins, but are simple crystals and occur only between chalcopyrite crystals, so they must have formed by unmixing. A. M. Brant

**Opal deposits in the southern part of Hargita.** János Rúnyai. *Matematik. Természettud. Értesítő* 49, 196-201 (German 202-3) (1932).—These deposits are explained by rhythmical diffusion deposition. S. S. de Finály

**Coronadite "redivivus."** Waldemar Lindgren. *Am. Mineral.* 18, 548-50 (1933); cf. *C. A.* 26, 5878. —New data on this mineral from a find in Morocco indicate the formula 2MnO<sub>2</sub>·PbO. In polished section it is galena-white in color and shows a granular to fibrous structure. The reflectivity is high. It is strongly anisotropic with dark brown to gray colors. Comparative analyses of Arizona and Morocco material are given. A. M. Brant

**Tilleyite, a new mineral from the contact zone at Crestmore, California.** Esper S. Larsen and Kingsley C.

Dunham. *Am. Mineral.* 18, 460-73 (1933).—Tilleyite is closely assocd. with wollastonite in metamorphosed limestone. Its compn. is: SiO<sub>2</sub> 24.09, Al<sub>2</sub>O<sub>3</sub> 0.61, Fe<sub>2</sub>O<sub>3</sub> 0.12, MgO 0.43, CaO 57.75, H<sub>2</sub>O 1.09, CO<sub>2</sub> 15.82, sum 99.91%. The suggested formula is 3CaO·SiO<sub>2</sub>·CO<sub>2</sub>. Tilleyite is biaxial + with α = 1.617, β = 1.635, γ = 1.652; 2V large; monoclinic with Y = b and XAc = 18°; cleavage (100); sp. gr. = 2.838. A. M. Brant

**A chemical and optical study of piedmontite from Shadow Lake, Madera County, California.** Allan M. Short. *Am. Mineral.* 18, 493-500 (1933).—The compn., recalcd. to allow for quartz impurity, is: SiO<sub>2</sub> 35.26, Al<sub>2</sub>O<sub>3</sub> 23.50, Fe<sub>2</sub>O<sub>3</sub> 4.65, MgO 0.21, CaO 22.73, H<sub>2</sub>O 1.37, TiO<sub>2</sub> 0.12, Mn<sub>2</sub>O<sub>3</sub> 12.13, sum 99.97%. A graph of published analyses indicates that the sesquioxides of Al, Fe and Mn mutually replace each other and that MnO and MgO probably replace CaO, the formula H(Ca,Mn,Mg)<sub>2</sub>(Al,Mn,Fe)<sub>2</sub>·Si<sub>2</sub>O<sub>3</sub> best representing these relations. The Madera County piedmontite has the pleochroism X = lemon yellow to orange, Y = amethystine red, Z = carmine. α = 1.7385, β = 1.7649, γ = 1.7985; 2V 64° to 75°. Recorded optical data in relation to Mn<sub>2</sub>O<sub>3</sub> content are shown graphically. A. M. Brant

**Paulopost stilbite in the Camas Land sill, Chelan County, Washington.** Walter M. Chappell. *Am. Mineral.* 18, 440-4 (1933).—The stilbite occurs in quartz-bearing gabbro and diabase, interstitially and also penetrating plagioclase. Residual liquids are thought to have caused a re-soln. of the plagioclase, with crystn. of stilbite and quartz. It is optically — with α = 1.487, β = 1.498, γ = 1.500; 2V = 48°; XAc = 7°. A. M. Brant

**A large monazite crystal from North Carolina.** Waldemar T. Schaller. *Am. Mineral.* 18, 435-9 (1933).—The crystal measures 0.5 × 9.5 × 11 in. and weighs 58.75 lb. Crystallographic features are described. Monazite from this locality contains 5-7% ThO<sub>2</sub>. A. M. Brant

**A study of some Canadian apatites.** A. S. Dadson. *Univ. Toronto Studies, Geol. Ser. No. 35*, 51-9 (1933).—Chem. analyses are given for 5 specimens from various localities, 2 terminated with pyramid and base, 3 with pyramid only. These agree fairly well with the usual formula and show no reason for the difference in crystal habit. Numerous inclusions are present. ε = 1.628-1.637, ω = 1.634-1.642, the highest values in a crystal with high Cl content. A. M. Brant

**Ammonioborite, a new mineral.** Waldemar T. Schaller. *Am. Mineral.* 18, 480-92 (1933).—The mineral is from Larderello, Italy. It is granular, white and lustrous, and is closely assocd. with sassolite. Optical and x-ray data indicate differences from larderellite, but the chem. compn. is similar, so that they seem to be dimorphous forms of (NH<sub>4</sub>)<sub>2</sub>O·5B<sub>2</sub>O<sub>3</sub>·5H<sub>2</sub>O. Ammonioborite crystals are platy, with α = 1.470, β = 1.487, γ = 1.540. A. M. Brant

**Stability relations of a Colorado planite (cuprian melanterite).** Edwin B. Eckel. *Am. Mineral.* 18, 449-54 (1933).—The mineral showed α = 1.473, β = 1.478, γ = 1.483. Its compn. is approx. 2[FeSO<sub>4</sub>·7H<sub>2</sub>O]·[(Cu,Zn)SO<sub>4</sub>·7H<sub>2</sub>O]. Over H<sub>2</sub>SO<sub>4</sub> solns. of known humidity at 22°, the 7H<sub>2</sub>O compd. was found to be stable in relative humidities from about 80 to 44%. 2H<sub>2</sub>O mols. were lost at 30%, and the 5H<sub>2</sub>O compd. was stable down to about 5% relative humidity. Near zero humidity 4H<sub>2</sub>O were lost to form the monohydrate. A. M. Brant

**Artificial jarosites—the separation of potassium from cesium.** J. G. Fairchild. *Am. Mineral.* 18, 543-7 (1933).—Artificial jarosites of K, Rb, Ag and Pb were prepd. by heating the resp. sulfate solns. with a soln. of Fe<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> in sealed glass tubes at 110-80°. At steam-bath temp. it was found that Rb and Cs were taken up by the K jarosite mol. in but small amt. Chem. and optical data are given for the artificial jarosites. A. M. Brant

**Sulfosalite and other minerals from the Otjwalundo Salt Pan, South West Africa.** Wm. F. Foshag. *Am.*

- Mineral.* 18, 431-4 (1933).—Sulfohalite, pirssonite, trona and thenardite are described. Chem. analysis of sulfohalite checked the theoretical values for the formula  $2\text{Na}_2\text{SO}_4 \cdot \text{NaCl} \cdot \text{NaF}$ . The mineral is isotropic and has dodecahedral habit;  $n = 1.455$ . A. M. Brant
- Tungstite.** T. L. Walker. *Univ. Toronto Studies, Geol. Ser.* No. 35, 13 11 (1933).—Microscopic examn. indicated one good cleavage with  $Bx_a$  normal to it and  $2E$  about  $26^\circ$ . The mineral appears to be orthorhombic. W. suggests making the cleavage (001) with  $Y = a$  and  $X = c$ . A. M. Brant
- Manganese deposit, Bombay.** H. E. Pyfe. *New Zealand J. Sci. Tech.* 15, 203-7 (1933).—The ore is a dense amorphous psilomelane ( $\text{H}_2\text{MnO}_4$ ) in which there are bands suggesting hausmannite ( $\text{Mn}_3\text{O}_4$ ). Analysis gave 78.72%  $\text{MnO}_2$  and 5.17%  $\text{MnO}$ . P. S. Roller
- The manganese minerals of the Sunnyside veins, Eureka Gulch, Colorado.** W. S. Burbank. *Am. Mineral.* 18, 513-27 (1933).—The Mn minerals were deposited during the third stage of a mineralization which is tentatively classed as mesothermal. Rhodonite predominates and has assocd. alabandite, alleghanyite, friedelite, helvite, rhodochrosite and tephroite in varied amt. The optical properties are included in the descriptions of the minerals. A. M. Brant
- The genesis of the Sanntal bauxites (Jugo-Slavia).** Emil Dittler and Othmar Kühn. *Chem. Erde* 8, 462-95 (1933).—The geology and mineralogy of the rock formations are described. The origin of the bauxite is in the weathering of andesite which had previously been altered by postvolcanic action. Unaltered, much younger Miocene andesite remained intact. A secondary mode of formation is in the deposition from solns. of Triassic limestone in contact with Al and Fe-bearing solns. derived from the andesite. The  $\text{Al}_2\text{O}_3$  is present mainly as the monohydrate, and its content varies from 59.34 to 74.43% dry basis. P. S. Roller
- The bauxite occurrence at Sümeg.** Tihamér Gedeon. *Földtani Közlöny* 63, 96 7 (1933).—Twenty-two analyses are published with a theoretical discussion. S. S. de Finály

- Development of the industry of gold mining in Roumania.** Ch. Berthelot. *Génie civil* 103, 373-7 (1933). The limit of max. Au content is 8 g. of Au per ton. Amalgamation, cyanidation and flotation methods are used, but 65.4% of the Au is produced by amalgamation. Ann Nicholson Hird
- Oxidation of iron pyrites in a sand residue dump.** Jas. Gray. *S. African J. Sci.* 30, 196 7 (1933).—The Witwatersrand Au ore contains about 3% pyrites. Upon oxidation, various products were formed within old dumps. Analyses were made upon the following materials originating from 30-year old dump: (1) liquid draining from the base of the dump, (2) deposit of crystals on a river beach close by, (3) greenish deposit and (4) white deposit at the base of the dump. Sample (1) contained  $\text{SO}_2$  1412,  $\text{Al}_2\text{O}_3$  254,  $\text{Fe}_2\text{O}_3$  122,  $\text{FeO}$  568 parts 100,000. Sample (2) contained  $\text{SiO}_2$  and insol. 6.6%,  $\text{FeO}$  20.6,  $\text{SO}_2$  27.7 and 34% moisture. Sample (3) contained moisture 20.7.

SiO<sub>2</sub> and insol. 32.6, FeO 11.1 and SO<sub>2</sub> 21.7%. The whitish deposit contained moisture 11.8, SiO<sub>2</sub> and insol. 40.0, Fe<sub>2</sub>O<sub>3</sub> 7.5, FeO 5.6 and SO<sub>2</sub> 22.1%. H. E. M.

**Arsenic production of the Boliden Works.** A. G. Paul Palen. *Industriidningen Norden* 62, 2-5 and 15-17 (1934).—An illustrated review. At the present working rate the smelting and refining works of the Boliden mines in the North of Sweden produce 40-50,000 metric tons of As<sub>2</sub>O<sub>3</sub> a year. The only problem is to find new uses for this product. The ore has an av. analysis of 20 g. Au and 60 g. Ag per ton, and 1.8% Cu, 29% S, and 9.1% As; about 1000 tons of this ore are worked per day.

**Ferro-alloys in steel making.** C. H. Herty, Jr. *Blast Furnace Steel Plant* 22, 68-70 (1934).—Ferro-alloys are added to liquid steel for 1 or more of 5 purposes: (1) to make an alloying addn. to the steel, (2) to deoxidize the bath, (3) to ensure correct chem. analysis, (4) to "shape up" the slag and (5) to obtain hardenability, grain size, freedom from aging and the like.

Downs Schaaf

**Present-day problems of metallurgy.** Georg Masing. *Trans. Am. Inst. Mining Met. Engrs., Inst. Metals Div.* 104, 13-47 (1933). In the last 2 decades metallurgical research has drifted from the thermodynamic point of view, involving the study of constitutional diagrams, to the kinetic and crystallographic points of view. As illustrations, M. discusses the present status of 3 important fields of research: parting (or corrosion resistance) limits, aging and transformations in the solid state. The theories of Masing and of Borelius on continuous paths of reactive atoms in solid solns. from which parting limits may be calculated are discussed and the artificialities of the theory pointed out; recent observations by Graf on the orientation of Au films left on Au-Cu alloys after partial soln. are considered important. The formation of nuclei or "knots" upon age hardening is discussed. It is shown that aging at a higher temp. following partial aging at a lower temp. results in an initial softening; this is theoretically permissible on the basis of resoln. of small nuclei at the higher temp. M. takes up transformations in the solid state from the thermodynamic, kinetic and crystallographic points of view, and a rational classification is proposed. Some transformations may be regarded as homogeneous, as the formation of martensite, and some as heterogeneous, as the pptn. of CuAl<sub>2</sub> in duralumin.

**Comparative studies on creep of metals using a modified Rohn test.** C. R. Austin and J. R. Gier. *Am. Inst. Mining Met. Engrs., Inst. Metals Div., Tech. Pub.* 544, 21 pp. (1934).—Data have been presented on elementary metals and com. alloys to illustrate how the temp.-time curves, obtained by means of a modified form of the Rohn test and resulting from plastic deformation, serve as a ready means of making comparisons of the creep charac-

teristics of metals at elevated temps. A convenient means of classification has been discussed whereby an approx. relationship is expressed between load-carrying capacity and temp. for any given metal. A series of curves for Fe, Ni and Co illustrates this method of sorting metals. The relationship between rate of creep and temp. with the 4 loads studied for Fe, Ni and Co indicates that the rate of creep increases much faster than temp. The effects of minute amts. of plastic deformation on resistance to further creep have been studied. In order to express the deformation-time data on the com. alloys in terms readily understood by those assoc. with results obtained by the conventional const.-temp. method, the data have been expressed in a series of curves illustrating the relationship between creep rate and temp. of test for const. load. Variation in load is represented in the different curves. In discussing the evaluation of the high-temp. strengths of the alloys, the importance of initial amt. of deformation on creep rate has been realized and taken into account. The information and analysis of data presented in the paper appear to substantiate the contention that this modified Rohn method of testing provides a valuable means of studying the high-temp. properties of materials.

C. L. Mantell

**Regeneration of exhausted sodium carbonate cementation mixture.** Kh. M. Akhazarian. *Vestnik Metallo-prom.* 13, 55-7 (1933); *Chimie & industrie* 30, 833.—The chemistry of the cementation reaction can be expressed by the equations:  $3Fe + 2CO = Fe_3C + CO_2$ ;  $CO_2 + C = 2CO$ . The latter reaction takes place only in the absence of H<sub>2</sub>O, which reacts with CO to give CO<sub>2</sub> and H<sub>2</sub>. The activity of cementation increases with the CO content of the gas. To produce CO<sub>2</sub>, 15-30% Na<sub>2</sub>CO<sub>3</sub> is added to the cementation mixt., its decompn. at high temp. liberating CO<sub>2</sub>. The regeneration of the exhausted mixt. is based on carbonation of Na<sub>2</sub>O in the air; to this end it is slightly moistened and allowed to stand in the air until the mass is covered with a white coating of Na<sub>2</sub>CO<sub>3</sub> crystals. Before use, the regenerated mixt. is dried and mixed with 10-15% sawdust or charcoal. Cementation mixts. contg. K<sub>2</sub>CO<sub>3</sub> or BaCO<sub>3</sub> instead of Na<sub>2</sub>CO<sub>3</sub> can be regenerated in the same way.

A. Papineau-Couture

**The technic of Parkerization and Bonderization.** O. Macchia, F. Moreno and G. Oddone. *Ind. Meccanica* 15, 866-8 (1933).—A detailed discussion of the technic, methods of operation and precautions which must be followed in securing optimum results in Parkerizing and Bonderizing.

F. D. Rossini

**Fatigue breaks.** A. Thum and H. Oschatz. *Metall-wirtschaft* 13, 1-8 (1934).—From the appearance of a fatigue fracture it is usually possible to det. what part of the fracture is due to fatigue and what part due to sudden breaking. In steel parts the fatigue fracture is smoother and finer grained than the sudden fracture, while in bronze parts it is usually the opposite. The fatigue fracture is often smooth because the 2 parts rub against each other after the fracture has started. Recent investigations indicate that when fatigue breaks start, slip-planes form in the crystals in the overstressed zone. In normal fatigue breaks the fracture takes place through the crystals, while in the presence of alkalies and some other corrosive media the fracture is intercryst. Fatigue fractures usually, but not necessarily, show the characteristic progressive lines which indicate the path along which the fracture proceeds. The typical forms of fractures due to tensile and compressive, single bending, double bending, circular and torsional stressing, with and without notches, are described. From the appearance of the fracture it is possible to draw conclusions as to type of stressing, the amt. of overstressing, the start of the fracture and how it progresses. Regardless of the type of stress the path of the fracture is always at right angles to the lines of force and is often not the shortest distance through the piece, but curved. The shape of the fracture can be used to det. the direction of forces and stresses in complicated shapes.

C. E. Macfarlane

**Investigation of the causes of axle failures due to brittleness.** P. Yalovoi. *Stal* 3, No. 6, 89-90 (1933).—

The principal cause at the Dzerzhinskii plant was found to be variation of the Si and Mn content in the converter charge, this causing great heat which results in high O and N contents in the steel. H. W. Rathmann

**Can cracking be predicted?** Jean Chanzy. *Rev. mét.* 30, 543-51 (1933).—Improper cooling of steel during manuf. produces seams. Their removal by chipping leaves weakened zones which open into cracks and seams in subsequent hot working or heat treatment. The conclusions were reached by exptl. and statistical work. More seamy billets in a shipment correspond to a greater number of seamy forgings or cracked tools when the heat used is the same. In a lot of 15% W, 4.5% Cr steel, the no. of seamy billets and of cracked tools is a function of the variation in hardness of the lot. J. D. Gat

**Occurrence of irregularities in lead cable sheathing and their relation to failures.** W. H. Bassett, Jr., and C. J. Snyder. *Trans. Am. Inst. Mining Met. Engrs., Inst. Metals Div.* 104, 254-75 (1933).—A microscopic study was made of cable-sheath failures in service. Their causes can be classed, aside from corrosion, as mech. or structural. Photographs show various examples of service failures and the structure of the adjacent sheath. The method of study involved the microexamination of the failed sheath and the exptl. reproduction of similar defects and structures. Standard mill equipment was used. Photomicrographs show the type of weld responsible for split sheath, and how it was reproduced by dropping the Pb kettle temp. to 650°F. or by the excessive use of lubricants in the Pb container. Frequent examns. of cross sections throughout the pipe extruded by complete extrusion cycles were made for general structural irregularities. Variations in handling of the Pb and operation of the presses caused great differences in the structures noted. A series of 9 macrographs shows dross streaks obtained under normal operation of a press when care is not taken to prevent and exclude oxides. The majority of the dross was found in the 1st quarter and last 8th of the pipe. For contrast, the clean regular structure obtained when extreme care was taken to prevent and exclude oxides is shown. It is concluded that defective welds can be avoided by maintaining proper Pb temps., and avoiding excessive lubrication, and that most of the suboxide and all defects caused by inclusions of yellow oxide, dirt, etc., can be avoided by using good foundry practice in handling the Pb. C. L. Mantell

**Heat treatment with oxy-acetylene flame.** J. H. Critchett. *Metal Progress* 24, No. 6, 28-31 (1933).—Rail ends and massive parts are hardened by heating the surface to just above the crit. point and allowing the cold metal underneath to withdraw the heat and so quench. W. A. Mudge

**Tough, strong, permanent die castings.** D. L. Colwell. *Metal Progress* 24, No. 6, 19-23 (1933).—Zn-base die castings in automotive construction have the strength, toughness and permanency of brass castings. W. A. M.

**New process for forming metallic coatings on aluminum or aluminum alloys.** Ch. Boulanger. *Mém. comm. corrosion aéron.* 1930 31, 80-1; *Chimie & industrie* 30, 833.—Al can be electroplated with Cu or Ni under definite conditions, but the use of the elec. current is not indispensable for plating with metals below Al in the e. m. f. series. Coating is effected by the use of solns. of double or complex cyanides obtained by dissolving oxides, carbonates, phosphates, oxalates, etc., of the resp. metals, or their simple or complex cyanides, in Na, K or NH<sub>4</sub> cyanide or in a mixt. of these. Soln. can be facilitated by addn. of NaOH, KOH, NH<sub>4</sub>OH or alkali carbonates. The coating is obtained by simple immersion of the objects at a variable temp. and at various concns. The coating, which generally requires 15-20 min., ceases with the evolution of gas; its thickness depends on the time of reaction. The coatings are adherent and can be superposed by successive action of solns. of simple cyanides, or can be obtained simultaneously in a single reaction by the use of a complex cyanide. The whole or any part of a given surface can be coated. Only a rather thin coating can be produced. A. Papineau-Couture

**Information for the user about chromium plate.** Marvin J. Udy. *Metal Progress* 24, No. 6, 24-7 (1933).—Hard coatings require hard steel backing and a fine polish to give a low coeff. of friction. Elec. cond., heat cond., reflecting power, oxidation and corrosion properties are given. W. A. Mudge

**Chlorate stains.** H. Krause. *Oberflächenstech.* 11, 1-4 (1934); cf. *C. A.* 26, 4571.—Solns. contg. KClO<sub>3</sub> or NaClO<sub>3</sub> for coloring Cu and its alloys are reviewed, their chem. action is explained and application and tints obtained are described. M. Hartenheim

**Electrolytic degreasing and the limits of its applicability.** K. W. Froehlich. *Mitt. Forschungsinst. Probieramt Edelmetalle* 7, 111-20 (1934).—Certain irregularities and defects which were met in the plating of material which was formerly degreased by electrolytic process are investigated. Especially Cu and Ag surfaces were subject to failures, and certain impurities were found to be the reason. Local development of spongy metal by H in the electrolytic process, impurities of O and P in Cu and Ag (Cu<sub>2</sub>O and Cu<sub>3</sub>P) are responsible. These conditions are discussed. If alloys (contg. such impurities) are first immersed in a 10% boiling soln. of KCN, Cu<sub>2</sub>O and Cu<sub>3</sub>P are dissolved and a silver film is formed and electrolytic degreasing can be applied. The same trouble was, however, not observed with Ni or Cu plating even if the same impurities were present. A no. of etchings illustrate the conditions. M. Hartenheim

**Materials for modern cutting tools.** J. V. Emmons. *Metal Progress* 24, No. 6, 35-40 (1933).—Plain C tool steel is still preëminent for cutting non-abrasive material where the service does not heat the tools. Deeper and faster cutting requires high-speed steels. Abrasive objects require diamonds or cemented carbides. Certain alloys of Fe, Co, W and Mo, in which C is non-essential, are useful for special cases. It is improbable that any single tool material will dominate the field in the future. W. A. Mudge

**Notes on the aging of metals and alloys.** Albert Sauveur. *Trans. Am. Soc. Steel Treating* 22, 97-113 (1934).—The Brinell ball hardness test is used as a means of producing cold-work deformation, and aging is detd. at the bottom of the depression by the Rockwell test. Pure metals, duralumin, Fe-C alloys and steels are included. Aging may take place in the quenching bath and also during cold working when less subsequent aging is to be expected. In com. steel, C is chiefly responsible for aging of ferrite; N, when present in unusually large proportion, greatly intensifies aging; the part played by O<sub>2</sub> is in doubt. W. A. Mudge

**Several measures toward eliminating local elements in the working of aluminum.** H. Röhrig. *Korrosion u. Metallschutz* 9, 332-4 (1933).—The importance of removing heterogeneous constituents from the surface by pickling or tooling is emphasized. Leopold Pessel

**The M. B. V. surface treatment for aluminum and its alloys.** Gustav Eckert. *Foundry Trade J.* 49, 281-2 (1933).—The corrosion resistance of Al and its alloys is improved for certain conditions by treatment in a dil. soln. of Na<sub>2</sub>CO<sub>3</sub> and Na<sub>2</sub>CrO<sub>4</sub>. Downs Schaaf

**Internal stresses in quenched aluminum and some aluminum alloys.** L. W. Kempf, H. L. Hopkins and L. V. Ivanso. *Am. Inst. Mining Met. Engrs., Inst. Metals Div., Tech. Pub.* 535, 23 pp. (1934).—The conditions utilized commercially in the heat treatment of Al alloy castings and forgings are such as to produce in simple shapes stresses of the same order of magnitude as the errors of the methods used in this investigation. Under extreme conditions, involving the quenching in ice water of heavy sections from temps. considerably above those used in ordinary practice, stresses of the same order of magnitude as the yield strength of the alloy may be induced in the heat-treated product. The magnitude of stresses induced by heat treatment is influenced by the mech. and phys. properties of the alloy, the rate of cooling and the vol. and geometry of the specimen. Stresses in simple shapes are compressive in the surface and tensile at the center of the specimen. In cylindrical specimens the

longitudinal stresses are of a higher order of magnitude than the tangential and radial stresses which are about equal at the center of the specimen. To bring about in relatively short periods of time a substantial reduction in internal stress, reheating to temps. in excess of about 500°F. is necessary.

**The velocity of solution, the solvent and the lattice forces in copper single crystals.** R. Glauner. *Oberflächentechn.* 19, 282(1933).—To find the laws according to which metallic single crystals are dissolved (as function of velocity in crystallographic directions and chem. nature of solvent) is of great importance for elucidation of corrosion phenomena. Single crystals of metals baser than H do not show a great difference of soln. velocity in the different crystal directions, but in metals nobler than H this is different. The mechanism of soln. was investigated on single crystals of Cu. The temp. coeff. of velocity of soln. is much greater than that of diffusion velocity; this is explained as due to surface forces emanating from the crystal lattice.

**Method to determine copper and nickel plate thickness on steel, brass and zinc die castings.** Fred Carl. *Metals & Alloys* 5, 39-42(1934).—See C. A. 27, 5702. D. S.

**Some causes of variation in hardness of gold-copper castings.** Harry H. Asher and John A. Comstock. *J. Dental Research* 13, 407-13(1933).—Variations in hardness may be due to formation of cavities (blowholes and shrinkage pipes), differences in compn. of Au-Cu solid solns. and pptn. of definite Au-Cu compds. In Au-Cu alloys contg. 0-83% Au by wt., the center of the crystallite is richer in Cu than the periphery; in alloys contg. 82-100% Au, the distribution is reversed. The hardest compd. has the compn. CuAu. Pptn. hardness is a very small factor in Au-Cu alloys contg. 0-35% and 70-100% at. Au and is negligible in dental alloys which belong to the latter group.

**The relation of phosphorus to copper and silver.** II, III. K. W. Froehlich. *Mitt. Forschungsinst. Probieramt Edelmetalle* 7, 75-80, 91-7(1933); cf. C. A. 27, 256. Contrary to general belief, presence of P is not necessarily harmful to mechanical properties of Ag-Cu alloys; even an improvement can be brought about if complete deoxidation by copper phosphide has been effected; in pouring the metal the contact with air should be as short as possible to avoid absorption of O. For this reason a slight excess of P is desirable, but the melt should always stand under cover of charcoal for about 1-2 min. to insure complete deoxidation. Tensile strength, elongation, deep-drawability, corrosion resistance and refinability are all improved if P is not more than 1%; usually 0.2-0.5% gives the max. effect. Tests with several alloys under different heat treatments are described.

**The principles of deoxidation with manganese and silicon.** A. Reactions between carbon-free liquid iron and iron-manganese oxide-silicates saturated with silicic acid. B. Equilibria of deoxidation of liquid iron with manganese and silicon. F. Köfher and W. Oelsen. *Mitt. Kaiser-Wilhelm Inst. Eisenforsch., Düsseldorf* 15, 271-309(1933).—In order to be able to det. equilibrium const. directly from the melt (which has not been possible for acid steel processes because the material used for crucibles always reacted with the silica melts) crucibles were made of pure sand which permitted observing directly the equilibria between liquid Fe and Fe-MnO-silicates satd. with SiO<sub>2</sub> for reaction temps. of 1550°, 1600° and 1650°. It was found that the equilibria of the individual reactions  $[Mn] + (FeO) \rightleftharpoons (MnO) + [Fe]$ ,  $[Si] + 2(FeO) \rightleftharpoons (SiO_2) + 2[Fe]$  and  $[Si] + 2(MnO) \rightleftharpoons (SiO_2) + 2[Mn]$  and their relations can be represented by the ideal mass law within the limits of error of the expts. The distribution of FeO between metal and slag can be given by Nernst's law. The O content of the Fe melt is, for const. temp., proportional to the content of FeO of the slag; the division coeff.  $[O]/(FeO)$  increases considerably with increasing temp. The formulas of van't Hoff represent very satisfactorily the heat of reaction as the difference of the heats of formation of the solid slag-forming components. Pure liquid Fe is able to reduce Si from SiO<sub>2</sub> if the content

of FeO in the slag is sufficiently low. The results point to the fact that Fe Mn silicates are dissoed. electrolytically to a great extent in "free" lower oxides and "free" silica which causes a dislocation of Mn equil. by the addn. of silica to pure FeO slags. On the basis of the reaction equilibria, the deoxidation equilibria and the quant. relations of Si alone for different O contents are detd. Space models are developed which are to illustrate the equilibria between liquid Fe and different deoxidation products which are sepd. from the melt with varying contents of Mn, Si and O. Practical suggestions are derived for the most favorable ratios of quantities of Mn and Si for common deoxidation.

**Requirements and testing of sheet zinc for the manufacture of batteries.** E. Zalesinski. *Metallwirtschaft* 12, 699-704(1933).—The corrosion of sheet Zn which is used for the container and the neg. electrode of dry cells is affected by the purity of the metal. Pb and Cd are not harmful, but Cu, Fe, Sb and As increase the corrodibility of Zn in the order given. The influence of the impurities is less if the Zn has been quenched so that the impurities are in solid soln. If the impurities are segregated, such as at the top of an ingot, they are more harmful. Cast Zn is attacked more than annealed rolled Zn and still more than hard rolled Zn. The corrosion is also affected by the surface condition of the metal. Most of the methods for testing the suitability of Zn for dry cells consist of detg. the temp. rise of acid in which it is dissolved or the loss in weight of the Zn. A more accurate method proposed consists of measuring the vol. of H liberated after 20 or 30 min. when a sheet Zn sample of 25 sq. cm. surface is immersed in 100 cc. 10% H<sub>2</sub>SO<sub>4</sub>. The app. for this test is described. This and the temp.-rise test were made on several grades of Zn, and it was found that Zn suitable for dry cells should not liberate more than 80 cc. H in 20 min. or more than 200 cc. in 30 min. These tests indicate the behavior of Zn while the battery is not in use, but while the current is flowing the amt. of corrosion depends on different factors. Formerly most battery cups were made from a cylindrical shell with a soldered seam and a bottom soldered on with Sn-Pb solder. Because of the local cells set up the soldered seams corrode first. Sweated cups corrode much less at the seams. Seamless cups made by cold drawing or cold extruding are much superior from the standpoint of corrosion. Thirty-eight references.

**Composition of zinc for polygraphic type plates.** M. D. Zudin. *Zvezdnie Metal* 1933, No. 1, 100-3.—Compns. of domestic and imported Zn for type plates are given. Hardness and fine grain are obtained by adding small amts. of Cd (up to 0.5%). Melting in induction furnace is recommended.

**The inner friction of liquid pig iron.** H. Esser, F. Greis and W. Bungardt. *Arch. Eisenhüttenw.* 7, 385-8 (1934).—Methods and instruments for detg. fluidity and inner friction of alloys with very high m. ps. are reviewed, and a measurement is described whereby the inner friction is detd. by the damping factor of vibrations which are transmitted from the container to the liquid metal in it. Diagrams giving the friction coeff. of melts with different C contents are given; they are calcd. from  $\lambda = \sqrt{\rho\eta}$ , where  $\lambda$  is the decrement in natural logarithms as caused by the damping effect of the melt,  $\rho$  the density of the melt and  $\eta$  the friction coeff. How to measure  $\lambda$  is described. Thirteen references.

**Hardness of cast iron.** R. Chavy. *Bull. assoc. tech. sonderie* 7, 528-36(1933).—Means to obtain castings with any hardness between 120 and 300 Brinell is discussed. Martensitic cast irons with Ni between 2 and 5% and Cr between 0 and 1.5% (according to thickness) are simply cooled in the mold or taken from the mold at a high temp. (hardness > 340); these castings are made machinable with a hardness of 280-300 by annealing at about 500° and also softened to 240-200 Brinell by annealing at 650-700°. Sorbitic cast irons with 2-3% Ni can be easily machined without any treatment, but are susceptible to quenching by quiet or blown air; hardness can be controlled between 280 and 350 by annealing. Over-tempered castings with

4-6% Ni and 3-5% Mn and a hardness of 120-160 can be hardened by annealing at 600-650° after machining. Measurements of hardness and different hardness scales are described.

M. Hartenheim

**Cast iron suitable for nitrogen hardening Nitricastiron (Centrad).** J. E. Hurst. *Foundry Trade J.* 49, 243-4, 247, 259-60(1933); cf. *C. A.* 27, 3690.—Phys. properties such as modulus of elasticity, tensile strength, hardness figures, sp. heat, sp. gr., coeff. of expansion and machinability are given for N-hardened cast Fe together with methods of prepn. for and rectification after treatment and ways and means of protecting surfaces which are not to be hardened.

Downs Schaaf

**Some principles upon which resistance and solidity of cast iron depend.** W. West. *Bull. assoc. tech. fonderie* 7, 514-27(1933).—The properties of fine-grained cast iron with particular respect to P content were investigated in a series of expts. of which the first results, obtained on a large ingot, an ordinary piece of casting with cores and another plain casting of av. dimensions, show that the P content must be below 0.3% if good, dense, resistant castings are to be obtained. It was also conclusively shown that consideration of the C-Si equil. alone does not suffice for a good casting of desired qualities; the content of P must likewise be considered; the greater the P content the more closely the equil. total C-Si must be controlled on account of the very small range within which these 2 elements can vary to avoid hardness in a thin section and porosity in a large section. Reduction of P to less than 0.3% permits of a great variation in Si content which can go to 0.5% without producing hardness or porosity with the highest content. The influence of P is still more accentuated if the C content is higher than 3%. The narrower the solidification interval of a cast iron, the greater is the internal solidity, and no matter what the C content is, it is necessary to find a proper balance between P and Si content. No conclusive evidence was found as to the binary and ternary phosphides in the casting from which, eventually, explanations could be derived for the conditions under which a healthy, resistant cast iron is produced.

M. Hartenheim

**The addition of nonferrous metals to cast iron.** J. E. Hurst. *Foundry Trade J.* 50, 21 2, 28, 73 5(1934).—Present-day production of alloy cast Fe, particularly by addns. of Ni, Cr, Cu, Mo, Al, V and Ti, is discussed.

Downs Schaaf

**Desulfurizing iron with beryllium.** W. Kroll. *Metallwirtschaft* 13, 21 3(1934).—When Be is added to Fe or steel contg. high percentages of S it combines with all of the S. If the S content is high enough, BeS seps. as a layer on top of the metal, but not at the grain boundaries. Steel contg. as high as 0.4% S when treated with sufficient Be can be rolled into sheet and is not red short. In high-C steels an excess of Be over that required to combine with the S has a slight influence on its ability to be hardened. Be is also useful as a desulfurizer for Ni, which can be rolled without the addn. of Mg. Be is a more powerful deoxidizer than Al and Mn.

C. E. Macfarlane

**Relations between primary structure, degree of rolling and quality values of two structural steels.** II. Voss. *Arch. Eisenhüttenw.* 7, 403-6(1934).—The influence exerted by forging (rolling) from 1 to 70 times on tensile strength, elongation, reduction of area and notch-toughness was investigated for steels with 0.15% C, 0.9% Cr and 3.7% Ni, and 0.35% C, 1.25% Cr and 0.20% Mn, resp., which had been melted, cast and worked in the same manner. Tensile strength changed very little; elongation, reduction of area and notch-toughness increased in longitudinal direction; in transverse direction, they partly increased then partly decreased; the ratio of transverse to longitudinal notch-toughness dropped irregularly from 100% in the ingot with the no. of forgings; it was noticeable only up to the eleventh deformation; after that the values remained fairly const. An ingot with better qualities remained also better to the end of working; the ingot which showed the best refinement in cryst. structure in the individual steps of deformation showed the best all-round values. The refinement went on beyond the eleventh

deformation while properties were not changed any more.

M. Hartenheim

**The utility of the spark test as applied to commercial steels.** R. W. Buzzard. *Bur. Standards J. Research* 11, 527-40(1933)(Research Paper No. 605).—Photographs illustrated typical spark streams of plain C steel, a variety of alloy steels, S. A. E. steels, nitrided steel and cast Fe. A study was also made of the appearance of the metal pellets collected from the spark streams of the various types of steel. A sorting chart is included based on the data given by the combined spark and pellet test.

Downs Schaaf

**The effect of rate of cooling in quenching on the mechanical properties of special steels.** B. Livshitz. *Stal* 3, No. 6, 51-63(1933).—Cr and Ni-Cr steels were quenched in air, air blast, water, oil and Pb bath. With the same final hardness rapid quenching followed by drawing gives greater ductility than slow quenching, the difference increasing as the free ferrite in the annealed specimen increases. The drastically quenched specimens showed an amorphous-fibrous fracture, whereas those slowly quenched had a fine cryst. fracture.

H. W. Rathmann

**Steel is embrittled if quenched in critical range.** James J. Curran. *Metal Progress* 25, No. 2, 27-30(1934).—Several steels, if quenched from just above  $A_{c1}$ , lack both the ductility and hardness they possess after a higher quench. This may be a property of all steels. Operating difficulties which may be due to this are cited.

4

W. A. Mudge

**Some problems of quenching steel cylinders.** Howard Scott. *Trans. Am. Soc. Steel Treating* 24, 68-84(1934).—Math. and exptl. data are given to support the following conclusions: (1) Cooling rate distribution can be detd. by S.'s method under conditions not amenable to exptl. attack. (2) The cooling rate at the center of a long cylinder is indicative of the max. size that can be fully hardened and can be estd. for water, oil or air quenching from its diam. with fair assurance. (3) The cooling rates at the center of cylinders quenched in water, or oil, do not vary much from the max. value over a considerable temp. range within which the rate of the  $A_{r1}$  reaction in the steel reaches a max. (4) During the quenching of large cylinders in air, or of very small ones in oil or water, the max. cooling rate is reached shortly after the beginning of the quench; cooling thereafter is expressed by very simple relations. (5) As the diam. is increased the advantage of water over oil quenching in producing faster cooling at the center tends to diminish provided other factors do not change excessively. (6) A well-agitated water quench approaches close to the fastest physically attainable as judged by the cooling rate at the center. (7) The chief advantage of exceptional quenching power is to insure uniform shallow hardening in fine-grained steels.

W. A. Mudge

**Investigations on steel bars under changing tensile stress.** A. Pomp and M. Hempel. *Mitt. Kaiser-Wilhelm Inst. Eisenforsch. Düsseldorf* 15, 247-54(1933). A machine is described in which static and dynamic tests, in particular alternating endurance tensile tests, were made. The results of tests with structural steels St 52 and St 37 are shown in curves, tables and micrographs. They show that the first sign or fine cracks of an endurance fracture depend, besides the amplitude of vibration stress and frequency of vibrations, on small inhomogeneities and defects of the material or on surface injuries which cause a local increase of tension due to their notch action. Eighteen references.

• M. Hartenheim

**Better steel castings reflected in specifications.** David Zuege. *Metal Progress* 25, No. 2, 22-6(1934).—Adequate heat treatment has resulted in better properties which have been adopted by A. S. T. M. specifications. W. A. M.

**Aging of fine sheets of ingot steel.** A. Pomp and Ottokar Klein. *Mitt. Kaiser-Wilhelm Inst. Eisenforsch. Düsseldorf* 15, 205-45(1933).—The effects of material, manner of annealing, slight cold-deformation, different heat treatment and final rolling temps. on the tendency of fine sheets to aging were investigated. Killed material ages less than non-killed. Armco iron ages most; next is

Thomas steel; open-hearth steel aged least. Box-annealing showed the most unfavorable action; normalized sheets also age somewhat. Slow cooling of the sheets is advantageous; twice-annealed sheets (normalized and box-annealed) show the least aging. Sensitivity to aging reduces with reducing thickness of sheets. Straightening of the sheets acts like a cold deformation with respect to aging. Subsequent cold-rolling causes aging corresponding to the degree of deformation. Artificial aging and heat treatments, as they occur, for instance, in galvanizing, bring about changes of property depending on kind of material, annealing and deformation. To reach the max. of aging a certain temp. and time are required; if these are exceeded or not reached values of aging are obtained which lie on the rising or falling branch of the aging curve. Heating of the sheets for galvanizing also changes the properties more or less. Higher final rolling temp. favors aging. Numerous tables and charts represent all tests in detail; Rockwell hardness, tensile strength, elastic limit, elongation, deep-drawing capacity and notch-toughness have been measured. Nine references. M. Hartenheim

A study of the effect of water vapor on the surface decarburization of steel by hydrogen with certain developments in gas purification. C. R. Austin. *Trans. Am. Soc. Steel Treating* 24, 81-88(1934).—Pure  $H_2$  has a definite but extremely limited decarburizing power at 800° on eutectoid steels. As the water vapor content of moist  $H_2$  is increased, except in very low concns., the decarburizing power of the gas is greatly increased. In low concns. of about 10 mg.  $H_2O$  per cu. ft. of  $H_2$ , the presence of water vapor appears to reduce the limited decarburizing power of dry  $H_2$ . The results should be com. for bright annealing of high-C steels. W. A. Mudge

The structure and constitution of an alloy steel. Owen W. Ellis. *Trans. Am. Soc. Steel Treating* 22, 139-83 (1934); cf. C. A. 28, 1642\*.—A description is given of methods employed to det. the conditions under which a Widmanstätten structure appears in steel contg. C 0.33, Mn 0.69, Ni 1.30 and Cr 0.73%. Under suitable conditions of cooling the steel can exhibit 4 crit. points,  $Ar'_1$ ,  $Ar'_2$ ,  $Ar'_3$ , and  $Ar'_4$ . At  $Ar'_1$ , part of the face-centered solid soln. (1) transforms into body-centered solid soln. (2). At  $Ar'_1$ , the satd. (1) in the vicinity of (2) already formed, transforms into a "conglomerate" of (2) and carbide of Fe. At  $Ar'_2$ , such (1) as remains unaltered changes into (2), pptg. in the form of needles. At  $Ar'_3$ , the satd. (1) lying between the needles changes into "conglomerate." The alternating needles of (2) and interstitial "conglomerate" form the Widmanstätten structure. Conditions are given showing how the steel may show  $Ar'_1$  and  $Ar'_2$  only;  $Ar'_2$  and  $Ar'_3$  only; all four points; or, when the crit. rate of cooling is exceeded, only  $Ar'_1$ , which corresponds to the hitherto designated  $Ar'$ . Data are given in graphs and photomicrographs. W. A. Mudge

Some factors affecting the physical properties and corrosion resistance of 18-8 chromium-nickel steel wire. W. H. Wills and J. K. Findley. *Trans. Am. Soc. Steel Treating* 24, 1-18(1934).—From 0.06 to 0.40% C alloys were used after cold drawing to tensile strengths up to 270,000 lb./sq. in. The alloy is unworkable from a cold-drawing standpoint if Cr is less than 16%. The higher-C alloys are more subject to carbide pptn. and subsequent decreased resistance to corrosion. The addn. of Ti is the best method for stabilization. Attempts to develop a corrosion-resistant structure by heating at 1500°F. for long periods were unsuccessful. W. A. Mudge

Kinetics of transformation of austenite. IV. Magnetic investigations of carbon steels. Heinrich Lange. *Mitt. Kaiser-Wilhelm Inst. Eisenforsch. Düsseldorf* 15, 263 9(1933); cf. C. A. 27, 5040.—An arrangement is described by which the austenite transformation of C steels below 500° can be magnetically observed under high magnetic fields. The disappearance of the Curie point as a function of temp. of the isothermal transformation permits the conclusion that at temps. below 400° Fe carbide is formed in a series of different forms of carbide with different contents of C. Five references. M. H.

The composition and critical temperature of pearlite

containing one per cent silicon. A. E. Schowalter and W. W. Delamater with H. A. Schwartz. *Trans. Am. Soc. Steel Treating* 22, 120-32(1934).—The investigation was made to det. the location of the metastable eutectoid point in hypoeutectoid Fe-C-Si alloys contg. 1% Si. Steels contg. 0.14 to 0.76% C were cooled through a range of rates including 5° and 100° per min. The 100% pearlitic alloy has approx. 0.92% C. Si does not lower the C content of the eutectoid. In the presence of 1% Si, the C content of the eutectoid and the temp. at which the eutectoid transformation occurs are functions of the percentage of C in the alloy. W. A. Mudge

Low-temperature impact tests of medium-manganese steel plate. H. W. Hiemke and W. C. Schulte. *Metals & Alloys* 5, 31-6(1934).—Notch-toughness test results are given for plain C steel and low alloy steels of the silico-Mn and Cromansil types in heavy sections over the range from +100° to -50°. Twelve photomicrographs and a bibliography of 39 references are included. D. Schaaf

The chemical resistance of nonrusting steels. Paul Schafmeister. *Metallwirtschaft* 12, 751-5, 767-8(1933).—The resistance to chem. attack of the various grades of stainless steel is due to the formation of a very thin oxide film which passivates the steel. They are not attacked by oxidizing acids such as  $HNO_3$  and aqua regia but are attacked by reagents which destroy the oxide film such as  $H_2SO_4$  and Cl. The oxide film is improved by a smooth, polished surface and by heating the steel to 200°. The resistance of 18-8 steel to  $H_2SO_4$  is increased by the addn. of 2% Mo which raises its passivity and is decreased by cold working, probably because of lower stability of the passivated surface. In the galvanic potential series 18-8 steel stands slightly above Ag. Its loss in weight due to electrolytic action when in contact with Cu and other metals in various electrolytes is very small. When the C content of Cr steels is raised, part of the Cr forms carbides and the Cr content of the steel must be raised to compensate for this if equal corrosion resistance is desired. The addn. of Ni, Mo or Cu to Cr steels increases their chem. resistance. Heat treatment also affects the chem. resistance as illustrated by the hardening of Cr knife steel and by heating 18-8 steel to 500° to 900°. The carbide pptn. at the grain boundaries of 18-8 steel due to heating can be overcome by lowering the C content to less than 0.07%, by the addn. of Ti or V which combine with C, or by reannealing after heating. Twenty-three references. C. E. Macfarlane

The temper hardening of alloys. IV. Change of hardness of copper-aluminum alloys rich in aluminum during tempering. 2. Hiroshi Kawai. *J. Chem. Soc. Japan* 54, 835-42(1933); cf. C. A. 27, 5291.—The 4% Cu alloy which was tempered for 2 hrs. and then quenched was again tempered. At various temps. during tempering the hardness was measured. It showed max. at 100° and 300°. V. Change of hardness of copper-aluminum alloys rich in aluminum during tempering. 3. *Ibid.* 1191 7.—Tempering at 150° gives the greatest hardness for the alloy with 4-6% Cu. T. Katsurai

Equilibrium relations in aluminum-chromium alloys of high purity. W. L. Fink and H. R. Freche. *Trans. Am. Inst. Mining Met. Engrs., Inst. Metals Div.* 104, 325 34 (1933).—The extreme Al end of the Al-Cr system was studied with alloys which contained less than 0.04% total impurities. It was found that there is a peritectic reaction at 661° between  $CrAl_3$  and a melt contg. 0.41% Cr, to form a solid soln. contg. 0.77% Cr. The solid soln., which was detd. microscopically, decreases with temp.; and at 530° the satd. solid soln. contained only 0.25% Cr. The liquidus was detd. from 685° to 790° by chem. analysis of the supernatant melt. C. L. Mantell

Equilibrium relations in aluminum-manganese alloys of high purity. II. E. H. Dix, Jr., W. L. Fink and L. A. Willey. *Trans. Am. Inst. Mining Met. Engrs., Inst. Metals Div.* 104, 335-52(1933); cf. C. A. 23, 2685.—A previous paper from the labs. of the Aluminum Co. of America reported an equil. study on Al-Mn alloys of the highest purity attainable at that time. The present paper deals with a like investigation on alloys of a still higher

purity, as well as a study of the intermetallic compds. that are inequil. with the Al phases in alloys contg. up to 10% Mn. The solid soly. of Mn in Al contg. not more than 0.008% Fe is 1.82% at the eutectic temp. (658.5°) and decreases to 0.36% at 500°. Small amts. of impurities, particularly Fe, have a marked effect in reducing the solid soly. of Mn in Al. A discussion of the pptn. of the Mn phase from supersatd. solid soln. is given. In alloys contg. more than 4.06% and at least up to 10% Mn, the first intermetallic compd. pptg. from the liquid is MnAl<sub>4</sub>. This compd. reacts with the melt contg. 4.06% Mn in soln. at 710° to form the compd. MnAl<sub>4</sub>. The eutectic between MnAl<sub>4</sub> and the Al solid soln. occurs at 658.5° and 1.95% Mn. The identification of the compds. and their etching characteristics are described. C. L. M.

**Very light magnesium-aluminum alloys.** Paul Bastien. *Rev. mét.* 30, 478-501, 528-42(1933).—A comprehensive thermal and microscopical study of equil. of Mg-Al-Cu alloys. Its liquidus contains 4 primary zones corresponding to the pptn. of Mg, Mg<sub>2</sub>Al<sub>3</sub>, Mg<sub>2</sub>Cu and Mg<sub>2</sub>Cu<sub>2</sub>Al<sub>3</sub> phases. The system has 2 ternary eutectics m. 412° and 484° and 2 ternary solid solns., rich in Mg and rich in Mg<sub>2</sub>Al<sub>3</sub>. Solid soly. limits were definitely established. Alloys contg. 12% Cu max. can be forged, this improving their mech. properties without affecting lightness and cond. phys. properties of machinable alloys are given. Cu addn. to alloys with the same Al content slowly increases their corrodibility in acid solns. and very rapidly in saline. Al in Mg-Cu alloys rapidly reduces their corrodibility in sea water. J. D. Gat

**The lithium-magnesium equilibrium diagram.** Otto H. Henry and Hugo V. Cordiano. *Am. Inst. Mining Met. Eng., Inst. Metals Div., Tech. Pub.* 536, 14 pp.(1934).—The equil. diagram for the Li-Mg system of alloys has been detd. The liquidus was obtained from a series of cooling curves, the solidus from a series of heating curves, and the limits of solid soly. from a series of heat-treating and quenching expts. While it is probable that the time of annealing was not sufficiently long to obtain equil., it is felt that the solid soly. limits as indicated are substantially correct. The diagram shows that Li and Mg are completely sol. in the liquid state, that they are partially sol. in the solid state and that there is a transition where a peritectic reaction takes place. C. L. Mantell

**Electric properties of iron-nickel alloys over a large temperature interval.** P. Chevenard. *Rev. gén. élec.* 33, 759-60(1933).—See C. A. 27, 5293. M. H.

**Chemical investigation of an alleged ancient Greek bronze statuette.** Earle R. Caley. *Tech. Studies Field Fine Arts* 2, 144-8(1934).—The alleged Greek statuette had the following compn.: Cu 83.25, Sn 7.36, Zn 4.87, Pb 4.40, Fe 0.15%; no other elements were present in determinable amts. The absence of semi-metallic or non-metallic impurities such as As or S and the presence of appreciable amts. of Zn indicates that the bronze was not of ancient Greek origin. Furthermore, the analysis does not agree with those of ancient statuary bronzes from other localities, but corresponds closely to that of a favorite modern compn. for making delicate bronze castings.

A. Papineau-Couture

**Ternary system: aluminum-antimony-magnesium.** W. Guertler and A. Bergmann. *Z. Metallkunde* 25, 81-4, 111-16, 132(1933).—In the binary Al-Sb system the solidus rises slowly to a max. at 82% Sb corresponding with the formation of AlSb, which, however, appears to dissociate at the m. p., since free Al occurs as minute particles in air-cooled alloys contg. more than 82% Sb. AlSb is rapidly decompd. by moisture, becoming first brown and then falling to a gray powder; it forms an ill-defined eutectic with Al at 657° and less than 2% Sb and a well-defined eutectic with Sb at 623° and less than 1% Al. In the ternary system Al-Mg-Sb no ternary compd. is formed and the following quasibinary systems exist: (A) Al<sub>2</sub>Mg<sub>3</sub>-Mg<sub>2</sub>Sb<sub>3</sub>, (B) Al<sub>2</sub>Mg<sub>3</sub>-Mg<sub>2</sub>Sb<sub>3</sub>, (C) Mg<sub>2</sub>Sb<sub>3</sub>-AlSb, (D) Al<sub>2</sub>Mg<sub>3</sub>Sb<sub>3</sub>. In D there is a miscibility gap extending from 9 to 98% Mg<sub>2</sub>Sb<sub>3</sub>, and in the ternary system this extends to 41% Mg in the Mg corner and to 73% Sb in the Sb corner. Binary eutectics occur in all the quasibinary

systems and ternary eutectics in the quasiternary systems: Al<sub>2</sub>Mg<sub>3</sub>-Mg<sub>2</sub>Sb<sub>3</sub>-Mg, Al<sub>2</sub>Mg<sub>3</sub>-Al<sub>2</sub>Mg<sub>3</sub>-Mg<sub>2</sub>Sb<sub>3</sub>, Al-AlSb-Mg<sub>2</sub>Sb<sub>3</sub> and AlSb-Sb-Mg<sub>2</sub>Sb<sub>3</sub>, but not in Al<sub>2</sub>Mg<sub>3</sub>-Al-Mg<sub>2</sub>Sb<sub>3</sub>. B. C. A.

**Theory and systematization of the corrosion of metals.** Gerhard Schikorr. *Mitt. deut. Materialprüfungsanstalt. Sonderheft* 22, 3-9(1933).—Comprehensive discussion of the different types of corrosion, particularly of irregularities unexplainable by prevailing theories. A division of corrosion types according to whether the rate of corrosion is detd. by the anodic or the cathodic reaction is outlined. Leopold Pessel

**Resisting hydrochloric acid corrosion with metals.** F. A. Rohrman. *Chem. & Met. Eng.* 40, 646-8(1933).—A discussion of the alloys found acceptable for contact with HCl. Leopold Pessel

**Suitability of the torsion test in observing corrosion phenomena.** B. Garre and H. Brose. *Korrosion u. Metallschutz* 9, 334-6(1933).—Expts. with Cu and Al wires show the dependence of the torque characteristics upon the corrosive medium, polishing material and total loss of wt. Especially with Al, this test offers a sensitive method of detecting pit attack. Leopold Pessel

**Corrosion and coordination.** H. L. Riley. *Proc. Roy. Soc. (London)* A143, 399-410(1934).—Corrosion of Cu and Ni in the presence of solns. of Na salts of org. acids which form sparingly sol. Cu and Ni salts is a function of the coordinating tendency of the anion. The effect of anion concn., acidity and surface area of the metal are discussed. Calvin Brouss

**Corrosion of aluminum by sodium chloride solution, with hydrogen development.** G. Schikorr. *Mitt. deut. Materialprüfungsanstalt., Sonderheft* 22, 22-5(1933).—Severe corrosion, combined with H development, may occur on Al when conditions favor formation of AlCl<sub>3</sub> and NaOH, on sections of the surface sufficiently remote from each other to prevent interaction, and of sufficient concn. to attack the Al under H development. Such corrosion is favored by small amts. of the NaCl soln., by irregular access of the soln. to the various parts of the Al surface, by the presence of O. In the course of the reaction cryst. Al(OH)<sub>3</sub> (Bayerite) is deposited on the Al surface which, being insol. in AlCl<sub>3</sub> and NaOH, gradually forms a protective layer and stops the attack. This type of corrosion could not be observed in tap water or in K<sub>2</sub>SO<sub>4</sub> soln. Leopold Pessel

**Theory of the corrosion of iron.** Gerhard Schikorr. *Mitt. deut. Materialprüfungsanstalt. Sonderheft* 22, 9-16(1933).—The corrosion phenomena of Fe in non-oxidizing acids, in contact with insufficient O and in contact with excess of O are discussed. A classification of corrosion is based upon these 3 types. Leopold Pessel

**Corrosive action on constantly stressed boiler steels.** A. Thum and Cl. Holzhauser. *Arch. Wärmewirt.* 14, 319-21(1933).—The effect of general corrosion in leading to failure of stressed material is described and illustrated. Solns. with passifying action may actually raise the resistance to repeated stress. Intercryst. corrosion is likewise treated. It is important only in very weak solns. Ernest W. Thiele

**Corrosion investigations of tin-silver amalgams.** N. Brecht-Bergen. *Z. Elektrochem.* 39, 927-35(1933).—Alloys of the three-phase region between the points Sn-Hg solid soln., Ag<sub>2</sub>Sn and (approx.) Ag<sub>2</sub>Hg<sub>2</sub>, exposed to the attack by 0.1 N perchloric acid, 0.1 N citric acid, 0.1 N NaOH, 0.1 N NaCl soln., showed a loss of wt. independent from the compn. of the Sn-Ag constituent. Samples contg. less Hg, being more porous, show greater loss of wt. than those richer in Hg. Corrosion of these alloys is essentially caused not by local cells, but by the direct attack by the soln. used. The potential of all amalgams in this region is that of the Sn-Hg solid soln., and is identical with that of Sn. This constituent is being attacked. The three-phase region adjoining, toward Hg, has a potential nobler by 40 mv. This is the potential of a liquid phase completely surrounding the solid crystals. Through this p. d., the boundary between these 2 three-phase regions could be clearly defined at 30°. When the

amalgams are subjected to anodic polarization, the Sn is dissolved as  $\text{Sn}^{++}$  in 0.1 N perchloric acid up to a c. d. of 15 ma./sq. cm. Sn dissolves in the same manner in the other 3 solns. up to 3 ma./sq. cm. With increasing c. d. passivity occurs in the 3 last solns., leading to  $\text{O}_2$  or  $\text{Cl}_2$  development. By means of anodic corrosion the depth of attack could be measured, which increases with the porosity of the amalgam and parallels the loss of wt. This offers a new method for structural investigations of amalgams.

**Corrosion resistance of bronzes.** O. Dahl. *Oberflächentechn.* 10, 282 (1933).—Behavior of Sn, Al, Ni and Si bronzes against corrosion is reviewed. The quantity of Cu present det. the behavior; O corrodes Cu, most strongly in HCl,  $\text{H}_2\text{SO}_4$  and  $\text{CH}_3\text{COOH}$ . Anodic corrosion is not very pronounced. Cu is most resistant when O is excluded. In bronzes (Sn-Cu, Al-Cu, Ni-Cu and Si-Cu) the combination of good mechanical-technological properties with chem. permanency det. the behavior. The alloying constituents exert great influences on the susceptibility of Cu to be made passive as the d. of the surface layers is increased. The properties of the individual bronzes are discussed in detail and explained in the light of the general discussion.

**Experimental welding and subsequent heat treatment of drills made of high-speed tool steel.** V. I. Skotnikov and I. N. Spiridonov. *Vestnik. Metalloprod.* 13, 42-53 (1933); *Chimie & industrie* 30, 839-40. In order to avoid internal stresses which eventually lead to cracking, before being welded the pieces must be annealed at 400-500°, which can be carried out in sand baths constructed in the walls of the Pb baths. The welded pieces should be subjected, immediately after welding, to an intermediate heating at 400-800° in a Pb or sand bath; the pieces are then air-cooled and annealed in a Pb bath at 850-900° for 30 min., and cooled to 700° in 1-2 hrs. at the rate of 2-3° per min., the end of the cooling taking place in sand. This method allows a considerable reduction in the time of annealing.

**Silver solders.** W. Stein. *Mitt. Forschungsinst. Probieramt Edelmetalle* 7, 80-7, 97-103 (1933).—The field of Ag solders and the demands made on them in the rare metal and jewelry industry are reviewed. Comps. of solders of Ag-Cu-Zn-Cd-Sn, Ag-Cu-Sn-Zn-Al, Ag-Sn-Zn, Ag-Cu-Sn-Zn-Sb-Al, Ag-Cu-Zn, their m. and f. ps., range of applications, and phys. and mech. properties are given in tables.

**Portland cement pipe coatings (Speller)** 20. Pitting and corrosion of locomotive boiler tubes and sheets (Davidson, et al.) 14. Corrosion inhibition by lime treatment (Powell) 14. External protection of metal pipes by cement mixts. (Rocca) 20. Corrosion of steel—tests carried out on "Dalmine" covering (Scarpa) 20. Internal attack of water mains (Adloff) 14. App. for washing ores, etc. (Ger. pat. 590,429) 21.

**Ore flotation.** H. Th. Böhme A.-G. Fr. 755,895, Dec. 1, 1933. Sulfonation products, particularly esters of  $\text{H}_2\text{SO}_4$  and fatty acs. of more than 9 C atoms, as well as esters of  $\text{H}_2\text{SO}_4$  and alkyl esters of fatty acids are used as addn. substances to flotation liquids.

**Mineral flotation.** Bolidens Gruvaktiebolag (S. G. Mörtzell, inventor). Swed. 78,304, Sept. 12, 1933. The flotation is carried out with application of one or more org. As compds.

**Flotation with assistance of electric current.** Bolidens Gruvaktiebolag (S. G. Mörtzell, inventor). Swed. 78,111, Aug. 22, 1933. For facilitating the selective flotation, for instance sepn. of pyrite from arsenopyrite, elec. current is applied under such conditions that the floatability of the mineral or minerals (for instance arsenopyrite) that are not intended to float is reduced, chiefly by oxidation of the surface of the particles effected by the action of the elec. current, while the floatability of the rest of the mixt. (for instance pyrite) remains practically unchanged.

**Ore and mineral concentration by flotation.** Wm. A. Douglass (to E. I. du Pont de Nemours & Co.). U. S. 1,943,758, Jan. 16. Ethyl ethylxanthate or other substance of the general formula  $\text{ROC}(\text{S})\text{SX}$ , in which R is a hydrocarbon radical and X is a radical contg. at least one C atom, is used as a flotation reagent with ores such as those of Cu.

**Magnetic separator.** E. O. E. Tydén. Swed. 79,021, Nov. 28, 1933.

**Leaching ores.** Thomas A. Mitchell (to Lafayette M. Hughes). U. S. 1,943,330, Jan. 16. Various details of operation and app. are described.

**Reduction of ore.** I. Rennerfelt. Swed. 76,699, March 14, 1933. Ore mixed with a reducing agent is charged into a container open at one end, and the charged container is placed in a larger surrounding container, the open end facing toward the bottom of the latter container, after which the space between the containers is filled with a reducing agent so that air cannot enter the charge without passing through the layer of reducing agent. The charge is heated externally until the ore is

reduced to metal powder, which may be pressed together before discharging.

**Device for mixing ore slime with coal or charcoal during the transport of the materials on a belt conveyor.** Sandvikens Jernverks A.-B. (A. B. Ralson and E. J. Larsson, inventors). Swed. 76,865, April 4, 1933.

**Extraction of cobalt from sulfidic copper ore.** F. A. A. Grönwall. Swed. 76,502, Feb. 14, 1933. An addn. to Swed. 74,511. The sulfides together with which the slag is remelted consist of alkali or earth alkali sulfides, or such sulfides formed from sulfites or sulfates during the melting by means of an addn. of a carbonaceous reducing agent or sulfides formed during the melting by means of free S added to the slag. Cf. C. A. 27, 5297.

**Treating ores.** Peter Jung. Brit. 400,933, Oct. 30, 1933. Fine ores, blast-furnace dust, etc., are briquetted with very fine gas coal, with or without binding agents and other materials, e. g., chalk, and the briquets are coked.

**Treatment of sulfidic or arsenical ores.** Carl Goetz. Ger. 590,388, Dec. 30, 1933 (Cl. 40a. 11.70). Addn. to 589,448 (C. A. 28, 1315'). The process of Ger. 589,448 is effected in the presence of sufficient finely divided Fe or Fe<sub>2</sub>O<sub>3</sub> to combine with the bulk of the S and (or) As in the ore.

**Treating tin-bearing ores.** Thomas A. Mitchell (to Lafayette M. Hughes). U. S. 1,943,338, Jan. 16. Various details are described of a process in which SnCl<sub>4</sub> is obtained and then treated with ZnO to form Sn oxide, which is sepd. from the ZnCl<sub>2</sub> formed.

**Treating materials such as roasted ore containing zinc oxide, etc.** Thomas A. Mitchell (to Lafayette M. Hughes). U. S. 1,943,333, Jan. 16. Material contg. ZnO and which also may contain various other Zn, Fe, Pb and Ca compds. is leached (suitably with HCl soln.) to remove a considerable proportion of the ZnO; the residue is treated with a gaseous chloridizing agent to convert remaining Zn into ZnCl<sub>2</sub>, and the material may then be further treated for recovery of values. Numerous details are described.

**Treating ores such as those containing zinc and iron sulfides, etc.** Thomas A. Mitchell (to Lafayette M. Hughes). U. S. 1,943,334, Jan. 16. An alk. earth metal compd. such as CaO or CaCO<sub>3</sub> is added and the mixt. is roasted in the presence of a reactive S compd. with the materials initially so proportioned that sufficient alk. earth compd. is present to react with substantially all the reactive sulfate radical present and with the other reactive ingredients of the ore. Such furnace conditions are maintained as to produce a considerable amount of alk. earth metal sulfate and alk. earth metal compds. with various reactive ingredients of the ore. After the furnace treatment, the material may be leached. Numerous details are described.

**Treating ores containing metal values such as complex sulfide ores.** Thomas A. Mitchell (to Lafayette M. Hughes). U. S. 1,943,331, Jan. 16. The ground ore is roasted with a considerable amt. of an alk. earth metal compd. such as CaO and a S-bearing material such as added sulfide, if required, which are capable of and are proportioned for reacting during the roasting operation to form an insol. alk. earth metal sulfate; low-temp. conditions are maintained, and the material is agitated to minimize sintering together of the ore particles; the resulting permeable non-sintered product is treated with a reagent for converting an ore metal value such as Zn to a sol. compd. which is readily recovered from assocd. insol. gang and alk. earth metal sulfate.

**Treating complex ores containing sulfides of silver and other metals.** Thomas A. Mitchell (to Lafayette M. Hughes). U. S. 1,943,339, Jan. 16. The finely divided ore is coated with an alk. earth metal oxide such as CaO, and the coated material is roasted under conditions required to remove the S from the Ag sulfide and produce alk. earth metal sulfate intimately assocd. with the Ag-bearing portions of the ore particles, thus minimizing any tendency for the ore particles to become globulized or to contact with other portions of the ore and combine with

them; the roasted ore is then treated to convert the Ag to a sol. compd. and the Ag is recovered.

**Treating complex ores containing sulfides of zinc and iron.** Thomas A. Mitchell (to Lafayette M. Hughes). U. S. 1,943,340, Jan. 16. The ore is roasted to produce Fe<sub>2</sub>O<sub>3</sub> and ZnO, the roasted material is leached with dil. H<sub>2</sub>SO<sub>4</sub> to remove most of the ZnO as ZnSO<sub>4</sub>, and reduce the ZnO content of the material to such an extent that, with reference to the capability of the residue to absorb the water of reaction during the chloridizing step, the amount of ZnCl<sub>2</sub> and water thus formed will be insufficient to hinder materially the penetration of the reagent gas, but leaving sufficient ZnO to prevent the Fe from going into soln. as a sulfate; the remaining ZnO content of the ore is then chloridized with HCl, forming FeCl<sub>3</sub>, and the chloridized material is heated with air to a temp. at which FeCl<sub>3</sub> is not stable to form nascent Cl for further chloridizing of the ore and to leave the Fe as an insol. ferric oxide, so that the ZnCl<sub>2</sub> may be dissolved and obtained substantially free from Fe.

**Producing metal chlorides from ores such as complex lead zinc sulfide ores.** Thomas A. Mitchell (to Lafayette M. Hughes). U. S. 1,943,341, Jan. 16. The ore is roasted in the presence of a S-bearing material and an added compd. of an alk. earth metal such as lime capable of, and proportioned for, reacting to form an alk. earth metal sulfate and produce a non-sintered product contg. the sulfate interspersed with an ore metal oxide which is permeable to chem. reagents, and the roasted material is chloridized. Numerous details are given.

**Chloridizing ores by use of ferric chloride.** Thomas A. Mitchell (to Lafayette M. Hughes). U. S. 1,943,332, Jan. 16. An ore material contg. a chloridizable metal sulfide such as ZnS is mixed with FeCl<sub>3</sub>, and the mixt. is heated with O at a temp. at which the chloride is unstable, in the presence of sufficient material such as CaO or CaCl<sub>2</sub> for reacting with the available sulfate radical formed by the oxidation of the sulfide S to prevent the ore metal from being converted into sulfate. The resulting material may then be leached.

**Chloridizing sulfide ores.** Thomas A. Mitchell (to Lafayette M. Hughes). U. S. 1,943,336, Jan. 16. Ore material contg. a large quantity of unroasted chloridizable ore metal sulfide such as that of Zn is treated with a current of Cl gas while the ore is in substantially dry condition and maintained at a low temp., and the reaction is carried on in the presence of an alk. earth metal compd. such as lime proportioned for fixing the available sulfate radical formed in the process as an insol. alk. earth metal sulfate and thus preventing the transposition of ore metal chloride to sulfate. App. is described, and the treated material may be leached. Various details of procedure are described.

**Chloridizing sulfide ores.** Thomas A. Mitchell (to Lafayette M. Hughes). U. S. 1,943,337, Jan. 16. A sulfide ore which may contain ZnS and FeS<sub>2</sub> is roasted and digested in an aq. soln. of a metal chloride such as FeCl<sub>3</sub>, capable of reducing from a higher to a lower valency and chloridizing the ore, and the material is then removed from the aq. soln. and heated to a temp. at which the metal chloride is not stable, for effecting further chloridizing of ore materials. Numerous details are given.

**Chloridizing sulfide ores such as those of zinc, lead and iron.** Thomas A. Mitchell (to Lafayette M. Hughes). U. S. 1,943,335, Jan. 16. A sulfide ore is roasted under oxidizing conditions to a low sulfide-S content and in the absence of a sulfate-fixing reagent; there is added to the ore a quantity of CaCl<sub>2</sub> proportioned to react with all available sulfate radical during the chloridizing operation and chloridizing of ore metal sulfate is effected; subsequently the material is treated with Cl under conditions to produce an ore metal chloride and form CaSO<sub>4</sub>.

**Rotary device for taking samples of iron ore in maritime transit, etc.** Samuel E. Atkins and Theodore Carlson. U. S. 1,944,392, Jan. 23. Mech. details.

**Reduction of, and removal of sulfur from, iron ore.** Leif Lindemann. Norw. 53,252, Nov. 6, 1933. Iron ores are desulfurized and reduced to FeO at higher temps.

(630-800°) by the gases from the final reduction or by another  $H_2$  gas contg. 11-30% of  $H_2O$  and are then reduced completely at lower temps. (450-650°) by technical  $H_2$  contg. up to 18% of  $H_2O$ .

**Refining copper.** Soc. d'électrochimie, d'électrometallurgie et des aciéries électriques d'Ugine. Fr. 755,592, Nov. 27, 1933. Cu is refined by heating it violently to a sort of emulsion with a fused slag having a compn. such that the impurities are decomposed and enter the compds. in sol. in the Cu. The slag may contain a salt of Cu (oxide, silicate, sulfide, chloride, etc.) and a flux. Fr. 755,593. The slag used has a high solvent power toward  $Cu_2O$  and may be formed by one or more of the following:  $SiO_2$ ,  $TiO_2$ ,  $Al_2O_3$ ,  $CaO$ ,  $MgO$ , alkali or alk. earth salts, oxides of Fe or of other metals not reduced by Cu.

**Apparatus for condensing zinc-reduction vapors.** The New Jersey Zinc Co. Ger. 588,072, Nov. 28, 1933 (Cl. 40a. 30).

**Melting metals.** David L. Summey. Brit. 400,259, Oct. 23, 1933. In casting ingots, etc., from refined metal, e. g., Cu, Al, Ni, Zn, Mg and their alloys, the metal is charged in continuous increments into a vessel, without contamination of fuel gases and while fully protected from air, and, if necessary, reduced by a medium incapable of leaving a harmful residue, the vessel being substantially air-tight and filled with nonoxidizing gas under pressure. App. is described.

**Reduction without melting.** A. Johnson & Co. (B. M. S. Kalling and C. von Delwig, inventors). Swed. 70,914, April 11, 1933. Powd. ore mixed with C is heated without melting in a S-free reducing gas in a rotary furnace. The gas serves as the main reducing agent, the properties of the C and the gas and the temp. of the furnace being so adjusted that most of the solid carbonaceous material passes unconsumed through the furnace, thus not transferring its S content to the metal. Cf. C. A. 27, 5259.

**Apparatus suitable for filtering smelter fumes, etc.** Ross B. Rathbun (to American Smelting and Refining Co.). U. S. 1,944,267-8, Jan. 23. Structural and mech. details.

**Porous metal castings.** Electro Metallurgical Co. Ger. 590,444, Jan. 4, 1934 (Cl. 31c. 15.04). See Brit. 390,533 (C. A. 27, 4761).

**Crucible for fusing metals.** Pose & Marré. Ger. 588,770, Nov. 27, 1933 (Cl. 18c. 5.40).

**Operating converters for steel manufacture.** Kurt Thomas. Ger. 590,056, Dec. 21, 1933 (Cl. 18b. 19). Addn. to 569,350 (C. A. 27, 2126). Further details of the method of Ger. 569,350 are given.

**Blast-furnace tuyères.** Martin Künckle. Brit. 400,793, Nov. 2, 1933.

**Blast-furnace operation.** Österreichisch-Alpine-Montanges. (Ludwig Richter, inventor). Ger. 590,055, Dec. 21, 1933 (Cl. 18a. 3). See Austrian 128,326 (C. A. 26, 4295).

**Explosion or bleeder valve for blast furnaces.** Michael Svorcina. U. S. 1,944,770, Jan. 23.

**Furnace and method for the heat treatment of metals, e. g., brass or copper strip.** Henry W. Brownson and Imperial Chemical Industries Ltd. Brit. 400,586, Oct. 13, 1933.

**Metallurgical furnace suitable for heat treatments.** James R. Munro (to Caterpillar Tractor Co.). U. S. 1,944,449, Jan. 23.

**Continuous heating furnace suitable for heating billets, ingots, etc.** Samuel Charlesworth (to Surface Combustion Co.). U. S. 1,944,729, Jan. 23. Various structural and operative details are described.

**Furnace for heating metal plates, sheets, etc., having a conveyor device for imparting step-by-step forward movement to the articles.** Alfred Smallwood and John Fallon. Brit. 400,185, Oct. 18, 1933.

**Muffle furnace for heat treatment of metals.** Soc. Allmänna Svenska Elektriska Aktiebolaget. Fr. 755,847, Nov. 30, 1933.

**Furnace for hardening metals by cementation.** The Singer Manufacturing Co. Ger. 590,057, Dec. 27, 1933 (Cl. 18c. 3.50). See U. S. 1,792,456 (C. A. 25, 1791).

**Furnace for annealing brass.** Siemens-Schuckertwerke A.-G. (Rudolf Grundmann, inventor). Ger. 588,616, Nov. 28, 1933 (Cl. 40d. 2.30).

**Thermal treatment of metals.** The Electric Furnace Co. Fr. 756,070, Dec. 4, 1933. A protecting gas for the thermal treatment of metals, which has an oxidizing, reducing, carbonating or decarbonating action, is obtained by mixing a hydrocarbon with air in proportions governed by the required character of the gas, and causing them to react in an exteriorly heated chamber, preferably in the presence of a catalyst.

**Heat-treating magnetic material.** Willoughby S. Smith, Henry J. Garnett and Walter F. Randall. Brit. 400,238, Oct. 18, 1933. The material is heated in coil form in an annealing box, within which the material is cooled in air, the charge being arranged in the box so that the inner coils are cooled more rapidly than the outer coils.

**Hardening metals.** Ewald Hanus. Ger. 590,243, Dec. 28, 1933 (Cl. 18c. 3.15). The article or the part thereof to be hardened is heated in a refractory mold of corresponding shape contg. the appropriate amt. of a gasifiable hardening agent.

**Apparatus for determining Brinell hardness.** S. L. E. Falk. Swed. 78,600, Oct. 10, 1933. The app. has the shape of a pair of tongs.

**Dies suitable for use in drawing wire or the like.** Adrian P. Roux (to General Cable Corp.). U. S. 1,944,758, Jan. 23. Various details of operation are described for making dies comprising W carbide and a metal such as W, Fe and Ni by sintering under pressure and subjection to an elec. current. U. S. 1,944,759 relates to details of similar dies.

**Film-making apparatus.** Peter Ostendorf and Otto Graf. Brit. 400,823, Nov. 2, 1933. The metal band or belt, upon which film-forming soln. is deposited, is made of hard metal, e. g., Fe, steel, plated with a metal, e. g., Ni or Ni alloy, which is not attacked by the fluids used in film manuf., and the plating is rolled to convert the coarse cryst. into a fine cryst. structure which takes on a fine glassy smoothness when polished.

**Degreasing metal articles.** Joseph Savage and Imperial Chemical Industries Ltd. Brit. 400,097, Nov. 6, 1933. In degreasing with volatile solvents, the solvent vapors being condensed by  $H_2O$ -cooled surfaces, the cooling- $H_2O$  is warmed to above the dew point of the atm., whereby the condensed solvent is free from  $H_2O$ . App. is described.

**Lubricant suitable for use in wire drawing.** George S. Rutherford (to Western Elec. Co.). U. S. 1,944,273, Jan. 23. A sol. alginate 1, tallow 4, soap 2 and water 195 parts are used together.

**Siphoning molten metals such as aluminum.** Victor C. Doerschuk and Erwin G. Schoeffel (to Aluminum Co. of America). U. S. 1,944,733, Jan. 23. In siphoning a metal such as Al, a molten material such as artificial cryolite of higher m. p. than the metal is drawn through a siphon and cooled to form a protective coating on the inner surface of the siphon, and the molten metal is then passed through the siphon. App. is described.

**Beryllium.** Heraeus-Vacuumschmelze A.-G. and Wilhelm Rolin. Ger. 588,081, Nov. 30, 1933 (Cl. 40a. 48.20). Addn. to 563,652 (C. A. 27, 941). The method of 563,652 for the prepn. of Be by reducing  $BeO$  is modified by adding metals of the Cr group or their oxides to the reaction mixt.

**Copper.** The Roessler & Hasslacher Chemical Co. Brit. 401,008, Nov. 9, 1933. Cu of high cond. is obtained by melting Cu contg. Ca, Ba, Sr or Mg which has been added as a deoxidizer and passing a substantially inert gas, e. g.,  $H_2$ , N,  $NH_3$ , through the melt to remove (partially) the excess of the deoxidizer.

**Hardening copper.** Charles E. Moyer. U. S. 1,943,738, Jan. 16. Cu is heated to its m. p. and treated with  $CuSO_4$ , salt and borax.

**Purifying crude light metals such as crude electrolytic sodium.** Harvey N. Gilbert (to E. I. du Pont de Nemours & Co.). U. S. 1,943,307, Jan. 16. The light metal is maintained in liquid condition in an inert atm. and at a temp. (suitably about 110° in the case of Na) at which

impurities solidify; the purified light metal is filtered off and sludge is collected from a level below that of filtration (in a described app.).

**Composite metal plates including tantalum suitable for jewelry.** Miner M. Austin (to Fansteel Products Co.). U. S. 1,943,853, Jan. 16. A Ta plate is protected from the atm. by an autogenously attached film of a base metal such as Cu alloy contg. Al or Ni and by a base metal plate autogenously attached to the film.

**Metals and alloys.** Heraeus-Vacuumschmelze A.-G. Brit. 401,094, Nov. 9, 1933. See Fr. 731,243 (C. A. 27, 699).

**Refining metals and alloys.** Isaiah Hall. Brit. 400,258, Oct. 23, 1933. A powder for refining Pb, Sn or Pb-Sn alloys, which may contain Sb, comprises finely powd.  $\text{NH}_4\text{Cl}$  37,  $\text{NaCl}$  14,  $\text{CaCl}_2$  11, C 25 and  $\text{C}_{10}\text{H}_8$  14 parts by vol. The powder is mixed with the metal at 300-750°F., being used particularly for alloys used in type-casting machines and stereotyping foundries and comprising approx. Sn 4-6, Sb 12-13 and Pb 80-85%.

**Sponge metal.** E. G. T. Gustafsson. Swed. 78,704, Oct. 31, 1933. Sponge Fe, Co, Ni or ferrochrome is produced by reduction of the oxidic ores by a reducing gas in a furnace where the charge is in continuous motion in opposite direction to the gas. Powd. coal or other carbonaceous material is added to the gas before it is introduced into the reduction zone of the furnace in such amts. that during the last critical stage the ore is reduced in the presence of such carbonaceous materials. Cf. C. A. 27, 5300.

**Iron sponge.** O. Bergqvist. Swed. 77,083, July 4, 1933. Iron ore is reduced in a shaft furnace by means of gases, e. g., CO,  $\text{H}_2$  and  $\text{CH}_4$ , in the presence of a solid reducing agent (coal or coke). The reducing gas is introduced into the furnace at two different levels, the chief part heated to a high temp. (1200-1300°) so far above the furnace bottom that a cooling zone is formed below the level of introduction, in which zone the reduced Fe sponge can give off its heat to a gas that is taken out at the top of the furnace and introduced cold into the reduction furnace at the lower level of the cooling zone.

**Iron sponge.** S. C. G. Ekelund. Swed. 79,159, Dec. 12, 1933. Iron ore mixed with a solid reducing agent with stirring and in a relatively thin layer is conveyed over one or more hearth surfaces in a reduction furnace by means of scrapers with rotary or oscillatory motion and at the same time is heated by means of a combustible gas that is burned partly with successive application of air during its passage through the furnace.

**Iron.** Eugen Piwowarsky. Ger. 590,059, Dec. 21, 1933 (Cl. 18d. 2.30). Cast iron contg. 0.1-3% of Sb and preferably at least 2% of Ni is used for making articles required to resist wear.

**Grey cast iron.** Heinrich Hanemann. Ger. 588,946, Nov. 30, 1933 (Cl. 18b. 1.02). Addn. to 499,712 (C. A. 24, 4501). In forming grey cast Fe by adding graphite, the method of 499,712 is modified by mechanically stirring the fused Fe during the addn. of the graphite.

**Plant for producing weld iron or steel.** A. M. Byers Co. Ger. 588,769, Nov. 28, 1933 (Cl. 18b. 4).

**Refining iron and steel.** Edith V. Davies. Brit. 400,593, Oct. 16, 1933. A compn. for refining Fe or steel comprises a mixt. of alkali metal chlorate, preferably  $\text{KClO}_3$ ,  $\text{MnO}_2$  and a concd. scavenging agent which comprises alkali metal fluoride, borax or  $\text{Na}_2\text{CO}_3$  or a mixt. of any 2 of these. In an example  $\text{KClO}_3$  12-20, borax and (or)  $\text{H}_3\text{BO}_3$  2-16, NaF and (or) soda ash 2-8 and  $\text{MnO}_2$  1-4 parts.

**Apparatus (employing vibration) for pickling iron and steel sheets, etc.** Edward N. Millan and Edwin B. Hudson (to American Rolling Mill Co.). U. S. 1,944,607, Jan. 23. Structural, mech. and operative details.

**Steels.** Mannesmannröhren-Werke. Brit. 400,102, Oct. 19, 1933. Pressure-welded containers for withstanding high internal and external pressures are made from ingot steel contg. W 0.1-0.7 and C 0.01-0.2%, with or without small amts. of Cu, Mo, V, Cr and (or) Ni, etc.

**Steel for nitriding.** Joseph K. Smith (to Beryllium

Corp.). U. S. 1,943,348, Jan. 16. A steel suitable for nitriding contains Fe (with its common contaminants) together with C 0.15-0.5, Cr 1.5-3.0, Mn about 0.5, Mo 0.5-5.0 and Be 0.35-5.0%.

**Steel for making drawplates and other tools.** Gebr. Böhler & Co. A.-G. Ger. 590,213, Dec. 28, 1933 (Cl. 18d. 2.30). See Austrian 127,769 (C. A. 26, 4297).

**Apparatus for quenching steel to maintain the austenitic structure after hot working.** Wm. Mellor (to Henry Disston & Sons, Inc.). U. S. 1,944,798, Jan. 23.

**Annealing steel.** Floyd C. Kelley (to General Elec. Co.). U. S. 1,944,743, Jan. 23. Various details of app. and operation are described adapted for heating steel strips in a nonoxidizing gas.

**Finishing steel sheets.** Harry H. Holloway (to Apollo Steel Co.). U. S. 1,943,764, Jan. 16. An oxidizing blue finish is applied to the opposite sides of thin previously densified steel sheets by reheating, passing between polished rolls each supplied with a water film, and effecting instantaneous oxidation and compression of the resulting oxide upon and into opposite sides of the sheets throughout their surface areas.

**Spring steel.** Joseph K. Smith (to Beryllium Corp.). U. S. 1,943,347, Jan. 16. A spring steel which has high fatigue resistance contains Fe together with Be 0.3-5.0, Mo 0.35-1.5, Cr 1.0-1.5, C 0.35-0.50 and Mn 1.0-1.5%.

**Steel rails.** Samuel Whyte. U. S. 1,943,944, Jan. 16. In producing rails from steel contg. C 0.5, Mn 1.0 and Cr 0.5%, the rolling heat of the rail is used for maintaining a slow cooling through the crit. range of temp. from about 900° to about 600°, and the rail is air-cooled below such temps. Cf. C. A. 27, 4766.

**Rustless steel.** Vereinigte Stahlwerke A.-G. Fr. 755,817, Nov. 30, 1933. The tendency of Fe and steel to rust is reduced by alloying therewith at least one element, the electrolytic potential of which is below the const. oxidation potential of the corrosion agent ( $E_h = +0.5$  v.) but above that of Fe or steel (Cu up to 1, As, Sb or Sn 0.05-5%) and besides at least one of the elements Ti (0.1-1%) and V (0.1-5%).

**Hardening alloy steel.** Francis B. Foley. U. S. 1,943,595, Jan. 16. Alloy steel contg. substantial but minor proportions of Ni and Al (together not more than 30%) is heated to such a temp. below its  $A_{c1}$  point as will cause the soln. of the Ni and Al in ferrite, followed by cooling at such a rate as will retain the Ni and Al in solid soln., and by reheating to a temp. at least about 166° below the  $A_{c1}$  point and cooling, the time and temp. of reheating and rate of cooling being such as will cause Ni and Al to form and retain a new cryst. phase imparting greatly increased hardness.

**Chromium steels.** Charles E. Macquigg (to Electro Metallurgical Co.). Brit. 401,123, Nov. 9, 1933. See Fr. 747,962 (C. A. 27, 5040).

**Steel and alloys.** Ralph Halkett, Henry A. Fells and James Brown. Fr. 755,927, Dec. 1, 1933. In treating metals with combustion products, the condensable vapor which they contain is removed by cooling.

**Alloy coating on steel.** Pinspongs Metallverks A.-B. (G. H. Clamer, inventor). Swed. 70,729, March 14, 1933. Two or more layers of different metals are applied in succession on the steel surface in proportions corresponding to the compn. of the desired alloy. The metal coatings are then melted.

**Alloys.** Th. Goldschmidt A.-G. Ger. 590,038, Dec. 21, 1933 (Cl. 40b. 12). Bearing alloys contg. Sn 70-90 and Sb 5-20, with or without Cu 0.5-10%, are improved by addn. of Ni and (or) Co 0.5-5 and Cd 0.2-5%. A further addn. of 0.2-2% of As improves the hardness of the alloys, and 0.3-3% of W, Cr, and (or) Mn may also be added, to improve the resistance to corrosion. Cu in the alloys may be replaced in part by Cu-P. Specific alloys are described.

**Alloys.** G. Trione & Co. Fr. 755,918, Dec. 1, 1933. An anti-friction alloy for bearings contains Cu 70 and Pb 30% to obtain perfect miscibility of the 2 metals and an absolute cohesion of their mols.

**Hard alloys.** Fried. Krupp A.-G. (Kurt Moers, Karl

Schröter and Hans Wolf, inventors). Ger. 598,911, Nov. 29, 1933 (Cl. 40b. 17). See Brit. 378,484 (C. A. 27, 3189).

**Nonoxidizing alloy.** Henri Durand. Fr. 755,603, Nov. 28, 1933. A hard white alloy which does not oxidize and is called "nickron" contains Cu (contg. phosphide) 46, Ni (contg. phosphide) 34 and Zn 20%. A small amt. of  $\text{CuSO}_4$  and  $\text{BiSO}_4$  is stirred into the molten alloy.

**Dental alloy.** Établissements Grimar. Fr. 755,827, Nov. 30, 1933. An alloy for metal bases of dental plates contains Sn 24, Sb 4, Cu 1 and Pb 20 parts. Its m. p. is 330°.

**Dental alloys.** Robert R. Bayes. Fr. 755,880, Dec. 1, 1933. See U. S. 1,930,119 (C. A. 28, 914).

**Dental plates and like articles of metal alloys.** Stefan Loos. Brit. 400,089, Oct. 19, 1933. Articles, made of alloys, which are required to fit closely an uneven surface are made by depositing on a mold, e. g., by electrolysis or spraying, a large no. of thin layers of the constituent metals. Diffusion of the metals takes place that may be completed by heating. Dental plates and plates for replacing portions of skull bones may be so made.

**Alloy for oil-cracking tubes.** Frederick M. Becket (to Electro Metallurgical Co.). U. S. 1,943,782, Jan. 16, 1934. An alloy is used contg. Fe together with Cr 16-22, Mn 6-16 and C not more than about 0.3%.

**Heating alloys.** The General Electric Co. Ltd. Fr. 756,288, Dec. 7, 1933. Alloys contg. a volatile constituent such as Zn are heated in a closed chamber contg. H as opposed to a stream of H.

**Aluminum alloys.** Edwin H. Moore. Brit. 400,121, Oct. 19, 1933. Al alloys contg. Si with or without smaller amts. of other elements and impurities are modified by stirring alkali metal nitrate(s) into the molten alloy.

**Aluminum and aluminum alloy castings.** Aluminium Ltd. Brit. 400,026, Oct. 19, 1933. See Fr. 749,182 (C. A. 27, 5707).

**Alloys of aluminum and silicon.** Louis W. Kempf and Ivan R. Dawson (to Aluminum Co. of America). U. S. 1,944,183, Jan. 23, 1934. See Can. 337,971 (C. A. 28, 1053).

**Aluminum-silicon alloys.** Compagnie de produits chimiques et électrometallurgiques Alais, Froges et Camargue. Fr. 756,255, Dec. 7, 1933. An alloy contg. Al 10-80 and Si 90-20% is obtained by reducing the constituents to powder, mixing them and subjecting the mixt. to pressure to form a dense homogeneous mass and heating to above 300° but not to fusion.

**Iron alloys.** Soc. d'électrochimie, d'électrometallurgie et des aciéries électriques d'Ugine. Fr. 755,939, Dec. 1, 1933. Fe alloys (particularly Fe-Cr and Fe-Mn) of very low C content are treated to remove as completely as possible the reducing metal, e. g., Si used for making the alloys, by an energetic beating of the molten metal with an oxidizing slag, fused at the start or fused in contact with the metal. The slag may be an ore contg.  $\text{Cr}_2\text{O}_3$  29.83,  $\text{Al}_2\text{O}_3$  6.86,  $\text{SiO}_2$  3.21,  $\text{CaO}$  45.73;  $\text{FeO}$  6.96 and  $\text{MgO}$  7.25%.

**Cast iron alloy.** The International Nickel Co. Inc. Ger. 580,832, July 17, 1933 (Cl. 18d. 1.20). An alloy contains C 2-4, Ni 5-25, Cr 2-8, Cu 2.2-16%, and the rest Fe. Al up to 3% and Mn between 3-10% may also be present.

**Purification of iron alloys.** Porter H. Brace (to The Canadian Westinghouse Co. Ltd.). Can. 338,679, Jan. 16, 1934. An Fe alloy is placed in an induction furnace in solid form and subjected to the action of a H-bearing gas free from oxidizing ingredients, while sufficient elec. energy is being supplied to the furnace to melt the alloy. The passage of the gas is continued through the metal and a reducing atm. is maintained over the surface of the metal while it is in a molten condition.

**Ferrous alloys suitable for surface hardening by nitriding.** Victor O. Homerberg (to Nitromal Corp.). U. S. 1,944,178, Jan. 23, 1934. Articles are formed of malleable cast iron having nitride-hardened surface portions, contg. 0.15-5.0% Al and 0.1-8.0% of B, Cr, Mo, Ni, Ti, W, V or Zr. U. S. 1,944,179 relates also to articles with

1 nitride-hardened surfaces formed of malleable cast iron contg. Al 0.15-5.0%.

**Ferromagnetic alloys.** Allgemeine Elektrizitäts-Gesellschaft (to International General Electric Co., Inc.). Brit. 400,395, Oct. 26, 1933. Ferromagnetic alloys which have been treated by repeated rolling or stretching, preferably with intermediate heating between the initial stretching steps, are subjected after the final rolling or stretching step to a prolonged heating at 100-250°. The treatment of Fe-Ni alloy rods is described in an example.

**Palladium alloys.** G. Siebert G. m. b. H. Fr. 755,701, Nov. 29, 1933. Alloys suitable for making spinning nozzles, thread-guides, etc., for rayon, contain Pd 20-60% and Ag the rest. The Ag may be replaced in part or wholly by Cu and up to 5% of the Cu may be replaced by Al. Ni, Co, Mn, Sn, Ta or P in amt. up to 10% of the total alloy may also be present. The alloys are improved by heating to 850°, quenching and reheating. Cf. C. A. 27, 2668.

**Alloy for use in the manufacture of tetraethyl lead.** Wm. S. Calcott, Alfred E. Parmelee and Homer F. Meschter (to E. I. du Pont de Nemours & Co.). U. S. 1,944,167, Jan. 23, 1934. Pb 90 and Na 10 parts are melted together with about 0.01 part of  $\text{AlCl}_3$  or  $\text{FeCl}_3$ , which serves as an activator in Et<sub>4</sub>Pb production.

**Hard bodies from tungsten-cobalt alloy.** E. A. A. Grönwall. Swed. 77,227 May 9, 1933. Pulverized WC and/or  $\text{W}_2\text{C}$  and/or pulverized metallic W with or without C is mixed well with not less than one fourth of its wt. of a finely ground W alloy having a lower m. p. than the W carbide or W metal and contg. not less than 50 and not more than 85% W, the remainder being chiefly Co or Co plus Cr and/or Ni. The powder mixt. is given the desired shape, e. g., by pressing, and finally sintered.

**Stable surfaces on sheets of ferrous metal.** Percy A. E. Armstrong. U. S. reissue 19,058, Jan. 23, 1934. A reissue of original pat. No. 1,813,654 (C. A. 25, 5137).

**Coating with metals.** Metallisation Ltd. and Robert A. Parkes. Brit. 400,752, Nov. 2, 1933. Articles of oxidizable metal or alloy, e. g., Fe, steel, Cu, Ni (alloys), are protected either by spraying thereon a coating of Cd, Sb, Bi, Pb, Mg, Sn or Zn and then a coating of Al or by spraying thereon a coating of an alloy of Al with a small proportion of 1 of the specified metals, the coated article in either case being heated to 650-1200°. A coating of bitumastic paint or other substance forming a carbonaceous deposit when heated may be applied before heating.

**Apparatus for hot galvanization of sheet materials.** Stockholms Galvaniseringsfabrik Aug. Pettersson (S. E. F. Björkman, inventor). Swed. 76,293, Jan. 17, 1933.

**Galvanizing malleable iron castings.** Votaw S. Durbin. U. S. 1,944,227, Jan. 23, 1934. For galvanizing, without embrittlement, iron castings which have been annealed so as to malleabilize them, the castings are dipped into molten Zn, cooled, and then reheated to about 650°.

**Rust-proofing oil.** Lawrence G. Benton, Howard R. Tate and Edward R. Lewtas (to Standard Oil Development Co.). U. S. 1,943,808, Jan. 16, 1934. About 2% of naphthalene is mixed with mineral white oil.

**Nickel composition for welding.** Norman B. Pilling and Theodore E. Kihlgren (to The International Nickel Co. Inc.). Can. 338,586, Jan. 9, 1934. An alloy contg. Mg 0.02-0.2, Si 0.05-4.0, Ti 0.05-2.0 and Ni more than 90% is well adapted for fusion welding. Cf. C. A. 27, 4770.

**Electric welding of cold-worked austenitic stainless steel.** Earl J. W. Ragsdale (to Edward G. Budd Mfg. Co.). U. S. 1,944,100, Jan. 10, 1934. Various details of operation are described.

**Welding electrode.** David L. Mathias (to Westinghouse Elec. & Mfg. Co.). U. S. 1,944,753, Jan. 23, 1934. A metallic core which may be formed of ferrous metal carries a surface coating of flux material such as kaolin,  $\text{CaCO}_3$ , ferro-Mn, Na resinates and Na silicate anchored to the core by a combination of first- and second-class conductors such as wire and asbestos yarn helically wound. Cf. C. A. 28, 1014.

**Reclaiming scrap pieces of welding electrodes.** Russell

H. McCarroll and Gosta Vennerholm (to Ford Motor Co.). U. S. 1,943,541, Jan. 16. Pieces from electrodes comprising sintered masses of W particles impregnated with Cu are powdered, forming particles of W coated with Cu and Cu oxide, the Cu oxide is reduced to Cu, the material is pressed in dies to the shape of an electrode and is then sintered.

**Flux-coated welding rod.** Walter R. Hume. U. S. 1,943,807, Jan. 16. A rod is rotated simultaneously with the extrusion upon it of an annular body of flux, and the flux coating is wound with a combustible cord. App. is described.

**Fluxes.** Hubert Sutton and John W. W. Willstop. Brit. 400,609, Oct. 23, 1933. A flux for soft-soldering stainless steels, Zn, Cu, brass, bronzes, etc., comprises a mixt. of  $H_2PO_4$  and a basic substance vaporizable without

decompn., e. g.,  $NH_3$ ,  $PhNH_3$ , pyridine, toluidine, an excess of acid or base being present after formation of the resultant phosphate.

**Solders.** Haus Kanz. Brit. 400,817, Nov. 2, 1933. A Cu-contg. hard solder or welding material in rod or wire form is composed of 2 or more different alloys, 1 at least of which is produced in such form by mech. shaping so as to form at the joint an alloy of m. p. materially lower than that of Cu and which cannot itself be made by mech. shaping. Thus for soldering brass a low-melting solder contg. Zn with 42% Cu, which cannot be obtained in wire form by pressing, rolling or drawing, is produced at the joint by forming by mech. shaping a wire of a Cu-Zn alloy contg. more than 58% Cu and thus of high m. p. and filling or coating it with Zn. Coating may be effected by electrolysis, dipping, sherardizing, etc.

## 10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

The question of free rotation around a single carbon bond. Adolph Partz. *Sitzber. Naturforsch.-Ges. Univ. Tartu* 39, 214-23 (1932).—From heat capacity data and potential energy curves of ethane it is necessary to conclude that free rotation of Me groups take place. It is not possible to explain the excess sp. heat of ethane over  $C_2H_4$  by a torsional vibration instead of free rotation.

A. B. F. Duncan

**Methane and methane homologs as raw materials for chemical synthesis.** A. D. Petrov. *Coke and Chem.* (U. S. S. R.) 1932, No. 9, 28-35.—The process of cracking of  $CH_4$  (for production of gas black +  $H_2$  and  $C_2H_2$  +  $H_2$ ) and other paraffin hydrocarbons of low mol. wt. to form  $C_2H_4$ ,  $C_2H_6$ ,  $C_3H_8$ , etc., is outlined. Also the recently developed methods of production of synthetic rubber,  $Ac_2O$ ,  $AcOH$ , synthetic liquid fuel and other ultimate products of natural and coke-oven gases. Expts. by Krovatzkii on the oxidation of gas (compn.:  $CH_4$  52-56%,  $C_2H_6$  10-12%,  $C_3H_8$  7-20%, higher hydrocarbons 10-12%) led to the following observations: 1. Absence of catalytic action of N oxides on the process of oxidation by pure  $O_2$ . 2. Yields of alcs., aldehydes and acids of 32% were obtained by oxidation without a catalyst. 3. The highest yields were obtained at 400-500° with a sufficient amt. of  $O_2$ . 4. At 600-700° a partial decomn. of the products of oxidation takes place with formation of CO,  $CO_2$  and  $H_2O$ .

James Sorrel

**Influence of poles and polar linkings on the course pursued by elimination reactions. XXI. Dynamics of the elimination of the *tert*-butyl group from sulfonium compounds.** E. D. Hughes and C. K. Ingold. *J. Chem. Soc.* 1933, 1571 G; cf. *C. A.* 27, 5304.—*tert*-BuI and  $Me_3S$  in  $MeNO_2$  give *dimethyl-tert-butylsulfonium iodide*, decomp. 160°; *picrate*, decomp. 132°. The hydroxide decomposes in 2 directions, giving  $Me_2C:CH_3$ ,  $SMe_2$  and  $H_2O$  (A) and  $Me_3COH$  and  $Me_3$  (B), reaction B predominating in aq. soln. When it is allowed to decomp. completely at const. vol., the results are interrelated in precisely the way which is required by the hypothesis that reaction A is bimol., whereas reaction B is unimol.; reaction A is of the 1st order with respect to each ion, while B depends on the cation only. Extraneous  $HO$  ions produce a relative increase in the rate of reaction A. Reaction A is suppressed relatively to reaction B when the strongly basic  $HO$  ion is replaced by the less basic  $CO_3$  ion or the much less basic  $I$  ion. The course of the decomn. can be represented by the unimol. equation  $k_1 = (2/3t) \log_{10} a/(a-x)$  to the degree of accuracy expected. One effect of replacing  $H_2O$  by  $EtOH$  is to cause a great increase in the speed of both decomns.; the other main effect is to cause a selective facilitation of reaction A; a true solvent influence operates selectively on the simultaneous reactions. The data are given in 5 tables.

C. J. West

**Production of organo-metalloidal compounds by microorganisms. II. Dimethyl selenide.** Frederick Challen-

ger and Harry E. North. *J. Chem. Soc.* 1934, 68-71; cf. *C. A.* 27, 1612.—The volatile product from cultures of 2 strains of *P. brevicaulis* (*Scopulariopsis brevicaulis*) or sterile bread crumbs contg.  $NaSeO_4$  and  $NaSeO_3$  is  $Me_2Se$ , this is also produced when the mold is grown on Czapek-Dox soln. contg.  $NaSeO_4$  with glucose (2%) as the sole source of C; with selenite and bread cultures, considerable reduction to red Se occurs; this does not occur with selenate in bread or glucose cultures and better yields of  $Me_2Se$  are obtained. Attempts were made to obtain  $Me_2Se$  by addn. of S or certain of its compds. to bread cultures of strains A and C of *P. brevicaulis*; neg. results were obtained with S,  $Na_2SO_3$ ,  $Na_2S_2O_4$ ,  $CS(NH_2)_2$ ,  $EtSO_3Na$ , "rongalite" and thiodiglycolic acid and its Na salt.  $Et_2S$  is produced when  $Et_2SO$  but not  $Et_2SO_2$  is added to bread cultures of the mold. *Di-Me selenide mercuribromide*, m. 99-100°; *di-Et selenide mercurichloride*, m. 92.5°

C. J. West

**The preparation of aliphatic mercaptans and sulfonic acids of high molecular weight.** G. Collin, T. P. Hilditch, P. Marsh, and A. F. McLeod. *J. Soc. Chem. Ind.* 52, 272-5T (1933).—Practical directions are given to obtain excellent yields of alkyl mercaptans of high mol. wt. from the corresponding iodide or bromide and NaS in alc. in an autoclave. Heating the mercaptans with I in alc. yields the corresponding disulfides. The oxidation of the mercaptans or disulfides to the corresponding sulfonic acid is efficiently obtained by oxidation with  $K_2Cr_2O_7$  or  $KMnO_4$  in acetone. After completion of the oxidation a large excess of concd. aq.  $HCl$  is added, and this "salts out" the sulfonic acid. The yields of all these operations are very good.

A. L. Henne

**Production of chloropicrin from by-products of the acetone industry.** G. Sanna. *Rend. seminario facoltu sci. univ. Cagliari* 2, 87-9 (1932); *Chimie & industrie* 30, 1387.—By-products from the distn. of  $Me_2CO$  are allowed to fall in a mixt. of concd.  $HCl$  and  $HNO_3$ . The reaction is carried out in presence of a catalyst (not disclosed) without which the reaction is too violent, oxidation passes the desired stage and yields oxalic acid, thus reducing the yield of chloropicrin. This process gives a 70% yield with the tail fractions of either the 1st or 2nd rectification of  $Me_2CO$ , and a 20% yield with mixed acetone oils or distn. residues.

A. Papineau-Couture

**Mode of addition to conjugated unsaturated systems. VI. Addition of halogens and hydrogen halides to conjugated unsaturated carboxylic acids and esters.** C. K. Ingold, G. J. Pritchard and H. G. Smith. *J. Chem. Soc.* 1934, 79-86; cf. *C. A.* 27, 4775.— $\delta$ -Vinylacrylic acid (I) and Cl in  $H_2O$  give 60% of  $\delta$ -chloro- $\gamma$ -hydroxy- $\Delta^a$ -pentenoic acid (II), m. 73-4°; its structure was established by the action of  $O_3$ , giving  $AcCHO$ , identified as the 2,4-dinitrophenylhydrazone, m. 299-300° (decomn.). I in  $Et_2O$ , treated with aq.  $HClO_4$ , gives a dichlorodihydroxyvaleric acid, m. 160°. I and Cl in  $H_2O$  or I in  $Et_2O$  and aq.  $HBrO$  give the  $\delta$ -Br deriv. corresponding to II,

m. 92-3°. The addn. of Br to sorbic acid in CS<sub>2</sub> gives as the main product the cryst.  $\gamma,\delta$ -dibromide (III), together with a liquid by-product, the quantity of which was considerable in CS<sub>2</sub>, CHCl<sub>3</sub> and hexane but was much less in AcOH or with quinolinium tribromide in AcOH, all expts. at room temp. III with O<sub>3</sub> gives MeCH:CHBrCHO and CHOCO<sub>2</sub>H. The liquid dibromide contains III and some  $\alpha,\beta$ -isomer. ICl and sorbic acid give  $\gamma$ -chloro- $\delta$ -iodo- $\beta$ -ethylacrylic acid (IV), m. 88°, and a liquid by-product not examd. IV with EtOH-AcOK or C<sub>6</sub>H<sub>5</sub>N, followed by esterification, gives Et sorbate and Et  $\gamma$ -chlorosorbate, b<sub>16</sub> 105-10°, m. 31-2°. The action of Cl on sorbic acid in H<sub>2</sub>O or of aq. HClO in Et<sub>2</sub>O gives 70% of  $\delta$ -chloro- $\gamma$ -hydroxy- $\Delta^{\alpha}$ -hexenoic acid (V), m. 97°; oxidation with O<sub>3</sub> gives ethylglyoxal, identified as the 2,4-dinitrophenylhydrazone, m. 247°; in neutral soln. KMnO<sub>4</sub> gives MeCHClCO<sub>2</sub>H; reduction of V with Pt oxide and H<sub>2</sub> gives  $\delta$ -chloro- $\gamma$ -hexolactone, b<sub>16</sub> 130-2°, b<sub>16</sub> 243°, m. about 10°. The main product of the action of Br was the  $\delta$ -Br deriv. corresponding to V, m. 110°; the oily by-product, esterified with MeOH, gave a fraction analyzing for Me bromohydroxyhexenoate, b<sub>16</sub> 118°, and a fraction, C<sub>7</sub>H<sub>11</sub>O<sub>4</sub>Br, b<sub>16</sub> 148-50°, m. 154-5°. Me sorbate with Br in H<sub>2</sub>O gives Me  $\gamma,\delta$ -dibromo- $\Delta^{\alpha}$ -hexenoate, since O<sub>3</sub> yields  $\alpha$ -bromocrotonaldehyde, whose 2,4-dinitrophenylhydrazone, deep red, m. 220° (decompn.). Br and sorbic acid in EtOH give the  $\gamma$ -Br deriv., also obtained by the action of EtOH-KOH on the di-Br acid. The 2,4-dinitrophenylhydrazone of AcH exists in 2 forms, the less stable modification, orange-red, m. 146°, changing to the more stable, yellow, m. 162°, on crystn. from EtOH. Liquid HCl and sorbic acid at room temp. for several days give an oil, which decomp. on distn. and consists largely of  $\delta$ -chloro- $\Delta^{\beta}$ -hexenoic acid, since O<sub>3</sub> gives AcCHO. Br and Et muconate give a dibromide, m. 81°, yielding with O<sub>3</sub> Et  $\beta$ -bromo- $\beta$ -aldehydoacrylate, the 2,4-dinitrophenylhydrazone of which, yellow, m. 193-4°, (CO<sub>2</sub>H)<sub>2</sub> and (CHBrCO<sub>2</sub>H)<sub>2</sub>; ICl gives a compd., m. 68°, believed to be Et  $\beta$ -chloro- $\alpha$ -iodo- $\Delta^{\gamma}$ -dihydromuconate. VII. Addition of hydrogen cyanide and methyl malonate to methyl cinnamylidenemalonate. Dora A. Duff and C. K. Ingold. *Ibid.* 87-93.—The addn. of 2 mols. HCN to PhCH:CHCH:CH(CO<sub>2</sub>Me)<sub>2</sub> and hydrolysis gives  $\delta$ -phenylbutane- $\alpha,\beta,\gamma$ -tricarboxylic acid (I), m. 187-90° (decompn.) (cf. Thiele and Meisenheimer, *Ann.* 306, 247(1899)); tri-Me ester, m. 60°; di-Me ester, m. 112°. PhC(CO<sub>2</sub>Et):CH<sub>2</sub> and (EtO<sub>2</sub>C)<sub>2</sub>CHCH<sub>2</sub>CO<sub>2</sub>Et with EtONa give Et-phenylbutane- $\alpha,\beta,\gamma$ -tricarboxylate, b<sub>16</sub> 165°; boiling with 1 vol. H<sub>2</sub>SO<sub>4</sub>, 1 vol. H<sub>2</sub>O and 3 vols. HCO<sub>2</sub>H for 16 hrs. gives  $\delta$ -phenylbutane- $\alpha,\beta,\gamma$ -tricarboxylic acid, m. 210-2°. PhCH<sub>2</sub>CH(CO<sub>2</sub>Et)<sub>2</sub> and Et lunarite with EtONa give Et-phenylbutane- $\alpha,\beta,\gamma,\gamma$ -tetracarboxylate (II), b<sub>16</sub> 204-8°, hydrolyzed to a stereoisomeric form of I, m. 168°; with Et  $\alpha$ -bromosuccinate there results an isomeric II, b<sub>16</sub> 184-6°, which yields I on hydrolysis. The original nitrile thus has the structure PhCH<sub>2</sub>CH(CN)CH(CN)CH(CO<sub>2</sub>Me)<sub>2</sub>; the intermediate in the reaction is the  $\alpha,\beta$ -adduct, which theory requires to possess greater thermodynamic stability than its  $\alpha,\delta$ -isomer. The addn. product of 2 mols. CH<sub>2</sub>(CO<sub>2</sub>Me)<sub>2</sub> to PhCH:CHCH:CH(CO<sub>2</sub>Me)<sub>2</sub> (Meerwein, *Ann.* 360, 323-47(1908); *C. A.* 2, 1005), m. 81°, has the structure suggested by M. The hydrolysis product,  $\beta$ -phenylisohexane- $\alpha,\alpha,\epsilon$ -tricarboxylic acid, m. 140°, subjected to the Dieckmann reaction, gives 2 isomers, m. 139° and 144°, which may be either Me 6- or 2-carboxy-3-phenylcyclohexanone-5-acetate; the lower-melting isomer changes into the higher-melting on standing several months or with a little HCl in cold MeOH; hydrolysis with HCl-HCO<sub>2</sub>H gives 3-phenylcyclohexanone-5-acetic acid, m. 118-9°, which is reduced to 3-phenylcyclohexane-1-acetic acid (III), m. 52-4°. Because of the possibility that the reduction product might be 2-benzylcyclopentane-1-acetic acid (IV), this acid was prepd. as follows: Et cyclopentanone-2-carboxylate, from Et adipate, with PhCH<sub>2</sub>Cl and EtONa gives the Et ester, b<sub>16</sub> 208°, n<sub>D</sub><sup>20</sup> 1.5050, of  $\alpha$ -benzylglypic acid, m. 116-8°; Ac<sub>2</sub>O gives 2-benzylcyclopentanone (V), b<sub>16</sub> 144-6° (semicarbazone, m. 198-200°); in the 1st

attempt to introduce the AcOH side chain, V was reacted with NCCH<sub>2</sub>CO<sub>2</sub>Et and piperidine, giving Et  $\alpha$ -cyan-2-benzylcyclopentylidene-1-acetate, m. 81-3°; satisfactory conditions for hydrolysis could not be detd; cold concd. H<sub>2</sub>SO<sub>4</sub> gives Et 2-sulfolbenzylcyclopentylidene-1-malonamate, m. 120°. Reduction of V with Na gives 2-benzylcyclopentanol, b<sub>16</sub> 154°; HBr in AcOH gives 2-bromo-1-benzylcyclopentane, b<sub>16</sub> 150-5°; CH<sub>2</sub>(CO<sub>2</sub>Et)<sub>2</sub> and EtONa give Et 2-benzylcyclopentane-1-malonate, b<sub>1</sub> 142-50°; the free acid m. 137° and on heating at 150° gives IV. III was prepd. as follows: 3-Phenylcyclohexanol was converted into the bromide and condensed with CH<sub>2</sub>(CO<sub>2</sub>Et)<sub>2</sub>, giving the Et ester, b<sub>16</sub> 160-5°, of 3-phenylcyclohexane-1-malonamic acid, m. 160°; decarboxylation gives III. This proves that the suggested Wagner change has nothing to do with the malonic ester addn. and, probably, with the HCN addn. C. J. West

4 Addition of hydrogen bromide to olefins. J. C. Smith. *Nature* 132, 447(1933). HBr passed through a 0.1% soln. of undecylenic acid in ligroin gives 70-80% yields of almost pure  $\alpha$ -bromoundecic acid. If O is removed either by passage of H or by addn. of Ph<sub>2</sub>NH or by both methods a mixt. is obtained in which the  $\alpha$ -Br isomer predominates. This substantiates Karasch's views.

A. L. Henne

4 Halogenation. V. Bromination and iodination of some fatty acids. Phuldeo Sahay Varma and V. T. Shridhara Menon. *J. Indian Chem. Soc.* 10, 591-2 (1933); cf. *C. A.* 24, 5740. The fatty acid or anhydride (20 cc.) was refluxed with KBr or KI (5 g.) and concd. H<sub>2</sub>SO<sub>4</sub> or nitrosulfonic acid (10 cc.) was gradually added. After 5 hrs. the mixt. was cooled, treated with H<sub>2</sub>SO<sub>4</sub> and extd. with Et<sub>2</sub>O. The dried ext. was evapd. and the residue recrystd. from H<sub>2</sub>O or alc. The lower fatty acids gave poor yields but with the higher acids the method gave satisfactory yields of  $\alpha$ -Br and  $\alpha$ -I derivs., both of which have been obtained in this manner from AcOH, Ac<sub>2</sub>O, EtCO<sub>2</sub>H, butyric anhydride, isobutyric acid, palmitic and stearic acids, in addn. to  $\alpha$ -Br derivs. of lauric and myristic acid. The results are tabulated.

5 VI. Bromination and iodination of benzonitrile. Phuldeo Sahay Varma and Nirode Baran Sen-Gupta. *Ibid.* 593-4.—Br and I derivs. have been obtained directly by the action of KBr and KI with concd. H<sub>2</sub>SO<sub>4</sub> on PhCN. A layer of PhCN (10 cc.) was poured over concd. H<sub>2</sub>SO<sub>4</sub> (5 cc.) in a test tube and KBr (4 g.) was carefully added. After 3 hrs. the solid upper layer was removed, shaken with cold H<sub>2</sub>O and filtered. On evapn. the filtrate gave 2.5 g. of *p*-BrC<sub>6</sub>H<sub>4</sub>CN. The residue was digested with H<sub>2</sub>O at 50° and yielded 0.6 g. of *o*-BrC<sub>6</sub>H<sub>4</sub>CN. The remaining solid was extd. with boiling H<sub>2</sub>O and sepd. into 0.8 g. BzOH and 0.4 g. BzNH<sub>2</sub>. When similarly treated with KI and concd. H<sub>2</sub>SO<sub>4</sub>, 10 cc. PhCN gave 2 g. *p*- and 0.7 g. of *o*-IC<sub>6</sub>H<sub>4</sub>CN, together with 0.7 g. of BzOH and 1.1 g. of BzNH<sub>2</sub>. VII. Iodination and bromination of naphthalene and  $\beta$ -naphthol. Phuldeo Sahay Varma, D. N. Mozumdar and K. Kunjan Rajah. *Ibid.* 595-8.—By refluxing a mixt. of 10 g. C<sub>10</sub>H<sub>8</sub>, 10 cc. glacial AcOH, 10 g. of I and 15 cc. of a mixt. of equal parts of nitrosulfonic acid and fuming HNO<sub>3</sub>, 6.2 g. of  $\alpha$ -iodonaphthalene (I), b. 302-5° (picrate, m. 127°), was formed. Other variations of the iodination with K<sub>2</sub>S<sub>2</sub>O<sub>8</sub>, CrO<sub>3</sub>, a mixt. of concd. H<sub>2</sub>SO<sub>4</sub> and HNO<sub>3</sub>, etc., varying amts. of I, and different reaction periods are tabulated together with yields of I. The iodination of  $\beta$ -HOC<sub>10</sub>H<sub>7</sub> (5 g.) in 10 cc. concd. NH<sub>4</sub>OH by the dropwise addn. of 4.5 g. of I in KI soln. gave 9.2 g. of iodo- $\beta$ -naphthol, m. 93-4°. The nascent NI<sub>2</sub> formed by the action of I on NH<sub>4</sub>OH seems to be the active iodination agent. The bromination of 10 g. of C<sub>10</sub>H<sub>8</sub> in the presence of a nitrosulfonic-nitric acid mixt. yielded 10.1 g. (62%) of C<sub>10</sub>H<sub>7</sub>Br, b. 283-5°, and 3 g. of C<sub>10</sub>H<sub>7</sub>NO<sub>2</sub>. Bromination of  $\beta$ -HOC<sub>10</sub>H<sub>7</sub> (5 g.) at 10° in the presence of concd. H<sub>2</sub>SO<sub>4</sub> (1 cc.) yielded 5.8 g. of 1-bromo- $\beta$ -naphthol, m. 83-4°. With fuming H<sub>2</sub>SO<sub>4</sub> and 3.6 cc. Br, 3.5 g. of 1,6-dibromo- $\beta$ -naphthol, m. 105-6°, was produced.

C. R. Addinall

Iodine compounds in seaweed. Etsuo Masuda. *Proc. Imp. Acad.* (Tokyo) 9, 599-601(1933).—The org. I

compd. from *Ecklonia cava*, oxidized with  $H_2O_2$ , gives the following compds.:  $CH_2IClO_2H$ ,  $(CH_2I)_2CO$ ,  $CHI_2CO_2H$ ,  $I_2C:CHCO_2H$  and a compd.,  $I_2CCHO$ , yellow, m. 126-7° (decompn.); the yields, based on the dry powder, were: 0.02, 0.08, 0.02, 0.009 and 0.007%, resp. C. J. West

**Catalytic hydrogenation of trifluoroacetic anhydride. Trifluoroethyl alcohol.** Fred. Swarts. *Compt. rend.* 197, 1261-4 (1933).  $-(CF_3CO)_2O$ , pure or in  $Bu_2O$ , hydrogenated over Pt black at 20-40° and 45-50 atm., yields principally  $CF_3CO_2CH_2CF_3$  (I), m. -65.5°,  $b_{760}$  55.0°,  $d_4^{20}$  1.5179,  $d_4^{15}$  1.4725,  $n_D^{20}$  1.2799,  $n_D^{15}$  1.2812,  $n_{H_2O}^{15}$  1.2823, viscosity  $\eta^{20}$  0.006719,  $\eta^{40}$  0.005067, and also  $CF_3CH_2OH$  (II), m. -43.5°, b. 74.05°,  $d_4^{20}$  1.4106,  $d_4^{15}$  1.3739,  $n_D^{20}$  1.2806,  $n_D^{15}$  1.2907,  $n_D^{10}$  1.2934,  $\eta^{20}$  0.01096,  $\eta^{40}$  0.00796,  $CF_3C(=O)H$  (III) (sepd. from II by its formation with  $Bu_2O$  of an azeotropic mixt. b. 144°) and  $CF_3Me$  (IV), m. -107°, b. -46.8°, crit. temp. 71-2°, wt. of normal I. 3.784 g. No aldehyde is formed. II is also formed by hydrogenation of  $CF_3CONH_2$  in  $Et_2O$ , and is readily obtained by sapon. of I in cold  $H_2O$ . With  $K_2CO_3$  or  $CaO$ , II yields the alcoholates; with  $H_2CrO_4$  it gives III but no aldehyde;  $HBr$  is inert, but  $PBr_5$  yields  $CF_3CH_2Br$ , b. 26.5°,  $d_4^{20}$  1.8383. With  $H_2SO_4$ , esterification of II is difficult, and  $Ba(CF_3CH_2SO_4)_2 \cdot H_2O$  is obtained. II and  $AcCl$  give  $CF_3CH_2OAc$ , b. 77.85°,  $d_4^{20}$  1.2887,  $d_4^{15}$  1.32058,  $n_D^{20}$  1.32191,  $n_D^{15}$  1.32517,  $n_D^{10}$  1.3273,  $\eta^{20}$  0.006987,  $\eta^{40}$  0.004676. In sunlight, IV and Cl form  $CF_3CCl_3$ , m. 13°, b. 46°. H. A. Beatty

**Preparation of isobutylenediamine.** H. D. K. Drew and F. S. H. Head. *J. Chem. Soc.* 1934, 49-50.  $Me_2C:CH_2$  is converted into  $Me_2CClCH:NOH$ , m. 104°; in satd.  $EtOH-NH_3$  this yields the *HCl* salt, m. 210° (decompn.), of  $\alpha$ -aminoisobutyraldoxime (I), m. 89° (benzylidene deriv., m. 110°); reduction of the oxime with  $Na-Hg$  in  $AcOH$  gives a mixt. of 15-20% of  $Me_2C(NH_2)CH_2NH_2$  and a tetramethylpiperazine, probably  $Me_2C \cdot CH_2 \cdot NH \cdot CMe_2 \cdot CH_2 \cdot NH$ . I and  $Ac_2O$  give  $\alpha$ -

acetamidoisobutyronitrile and *N*-acetyl- $\alpha$ -aminoisobutyraldoxime, m. 198-9°. C. J. West

**Serinephosphoric acid obtained on hydrolysis of vitellinic acid.** P. A. Levene and A. Schormüller. *J. Biol. Chem.* 103, 537-42 (1933).—Hydrolysis of vitellinic acid by the method of Lippmann and Levene (*C. A.* 27, 743) followed by treatment with brucine, yielded *serinephosphoric acid*,  $C_6H_8O_6NP$  (I), isolated as the *brucine* salt, m. 98°. Hydrolysis of the *Ba* salt of I gave serine in 50% yield. The failure to obtain a peptide of I with glutamic acid, although in the hydrolysis of casein by more vigorous methods such a peptide appears, indicates that in vitellinic acid I is not combined with glutamic acid. K. V. T.

**Enol content in the acetylacetone series.** Charley Gustafsson. *Finska Kemistamsfundels Medd.* 42, 64-8 (1933).—The enol contents of valeryl- and caproyl-acetone determined by their optical exaltation are 77% and 68% which are, respectively, 7.4% and 14.5% higher than the values given by titration. A German summary is included. H. C. Duus

**Optical rotatory dispersion in the carbohydrate group. II. Ascorbic acid.** R. W. Herbert, E. L. Hirst and C. E. Wood. *J. Chem. Soc.* 1933, 1564-7; cf. *C. A.* 28, 1071.—The rotatory dispersion of aq. solns. of ascorbic acid may be represented by the equation  $\alpha_\lambda = 2.518/(\lambda^2 - 0.195) - 1.340/(\lambda^2 - 0.063)$ . The equation representing the dispersion of *Na* ascorbate is  $\alpha_\lambda = 1.916/(\lambda^2 - 0.060)$ . W. Gordon Rose

**The preparation of glucuronic acid from borneol-glucuronic acid.** K. T. Swartz and C. O. Miller. *J. Biol. Chem.* 103, 651-5 (1933).—The hydrolysis of borneol-glucuronic acid by the method of Quick (*C. A.* 21, 3373), is only 50% complete, but if the borneol is steam-distd. at the same time the yield is 69%. During the hydrolysis there is formed *bornyl borneolglucuronate*, which seps. as an oil  $(C_{16}H_{17})_2 \cdot C_6H_5O_7$ , m. (after purification) 96-7°. K. V. Thimann

**Ascorbic acid and synthetic analogs.** D. K. Baird, W. N. Haworth, R. W. Herbert, E. L. Hirst, F. Smith

and M. Stacey. *J. Chem. Soc.* 1934, 62-7; cf. *C. A.* 28, 1071.—Improved directions are given for the prepn. of *d*-glucoascorbic acid (3-keto-*d*-glucoheptonofuranolactone) (I); the hydrate m. 138°,  $[\alpha]_D^{20} -14^\circ$  ( $H_2O$ , c 1 as hydrate),  $-22^\circ$  ( $MeOH$ , c 1 as hydrate); the *Na* salt has  $[\alpha]_D^{20} -80^\circ$  (neutral aq. soln., c 0.75); the anhyd. compd. m. 191° (decompn.); the oxidation compd. with acid I gives with  $PhNHNH_2$  a compd.,  $C_{19}H_{20}O_6N_4$ , yellow, m. 222°. Details are given of the prepn. *l*-arabinosazone and arabinosone, which reacts with  $NH_3$ ,  $KCN$  and  $CaCl_2$  to give  $\psi$ -araboascorbic acid, converted by 8% aq.  $HCl$  to the *l*-acid (3-keto-*l*-glucofuranolactone), m. 168° (decompn.),  $[\alpha]_D^{20} 19^\circ$  ( $H_2O$ , c 0.6); the *Na* salt shows  $[\alpha]_D^{20} -94^\circ$  (neutral aq. soln., c 0.7); the primary oxidation product showed  $[\alpha]_D^{20} -100^\circ$  (in presence of III immediately after oxidation with I), changing to 12° in 90 hrs.;  $[\alpha]_D^{20}$  of *Na* salt 70° (approx.) in aq. soln. immediately after neutralization. In the same way *d*-galactosone yields *d*-galactascorbic acid (3-keto-*d*-galactofuranolactone), whose monohydrate m. 100° (decompn.); *Na* salt,  $[\alpha]_D^{20} -77^\circ$  (neutral aq. soln., c 0.7). Lactosone yields  $\psi$ -lactascorbic acid, which gives I with 8%  $HCl$ . The absorption spectra of ascorbic acid and its analogs are given; all the substances, excluding the  $\psi$ -compds., show in dil. aq. soln. (2 g. per 100 cc.) an intense band at  $\lambda 265 m\mu$ ; in more concd. aq. soln. the band is at  $\lambda 240-5 m\mu$  and the neutral *Na* salts of the acids have a band at  $\lambda 265 m\mu$ ; in all cases  $\log \epsilon$  is very close to 4. C. J. West

**Influence of solvents and of other factors on the rotation of optically active compounds. XXXII. Rotation dispersion of esters of dibenzoyl-*d*-tartaric acid in various solvents.** T. S. Patterson and David McCreath. *J. Chem. Soc.* 1934, 100-3; cf. *C. A.* 27, 4779.—Data are given for the *Me*, *Et*, *Pr* (I) and *Bu* (II) esters of dibenzoyl-*d*-tartaric acid. I b. 234°, m. 45.5°,  $[\alpha]_D^{20} -78.16^\circ$  ( $C_6H_5N$ , c 2.162); II b. 250°, m. 43°,  $[\alpha]_D^{20} -57.62^\circ$  ( $C_6H_5N$ , c 3.64). Values for *d* and  $[\alpha]$  are given for the *Me* ester in  $MeNO_2$ ,  $C_2H_5Br$ ,  $C_3H_7N$  and quinoline; for the other 3 esters in  $C_2H_5Br$ ,  $C_3H_7N$  and quinoline. While the results confirm in general those previously published for the *o*-nitrobenzyl ester, in no case was there found an equally definite region of anomalous dispersion. For the *Me* ester a distinct min. occurs in the *T-R* curve for green light in  $C_2H_5Br$  at a temp. of about 50°, whereas in quinoline the graph appears to be approaching a min. at a considerably lower temp., in agreement with which the actual rotation is lower; much the same thing applies to the solns. in  $C_3H_7N$  and  $MeNO_2$ . For the *Et* ester a min. appears in all 3 solns. but at a higher temp. in quinoline than in the other 2. The *Pr* ester shows a very similar behavior but with a tendency for the min. to move to a higher temp. and this tendency is more pronounced in the *Bu* ester. The rotation of the *Bu* ester in quinoline rises as the temp. falls, in such a way as to cross the 0 axis and become pos., in the sequences red, yellow, green and blue; and the temp. rotation curves just begin to intersect one another at a temp. of 0°, below which the region of visibly anomalous dispersion would doubtless develop. C. J. West

**Condensation of chloral and bromal with diamides.** F. D. Chattaway and E. J. F. James. *J. Chem. Soc.* 1934, 109-13.—Methylurea and chloral hydrate (2 mols.) in  $H_2O$  give *N*-methyl-*N'*-( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl)urea (I), m. 140° (decompn.); *di-Ac* deriv., m. 90-1° (decompn.);  $Ac_2O$  in *N*  $NaOH$  gives *bis*( $\beta,\beta,\beta$ -trichloro- $\alpha$ -*N'*-methylcarbamidoethyl) ether, m. 230° (decompn.); *di-Ac* deriv., m. 131° (decompn.); *Na* in  $EtOH$  gives the  $\alpha$ -*EtO* deriv. of I, m. 145° (decompn.). Ethylurea gives *N*-ethyl-*N'*-( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl)urea (II), m. 138° (decompn.); *di-Ac* deriv., m. 80° (decompn.); *bis*( $\beta,\beta,\beta$ -trichloro- $\alpha$ -*N'*-ethylcarbamidoethyl) ether, m. 226° (decompn.); *di-Ac* deriv., m. 145° (decompn.);  $\alpha$ -*MeO* deriv. of II, m. 180° (decompn.);  $\alpha$ -*EtO* deriv., m. 135° (decompn.);  $\alpha$ -*PrO* deriv., m. 140° (decompn.);  $\alpha$ -*BuO* deriv., m. 95° (decompn.). Diphenylurea gives *N,N*-diphenyl-*N'*-( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl)urea, m. 170° (decompn.); *mono-Ac* deriv.,

m. 108° (decompn.). Bromal and methylurea give *N*-methyl-*N'*-( $\beta,\beta,\beta$ -tribromo- $\alpha$ -hydroxyethyl)urea (III), m. 180° (decompn.); *di*-Ac deriv., m. 119° (decompn.); *bis*( $\beta,\beta,\beta$ -tribromo- $\alpha$ -*N'*-methylcarbamidoethyl)urea, m. 162° (decompn.); *di*-Ac deriv., m. 180° (decompn.);  $\alpha$ -EtO deriv. of III, m. 162° (decompn.). The *Ph* analog (IV) of III m. 167° (decompn.); its *di*-Ac deriv. m. 142° (decompn.); the ether m. 185° (decompn.), and its *di*-Ac deriv. m. 163° (decompn.); the  $\alpha$ -MeO deriv. of IV m. 158° (decompn.), and the  $\alpha$ -EtO deriv. m. 145° (decompn.). The *N,N*-*di*-Me analog of III m. 165° (decompn.) and forms an unstable hydrate, m. 96° (decompn.). The *N,N*-*di*-Ph analog of III m. 168° (decompn.). Oxamide and chloral give *N,N'*-*bis*( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl)oxamide (V), decomp. gradually above 190° into its constituents; *di*-Ac deriv., m. 192°. Et *N*-( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl)oxamide and PhNH<sub>2</sub> in EtOH give *N*-phenyl-*N'*-( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl)oxamide, decomp. above 180° into chloral and *N*-phenyloxamide; *mono*-Ac deriv., m. 185°. V and PCl<sub>5</sub>, heated on the water bath for 30 min., give *N,N'*-*bis*( $\alpha,\beta,\beta,\beta$ -tetrachloroethyl)oxamide, m. 170°; crystn. from boiling EtOH gives the  $\beta,\beta,\beta$ -trichloro- $\alpha$ -ethoxyethyl deriv., m. 176°; EtOH-NH<sub>2</sub> gives the corresponding *di*-NH<sub>2</sub> deriv., m. 213°; PhNH<sub>2</sub> gives the *dianilino* deriv., m. 193° (decompn.). Malonamide gives *C,N,N'*-*tris*( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl)malonamide, prisms or plates, m. 180°; *tri*-Ac deriv., m. 165° (decompn.). *N,N'*-*Diphenyl* ( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl)malonamide, m. 187° (decompn.); Ac deriv., m. 210° (decompn.). *N*-Phenyl-*N'*-( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl)( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl)malonamide, m. 170° (decompn.); *di*-Ac deriv., m. 175° (decompn.). *N,N'*-*Bis*( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl)ethylmalonamide, m. 163° (decompn.); *di*-Ac deriv., m. 132°. *N*-Phenyl-*N'*-( $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethyl)ethylmalonamide, m. 164° (decompn.); Ac deriv., m. 185° (decompn.). Chloral and malonanilic acid give  $\gamma,\gamma,\gamma$ -trichloro- $\beta$ -hydroxybutyranilide, m. 146° (decompn.); Ac deriv., m. 149° (decompn.). NCCH<sub>2</sub>CONH<sub>2</sub> gives cyanoacet- $\beta,\beta,\beta$ -trichloro- $\alpha$ -hydroxyethylamide, m. 155° (decompn.); Ac deriv., m. 108° (decompn.). C. J. West

**Mercury derivatives of the purine group.** Mario Covello. *Rend. accad. sci. Napoli* [4], 3, 65-70(1933).—The Hg derivs. of purines should have pharmacol. properties (cf. C. A. 18, 880; 23, 1622). Nineteen g. of a purine base contg. Me or CH<sub>2</sub>Cl at position 8 was dissolved in 1 l. of 5% AcOH, treated with 30 g. of Hg(OAc)<sub>2</sub> in 10 cc. AcOH and 20 cc. H<sub>2</sub>O, heated 2 days under a reflux condenser and finally evapd. to 300 cc. The Hg acetate deriv. (—HgOAc substituted for a H of the 8-Me group) ppts. Ten g. of this acetate heated with 20 g. KI in 50 cc. H<sub>2</sub>O, filtered and evapd. to 15 cc. gives the *mercuripurine*, (purine)<sub>2</sub>Hg. 8-Methylcaffeinemericuric acetate decomposes 250°; *mercuri-8-methylcaffeine* decomposes 300°; *tetrachlorotetramethylxanthinemericuric acetate* does not decompose 300°; *mercuritetrachlorotetramethylxanthine* decomposes 200°; *trichloro-8-methylcaffeinemericuric acetate* decomposes above 300°; *mercuritrichloro-8-methylcaffeine* browns at 200° without melting. All are sol. in weakly alk. solns. The Hg is not ionizable in these compds.: solns. treated with NH<sub>4</sub> polysulfide do not blacken appreciably, and HgO is not formed on treatment with potash. Janet E. Austin

**Phytochemical notes. II. The carbohydrates of several plant downs.** E. Votoček and J. Zvoníček. *Collection Czechoslov. Chem. Communications* 5, 448-451(1933); cf. C. A. 26, 5306.—The materials were extd.

with Et<sub>2</sub>O, boiled with water to give an aq. ext., boiled with 3% H<sub>2</sub>SO<sub>4</sub> for 8 hrs. to dissolve hemicelluloses, and the residue dissolved in 80% H<sub>2</sub>SO<sub>4</sub>, dild., boiled, and tested for glucose to identify true cellulose. J. J. W.

**Carbon rings. XXVI. Many-membered cycloalkylamines.** L. Ruzicka, M. W. Goldberg and M. Hürbin. *Helv. Chim. Acta* 16, 1330-42(1933); cf. C. A. 27, 5062.—Cyclooctylamine (I), m. 179-80°, cyclopentadecylamine (II), m. 137.5-38° and 1,16-diaminocyclotriacotane (III), m. 178-9° (decompn.), were prepd. by reduction of the corresponding oximes with Na and alc. I and III showed no noteworthy physiol. effect. II (1:100,000) stopped the heat of an isolated frog heart in diastole while substances like digitalis do so in systole. Oxime of I, m. 33°, d<sub>4</sub><sup>20</sup> 1.025, d<sub>4</sub><sup>25</sup> 0.979, n<sub>D</sub><sup>20</sup> 1.508, n<sub>D</sub><sup>25</sup> 1.4834, M<sub>D</sub><sup>20</sup> 41.05, and M<sub>D</sub><sup>25</sup> 41.22; oxime of II, m. 75-6°, d<sub>4</sub><sup>20</sup> 0.9273, n<sub>D</sub><sup>20</sup> 1.4830, M<sub>D</sub> 73.06; oxime of III, m. 141-2°. A. W. D.

**The trans- $\alpha,\alpha'$ -dimethylcyclohexanone of Skita should be a cis isomer.** R. Cornubert and M. de Demo. *Compt. rend.* 197, 843 5(1933).—The prepn. of  $\alpha,\alpha'$ -dimethylcyclohexanone (I) from the hexanol by Skita's method (C. A. 18, 979) has been repeated. It does not combine with NaHSO<sub>3</sub> but gives 2 oximes m. 79° (Skita 86°) and 119°; 2 semicarbazones m. 183° and 197°; and 2 tetrahydropyrene compds. m. 175° and 216°. These compds. are identical with those prepd. from I made by methylation of  $\alpha$ -methylcyclohexanone (C. A. 22, 1900) since the oxime m. 65° after further purification m. 79°. Skita's ketone is identical with that of C. and D. and must be the cis form. Janet E. Austin

**p-Cymene. I. The preparation of p-cymene from white camphor oil by the action of sulfur.** Seizō Kimura. *J. Soc. Chem. Ind., Japan*, 37, Suppl. binding 4(1934).—Addns. of vulcanization accelerators, activated C or Japanese acid clay to the reacting substances resulted in increased yields. When ZnCl<sub>2</sub> was used for dehydrating cineole in white camphor oil a high yield of very pure p-cymene was obtained. The combined use of vulcanization accelerators or activated C with ZnCl<sub>2</sub> was ineffectual and heating under reduced pressure was unfavorable for the completion of the reaction. Similar results were obtained when prepg. p-cymene from dipentene in camphor oil with S. II. **The preparation of an azo dye and 5-amino-p-cymene.** *Ibid.* 4.—p-Cymene was nitrated to 2-nitro-cymene (yield 46%), then reduced to 2-aminocymene (yield 60-77%). Coupling with diazotized sulfanilic acid gave a red azo dye found to be p-sulfolbenzeneamino-azo-p-cymene. Diazotization of this compd. resulted in the formation of 5-amino-p-cymene. K. K.

**The shifting of the allyl group.** Jakob Meisenheimer and Georg Beutter. *Ann.* 508, 58-80(1933).—PhCH:—CHCH<sub>2</sub>Cl reacts with metallic acetates to give PhCH:—CHCH<sub>2</sub>OAc (I) (normal substitution) or PhCH(OAc)—CH:CH<sub>2</sub> (II) (abnormal substitution); a rearrangement of II into I also occurs. The % of II and I formed with various acetates in 1 hr. on warming on the water bath were: Li, 9, 55; Na, 20, 35; K, 22, 38; Mg, 0, 44; Ca, 6, —; Ba, 21, 36; Pb, 30, 46; at this temp. there was considerable polymerization; at 50° there was much less polymerization; the % of II formed at 50° was: Li, 48 hrs., 12; K, 24 hrs., 35; Mg, 120 hrs., 0; Ca, 72 hrs., 5; Ba, 63 hrs., 24. The effect of solvent upon the reaction (using AcOK) is shown by the following values: pure AcOH, 27% II, 32% I; AcOH with 3.6% H<sub>2</sub>O, 22, 38; with 7.2% H<sub>2</sub>O, 19, 43; with 12.6% H<sub>2</sub>O, 14, 50. Thus H<sub>2</sub>O favors the normal substitution. Using PhCH:—CHCH<sub>2</sub>Cl and AcOK in the concns. given, the % yields of II were: N, 1.5 N, 22%; N, 2.5 N, 28%; 2 N, 3 N,

1°; its alc. solns. give a green color with alc. KOH. It is also formed from I,  $\text{PhHNH}_2 \cdot \text{HCl}$  and  $\text{NaOAc}$ , but in lower yield. In accordance with the behavior of compds. of the XII type, the products obtained give with alc. KOH more or less intense colors as a result of the formation of quinonoid salts of the XIII type.

C. C. Davis

**The monochlorination of *m*-nitrotoluene.** W. E. Evison. *J. Soc. Chem. Ind.* 52, 275-6T (1933). The chlorination of *m*-nitrotoluene gives a product 30% of which is the 6-Cl, 21% the 2-Cl, and 10-15% the 4-Cl isomer, together with about 10% of di-Cl compds. A. L. H.

**Nitration of alkylbenzenes.** I. Nitration of *p*-ethyltoluene. O. L. Brady and J. N. E. Day. *J. Chem. Soc.* 1934, 114-21.—This work was undertaken with the idea of studying the view that the electron-donating power of alkyl groups increases with the length of the C chain and that branched chains are more effective than isomeric normal chains. On mononitration of *p*- $\text{EtC}_6\text{H}_4\text{Me}$  (I) with  $\text{HNO}_3$ - $\text{H}_2\text{SO}_4$  under conditions which ensure complete mononitration of PhEt, I is only partly nitrated, some 14% being recovered unchanged; oxidation also occurs with the production of *p*- $\text{MeC}_6\text{H}_4\text{Ac}$  and *p*- $\text{MeC}_6\text{H}_4\text{CO}_2\text{H}$ ; the highest-boiling fraction,  $b_{700}$  247-9°, consists essentially of the 2- $\text{NO}_2$  deriv. of I; oxidation gives 2-nitro-*p*-toluic acid; the intermediate fractions were mixts., probably contg. the 3- $\text{NO}_2$  deriv. of I, although it could not be isolated; 3-benzamido-*p*-ethyltoluene(?), m. 131°. Less drastic nitration conditions (sufficient for the mononitration of PhMe) gave a larger proportion of unchanged I and, although *p*- $\text{MeC}_6\text{H}_4\text{CO}_2\text{H}$  was not found, more *p*- $\text{MeC}_6\text{H}_4\text{Ac}$  was produced, together with what was probably *p*- $\text{MeC}_6\text{H}_4\text{CH}_2\text{CHO}$ , whose dinitrophenylhydrazone, yellow, m. 206°; the 2- $\text{NO}_2$  deriv. of I was the main product of the nitration. Dinitration of I gives about 25% of the 2,3-di- $\text{NO}_2$  deriv., m. 51.5°. Trinitration of I gives 40-50% of the 2,3,6-tri- $\text{NO}_2$  deriv. (II), m. 93°; no ketones or aldehydes were present. II and  $\text{N}_2\text{H}_4$  (III) in EtOH give 2,6-dinitro-3-hydrazino-*p*-ethyltoluene (III), yellow, m. 171° (decompn.); warming with  $\text{NH}_4\text{OH}$  (d. 0.88) gives the 3- $\text{NH}_2$  deriv. (IV), yellow, m. 143°. III in AcOH, heated with  $\text{Cu}(\text{OAc})_2$  at 100° for 30 min., or IV in abs. EtOH contg. 20% oleum, treated with drv  $\text{NaNO}_2$ , gives 2,6-dinitro-*p*-ethyltoluene (V), m. 60°; oxidation gives 2,6-dinitro-*p*-toluic acid, whose Me ester m. 87-8°. III and  $\text{MeNH}_2$  in EtOH give the 3-methylamino deriv., yellow, m. 168°. Boiling III with  $\text{N}_2\text{H}_4$  -  $\text{H}_2\text{O}$  for 1.5 hrs. gives 6-nitro-1-hydroxy-7-methyl-4-ethyl-1,2,3-benzotriazole, m. 224° (decompn.). Reduction of V with  $(\text{NH}_4)_2\text{S}$  gives 2-nitro-6-amino-*p*-ethylbenzene, yellow, m. 96° (Ac deriv., m. 166°). 3-Nitro-4-methylacetophenone (VI) gives an oxime, m. 133°; a semicarbazone, m. 262° (decompn.); and a 2,4-dinitrophenylhydrazone, orange-yellow, m. 232°. Oxidation of VI gives 2-nitro-*p*-toluic acid. Reduction of VI with Fe and HCl in EtOH gives the 3- $\text{NH}_2$  deriv., m. 80° (2,4-dinitrophenylhydrazone, red, m. 265° (decompn.)); the Ac deriv., m. 142°, gives a semicarbazone, m. 252° (decompn.), and a 2,4-dinitrophenylhydrazone, orange-red, m. 280° (decompn.). VI (25 g.), Zn and HCl give 3 g. 2-amino-*p*-ethyltoluene,  $b_{700}$  220-8°; Ac deriv. (VII), m. 137°; Bz deriv., m. 119°. VII and  $\text{HNO}_3$  (d. 1.5) at -5° to -10° give the 3,5-dinitro deriv., m. 176°; the free base, yellow, m. 183°. 2  $\text{MeC}_6\text{H}_4\text{Ac}$  gives a 2,4-dinitrophenylhydrazone, yellow, m. 159°; that of the 3-isomer, orange-red, m. 207°. II. Nitro derivatives of propylbenzene. O. L. Brady and R. Neil Cunningham. *Ibid.* 121 4. PhPr (12 g.) in  $\text{H}_2\text{SO}_4$ - $\text{HNO}_3$  gives 14 g. crude 2,4-di- $\text{NO}_2$  deriv. (I), reduced by EtOH- $(\text{NH}_4)_2\text{S}$  to 2-nitro-4-aminopropylbenzene, orange, m. 59° (Ac deriv. (II), pale yellow, m. 90°); deamination gives *o*-nitropropylbenzene, pale yellow,  $b_{700}$  133-6°. Reduction of I with  $\text{SnCl}_2$  and HCl in EtOH gives 4-nitro-2-aminopropylbenzene, yellow, m. 73°. Nitration of II in  $\text{H}_2\text{SO}_4$  gives 2,3-dinitro-4-acetamidopropylbenzene, yellow, m. 130°; the free base, orange, m. 124°; deamination gives 2,3-dinitropropylbenzene, m. 64°. The 3,5-di- $\text{NO}_2$  isomer, pale yellow, m. 51°, was prepd. by reduction of the mixt. of *o*- and *p*- $\text{NO}_2$  derivs. ob-

tained by nitration, dinitration of the AcNH deriv. and subsequent removal of the  $\text{NH}_2$  group. Mononitration and removal of the  $\text{NH}_2$  group gives *m*-nitropropylbenzene, yellow,  $b_{700}$  136°. Although neither compd. could be isolated pure, evidence is given that the 2,4-di- $\text{NO}_2$  compd. is the main product of the dinitration of PhPr and that the 2,4,6-tri- $\text{NO}_2$  compd. also is formed to some extent on vigorous nitration. 2,6-Dinitro-4-aminopropylbenzene(?), brown, m. 162°.

C. J. West

**Halogenation of the condensation products of alkyl-*o*-toluidines with chloral hydrate and the nitration of the resulting compounds.** A. H. Advani. *J. Indian Chem. Soc.* 10, 621 4 (1933). To study the nature of the reactions involved in the nitration of chloral derivs. of phenylalkylamines in which both *o*-positions to the amino group are occupied, bromination and chlorination of the chloral derivs. of alkyl-*o*-toluidines,  $\text{RHNC}_6\text{H}_4\text{MeCH}(\text{OH})\text{CCl}_3$  (R = Me and Et) was carried out. Br at ordinary or increased temps., with or without I as carrier, yielded only mono-Br compds. forming di-Ac derivs., showing that neither the  $\text{CH}(\text{OH})\text{CCl}_3$  nor the RHN groups had been affected by the action of Br. The formation of a ketonic acid contg. Br on alk.  $\text{KMnO}_4$  oxidation of the di-Ac derivs. proved that the Me group attached to the nucleus had not been attacked by Br. These reactions, together with the work of Fries (*Ann.* 346, 128 (1906)), indicate that, as in nitration, the Br atom enters the nucleus in the *o*-position to the amino group. The corresponding Cl compds. were best prepd. from the HCl salts of the chloral compds. Bromination in  $\text{CCl}_4$  of  $\text{MeHNC}_6\text{H}_4\text{MeCH}(\text{OH})\text{CCl}_3$  gave 2-methyl-4-( $\alpha$ -hydroxy- $\beta$ -trichloroethyl)-6-bromo-*N*-methylaniline (I), m. 150°; di-Ac deriv., m. 130°, converted by alk.  $\text{KMnO}_4$  oxidation to 3-methyl-4-(*N*-acetyl-methylamino)-5-bromophenylglyoxylic acid, m. 201°. The corresponding *N*-ethyl deriv. (II), m. 115°, gave a di-Ac deriv., m. 150-2°. The corresponding 6-chloro-*N*-methyl deriv. (III), m. 132-3° (di-Ac deriv., m. 112°) and 6-chloro-*N*-ethyl deriv. (IV), m. 116-7° (di-Ac deriv., m. 155-6°), were similarly prepd. On treatment with coned.  $\text{HNO}_3$  I yielded 2-methyl-4-( $\alpha$ -hydroxy- $\beta$ -trichloroethyl-6-bromophenyl)-*N*-methylnitroamine, m. 230° (decompn.); Ac deriv., m. 107°. Similarly from II, III and IV were formed the corresponding nitroamines,  $\text{C}_{10}\text{H}_{12}\text{BrCl}_2\text{N}_2\text{O}_3$ , m. 198° (Ac deriv., m. 127°);  $\text{C}_{10}\text{H}_{10}\text{Cl}_4\text{N}_2\text{O}_3$ , m. 230° (decompn.) (Ac deriv., m. 113°); and  $\text{C}_{10}\text{H}_{12}\text{Cl}_4\text{N}_2\text{O}_3$ , m. 181° (Ac deriv., m. 132°). Treatment of 2,6,4-Me( $\text{O}_2\text{N}$ )[ $\text{CCl}_3$ CH(OH)] $\text{C}_6\text{H}_4\text{NMeCO}_2\text{N}$  with  $\text{SOCl}_2$  replaces the OH group of the chloral side chain with Cl and forms 2-methyl-4-( $\alpha$ -chloro- $\beta$ -trichloroethyl)-6-nitrophenyl-*N*-methylnitroamine, m. 199°. It is found that the nitration of the chloral derivs. of alkylamines, alkyl-*o*-toluidines (C. A. 27, 2941) and of the halogenation products of the latter at ordinary temp. without use of diluents yields chloral derivs. of dinitrophenylalkylnitroamines, mononitrophenylalkylnitroamines and halophenylalkylnitroamines, the no. of the entering  $\text{NO}_2$  groups depending upon the presence of replaceable H atoms in the *o*-position to the amino group.

C. R. Addinall

**Optical activity in relation to tautomeric change.** II. Comparison between the rate of racemization of a tautomeric substance and the rate of its tautomeric interconversion. C. K. Ingold and C. L. Wilson. *J. Chem. Soc.* 1934, 93 7; cf. C. A. 28, 746°. Dynamical investigation of the isomerization of optically inactive *p*-chlorobenzohydrylidene- $\alpha$ -phenylethylamine (I) in 1.33 *N* EtOH-EtONa gives  $K = 1.00$ ,  $k = 0.0145 \text{ hr.}^{-1}$  and  $k_1 = k_2 = 0.00725 \text{ hr.}^{-1}$ ; the equil. proportion of the original isomer was almost exactly 50%; the speed of racemization during the isomerization of optically active I is also reported. The values agree with the theoretical equation for racemization by tautomerization but not by ionization. The velocity of racemization is quant. equiv. to its rate of isomeric change. III. Constitutional and catalytic influences on the rates of racemization of prototropic compounds. Christopher L. Wilson. *Ibid.* 98-9.—A no. of examples are cited from the literature.

C. J. West

**Action of nitrous acid and nitrosyl chloride on  $\beta$ -phenylpropylamine.** A method of separating primary, secondary and tertiary phenyl chlorides and phenylcarbinols. P. A. Levene and R. B. Marker. *J. Biol. Chem.* 103, 373-82 (1933).—1-2-Methylphenylethylamine (I), prepd. by reduction of the corresponding carbinol, gave, on treatment with  $\text{HNO}_2$ , a mixt. of carbinols. Treatment of this mixt. with cold aq. HCl led to chlorination of the secondary and tertiary carbinols, which could thus be detd. from the Cl content. In this case 33% of the product was secondary and tertiary. Isolation of the primary carbinol through the phthalic ester gave 1-2-methyl-2-phenylethanol, i. e., a carbinol having the same rotation as the one obtained by direct reduction of the acid (cf. C. A. 24, 5741). From the mixt. obtained on treating I with NOCl the secondary and tertiary chlorides were detd. by shaking a sample with  $\text{AgNO}_3$ , and the remainder treated with  $\text{AgOAc}$ , hydrolyzed with KOH and treated with  $\text{C}_6\text{H}_5(\text{CO})_2\text{O}$ . The unesterified primary chloride and hydrocarbon were then extd. with ether and detd. The carbinol phthalates were hydrolyzed and the amt. of secondary alc. was detd. by treatment with cold aq. HCl as above. The primary, secondary and tertiary halides are thus all detd. in the mixt., and the method is of general application. In this case the proportions were 90, 2 and 8%, resp. K. V. Thimann

**Organic mercury compounds. VI. The synthesis of organic mercury compounds with a negative substituent by means of the diazo method.** A. N. Nesmeyanov, N. Th. Glushnev, P. Th. Epiwanski and A. I. Flegontov. *Ber.* 67B, 130-4 (1934); cf. C. A. 27, 1872.—Two undesirable side reactions (formation of salts of the type  $(\text{RN}_2)_2\text{HgCl}_2$  instead of  $\text{RN}_2\text{Cl} \cdot \text{HgCl}_2$ , and substitution of the diazo group by Cl or H) could be prevented or decreased by lowering the temp., using the proper solvent, stirring carefully, adding the reagents in proper order. *o*-Nitroaniline (69 g.), dissolved at 90° in 150 cc. concd. HCl and 75 cc.  $\text{H}_2\text{O}$ , cooled to 25° and diazotized with 250 g. ice and 35 g.  $\text{NaNO}_2$  in 72 cc.  $\text{H}_2\text{O}$ , gives with 136 g.  $\text{HgCl}_2$  in 80 cc. HCl 190 g. *o*-nitrophenyldiazonium chloride-mercuric chloride,  $\text{NO}_2\text{C}_6\text{H}_4\text{N}_2\text{Cl} \cdot \text{HgCl}_2$ , m. 116-7°. The *p*-compd. (144 g.) is prepd. analogously. With more  $\text{H}_2\text{O}$  (1200 g. including ice) ( $\text{NO}_2\text{C}_6\text{H}_4\text{N}_2\text{Cl}_2 \cdot \text{HgCl}_2$  results. The *m*-compd. (210 g. from 60 g. *m*-nitroaniline in 150 g. concd. HCl and 150 cc.  $\text{H}_2\text{O}$  of 90°, poured into 500 cc.  $\text{H}_2\text{O}$  and 500 g. ice, diazotized with a concd. soln. of 35 g.  $\text{NaNO}_2$  and 136 g.  $\text{HgCl}_2$  in 136 cc. HCl), m. 138°. A soln. of 52 g. diazobenzenesulfonic acid and 150 g.  $\text{HgCl}_2$  in 150 g. concd. HCl yields on cooling to -15° 28 g.  $(\text{HO}_2\text{SC}_6\text{H}_4\text{N}_2\text{Cl})_2 \cdot \text{HgCl}_2$ , m. 152-3°. The reactions were carried out in 3 ways: (a) diazonium chloride-mercuric chloride (or a mixt. of the diazonium compd. and  $\text{HgCl}_2$ ) acted slowly upon Cu powder suspended in the solvent, keeping the temp. as const. as possible, (b) Cu powder was added slowly to a soln. of the diazo compd. or (c) both reagents were added simultaneously to the solvent. There were prepd.:  $\text{ClHgC}_6\text{H}_4\text{CO}_2\text{H}$ ;  $\text{HSO}_4\text{Hg} \cdot \text{C}_6\text{H}_4\text{SO}_3\text{H}$ , which does not melt; *o*-nitrophenylmercuric chloride,  $\text{NO}_2\text{C}_6\text{H}_4\text{HgCl}$ , m. 185°; *m*-compd., m. 235°; *p*-compd., m. 265°; and  $\text{Cl}_2\text{C}_6\text{H}_4\text{HgCl}$ , m. 208°.

A. E. Beilich  
**Substitution in the methyl-4'-nitro- and 4'-acetamidodiphenyl ethers.** Harold A. Scarborough and John L. Sweeten. *J. Chem. Soc.* 1934, 52-6.—*o*- $\text{Me} \cdot \text{C}_6\text{H}_4\text{OH}$ , *p*- $\text{ClC}_6\text{H}_4\text{NO}_2$  and KOH at 160° for 6 hrs. give 4- $\text{O}_2\text{NC}_6\text{H}_4\text{OC}_6\text{H}_4\text{Me}$ -2 (I),  $b_{11}$  225-30°, m. 35°; reduction and acetylation gives the 4'-acetamido deriv., m. 110°. I and  $\text{SO}_2\text{Cl}_2$  give 4-chloro-4'-nitro-2-methyldiphenyl ether,  $b_{11}$  235-40°, m. 65°; 4'-acetamido deriv., m. 122°. 4-Chloro-3'-nitro-4'-acetamido-2-methyldiphenyl ether, pale brown, m. 128°, or yellow, m. 133° (the lower-melting form changes into the higher-melting at 124°), results from the nitration of 4,2- $\text{Cl}(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{OC}_6\text{H}_4\text{NHAc}$ -4 in AcOH at 80° or by chlorination of 3,4- $\text{O}_2\text{N}(\text{AcNH})\text{C}_6\text{H}_3\text{OC}_6\text{H}_4\text{Me}$ -2; the 4'-*NH* deriv., bright red, m. 104°. Removal of the  $\text{NH}_2$  group or condensation of *m*- $\text{IC}_6\text{H}_4\text{NO}_2$  with 5,2- $\text{Cl}(\text{KO})\text{C}_6\text{H}_3\text{Me}$  at 220° with Cu powder gives 4-chloro-3'-nitro-2-methyldiphenyl ether, pale orange, m.

52°; the corresponding 4-*Br* analog, m. 73°; reduction and acetylation or bromination of 4- $\text{AcNH} \cdot \text{C}_6\text{H}_4\text{OC}_6\text{H}_4\text{Me}$ -2 gives 4-bromo-4'-acetamido-2-methyldiphenyl ether, m. 144°; nitration in AcOH at 80° or bromination of 3,4- $\text{O}_2\text{N}(\text{AcNH})\text{C}_6\text{H}_3\text{OC}_6\text{H}_4\text{Me}$ -2 gives the 3'- $\text{NO}_2$  deriv., lemon-yellow, m. 147°; the free base, red, m. 92°; deamination of the base or bromination of 3- $\text{O}_2\text{NC}_6\text{H}_4\text{OC}_6\text{H}_4\text{Me}$ -2 gives 4-bromo-3'-nitro-2-methyldiphenyl ether, pale orange, m. 50°. Nitration of 4- $\text{AcNH} \cdot \text{C}_6\text{H}_4\text{OC}_6\text{H}_4\text{Me}$ -2 gives 3'-nitro-4'-acetamido-2-methyldiphenyl ether, yellow, m. 83°; the free base, deep red, m. 94°; deamination gives 3- $\text{O}_2\text{NC}_6\text{H}_4\text{OC}_6\text{H}_4\text{Me}$ -2, also prepd. from *m*- $\text{IC}_6\text{H}_4\text{NO}_2$  and *o*- $\text{MeC}_6\text{H}_4\text{OK}$  at 200°. 4- $\text{AcNH} \cdot \text{C}_6\text{H}_4\text{OC}_6\text{H}_4\text{Me}$ -2, slowly added to  $\text{HNO}_3$  (d. 1.4) and poured onto ice after 10 min., gives the 3',4-di- $\text{NO}_2$  deriv., dull yellow, m. 137°; the base, golden brown, m. 170°; deamination or condensation of *m*- $\text{O}_2\text{NC}_6\text{H}_4\text{OK}$  with 2,5- $\text{Br}(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{Me}$  at 220° gives 3',4-dinitro-2-methyldiphenyl ether, light brown, m. 110°. 4- $\text{O}_2\text{NC}_6\text{H}_4\text{OC}_6\text{H}_4\text{Me}$ -3, added to a large excess of  $\text{HNO}_3$  (d. 1.4) and carefully warmed, gives 4,4'-dinitro-2-methyldiphenyl ether, m. 132°, also prepd. from *p*- $\text{ClC}_6\text{H}_4\text{NO}_2$  and 5,2- $\text{O}_2\text{N}(\text{Me})\text{C}_6\text{H}_3\text{OK}$ . Oxidation of 4- $\text{O}_2\text{NC}_6\text{H}_4\text{OC}_6\text{H}_4\text{Me}$ -3 with  $\text{CrO}_3$  in AcOH gives a poor yield of 3-carboxy-4'-nitro-diphenyl ether, m. 183°. 4'-Amino-3-methyldiphenyl ether, m. 82° (nitrate, m. 158° (decompn.)); *Ac* deriv., m. 140°. Chlorination of 4- $\text{O}_2\text{NC}_6\text{H}_4\text{OC}_6\text{H}_4\text{Me}$ -3 or condensation of *p*- $\text{ClC}_6\text{H}_4\text{NO}_2$  with 6,3- $\text{ClMeC}_6\text{H}_3\text{OK}$  at 180° gives 4-chloro-4'-nitro-3-methyldiphenyl ether, m. 114°. 4-Chloro-4'-acetamido-3-methyldiphenyl ether, m. 115°; 3'-nitro deriv., lemon-yellow, m. 101°; the free base, bright red, m. 95°. 4-Chloro-3'-nitro-3-methyldiphenyl ether, pale orange, m. 57°. 4-Bromo-4'-nitro-3-methyldiphenyl ether, m. 96°; oxidation gives the 3-carboxy deriv., m. 157°, whose *Et* ester m. 76°. 4-Bromo-4'-acetamido-3-methyldiphenyl ether, m. 130°; 3'- $\text{NO}_2$  deriv., lemon-yellow, m. 102°; the free base, deep red, m. 111°. 4-Bromo-3'-nitro-3-methyldiphenyl ether, yellow, m. 59°. 3'-Nitro-4'-acetamido-3-methyldiphenyl ether, golden, m. 81°; the base, red, m. 52°; deamination of the base or condensation of *m*- $\text{IC}_6\text{H}_4\text{NO}_2$  with *m*- $\text{MeC}_6\text{H}_4\text{OK}$  at 200° gives 3'-nitro-3-methyldiphenyl ether, pale yellow, m. 47°. 4- $\text{AcNH} \cdot \text{C}_6\text{H}_4\text{OC}_6\text{H}_4\text{Me}$ -3 or its mono- $\text{NO}_2$  deriv. in  $\text{HNO}_3$  (d. 1.4) at 15° for 15 min. gives the 3',4-dinitro deriv., olive-yellow, m. 144°; the base, orange, m. 140°; deamination or condensation of *m*- $\text{O}_2\text{NC}_6\text{H}_4\text{OK}$  with 5,2- $\text{Br}(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{Me}$  gives 3',4-dinitro-3-methyldiphenyl ether, orange, m. 87°; the 4,4'-di- $\text{NO}_2$  isomer, yellow, m. 120°, results from the 4- $\text{NO}_2$  deriv. or from *p*- $\text{ClC}_6\text{H}_4\text{NO}_2$  and 3,4- $\text{Me}(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{OK}$  at 180°; oxidation gives 4,4'-dinitro-3-carboxy-diphenyl ether, m. 185°. 4- $\text{O}_2\text{NC}_6\text{H}_4\text{OC}_6\text{H}_4\text{Me}$ -3 and  $\text{AcCl}$  with  $\text{AlCl}_3$  in  $\text{CS}_2$  give 4'-nitro-4'-acetyl-3-methyldiphenyl ether, m. 88°, which is oxidized to the 4-carboxy deriv., m. 204°. 4- $\text{O}_2\text{NC}_6\text{H}_4\text{OC}_6\text{H}_4\text{Me}$ -4 is oxidized to the 4'-carboxy deriv., m. 245° (*Et* ester, m. 78°). 4'-Acetamido-4-methyldiphenyl ether, m. 135°. 2-Bromo-4'-nitro-4-methyldiphenyl ether, m. 82° is formed by bromination of the  $\text{NO}_2$  compd. or by condensation of *p*- $\text{ClC}_6\text{H}_4\text{NO}_2$  with 3,4- $\text{BrMeC}_6\text{H}_3\text{OK}$  at 220°; oxidation gives the 4-carboxy deriv., m. 108° (*Et* ester, m. 119°). 2-Bromo-4'-acetamido-4-methyldiphenyl ether, m. 142°; 3'- $\text{NO}_2$  deriv., yellow, m. 98°; the base, red, m. 101°; deamination gives 2-bromo-3'-nitro-4-methyldiphenyl ether, pale orange, m. 47°, also formed from *m*- $\text{ClC}_6\text{H}_4\text{NO}_2$  and 3,4- $\text{BrMeC}_6\text{H}_3\text{OK}$ . 3-Bromo-3'-nitro-4-methyldiphenyl ether, pale yellow, m. 68°, results from *m*- $\text{IC}_6\text{H}_4\text{NO}_2$  and 2,4- $\text{BrMeC}_6\text{H}_3\text{OK}$  at 200°. 3'-Nitro-4'-acetamido-4-methyldiphenyl ether, golden, m. 95°; the base, red, m. 91°. 2,3'-Dinitro-4'-acetamido-4-methyldiphenyl ether, pale brown, m. 134°; the base, red-brown, m. 119°; deamination gives 2,3'-dinitro-4-methyldiphenyl ether, m. 87°; the 2,4'-di- $\text{NO}_2$  isomer, pale brown, m. 104°; this also results from 4,3- $\text{Cl}(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{Me}$  and 4- $\text{O}_2\text{NC}_6\text{H}_4\text{OK}$  at 220°. These results show that the etheral O atom exercises complete control of the orientation of the substituents, except for the introduction of a  $\text{NO}_2$  group when 1 nucleus contains an  $\text{AcNH}$  group; by comparison with

$O_2NC_6H_4OPh$ , the only effect which can be ascribed to the Me group is a more controlled nitration. C. J. West

**Action of bromine on 2- and 6-chloro- and 2- and 6-iodo-3-bromophenols.** Herbert H. Hodgson and Joseph Nixon. *J. Chem. Soc.* 1934, 137-8.—3,2-Br( $H_2N$ )- $C_6H_4OH$  gives 2-chloro-3-bromophenol, m. 60°, which reacts in  $CHCl_3$  with Br to give the 3,4,6-Br<sub>3</sub> deriv., m. 90°. 2-Chloro-5-bromophenol, m. 60°, gives 6-chloro-2,3,4-tribromophenol, m. 98°; this also results on chlorination of the dibromination product of *m*-Br $C_6H_4OH$ . 3-Bromo-2-iodophenol, m. 85°, gives with Br in AcOH the 3,4,6-Br<sub>3</sub> deriv., m. 125°, and some 2,3,4,6-Br<sub>4</sub> $C_6H_2OH$ ; if the reaction product stands 18 hrs., only the latter compd. is obtained; it was the only product of the bromination of 5-bromo-2-iodophenol, m. 55°. C. J. West

**Mobility of groups containing a sulfur atom. III.** Douglas W. Cowie and David T. Gibson. *J. Chem. Soc.* 1934, 46-8; cf. C. A. 27, 2420.—Bromination of thioanisole gives *p*-Br $C_6H_4SMe$ , identified as the sulfone. Cyclohexylsulfonolactone (I), Me *d*-camphorylthiol-sulfonate (II) and  $Na_2CO_3$  give anhydrocamphorsulfonolactone (III) and an oil which, after hydrolysis and oxidation, yields cyclohexylsulfonolactone (IV), m. 119°. Ethylsulfonolactone and II give *d*-camphorsulfonic acid, III and an oil, yielding camphorsulfonolactone (V), m. 123°. I, Et ethanethiol-sulfonate (VI) and  $Na_2CO_3$  give a sulfide, which yields  $MeSO_2Et$  on oxidation and an alk. ext., from the oil of which were isolated  $\alpha$ -ethylsulfonolactone (VII), m. 165-6° (lowest fraction), and  $\alpha$ -cyclohexylsulfonolactone (VIII), m. 132°, hydrolyzed to cyclohexylsulfonolactone (IX), m. 38°. Cyclohexyl cyclohexanethiol-sulfonate, m. 38°, with methylsulfonolactone (VII) and EtONa gives, by hydrolysis and oxidation of the alkali-sol. product, IV. The alkali-sol. product from camphor disulfide, VII and  $Na_2CO_3$  gives V; ethylsulfonolactone gives the corresponding Et deriv., m. 85°. Methylsulfonolactone (IX), m. 54°, VI and  $Na_2CO_3$  give, after hydrolysis and oxidation of the alkali-sol. product, bisethylsulfonolactone; when equimol. proportions of the reagents were used, the sulfone,  $C_6H_{10}O_2S_2$ , m. 95°, was obtained. Benzyl benzylthiol-sulfonate, IX and  $Na_2CO_3$  give a compd.,  $C_6H_{12}O_2S_2$ , m. 54°. The alkali-sol. product from IX and *p*-tolyl *p*-toluenethiol-sulfonate with EtONa give methylsulfonolactone, m. 50°.  $BzCH_2CN$  and Me *p*-toluenethiol-sulfonate in EtOH-NaOH give 30% of  $\omega$ -cyano- $\omega$ -methylthioacetophenone, m. 50°; 4-chlorophenyl-sulfonolactone gives a mixt. of  $RSO_2CH(SMe)Ac$ , in which the ratio of *p*-Me $C_6H_4:4-ClC_6H_4$  is 53:47.  $PhSO_2F$  and  $MeMgI$  or  $EtMgI$  give bisphenylsulfonolactone and -ethane, resp. C. J. West

**Synthesis of several phenols with unsaturated side chains.** Riko Majima and Kunisaburo Tamura. *Proc. Imp. Acad. (Tokyo)* 9, 606 8(1933).—PhONa and dichlorohexadiene in PhMe (Claisen reaction) give a good yield of 3'-chlorohexa-2',4'-dienylphenol, *b*<sub>1</sub> 120-40°, turning brown in the air but stable in dil. Et<sub>2</sub>O soln.; Me ether, *b*<sub>1</sub> 108-17°, is a mixt. of 2 compds., probably *o*- and *p*-derivs. There also results a chlorohexadienyl Ph ether, reduced by Na and EtOH to hexyl Ph ether, *b*<sub>1</sub> 75-7°. 3'-Chlorohexa-2',4'-dienylpyrocatechol, polymerizes readily on heating; di-Me ether; a by-product is pyrocatechol chlorohexadienyl ether; methylation and reduction gives pyrocatechol Me hexyl ether, *b*<sub>0.8</sub> 93-6°. C. J. West

**4,6- and 2,4-Diacetylresorcinol.** Wilson Baker. *J. Chem. Soc.* 1934, 71 3.—4,6-Diacetylresorcinol (I) is obtained in 32% yield by the action of  $FeCl_3$  on resorcinol diacetate; a  $FeCl_3$  complex of I is an intermediate product and is decompd. by heating with HCl; all methods for prep. I give the same product, m. 182°. The constitution of I follows from its oxidation by alk.  $H_2O_2$  and methylation of the product to 2,4,5-(MeO)<sub>3</sub> $C_6H_2Ac$ , identical with the methylation of 2,4,5-(HO)<sub>3</sub> $C_6H_2Ac$ ; the Me ether of I gives the same product. Resacetophenone,  $Ac_2O$  and AcONa give 7-acetoxy-3-acetyl-2-methylchromone, m. 126.5°; with  $AlCl_3$  in  $PhNO_2$  this gives 7-hydroxy-8-acetyl-2-methylchromone, m. 185-0.5°. C. J. West

**The oxidation of isosafrole.** Minoru Imoto. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding, 20-9(1934).—The oxidation of isosafrole to piperonylic acid by  $KMnO_4$  and  $HNO_3$ , and the action of some oxidizing catalysts, were studied. Activated C is an active catalyst in the case of  $KMnO_4$ .  $HNO_3$  gave piperonylic acid, heliotropin and oxalic acid. Karl Kammermeyer

**Beryllium benzoylacetate.** R. W. Bailey, F. M. Brewer and H. M. Powell. *J. Chem. Soc.* 1933, 1546-7.—Be benzoylacetate was prepd. from basic carbonate of Be suspended in alc. plus alc. benzoylacetone refluxed on the  $H_2O$  bath and recrystd. from PhMe. Be benzoylacetate m. 210°, is insol. in  $H_2O$ , dil. acids and alkalis, almost insol. in alc. but moderately sol. in benzene and more sol. in PhMe; its crystals are monoclinic with no distinct cleavage. Very strong double refraction and high dispersion are outstanding optical properties. M. McMahon

**$\omega$ -Nitrophenylglyoxal arylhydrazones.** G. D. Parkes and E. H. Williams. *J. Chem. Soc.* 1934, 67-8.— $BzCH_2NO_2$  (for which a method of prep. is given) and  $PhN_2Cl$  in a mixt. of HCl, AcOH and AcONa at 0° give 60% of  $\omega$ -nitrophenylglyoxal phenylhydrazone (I), orange-yellow with blue reflex, m. 101°; *p*-chlorophenylhydrazone, yellow, m. 134°; 2,4-dichlorophenylhydrazone, pale yellow, m. 135.5°; 2,5-isomer, pale yellow, m. 137°; *p*-bromophenylhydrazone (II), yellow, m. 137°; 2,4-dibromophenylhydrazone (III), yellow, m. 139°; 2,4,6-tribromophenylhydrazone (IV), yellow, m. 111°; 3,4,5-isomer, yellow, m. 169°; *o*-nitrophenylhydrazone, yellow, m. 118°; *p*-isomer, m. 147°. I and I mol. Br in AcOH give II. II and Br in AcOH contg. a little AcONa, on standing 24 hrs., give  $\omega$ -bromophenylglyoxal *p*-bromophenylhydrazone, while refluxing II and Br in  $CHCl_3$  for 1 hr. gives  $\omega$ -bromophenylglyoxal 2,4-dibromophenylhydrazone. IV and Br give the  $\omega$ -Br deriv. III and EtOH-NH<sub>3</sub>, heated 30 min. under the reflux, give the  $\omega$ -amino deriv., yellow, m. 131°, and  $PhNH_2$  gives the  $\omega$ -anilino deriv., yellow, m. 137°. C. J. West

**The physiologically active isomer of Bredt's 5-ketocamphor.** Kunijiro Takeuchi and Yoshikazu Sahashi. *Sci. Papers. Inst. Phys. Chem. Research.* 22, 59-68 (1933).—Bornyl acetate, *b*<sub>4</sub> 80-1°, oxidized with  $CrO_3$  in glacial acetic acid gave 5-ketobornyl acetate (I), *b*<sub>4-1</sub> 125-7°. Sapon. of I with alc. KOH, evapn., acidification with  $CO_2$  and extn. with Et<sub>2</sub>O gave 5-ketoborneol (II), m. 232-5° (from alc.),  $[\alpha]_D^{25}$  82.1° (alc.). II, oxidized with  $CrO_3$  gave 5-ketocamphor (III), m. 207° (ligroin),  $[\alpha]_D^{25}$  103.5 (ligroin). The prismatic crystals of III, on heating in hexane, were converted into irregular plates of the enol isomer (IV), m. 209 10° (from ligroin),  $[\alpha]_D^{25}$  144.6 7.3°; semicarbazone, m. 230-1°. Reduction of IV gives 5-hydroxycamphor (V), m. 220 2°  $[\alpha]_D^{25}$  47.5° (alc.); semicarbazone, m. 220°. Ac deriv. of V, *b*<sub>2</sub> 137-40°; semicarbazone, m. 197-200°. Identical samples of V were isolated from dog urine. V, oxidized with  $H_2SO_4$  and  $K_2Cr_2O_7$  at 50-60°, gave a mixt. of III and IV, m. 197-200°,  $[\alpha]_D^{25}$  70.8 (alc.), which on boiling with hexane was all converted into IV. IV is believed to have the

and has been shown to be

an active heart stimulant, whereas III is without such action. T. H. Rider

**Identity of swertic acid and oleanolic acid.** S. Kuwada and T. Matsukawa. *J. Pharm. Soc. Japan* 53, 680-6 (1933).—Kariyone and Matsushima isolated a cryst. acid from the root of *Swertia japonica* and named it

swertic acid (*J. Pharm. Soc. Japan* No. 540, 133(1927)). According to them, the empirical formula is  $C_{27}H_{42}O_8$  and it contains 3 OH groups, one of which is of an acid character while the other 2 are of alc. nature. The present authors show that the acid is identical with oleanolic acid and has the formula  $C_{30}H_{48}O_8$  as detd. by the prepn. of various derivs. Nao Uyei

**Oxidation of hydroxymethylenecamphor esters with ozone.** John Palmén. *Finska Kemistsamfundets Medd.* 42, 85-98(1933).—Ozonization of hydroxymethylenecamphor in glacial AcOH indicates that the tendency to enlarge the ring structure exceeds the ketone-splitting tendency. P. concludes that the rate of hydrolysis is greater for the formyl than for the camphor radical. The Me and Et esters show no ketone splitting. The diperoxide from hydroxymethylenecamphor has two OH groups on the methylene C, but the esters seem to give the group  $-O.O.CH(OH)OMe$ . Investigations are in progress to det. the influence of different radicals on the relative rates of the ketone-splitting and ring-enlarging tendencies. A German summary is given. H. C. D.

**Preparation of camphorquinone.** W. C. Evans, J. M. Ridgion and J. L. Simonsen. *J. Chem. Soc.* 1934, 137.—Camphor (5 g.), 6 g.  $SeO_2$  and 5 cc.  $Ac_2O$ , heated 3-4 hrs. at  $140-50^\circ$ , give 5.22 g. camphorquinone; dioxane may be used as solvent but the yield is lower and the product more difficult to purify. C. J. West

**Instance of the action of air in determining the course of bromination.** John Hannon and J. Kenner. *J. Chem. Soc.* 1934, 138.—When dry air is allowed through the condenser during the interval (13.5 hrs.) between the bromination of 2,2'-bitolyl for 2 working days, there results 60% of the tetra-Br deriv. *o*-Iodocyanobenzene, m.  $54-5^\circ$ , and Cu at  $275^\circ$  give 2,2'-dicyanobiphenyl, m.  $170-7^\circ$ ; this could not be converted to the dialdehyde by Stephen's method (dioxime, m.  $186-7^\circ$ ). C. J. West

**The condensation of *o*-fluorenylbenzoic acid.** A. Dansi and A. Semproni. *Gazz. chim. ital.* 63, (681-4 (1933)).—A preliminary paper. Efforts to obtain better yields of *o*-fluorenylbenzoic acid (I) than previously reported (cf. *Ber.* 36, 4035(1903); *Monatsh.* 25, 1164 (1904)) gave with the Friedel-Crafts reaction a max. of 65% of I from fluorene (6 g.),  $C_6H_5(CO)_2O$  (12 g.),  $AlCl_3$  (20 g.) and  $CS_2$  (75 cc.) at  $100^\circ$  for 9 hrs. I heated at  $300-20^\circ$  until solid yields 100% of phthalylfluorene (II), red vitreous mass, which when pulverized is intense orange. It may have either of the following 2 constitutions:

which by oxidation should yield anthraquinone-2,3-fluorenone and anthraquinone-1,2-fluorenone, resp. However, with  $CrO_3$  oxidation proceeds further, i. e., II and  $CrO_3$  in  $Ac_2O$  kept at room temp. (until a sample gives a yellow ppt. in water), and heated in excess water, yield the compd.  $C_{24}H_{12}O_4$  (III), pale yellow, m.  $259-60^\circ$ , sol. in aq. alk. hydroxides, carbonates and bicarbonates (reppd. by acids), gives a reddish color in hot alk. hydroxides, and also in boiling aq. NaOH and powd. Zn. From its  $NH_4OH$  solns.,  $AgNO_3$  ppts. a stable yellow *Ag* salt and cupric solns. a green flocculent *Cu* salt, while  $Ba(NO_3)_2$  gives no ppt. Because of its acidic character and its anthraquinone reactions, III has 3 possible constitutions: 3,2- $Ph(HO_2C)C_6H_2(CO)_2C_6H_4$  (IIIa), 2-( $o$ - $HO_2CC_6H_4$ ) $C_6H_2(CO)_2C_6H_4$  (IIIb) or 2,1- $Ph(HO_2C)C_6H_2(CO)_2C_6H_4$  (IIIc), i. e., it is either a 2-(*o*-carboxyphenyl)anthraquinone or an *o*-phenylanthraquinone-carboxylic acid. During purification of the oxidation product of II, there was also obtained in a few cases an acid, m.  $236-8^\circ$ , which may have been the 1-(*o*-carboxyphenyl)anthraquinone, m.  $236^\circ$ , of Kränzlein and Voll-

mann (Ger. pat. 506,439, C. A. 25, 304); this would indicate that I may exist in isomeric forms. C. C. Davis

**Stereochemical structure. VI. The isomeric (-)-menthyl  $\alpha$ -naphthylglycolates.** Robert Roger and Evelyn R. L. Gow. *J. Chem. Soc.* 1934, 130-7; cf. C. A. 27, 971.—Values are given for the rotation of (-)- $\alpha$ -naphthylglycolic acid (I) in  $Me_2CO$ ,  $CHCl_3$ , EtOH and  $H_2O$ , of the (+) acid in EtOH (II), of the (-)-menthyl ester (III) of I, of II(IV) and of the *dl*-acid(V) in  $Me_2CO$ ,  $C_6H_6$ ,  $CHCl_3$ ,  $CS_2$  and EtOH. I is much more *l*-rotatory than (-)-mandelic acid(VI) in  $Me_2CO$ ; it exhibits a greater variance with solvent and a similar temp. effect to VI, the Rupe criteria for the 2 acids were very similar and the dispersion is very like that of I, i. e., normal and slightly complex. The rotatory power of solns. of III varied somewhat with the solvent but not with the temp. Concn. had a slight effect in  $CS_2$  and in  $C_6H_6$ ; the Rupe criteria were similar to those of the corresponding ester of VI, except that the value for the EtOH solns. did not depart markedly from those for the other solns.; 1-term Drude equations expressed the dispersion between  $\lambda$  6663-4358; the dispersion is normal but slightly complex. The rotatory powers of IV(always +) varied markedly with solvent and were also affected by temp. and concn.; 1-term Drude equations did not express the dispersions and the Rupe criteria showed a certain regularity that was entirely lacking in the corresponding mandelate. The dispersion is definitely complex but normal. While the rotatory powers of V in  $Me_2CO$ ,  $CHCl_3$  and EtOH did not vary greatly, that in  $CS_2$  showed a depression; the dispersion may be regarded as normal and almost simple. The rotatory power of V can be calcd. from the values of III and IV and agrees with that detd. experimentally for the ester itself. The values from an equimol. soln. of III and IV also agreed, as did those resulting when sep. equimol. solns. were superimposed in the polarimeter, e. g., in  $CS_2$ . C. J. West

**Synthesis of nine chloriodonaphthalenes.** Robert W. Beattie and Frank C. Whitmore. *J. Chem. Soc.* 1934, 50-2.—The following  $C_{10}H_7$  derivs. were prepd. by the action of EtOH solns. of I and NaI on the corresponding Hg derivs. Thus refluxing 7.95 g. 4,1- $C_{10}H_7(HgCl)_2$  in 100 cc. EtOH with 5.05 g. I and 10 g. NaI in 200 cc. EtOH for 1 hr. gives 90% of 1-chloro-4-iodonaphthalene, m.  $54.5^\circ$ . 5-*I* deriv., m.  $80^\circ$  (73%); 6-*I* deriv., m.  $57^\circ$  (70%); 7-*I* deriv., m.  $39^\circ$  (63%); 8-*I* deriv., pale yellow, m.  $80.5^\circ$  (84%); 2-chloro-1-iodo deriv., m.  $83^\circ$  (64%); 6-*I* deriv., m.  $141^\circ$  (70%); 7-*I* deriv., pale yellow, m.  $129^\circ$  (70%); 8-*I* deriv., m.  $55.5^\circ$  (71%). C. J. West

**Constitution of the coloring matter of Lawsonia alba (Lam.) or Indian mehedhi.** Jagaraj B. Lal and Sikhishushan Dutt. *J. Indian Chem. Soc.* 10, 577-82(1933).

Henna, the coloring matter of *Lawsonia alba*, was prepd. from the fresh leaves by maceration in a stone mortar, extrn. with 5%  $NaHCO_3$  and acidification with 50%  $H_2SO_4$ . Recrystn. of the pptd. material from benzene and  $AcMe$  solns. yielded lawsonone (I),  $C_{10}H_6O_3$ , m.  $190^\circ$  (decompn.), sol. in alkalis and forming  $Ag$ ,  $Na$ ,  $NH_4$  and  $Ph$  salts. I contains a phenolic OH group and 2 ketonic groupings and yields the following compds.: *Ac* deriv.,  $C_{12}H_8O_4$ , m.  $128-9^\circ$ ; *anilino* deriv.,  $C_{10}H_7NO_3$ , m.  $190^\circ$ ; *oxime*,  $C_{10}H_7N_2O_3$ , m.  $180^\circ$ ; *dioxime*,  $C_{10}H_7N_2O_4$ , m.  $200^\circ$  (decompn.); *phenylhydrazone*,  $C_{10}H_7N_3O_2$ , m.  $229^\circ$  (decompn.); *mono-Br* deriv.,  $C_{10}H_6BrO_3$ , m.  $198^\circ$ . Heating a mixt. of the *Ag* salt of I with EtBr in a pressure flask on the steam bath for 4 hrs. gave the *Et* ether, m.  $126-7^\circ$ . I was boiled with  $Ac_2O$  under reflux and Zn dust was gradually added until the soln. was decolorized, with the formation of triacetyldehydrolawsonone,  $C_{10}H_4O_6$ , m.  $134.5^\circ$ . The distn. of I with Zn dust in a current of H gave an almost quant. yield of  $C_{10}H_6$  and oxidation of I with alk.  $KMnO_4$  produced only phthalic acid. I was coupled with diazotized  $PhNH_2$  to give a small quantity of benzene-azolawsonone in scarlet needles m. above  $305^\circ$ . By comparison with the work of Tommasi (C. A. 14, 3654) it is probable that the Indian and European varieties of *Lawsonia* contain the same coloring matter I. The identity of I with 2-hydroxy- $\alpha$ -naphthoquinone (II) has

been demonstrated by a direct comparison of I and its derivs. with the synthetically prepd. II and its corresponding derivs.

C. R. Addinall  
Preparation of naphthostyryl from 8-bromo-1-naphthoic acid. H. Gordon Rule and Robert R. H. Brown. *J. Chem. Soc.* 1934, 137.—8-Bromo-1-naphthoic acid (20 g.) in 300 cc. concd.  $\text{NH}_4\text{OH}$  contg. 0.4 g. Cu bronze, 5 g.  $\text{NH}_4\text{NO}_3$  and 0.4 g.  $\text{KClO}_3$ , heated at  $130-50^\circ$  for 1 hr., gives 82% of naphthostyryl, m.  $181^\circ$ ; in open vessels the yields were 52-67%; without  $\text{NH}_4\text{NO}_3$  and  $\text{KClO}_3$  the yield was 15% less.

C. J. West  
Aryl selenohalides. IV. 1-Anthraquinonyl selenohalides and the 1-anthraquinoneselenenic acid. Otto Behaghel and Wilhelm Müller. *Ber.* 67B, 105-8 (1934); cf. *C. A.* 27, 4785.—The intensive colors observed in reactions of caustic alkali with nitrophenyl selenohalides are caused by alkali salts of nitrated arylselenenic acids. The arylselenenic acids could not be prepd. However selenenic acids of the anthraquinone series were isolated from anthraquinonyl selenohalides. Di-1-anthraquinonyl diselenide (I) was prepd. with good yield from 1-chloro-anthraquinone and  $\text{Na}_2\text{Se}_2$ . Five g. I and 0.5 cc. Br in 50 cc.  $\text{CHCl}_3$  yield 1-anthraquinonyl selenobromide (II), m.  $217^\circ$ . The corresponding tribromide could not be prepd. 1-Anthraquinonyl selenotrichloride (III), prepd. from I and Cl or  $\text{SO}_2\text{Cl}_2$  in  $\text{AcOH}$ , m.  $203^\circ$ , decomps. in air. 1-Anthraquinonyl selenochloride (IV), prepd. (a) from I and the theoretical amt. Cl, or (b) by heating III in  $\text{CHCl}_3$  and acetone, m.  $220^\circ$ . Addn. of Cl or  $\text{SO}_2\text{Cl}_2$  yields III again. III sapon. with  $\text{H}_2\text{O}$  or caustic alkali yields 1-anthraquinoneselenenic acid (V),  $\text{C}_{14}\text{H}_7\text{O}_5\text{SeOOH}$ . Halides and Zn dust in indifferent solvents form I.  $\text{PhNMe}_2$ , boiled in  $\text{Et}_2\text{O}$  with the calcd. amt. of II, yields 1-anthraquinonyl 4-dimethylamidophenyl selenide, recrystd. from  $\text{AcOH}$ , does not m. below  $270^\circ$ . One g. II, boiled in abs.  $\text{Et}_2\text{O}$  with the calcd. amt.  $\text{PhMgBr}$ , gives 1-anthraquinonyl Ph selenide, m.  $178^\circ$ . II or IV, boiled with an excess of  $\text{AgOAc}$  in  $\text{MeOH}$ , gives 1-anthraquinoneselenenic acid (VI),  $\text{C}_{14}\text{H}_7\text{O}_5\text{SeOH}$ , which does not m. below  $250^\circ$ . Oxidizing agents change VI into V.

A. E. Beitlich  
Oxidative destruction of 1,9-benzanthrone. G. Charner and Elisa Ghigi. *Gazz. chim. ital.* 63, 685-97 (1933).—Because of the importance of knowing the position of substituents in the benzene group of benzanthrone, attempts were made to develop a method which would open the anthraquinone residue and yet leave intact the benzene nucleus. It was at first hoped to weaken the benzene nucleus by introducing a  $\text{NO}_2$  group, reducing it to an  $\text{NH}_2$  group, and then by mild oxidizing agents to open and preserve the chain from the benzene group, which should end with a CO group. However, the results obtained with *bs*-1-aminobenzanthrone (I) were not encouraging, for prolonged heating of I in alk.  $\text{KMnO}_4$  and purification by acidification with HCl ppts. anthraquinone-1-carboxylic acid (II); *Ba salt*,  $\text{C}_{20}\text{H}_{11}\text{O}_5\text{Ba}$ . The acid liquor from the prepn. of II yields, on extn. with  $\text{Et}_2\text{O}$ , a very small quantity of an acid, m.  $180-5^\circ$  (decompn.), which does not contain N and does not give with Zn and NaOH a reaction for anthraquinone derivs. Probably in alk. medium there is hydrolysis of the  $\text{NH}_2$  to OH and oxidation to a hydroxydiphenylketotetracarboxylic acid, because the product is similar to an acid formed by the oxidation of trimethyleneoxyphenanthrene (III). In view of the fact that the hydrogenation of  $\text{C}_{14}\text{H}_8$  to tetralin renders it far more sensitive to oxidation by  $\text{KMnO}_4$ , an attempt was made to break down III by gradual oxidation, since its resistance should be correspondingly less than that of benzanthrone. III in alk.  $\text{KMnO}_4$ , heated at  $85-90^\circ$  (in a tin-lined vessel) and acidified, yields a small quantity of II and 2',3'-dicarboxy-biphenyl-2-glyoxylic acid (*o*-carboxyphenylphthalonic acid),  $\text{HO}_2\text{CC}_6\text{H}_4\text{C}_6\text{H}_3(\text{COCO}_2\text{H})\text{CO}_2\text{H}$  (IV), m.  $230^\circ$  (decompn.), turns blue litmus a strong red, decomps. carbonates; *tri-Na salt*,  $\text{C}_{16}\text{H}_7\text{O}_7\text{Na}_3$ ; *Ba salt*,  $(\text{C}_{16}\text{H}_7\text{O}_7)_2\text{Ba}_3 \cdot 6\text{H}_2\text{O}$ . IV is oxidized by acidic  $\text{KMnO}_4$  by the method of Henriques (*Ber.* 21, 1607 (1888)), with evolution of  $\text{CO}_2$  to biphenyl-2,3,2'-tricarboxylic acid,  $(\text{HO}_2\text{C})_2\text{C}_6\text{H}_3\text{C}_6\text{H}_4\text{CO}_2\text{H}$ , m.  $195-6^\circ$  (decompn.). Prolonged heating of ben-

zanthrone (V) in alk.  $\text{KMnO}_4$  in a glass vessel gives no reaction, but in a Sn-lined Cu vessel at  $80-90^\circ$  there are obtained, after 36 hrs., 30% of IV, 3-5% of II, and 15% of unaltered V. With alc.  $\text{PhHNH}_2$ , IV gives a phenylhydrazone,  $\text{HO}_2\text{CC}_6\text{H}_4\text{C}_6\text{H}_3(\text{CO}_2\text{H})\text{C}(\text{C}(\text{NNHPh})\text{CO}_2\text{H})_2$ , yellow, m.  $180^\circ$  (decompn.). With  $\text{HONH}_2\text{HCl}$  in aq.

$\text{Na}_2\text{CO}_3$ , IV gives an oxime anhydride,  $\text{HO}_2\text{CC}_6\text{H}_4\text{C}(\text{CO}_2\text{H})_2\text{N}=\text{N}=\text{O} \cdot \text{CO}$ , straw-colored, m.  $250^\circ$  (decompn.); *mono-Na salt*,  $\text{C}_{16}\text{H}_{10}\text{O}_7\text{NNa}$ , m.  $270^\circ$  (decompn.). With semicarbazide-HCl and KOAc in dil.  $\text{MeOH}$ , IV gives a semicarbazone,  $\text{HO}_2\text{CC}_6\text{H}_4\text{C}_6\text{H}_3(\text{CO}_2\text{H})\text{C}(\text{C}(\text{NNHCO}_2\text{NH}_2)\text{CO}_2\text{H})_2$ , straw-colored, m.  $220^\circ$  (decompn.). Distn. of a mixt. of IV and  $\text{Ca}(\text{OH})_2$  and steam distn. of the oil yields  $\text{Ph}_2$ , while distn. of IV with powd. Zn and steam distn. of the oil yields fluorene. At  $230-40^\circ$ , IV evolves  $\text{CO}_2$  and leaves a residue which yields an  $\text{Et}_2\text{O}$ -sol. dicarboxylic acid (6.2 g. from 8 g. of IV), decomps. carbonates. The  $\text{Et}_2\text{O}$ -insol. residue extd. with  $\text{C}_6\text{H}_6$  yields a substance which is sol. in boiling alk. carbonates and m. approx.  $240^\circ$ . The  $\text{Et}_2\text{O}$ -insol. residue m. around  $300^\circ$  (decompn.) and is sol. in cold alk. carbonates. All these decompn. products are to be studied further. IV and excess concd.  $\text{H}_2\text{SO}_4$ , heated at  $150-60^\circ$ , evolve  $\text{CO}_2$  and  $\text{SO}_2$  and yield 1,5-fluorenedicarboxylic acid (VI), formed by rotation through  $180^\circ$  of its axis of union of one of the  $\text{C}_6\text{H}_4$  nuclei and elimination of water. It is red and m.  $295-9^\circ$  (decompn.). VI on distn. yields fluorenone and an unidentified acidic substance, pale yellow, m.  $185^\circ$ , probably a mixt. of 2 isomers formed from VI by elimination of CO, *vis.*, 1- and 5-fluorenonecarboxylic acids (VII and VIII), with VII predominating, since the oxime of the mixt. m.  $215^\circ$  (the oxime of VII m.  $230^\circ$ , that of VIII m.  $263^\circ$ ). On distn. with powd. Zn, VI yields fluorene. Alc. VI,  $\text{HONH}_2\text{HCl}$  and  $\text{Na}_2\text{CO}_3$ , refluxed, yields on purification by HCl and  $\text{Na}_2\text{CO}_3$  an oxime,  $\text{C}_{16}\text{H}_9\text{O}_4\text{N}$ , yellowish, m.  $295-300^\circ$  (to a black liquid). VI and alc.  $\text{PhHNH}_2$ , refluxed, form the phenylhydrazone,  $\text{C}_{21}\text{H}_{14}\text{O}_4\text{N}_2$ , red, decomp. at  $240^\circ$  to the pyridazinone (IX), m.  $204-5^\circ$ .

It is also formed by refluxing VI in a mixt. of  $\text{AcOH}$  and  $\text{Ac}_2\text{O}$ . The new method of oxidative destruction leaves intact the benzene nucleus of V, and thus explains the structure not only of derivs. of V in the benzene nucleus (important from the tech. point of view), the constitution of which has been uncertain, but also of condensation compds. of V derivs. of the dibenzanthrone and isodibenzanthrone types. The method also makes possible the prepn. of important new derivs. of  $\text{Ph}_2$  and of fluorene.

C. C. Davis

Nuclear hydrogenation of furan with osmium catalyst. N. D. Zelinskii and N. I. Shufkin. *Compt. rend. acad. sci. U. R. S. S.* [N. S.], 1933, 60-3 (in German 64-5).—Hydrogenation of furan and its derivs. in the vapor phase with Ni catalysts opens the ring and forms alcs. and satd. hydrocarbons. At high pressures the ring is reduced with difficulty. Cu is not a suitable catalyst for nuclear reduction. With  $\text{PtO}_2$  alc. furfural has been previously reduced to tetrahydrofurfuryl alc. accompanied by pentane-1,2-diol, pentane-1,5-diol and pentan-1-ol. With the aid of Pd-charcoal  $\text{C}_4\text{H}_7\text{OCH}_2\text{OH}$  has been reduced to  $\text{C}_4\text{H}_9\text{OCH}_2\text{OH}$ . Below  $100^\circ$  20% Pt-activated charcoal or 19% Pt-asbestos have very little effect on sylvan (I) in the vapor phase. A 4-fold repetition at  $160^\circ$  over 20% Pt-charcoal gave a mixt. of tetrahydrofuran, tetrahydroxyvan, butan-2-ol and pentan-2-ol. Furfural was converted according to the method of Wolf (*C. A.* 7, 790) into I, which after distn. gave  $\text{C}_4\text{H}_8\text{O}$ , *b<sub>700</sub>* 63-4°, *d<sub>4</sub>*°

0.9130,  $n_D^{20}$  1.4341, M. R. 23.80 (calcd. 23.41). I was vaporized at 80–2° and carried at the rate of 4–5 drops per min. in a stream of H over a 25-cm. layer of loosely packed 25% Os-asbestos in an 8-mm. glass tube. The reduced material was collected in a chilled receiver. It showed little change of  $n$  on a repetition of the reduction process. The product after distn. over Na gave tetrahydrosilylvan,  $C_8H_{10}O$ ,  $b_{76}$  78.5–80°,  $d_4^{20}$  0.8552,  $n_D^{20}$  1.4072, M. R. 24.73 (calcd. 24.78). Thus Os is a unique catalyst for the smooth hydrogenation of furan derivs. in the vapor phase without ring cleavage. C. R. Addinall

Red dyes from indolenine alkyl iodides. Elisa Ghigi. *Gazz. chim. ital.* 63, 694–701 (1933).—A further contribution to the work of Plancher and G. (*Rend. accad. sci. ist. Bologna*, May 20, 1928), who showed that König (C. A. 18, 2163) was wrong in concluding that 2-methyl-1-ethylindole is formed by the action of MeI on 2-methylindole.  $Et_3CHAC$ ,  $PhHNNH_2$  and anhyd.  $Et_2O$  condense directly to 3,3-diethyl-2-methylindolenine (I). The MeI deriv. of I,  $HC(OEt)_2$  (II) and  $Ac_2O$ , refluxed, yield the

corresponding indocyanine,  $MeN \cdot C_6H_4 \cdot CEt_2 \cdot C : CHCH : -$

$CHC : NMeI \cdot C_6H_4 \cdot CEt_2$ , violet reflection, m. 271°. Likewise the  $EtI$  deriv. of I, II and  $Ac_2O$ , refluxed, yield the

corresponding indocyanine,  $EtN \cdot C_6H_4 \cdot CEt_2 \cdot C : CHCH : -$

$CHC : NEtI \cdot C_6H_4 \cdot CEt_2$ , intense red with steel reflection, m. 293–4°. The MeI deriv. of 3-ethyl-3-methyl-2-methylindolenine, II and  $Ac_2O$ , refluxed, yield the corre-

sponding indocyanine,  $MeN \cdot C_6H_4 \cdot CMeEt \cdot C : CHCH : CH-$

$C : NMeI \cdot C_6H_4 \cdot CMeEt$ , violet reflection, m. 254°. Likewise the MeI deriv. of 3-phenyl-3-methyl-2-methylindolenine, II and  $Ac_2O$ , refluxed, yield the correspond-

ing indocyanine,  $MeN \cdot C_6H_4 \cdot CPhMe \cdot C : CHCH : CH-$

$C : NMeI \cdot C_6H_4 \cdot CPhMe$ , violet, m. 272°. As found in the earlier expts., alkyl and aryl groups in the 3-position of indolenine have a bathochromic effect, and the higher the mol. wt. of the group the more pronounced is the effect. Among these new compds., the color depends upon the presence in the indolenine of a Me group in the 2-position, since attempts to prep. a dye from the MeI deriv. of 3,3-dimethyl-2-ethylindolenine were unsuccessful, and gave an intense violet substance which dyed wool a light violet, but which could not be obtained in cryst. form, as with the dye prepd. from the HI derivs. of 9,11-dimethylcarbazolene. C. C. Davis

Condensation of isatin with phenyl esters of fatty acids. Shigenobu Inagaki and Taro Nakato. *J. Pharm. Soc. Japan* 53, 719–27 (1933).—The best condition for the condensation of isatin and Ph esters of fatty acids is the simultaneous use of  $P_2O_5$  and concd.  $H_2SO_4$  and heating the reaction mixt. at 85–90° for 8 hrs. By this method besides bis(acetoxyphenyl)isatin, the following new compds. were obtained: bis(propionyloxyphenyl)isatin, m. 192–3°, and dibutylbis(butyroxyphenyl)isatin, m. 148–9°. The yield decreases as the no. of C atoms of the fatty acid increases. Nao Uyei

Diphenylisatin. I. Synthesis and oxidation of diphenylisatin. Shigenobu Inagaki. *J. Pharm. Soc. Japan* 53, 686–78 (1933).—Bayer (*Ber.* 12, 1310 (1879); 18, 2637 (1885)) has shown that isatin (I) combines with 2 mols. each of  $PhOH$ ,  $PhMe$  or  $PhNMe_2$ ; he did not give conclusive evidence of the point of linkage but assumed it was position 3 of the indole ring, since reduction of I gives hydroxyindole. Sen (C. A. 19, 2196) stated that  $PhOH$  combines with I at position 2 when  $ZnCl_2$  is used as the condensing agent. I. has cleared up this point as follows: Hantzsch's 3,3-dichloroisatin (II) was condensed with  $PhOH$ ,  $PhOMe$ ,  $o-HOC_6H_4Me$  or  $PhOAc$  and the resulting products were compared with already known compds. It was found that these products were identical with products obtained by the use of  $H_2SO_4$  as condensing

agents showing Bayer's assumption was correct. II,  $PhH$  and  $AlCl_3$  gave diphenylisatin (III), needles, m. 230–1°. Ac deriv., platelets, m. 176–7°. Oxidation of III with  $CrO_3$  in  $AcOH$  gave diphenylisatoic anhydride, needles, m. 239–40° (IV). IV dissolves in concd.  $H_2SO_4$  with orange color and evolution of  $CO_2$ . On pouring into a large amt. of  $H_2O$ , it gives a colorless soln. from which *o*-amino-triphenylcarbinol (V), m. 121°, was obtained. Reduction of V with  $Zn$  dust gave acetylaminotriphenylmethane. II. Study of dianisoleisatin and the constitution of diphenol-isatin. *Ibid.* 698–718.—Bayer obtained dianisoleisatin (I), m. 65°, from isatin (II) and  $PhOMe$  in concd.  $H_2SO_4$ . Ger. pat. 462,527 makes I, m. 117–18°, from diphenol-isatin (III) and  $Me_2SO_4$ . But no one has established the exact position of  $MeO$  groups in I. There is a possibility of forming 3 different isomers. In order to det. the exact structure, this work was carried out. II and  $PhOMe$  in  $AcOH$  and  $H_2SO_4$  gave 4 products, (a) m. 157°, (b) 322–4°, (c) m. 98–117° and (d) m. 165°. The main product (IV), m. 157° and had tendency to crystallize with the solvent. Elementary analysis showed this compd. to be identical with I. Ac deriv., m. 153°. III and MeI gave a mono-Me deriv. m. 149–50°, which was identical with trimethylidiphenolisin (V) obtained from III and  $Me_2SO_4$ . Therefore, the OH groups of III and the  $MeO$  groups of I are in the same positions. In order to det. the exact structure, I was oxidized with  $CrO_3$  in  $AcOH$ . A compd. m. 202° (V) was obtained which gave a red soln. with concd.  $H_2SO_4$  with evolution of  $CO_2$ . On pouring the latter soln. into  $H_2O$ , a colorless soln. resulted, which on addn. of  $NaOH$  gave diphenylisatoic anhydride (VI), m. 103°. Ac deriv. m. 174°. From this it is assumed that VI must be one of the following: 2-amino-4',4''- (VII); 2-amino-2',2''- (VIII); or 2-amino-2',4''-dimethoxytriphenylcarbinol (IX). These new compds. have been synthesized by the method of Bayer and Hassel (*Ber.* 37, 3192). *p*- $IC_6H_4OMe$  and *o*- $H_2NC_6H_4CO_2Me$  in presence of  $Mg$  in ether gave VII, m. 103°, which was also obtained from *p*- $IC_6H_4OMe$  and 2-amino-4'-methoxybenzophenone (X). *o*- $IC_6H_4OMe$  and *o*- $H_2NC_6H_4CO_2Me$  gave VIII, m. 181–2°, which gives a greenish blue soln. with concd.  $H_2SO_4$ . Ac deriv. m. 229°. X and *o*- $IC_6H_4OMe$  gave IX, m. 170–1°, which gave a red soln. with concd.  $H_2SO_4$ . Ac deriv., m. 195–6°. Thus it is shown VI and VII are identical; the mixed m. p. was also 103°. This shows that IV is 3-(4',4''-dimethoxydiphenyl)isatin, and III, m. 269°, is the 4',4''-di-*HO* compd. III and  $H_2O$  gave 2-amino-4'-hydroxybenzophenone, m. 165°, and *o*- $H_2NC_6H_4CO_2H$ . Nao Uyei

Tautomerism of pyrazoles. K. v. Auwers. *Ann.* 508, 51–8 (1933).—3-Phenylpyrazole,  $d_4^{18.9}$  1.1037 (14.203% in quinoline),  $n_D^{18.9}$  1.61947, 1.62789, 1.65010 for  $\alpha$ ,  $\beta$ , and  $\gamma$ ; 5-Me deriv.,  $d_4^{20.7}$  1.0966 (11.133%),  $n_D^{20.7}$  1.61672, 1.62540, 1.64732; Me 3-phenylpyrazole-5-carboxylate,  $d_4^{18.1}$  1.1085 (10.315%),  $n_D^{18.1}$  1.61721, 1.62576, 1.64774; 1-Me deriv.,  $d_4^{17.6}$  1.1090 (16.19%),  $n_D^{17.6}$  1.61294, 1.62139, 1.64307; Me 1-ethyl-5-phenylpyrazole-3-carboxylate,  $d_4^{18.1}$  1.1038 (13.202%),  $n_D^{18.1}$  1.61093, 1.61925, 1.64036. The structure of the pyrazole derivs. is discussed from the spectrochem. view; the idea of the equivalence of the 3- and 5-positions is no longer tenable; like other substances capable of tautomerism, the parent pyrazoles are mixts. of isomers, though in some cases they may be practically homogeneous. Other phys. methods must be applied to the problem for the final soln. C. J. W.

Reduction of 2-methylimidazole-4,5-dicarboxylic acid. (Synthesis of 2-methyl-5-hydroxymethylimidazole-4-carboxylic acid.) Y. Tamamushi. *J. Pharm. Soc. Japan* 53, 664–8 (1933).—T. tried to reduce 2-methylimidazole-4,5-dicarboxylic acid by various methods. The reduction was not successful with the acid or its ester. With the 5-monochloride, the reduction with  $Sn$  and  $HCl$  gave 2-methyl-5-hydroxymethylimidazole-4-carboxylic acid. Nao Uyei

Spontaneous resolution of a racemic compound (histidine monohydrochloride). R. Duschinsky. *Chemistry & Industry* 1934, 10; cf. C. A. 22, 2360.—By fractional

crystn. of a mixt. of pure *l*- and *dl*-histidine-HCl from 1.5 parts of H<sub>2</sub>O, the *d*-isomer was produced as follows: (a) On rapidly cooling the hot soln. to 20°, then rapidly filtering, crystals of more or less optically pure *l*-histidine-HCl (I) were sepd. (b) By adding EtOH and Et<sub>2</sub>O to the filtrate and further cooling to 0°, almost pure *dl*-salt (II) was obtained. (c) On concg. the mother liquor and treating as in (a) almost optically pure *d*-histidine-HCl (III) was deposited. (d) The filtrate when treated as in (b) gave II. A mixt. of 660 g. of II and 340 g. of I gave 400 g. of II,  $[\alpha]_D^{25} -38-9.5^\circ$ , 540 g. of II,  $[\alpha]_D^{25} 0^\circ$ , and 46 g. of III,  $[\alpha]_D^{25} 38-9.5^\circ$ . II corresponds to the formula C<sub>6</sub>H<sub>7</sub>N<sub>3</sub>O<sub>2</sub>·HCl·2H<sub>2</sub>O, while the optically active salts fix only 1 mol. of H<sub>2</sub>O. Accordingly II seems to be a racemate and not an externally compensated mixt. It is now possible to prep. large quantities of III previously only available by biol. methods or by combination with optically active substances.

C. R. Addinall

**Naphthothiazole series. II. The methylation of 1-anilino- $\alpha$ -naphthothiazole and of 1-*p*-bromoanilino- $\alpha$ -naphthothiazole. The aromatic character of the heterocyclic nucleus in  $\alpha$ -naphthothiazoles. Mahmudur Rahman Chowdhury, Ranchhodji Dajibhai Desai and Robert F. Hunter. *J. Indian Chem. Soc.* 10, 637-42 (1933); cf. *C. A.* 24, 4036.—On methylation, 1-amino- $\alpha$ -naphthothiazole reacts exclusively in the amino phase (cf. *C. A.* 23, 835, for mechanism), yielding 1-imino-2-methyl-1,2-dihydro- $\alpha$ -naphthothiazole, unaccompanied by any detectable quantity of the isomeric methylamino- $\alpha$ -naphthothiazole. In the benzothiazole series, the reactivity of the amidine system is also almost entirely in favor of the aminothiazole phase. The introduction of a conjugated substituent as in 1-anilinobenzothiazole forms a system which, on methylation, yields a mixt. of both isomers (*C. A.* 25, 103). To exam. the effect of substitution in the NH<sub>2</sub> group on the reactivity of the semicyclic amidine the methylation of 1-anilino- $\alpha$ -naphthothiazole (I), m. 211-12°, prepd. by the condensation of 1-chloro- $\alpha$ -naphthothiazole (II) and PhNH<sub>2</sub>, was investigated. I reacted completely in the amino phase, yielding 1-phenylimino-2-methyl-1,2-dihydro- $\alpha$ -naphthothiazole, m. 182° (picrate, m. 218°), and no trace of the isomeric 1-phenylmethylamino- $\alpha$ -naphthothiazole (picrate, m. 184°), synthesized from II and PhNHMe. Since the attraction of the Ph nucleus for the  $\alpha,\beta$ -double bond in I is evidently insufficient to overcome the effect of internal aromatic conjugation of the heterocyclic ring 1-*p*-bromoanilino- $\alpha$ -naphthothiazole, m. 256°, was methylated. The amino form gave exclusively 1-*p*-bromophenylimino-2-methyl-1,2-dihydro- $\alpha$ -naphthothiazole, m. 182°. No trace of the isomeric 1-*p*-bromophenylmethylamino- $\alpha$ -naphthothiazole, m. 245°, prepd. from *p*-BrC<sub>6</sub>H<sub>4</sub>NHMe and II, was found. The behavior of the 1-amino- $\alpha$ -naphthothiazoles resembles that of the simple aminothiazoles much more closely than that of the 1-anilinobenzothiazoles and the heterocyclic nucleus in  $\alpha$ -naphthothiazole is evidently more aromatic than in benzothiazole. The loss of aromatic character by the thiazole nucleus on combination with the benzene ring as in benzothiazole may be compensated for by the presence of a 2nd fused aromatic nucleus as in  $\alpha$ -naphthothiazole.**

C. R. A.

**Comparison of the directive powers of elements having consecutive atomic numbers. VI. Examination of further possible comparative cases and conclusions. Catharine C. Le Fèvre, Raymond J. W. Le Fèvre and John Pearson. *J. Chem. Soc.* 1934, 37-43; cf. *C. A.* 27, 3475.—A satisfactory exptl. comparison of an oxonium salt with an NH<sub>2</sub> salt is impracticable. The *m*-directive influence of O in the onium condition has been demonstrated most clearly in the cases of 2-phenyl-, 2-phenyl-3-methyl- and 2-*p*-tolyl-benzopyrylium perchlorates and 2,4,6-triphenylpyrylium perchlorate. The contrast between the activating effect of bivalent O and the deactivating effect of "quadrivalent" O was demonstrated by the observations that (a) xanthylum salts were not nitrated under conditions which adequately sufficed to dinitrate xanthone and (b) *o*-phenylxanthylum salts underwent mono-*p*-nitration in the *p*-Ph group only.**

Qual. indications were that oxonium O forms a stronger deactivating pos. pole than does ammonium N (when this element is covalently bound to a Me group, as in all the expts.). Dry HCl passed through a soln. of propiophenone (I), salicylaldehyde (II) and HClO<sub>4</sub> gives 2-phenyl-3-methylbenzopyrylium perchlorate, orange, m. 174-7°; nitration gives the *m*-nitrophenyl deriv., yellow, m. 248-9°, also obtained from *m*-nitropropiophenone. I, isatin and 30% NaOH, heated 8 hrs., give 2-phenyl-3-methylquinoline, m. 50°; methiodide, m. 215°; methopicate, yellow, m. 169-70°; its nitration was not studied. PhCH<sub>2</sub>Ac, I and piperidine give 2-hydroxy- $\alpha$ -phenylstyryl Me ketone, m. 180-1°, ring closure of which could not be effected; 3-phenyl-2-methylbenzopyrylium perchlorate, m. 189-91°, was prepd. from PhCH<sub>2</sub>Ac, II, HClO<sub>4</sub> and HCl in Et<sub>2</sub>O; attempted nitration gave only black masses. 2,1-C<sub>10</sub>H<sub>8</sub>(OH)CHO (III), PhAc and HClO<sub>4</sub> in Et<sub>2</sub>O, with HCl, give 2-phenyl- $\alpha$ -naphthopyrylium perchlorate, yellow, m. 216-20°; II appears to be inferior to III in reactivity, as judged from the reaction with PhAc. PhCH<sub>2</sub>Ac and isatin give 3-phenyl-2-methylquinoline-4-carboxylic acid, m. above 250°; distn. with lime gives 3-phenyl-2-methylquinoline, whose picrate, yellow, m. 170-5°. II and *p*-MeC<sub>6</sub>H<sub>4</sub>Ac give salicylidene-4-methylacetophenone, yellow, m. 158-9°; HCl in AcOH gives 2-*p*-tolylbenzopyrylium perchlorate, yellow, m. 148-50°; nitration gives 3'-nitro-2-phenyl-4'-methylbenzopyrylium perchlorate, m. 200-5°, also synthesized from 4,3-Me(O<sub>2</sub>N)-C<sub>6</sub>H<sub>4</sub>Ac. *p*-MeC<sub>6</sub>H<sub>4</sub>Ac and isatin, after distn. with lime, give 2-*p*-tolylquinoline, pale yellow, m. 82-3°; the methosulfate m. 158-9°; the methopicate m. 157-8°; the *m*-NO<sub>2</sub> deriv. m. 192-4°. 2'-Hydroxy-2-styrylbenzopyrylium perchlorate gives a *di*-NO<sub>2</sub> compd., chocolate-brown, which could not be crystd. without apparent decompn. Quinaldine methopicate gives about 75% of a 5-NO<sub>2</sub> compd., m. 148-50°; the synthetic product m. 149-51°. 2-*o*-Hydroxystyryl-3-methylbenzopyrylium perchlorate gives a *di*-NO<sub>2</sub> compd., decomps. above 150°. Considerable oxidation always occurs when the nitration of benzopyrylium ferrichloride is attempted, small yields only of nitrosalicylic acid being isolated. 5-Nitrosalicylaldehyde and PhAc give 6-nitro-2-phenylbenzopyrylium perchlorate, red, which cannot be recrystd.; the 3-nitrosalicylaldehyde appears to give 3-nitro-2-hydroxychalcone, yellow, m. 163-4°.

C. J. West

**Cyclic compounds containing a carbonyl group. A mechanism for the formation of pyrylium salts from 1,5-diketones. C. F. H. Allen and H. R. Sallans. *Can. J. Research* 9, 574-82 (1933); cf. *C. A.* 27, 5071.—An EtOH**

soln. of NaOH, CH<sub>2</sub>(CH<sub>2</sub>)<sub>4</sub>CO and BzCH:CHPh (I) on standing gives 2-phenylbenzylcyclohexanone (II), white, m. 149° (dioxime, white, m. 180°). A trimol. compd. C<sub>16</sub>H<sub>14</sub>O<sub>3</sub>, m. 167-8°, forms in the absence of solvent with NaOEt. Similarly there is produced 2-(4-chlorophenacylbenzyl)cyclohexanone, white, m. 125-6°, and 3-Me homolog, white, m. 155-6°. II refluxed with H<sub>2</sub>NOH.HCl in EtOH or the dioxime of II in C<sub>6</sub>H<sub>6</sub> with HCl gives 5,6,7,8-tetrahydro-2,4-diphenylquinoline as a gum (picrate, yellow, m. 196°). Excess of H<sub>2</sub>NOH with phenacylbenzylanthrone (III) (the addn. product of I and anthrone) gives only a monoxime, m. 144-5°, but III in the Grignard machine consumes 2 mols. of reagent without evolution of gas, indicating a diketone. II in EtOH and concd. H<sub>2</sub>SO<sub>4</sub> is dehydrated to 2 stereoisomeric forms of bicyclo[3.1.3]-2,4-diphenyl-9-keto-4-nonene (IV), m. 143° and 151°. The lower-melting isomer gives the oxime, m. 156°, and in the Grignard machine consumes 1 mol. of reagent to give bicyclo[3.1.3]-2,4-diphenyl-9-methyl-9-hydroxy-4-nonene (V), m. 147°. IV does not lose the CO bridge on heating in contrast to the behavior of other compds. of a similar ring system. II in CHCl<sub>3</sub> and abs. MeOH with HBr gives 2,4-diphenyl-2-methoxyhexahydrobenzopyran (VI), m. 171°. II with H<sub>2</sub>SO<sub>4</sub>, or any mineral acid or anhyd. CuSO<sub>4</sub>, also gives VI. None of the other addn. products nor several other previously known 1,5-diketones give a Me ether similar to VI. The addn. product of I and menthone prepd. by Stobbe (cf. *C. A.* 7, 3130) is represented best

by VII since it gives only a monoxime, consumes 2 mols. of Grignard reagent, and evolves 1 mol. of gas. The 1,5-diketones studied undergo ring closure to produce pyrylium salts of which those containing a metal are made from the ketone and the metal chloride in  $\text{Ac}_2\text{O}$ , and the perchlorates are made by the addn. of 50%  $\text{HClO}_4$  to a suspension of the diketone in  $\text{Ac}_2\text{O}$  and abs.  $\text{Et}_2\text{O}$ .  $\text{SnCl}_4$  and  $\text{SbCl}_5$  can replace  $\text{FeCl}_3$  in the ferrichlorides. The Sn compd. is an addn. product of an acetate, but the Fe and Sb compds. are addns. of 1 mol. of the metal chloride to the chloride of the

cyclic deriv. II,  $\text{BzCH}_2\text{CHPhCH}(\text{CHMe})_2\text{CO}$

(VIII) and  $\text{BzCH}_2\text{CHPhCH}(\text{CH}_2)_2\text{CO}$  (IX), give, resp., the ferrichlorides:  $\text{C}_{22}\text{H}_{19}\text{OFeCl}_4$ , yellow, m.  $161^\circ$ ;  $\text{C}_{22}\text{H}_{19}\text{OFeCl}_4$ , yellow, m.  $133^\circ$ ; and  $\text{C}_{20}\text{H}_{17}\text{OFeCl}_4$ , brown, m.  $126^\circ$ . II, VIII, IX, and  $p\text{-PhC}_6\text{H}_4\text{CO}(\text{CH}_2)_2\text{CHPhBz}$  (XI) give, resp., the perchlorates:  $\text{C}_{21}\text{H}_{19}\text{O}_3\text{Cl}$ , yellow, m.  $214^\circ$ ;  $\text{C}_{20}\text{H}_{17}\text{O}_3\text{Cl}$ , orange-yellow, m.  $231^\circ$ ;  $\text{C}_{20}\text{H}_{17}\text{O}_3\text{Cl}$ , yellow, m.  $240^\circ$  (decompn.);  $\text{C}_{20}\text{H}_{17}\text{O}_3\text{Cl}$ , yellow, m.  $258^\circ$ . II, VIII, IX,  $\text{BzCH}_2\text{CHPhCH}_2\text{Bz}$  (X), and XI give, resp., the Sn salts:  $\text{C}_{22}\text{H}_{22}\text{O}_4\text{SnCl}_4$ , yellow-orange, m.  $143^\circ$ ;  $\text{C}_{21}\text{H}_{21}\text{O}_4\text{SnCl}_4$ , yellow, m.  $135^\circ$ ;  $\text{C}_{21}\text{H}_{21}\text{O}_4\text{SnCl}_4$ , brown, m.  $161^\circ$ ;  $\text{C}_{20}\text{H}_{19}\text{O}_4\text{SnCl}_4$ , yellow, m.  $205^\circ$ ;  $\text{C}_{21}\text{H}_{21}\text{O}_4\text{SnCl}_4$ , orange, m.  $206^\circ$ . X and XI give, resp., the Sb salts:  $\text{C}_{22}\text{H}_{21}\text{OSbCl}_4$ , brown, m.  $320^\circ$  (decompn.);  $\text{C}_{20}\text{H}_{19}\text{OSbCl}_4$ , brown, m.  $233^\circ$  (decompn.). II and VI with  $\text{FeCl}_3$  and  $\text{Ac}_2\text{O}$  give the same ferrichloride. A plausible mechanism for the formation of pyrylium salts from 1,5-diketones is given.

R. B. Sandin

**Synthesis of brazilinic acid.** Juanendra N. Ray, Santokh S. Sillooja and Prem R. Wadha. *J. Indian Chem. Soc.* 10, 617-20 (1933).—The condensation of Et methoxyphenoxypropionate with veratroyl chloride in the presence of  $\text{AlCl}_3$  takes place with extrusion of the side chain carrying the ester grouping and the consequent formation of 2-hydroxy-4,4',5'-trimethoxybenzophenone (I),  $\text{C}_{18}\text{H}_{16}\text{O}_6$ , m.  $141^\circ$ , together with a small amt. of the isomeric 4-hydroxy-2,4',5'-trimethoxybenzophenone (II), m.  $175^\circ$ . Treatment of  $m\text{-MeOC}_6\text{H}_4\text{OH}$  and veratroyl chloride in  $\text{PhNO}_2$  with  $\text{AlCl}_3$  also gave I and II in almost equal quantities. The resp. structures were assigned after consideration of the  $\text{FeCl}_3$  color reactions of the 2 ketones. I was converted by nitration, reduction, replacement of the  $\text{NH}_2$  group by CN and hydrolysis of the nitrile to 2-hydroxy-4,4',5'-trimethoxybenzoic acid (III), m.  $203^\circ$ , previously prep'd. by Perkin and Robinson (*C. A.* 2, 1908) by condensing hemipinic anhydride with  $m\text{-C}_6\text{H}_4(\text{OMe})_2$ . A soln. of 1 g. of I in 15 cc.  $\text{AcOH}$  on treatment with a mixt. of concd.  $\text{H}_2\text{SO}_4$  and  $\text{HNO}_3$  at  $48-52^\circ$  for 2 hrs. gave 2-hydroxy-4,4',5'-trimethoxy-2-nitrobenzophenone, m.  $211^\circ$ , reduced by  $\text{SnCl}_2$  and  $\text{HCl}$  to the 2-amino deriv.  $\text{HCl}$ , m.  $240^\circ$ , converted by treatment with 1%  $\text{NaNO}_2$  and potassium cuprocyanide to the corresponding cyano compd. m.  $152-4^\circ$ , hydrolyzed by alc.  $\text{KOH}$  to III. The condensation of III with  $\text{ClCH}_2\text{CO}_2\text{H}$  in alk. soln. yielded brazilinic acid (IV)  $\text{C}_{18}\text{H}_{16}\text{O}_8$ , m.  $209^\circ$ , developing the characteristic red color with concd.  $\text{H}_2\text{SO}_4$ . IV is identical with the natural brazilinic acid and with the synthetic acid prep'd. by refluxing a mixt. of the above cyano compd. and  $\text{ClCH}_2\text{CO}_2\text{H}$  in alk. soln. for 7 hrs., acidifying and crystg. from hot dil.  $\text{AcOH}$ . C. R. A.

**Cyanine dyes.** VI. Thia-, thiazolo-, oxa- and imidocyanines. Terutaro Ogata. *Proc. Imp. Acad.* (Tokyo) 9, 602-5 (1933); cf. *C. A.* 27, 1631.— $\mu, N, N'$ -Trimethylbenzimidazole iodide,  $\text{Cl}_2\text{CCHO}$  and  $\text{EtONa}$  give 13% of 1,1',3,3'-tetramethyltrimethinimidocyanine iodide, orange-red, m.  $303^\circ$ , sensitizing max 530  $\mu$ . 1-Methylbenzothiazole-R11 (I) and propenedianil (II) with piperidine give 61% of 1,1'-diethylpentamethinethiocyanine iodide,

green with metallic luster, m.  $253^\circ$  (decompn.), 700  $\mu$ .  $\mu$ -Methylthiazole-Mel (III) and II give 5% of 1,1'-dimethylpentamethinethiazolocyanine iodide, steel-blue, m.  $215^\circ$  (decompn.), 690  $\mu$ .  $\alpha, \mu$ -Dimethylthiazole-Mel (IV) and II give 24% of 1,1',5,5'-tetramethylpentamethinethiazolocyanine iodide, steel-blue, m.  $226^\circ$ , 690  $\mu$ . I and pentadienedianil give 15% of 1,1'-dimethylheptamethinethiocyanine iodide, green, m.  $240^\circ$ , 800  $\mu$ . III gives 10% of 1,1'-dimethylheptamethinethiazolocyanine iodide, green, m.  $152^\circ$  (decompn.), 780  $\mu$ . IV gives 27% of the 1,1'-5,5'-tetra-Me deriv., green, m.  $174^\circ$  (decompn.), 780  $\mu$ . I, heated with  $\text{HC}(\text{CO}_2\text{Et})_2$  and  $(\text{CH}_3\text{CO}_2\text{H})_2$  3 min. at  $170^\circ$ , gives 2% of 1,1',1'-triethyl-9-benzothiazolyl-11-methinethiocyanine 1,1'-diiodide, golden, m.  $256^\circ$  (decompn.), 640  $\mu$ . III gives 40% of 1,1',1'-trimethyl-7-thiazolyltrimethinethiazolocyanine 1,1'-diiodide, green, m.  $250^\circ$  (decompn.), 640  $\mu$ . IV gives 42% of 1,1',1',5,5',5'-hexa-Me deriv., greenish blue, m.  $283^\circ$  (decompn.), 640  $\mu$ . 1,1',1',3,3',3'-Hexamethyl-9-benzimidazolyl-trimethinimidocyanine 1,1'-diiodide, dark red, m.  $230^\circ$ , 570  $\mu$ , in 5% yield from trimethylbenzimidazole iodide. Most of these dyes are unstable toward acids. C. J. W.

**Preliminary synthetic experiments in the cytosine group.** I. Attempted synthesis of Ewins' structure for cytosine. Salyendranath Chakravarti and A. Venkatasubban. *J. Annamalai Univ.* 2, 227-37 (1933).—A preliminary description of unsuccessful attempts to synthesize a compd. of the structure assigned by Ewins to cytosine. Further work is in progress. Condensation of the mixt. of nitrotolualdehydes resulting from nitration of  $m\text{-MeC}_6\text{H}_4\text{CHO}$  with  $\text{CH}_2(\text{CO}_2\text{H})_2$  in the presence of  $\text{C}_6\text{H}_5\text{N}$  and piperidine gave 2-nitro-3-methylcinnamic acid (I), m.  $244^\circ$  (Me ester, m.  $83^\circ$ ), and the 6-nitro isomer (II), m.  $224^\circ$  ( $p$ -toluide, m.  $89^\circ$ ). Nitration of  $m\text{-MeC}_6\text{H}_4\text{CH}_2\text{CHCO}_2\text{H}$  gave 4-nitro-3-methylcinnamic acid, m.  $251^\circ$  (Me ester, m.  $124^\circ$ ), together with I and II. Hydroxyuvitic aldehyde with  $p\text{-NH}_2\text{C}_6\text{H}_4\text{Me}$  gave a mono-Schiff's base, m.  $161^\circ$ , which on condensation with  $\text{CH}_2(\text{CO}_2\text{H})_2$  and hydrolysis with  $\text{HCl}$  gave 2-hydroxy-3-formyl-5-methylcinnamic acid, m.  $212^\circ$  (Me ester, m.  $129^\circ$ ). 3-Cyano-4-nitrotoluene by the Skraup reaction in the presence of  $\text{As}_2\text{O}_3$  gave 70% of 6-methyl-8-carboxyquinoline, m.  $169^\circ$ , which on reduction with Sn and  $\text{HCl}$  gave 6-methyl-1,2,3,4-tetrahydro-8-carboxy, uinaline, m.  $190-1^\circ$  (N-nitroso compd., m.  $138^\circ$ ). R. C. Elderfield

**Phenanthridine series.** III. meso-Substituted derivatives. Leslie P. Walls. *J. Chem. Soc.* 1934, 104-9; cf. *C. A.* 26, 5956.—Phenanthridone,  $\text{POBr}_2$  and  $\text{PBr}_3$ , heated 5 hrs. at  $200^\circ$ , give 9-bromophenanthridine (I), m.  $123-4^\circ$ .  $\text{C}_6\text{H}_4(\text{CO})_2\text{NK}$  and  $\text{Et}_2\text{NCH}_2\text{CH}_2\text{Cl}$ , heated 2 hrs. at  $130^\circ$ , give  $\beta$ -phthal- $\beta$ -diethylaminoethylimide, m.  $46-7^\circ$ .  $\text{C}_6\text{H}_4(\text{CO})_2\text{NCH}_2\text{CH}_2\text{Br}$  and  $(\text{iso-Bu})_2\text{NH}$ , heated 4 hrs. at  $130-40^\circ$ , give  $\beta$ -phthal- $\beta$ -diisobutylaminoethylimide, m.  $52^\circ$ ; hydrolysis with 20%  $\text{HCl}$  gives  $\beta$ -diisobutylaminoethylamine, whose  $\text{dipicrate}$ , yellow, m.  $190-2^\circ$  (decompn.). I and  $\text{Et}_2\text{NCH}_2\text{CH}_2\text{NH}_2$  in  $\text{PhOH}$  at  $100^\circ$  give  $N$ -phenylphenanthridone, m.  $118-19^\circ$ ; excess  $\text{Et}_2\text{NCH}_2\text{CH}_2\text{NH}_2$  at  $120^\circ$  gives 9- $\beta$ -diethylaminoethylamino phenanthridine, whose  $\text{di-HCl}$  salt m.  $238-43^\circ$ ; it seps with 1 mol.  $\text{EtOH}$  or 3 mols.  $\text{H}_2\text{O}$ ; the  $\text{dipicrate}$ , yellow, m.  $208-11^\circ$ . I and  $\beta$ -piperidinoethylamine give the 9- $\beta$ -piperidinoethylamino deriv., whose  $\text{di-HCl}$  salt m. about  $265-70^\circ$  and seps. with 2 mols.  $\text{H}_2\text{O}$ ; the  $\text{dinitrate}$  m.  $130-5^\circ$  (decompn.). The 9- $\beta$ -diisobutylaminoethylamino deriv. gives a  $\text{di-HCl}$  salt, crystals with 4 mols.  $\text{H}_2\text{O}$ , m.  $142-4^\circ$ . These compds. have a taste less bitter than quinine, but have no curative properties in malaria and are of no value in trypanosomiasis. 9-Methylphenanthridine, 40% aq.  $\text{HCHO}$  and  $\text{EtOH}$ , refluxed for 5 hrs., give 9- $\beta, \beta'$ -di-hydroxyisopropylphenanthridine, m.  $129.5^\circ$  ( $\text{di-Ac}$  deriv., m.  $93^\circ$ ); oxidation gives phenanthridine-9-carboxylic acid, which forms a complex with 1 mol.  $\text{HCl}$  and 1 mol.  $\text{H}_2\text{O}$ , yellow; the  $\text{Na}$  salt seps. with 3 mols.  $\text{H}_2\text{O}$ ;  $\text{Et}$  ester (III), m.  $57-8^\circ$ ; the acid frequently causes fatty degeneration of the liver and its pharmacology was not studied.  $\alpha$ -Xenylamine and  $(\text{CO}_2\text{Et})_2$ , heated at  $140^\circ$  for 4.5 hrs., yield a mixt. of  $\text{sym-di-o-xenylloxamide}$  (III), m.  $233-5^\circ$ , and  $\text{Et o-xenylloxamate}$ , m.  $112-13^\circ$ ; refluxing the Et

destruction of double bonds occurs under these conditions; if anything the no. of double bonds is somewhat increased. V. The oxidation of ergosterol. *Ibid.* 607-16.—Ergosterol takes up  $O_2$  in the dark, the max. rate being at  $pH$  8. The uptake of  $O_2$  is inhibited, though not completely, by HCN or pyrophosphate and accelerated by Fe, i. e., is a typical heavy metal catalysis. The oxidation is accelerated by phosphate or arsenate. The oxidation is greater in visible light than in the dark, and in light is increased by eosin or chlorophyll. The light reaction varies with the solvent, but is not affected by HCN. It consists of an uptake of 1 mol. of  $O_2$  with eosin, or 0.5 mol. with chlorophyll; in the latter case, vitamin D may be produced. Cholesterol is only very slightly oxidized under the same conditions.

K. V. Thimann

The constitution of laccol. Gabriel Bertrand and Georges Brooks. *Chimie & industrie* 30, 759-66(1933); cf. C. A. 26, 5558.—A more detailed account of the investigation.

A. Papineau-Couture

Syntheses of polycyclic compounds related to the sterols. II. Diel's hydrocarbon  $C_{15}H_{16}$ . S. H. Harper, G. A. R. Kon and F. C. J. Ruzicka. *J. Chem. Soc.* 1934, 124-8; cf. C. A. 27, 5336.—It has been shown that 1,2-cyclopentenophenanthrene (I) is not identical with Diel's hydrocarbon  $C_{15}H_{16}$  (II); II is not the 4'- or the 5'-Me deriv. of I (cf. Ruzicka, C. A. 27, 4800), but is the 3'-Me deriv. (cf. Bergmann and Hillemann, C. A. 27, 5749). 2-Methylcyclopentanone (43 g.) and the Grignard reagent from 90 g.  $\alpha$ - $C_{10}H_7CH_2CH_2Br$  give 24.4 g. 2-methyl-1-( $\beta$ - $\alpha$ -naphthylethyl)cyclopentanol (III),  $b_p$  190°; there also results some  $\alpha,\beta$ -di( $\alpha$ -naphthyl)butane (?),  $b_p$  240°, m. 102° (picrate, m. 174°; bis(*s*-trinitrobenzene) compd., m. 187°; bis(trinitrotoluene) compd., m. 131°). Heating 24 g. III with 40 g.  $P_2O_5$  at 140° under reduced pressure gives 1-methyl-1,2-cyclopentano-1,2,3,4-tetrahydrophenanthrene,  $b_p$  155°,  $d_4^{25}$  1.04542,  $n_D$  1.61363; dehydrogenation gives I, the trinitrotoluene compd. of which, yellow, m. 102°. 2-( $\beta$ - $\alpha$ -Naphthylethyl)cyclopentanol and Me-MgI give 1-methyl-2-( $\beta$ - $\alpha$ -naphthylethyl)cyclopentanol,  $b_p$  154°,  $d_4^{25}$  1.06338,  $n_D$  1.61991; dehydrogenation gives I. 2,5-Dimethylcyclopentanone and  $\alpha$ - $C_{10}H_7CH_2CH_2MgBr$  give 2,5-dimethyl-1-( $\beta$ - $\alpha$ -naphthylethyl)cyclopentanol,  $b_p$  190-5°;  $P_2O_5$  gives 1,3'-dimethyl-1,2-cyclopentano-1,2,3,4-tetrahydrophenanthrene,  $b_p$  160°,  $d_4^{25}$  1.04203,  $n_D$  1.60681; dehydrogenation gives the 3'-Me deriv. of I, m. 125-6° (picrate, brownish orange, m. 118-19°; trinitrobenzene deriv., m. 145-6°; trinitrotoluene compd., pale yellow, m. 93°); a 2nd hydrocarbon is also formed, m. 230° (picrate, scarlet, m. 134-5°). Mixed m. ps., absorption spectra and crystallographic data show that this is identical with II. The compd. prepd. by B. and H. shows several points of distinction from the 3'-Me deriv. prepd. as above, such as crystal form and m. p. of its derivs.; judgment is reserved until a larger quantity is available for study.

C. J. West

Cerevisterol: new notes on composition, properties and relation to other sterols. Edna M. Honeywell and Charles E. Bills. *J. Biol. Chem.* 103, 515-20(1933); cf. C. A. 27, 1355.—Five analyses of cerevisteryl diacetate confirm the formula  $C_{28}H_{46}O_6$ , so that cerevisterol is  $C_{26}H_{44}O_6$ . The mol. has 2 double bonds, 2 and possibly 3 OH groups, of which one is tertiary and not readily acetylated. Its reactions with  $CCl_3CO_2H$  and  $CCl_3CHO.H_2O$  are similar to, but more intense than, those of ergosterol. The digitonide, unlike those of other sterols, is not insol.

4 Partially oxidizing unsaturated hydrocarbons. E. I. du Pont de Nemours & Co. Brit. 400,297, Oct. 26, 1933. In the oxidation by O of gaseous unsatd. hydrocarbons for the production of olefin oxides, glycols, etc., the process is effected at 250-600° in a reaction vessel having a ratio of surface to vol. not exceeding about 4 (in sq. in.)/l (in cu. in.). Examples describe the oxidation of  $C_2H_4$  to  $C_2H_4O$ ,  $CH_2O$  and  $HCOOH$  and of  $C_3H_4$  to  $C_3H_4O$ ,  $C_3H_5(OH)_2$ , propionaldehyde, propionic acid,  $AcOH$ ,  $HCOOH$ ,  $AcH$  and  $CH_2O$ . The interior surface of the vessel is preferably of a siliceous material, e. g., glass, porcelain, clay.

5 Addition compounds of unsaturated hydrocarbons with hydrogen halides and alkyl halides. John P. Baxter (to Imperial Chemical Industries Ltd.). U. S. 1,944,161, Jan. 23. In producing compds. of this class (such as vinyl chloride from  $C_2H_2$  and  $HCl$ ) in the presence of active carbon as a catalyst, the partially spent catalyst is reactivated by temporarily interrupting the flow of the reaction gas mixt. and substituting a stream of the halide of the character employed in the reaction (the temp. during this stage being 200-600° and being higher than the reaction temp.).

6 Olefins from paraffin hydrocarbons. Per K. Frolich and Benjamin C. Boeckeler (Frolich to Standard Oil Development Co.). U. S. 1,944,419, Jan. 23. In treating hydrocarbons such as  $C_2H_6$ ,  $C_3H_8$ ,  $C_4H_{10}$  or  $C_5H_{12}$  for the production of olefins mainly having the same number of C atoms as the initial material, the material is passed through a reaction zone at 450-700° in contact with a catalyst, formed of Zn and Cr oxides, which has been subjected to reducing conditions before use in the reaction.

7 Absorbing olefins in sulfuric acid. Adrianus J. van Peski (to Shell Development Co.). U. S. 1,944,622, Jan. 23. Compds. such as  $C_2H_4$ ,  $C_3H_4$  or  $C_4H_6$  contg. at least one double bond in the mol. are absorbed in  $H_2SO_4$  in the presence of complex metallic-cyano compds. (numerous examples being given) which serve to facilitate the absorption.

8 Reactions of alkylene oxides with hydrogen halide. Paul L. Salzberg (to E. I. du Pont de Nemours & Co.). U. S. 1,944,274, Jan. 23. An olefin oxide such as ethylene oxide is added to an alkyl ester such as Et silicate contg. free H halide such as  $HCl$  and reaction is effected between the alkylene oxide and the H halide to form a product such as ethylene chlorohydrin.

9 Diolefin production. Martin Mueller-Cunradi (to I. G. Farbenind. A.-G.). U. S. 1,944,153, Jan. 23. For the production of a diolefin such as butadiene, a butylene glycol such as 1,3-butylene glycol, together with an addn. of water vapor is passed over a solid oxide dehydration

catalyst at a temp. of 160–500°.  $\text{CuSO}_4$  or red P may be used as an activator. Cf. C. A. 27, 5082.

**Secondary alcohols from olefin-sulfuric acid reaction liquors.** Benjamin T. Brooks (to Standard Alc. Co.). U. S. 1,944,400, Jan. 23. For obtaining secondary alcs. contg. 3 to 6 C atoms per mol. from acid reaction products formed by treating olefins with aq.  $\text{H}_2\text{SO}_4$ , an acid reaction product is dild. with water, the dild. material is permitted to stratify, forming an aq. layer and a layer consisting largely of hydrocarbons which is then sepd. from the aq. layer, directly and separately partially distd. to obtain a condensate of secondary alcs. with minor proportions of hydrocarbon material and the components of the condensate are sepd. Cf. C. A. 28, 17147.

**Aromatic alcohols.** Ludwig Valik and Irene Valik née Fleischacker. Fr. 756,229, Dec. 6, 1933. See Brit. 398,136 (C. A. 28, 10477).

**Carbohydrates.** Lucien H. Roman. Ger. 590,236, Jan. 4, 1934 (Cl. 12a. 6). Hexoses and higher carbohydrates are prepd. by polymerizing aldehydes, particularly  $\text{CH}_2\text{O}$ , under the influence of light, preferably orange-red light. The reaction is best effected in the presence of a compd. capable of combining with the carbohydrate formed, e. g., an alk. earth hydroxide. App. is described. Cf. C. A. 27, 4123.

**Primary and secondary amines.** Compagnie de produits chimiques et électrometallurgiques Alais, Proges et Camargue. Ger. 588,648, Nov. 21, 1933 (Cl. 12q. 5). Primary or secondary aliphatic or aromatic alcs. (except hydrogenated phenols) are heated with  $\text{NH}_3$  or primary amines in the presence of Ni or other metallic H-attaching catalysts, excluding metals of the 8th periodic group. Thus, a mixt. of  $\text{EtOH}$  vapor and  $\text{NH}_3$  is led over a Ni catalyst at atm. pressure and at 180–200° to give a 90% yield of amine consisting of 40%  $\text{EtNH}_2$  and 60%  $\text{Et}_2\text{NH}$ . The Ni catalyst is obtained by reducing  $\text{Ni}_2\text{O}_3$  at 200°. Other examples are given.

**Acyated cyclohexylphenylamines.** Georg Kalischer and Richard Fleischhauer (to General Aniline Works). U. S. 1,944,514, Jan. 23. Acyated cyclohexylphenylamines (which may be diazotized and used for making azo dyes) are prepd. by replacing, in a *N*-cyclohexylnitroaryl of the general formula cyclohexyl-NH-R- $\text{NO}_2$  (in which R stands for a benzene radical, the H atoms of which may be substituted by the nitro or sulfo group, and "cyclohexyl" stands for a cyclohexyl radical, the H atoms of which may be substituted by the methyl group), the H atom of the NH group by treating the compd. with an acylating agent, and subsequently reducing the  $\text{NO}_2$  group to  $\text{NH}_2$ . Details are given of the production of: 1-*N*-acetylcyclohexylamino-4-nitrobenzene, m. 114°; 1-*N*-acetylcyclohexylamino-4-aminobenzene, m. 143°; 1-*N*-benzoylcyclohexylamino-4-aminobenzene, m. 185°; *N*-2',5'-dichlorobenzoylcyclohexylamino-4-nitrobenzene, m. about 206°; *N*-2',5'-dichlorobenzoylcyclohexylamino-4-aminobenzene, m. 196°; *N*-3'-nitrobenzoylcyclohexylamino-4-nitrobenzene, m. about 147°; *N*-3'-aminobenzoylcyclohexylamino-4-aminobenzene, m. 180°; 1-*N*-acetyl-*o*- and *p*-methylecyclohexylamino-4-nitrobenzenes, m. 112° and 135°, resp.; and similar compds. including some sulfonic acids.

**Aromatic sulfodichloroamides.** Hans Mirau (to Chemische Fabrik von Heyden A.-G.). U. S. 1,944,508, Jan. 23. An aromatic sulfodichloroamide of the benzene series such as *p*-toluenesulfodichloroamide is formed by reacting upon an aromatic sulfoamide such as *p*-toluenesulfoamide with an alkali metal hypochlorite and introducing  $\text{CO}_2$  into the mixt.

**Ketones.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Brit. 400,384, Oct. 26, 1933. Higher aliphatic ketones are prepd. by subjecting a mixt. of a lower aliphatic ketone with a lower aliphatic primary alc. together with H or N to 150–400° in the presence of a catalyst consisting of  $\text{Al}_2\text{O}_3$ , with or without  $\text{MgO}$  or other alk. earth metal oxide, as main constituent with small amts. of Cu and (or) Ag, or an oxide thereof, to which  $\text{MoO}_3$  may be added. Small amts. of higher primary alcs. are also formed when H is used. Among examples (1)

1 MeOH and  $\text{Me}_2\text{CO}$  in equimol. quantities are passed with at least an equal quantity of N over a catalyst prepd. by impregnating  $\text{Al}_2\text{O}_3$  with  $\text{Cu}(\text{HCOO})_2$  and  $\text{MoO}_3$  or  $\text{BaO}$  and treating with steam and air at 450°; the product contains  $\text{MeEtCO}$ ,  $\text{Et}_2\text{CO}$  and high-boiling polysubstituted ketones, and (2)  $\text{MgO}$  is mixed with  $\text{Al}(\text{OH})_3$  and  $\text{CuO}$  and treated with air and steam at 400–500° and a mixt. of  $\text{Me}_2\text{CO}$  (2.5 mols.),  $\text{BuOH}$  (2 mols.) and H (3 mols.) is passed under pressure thereover to give  $\text{MeAmCO}$  as main product, heptyl alc., octyl alc. and higher ketones and alcs. being also formed. Cf. C. A. 27, 2692.

**Ketones and acid anhydrides.** I. G. Farbenind. A.-G. (Otto Nicodemus and Walter Weibezahn, inventors). Ger. 590,237, Jan. 4, 1934 (Cl. 12a. 10). An aliphatic carboxylic acid is treated with a compd. of the type  $\text{RC}:\text{CH}$  at atm. or moderately raised temp. and pressure in the presence of a catalyst, e. g., a mixt. of a salt of Hg, Zn or Cd with  $\text{H}_2\text{SO}_4$  or  $\text{H}_3\text{PO}_4$ . The anhydride of the acid and a ketone corresponding to the acetylenic compd. used are obtained. Thus,  $\text{AcOH}$  and  $\text{MeC}:\text{CH}$  yield  $\text{Ac}_2\text{O}$  and acetone. Other acetylenic compds. which may be used are  $\text{EtC}:\text{CH}$ ,  $\text{PhC}:\text{CH}$ ,  $\text{PhCH}_2\text{C}:\text{CH}$  and  $\text{CH}_2\text{CHC}:\text{CH}$ . Cf. C. A. 27, 4814.

**Esters of formic acid.** Ges. für Kohlentechnik m. b. H. (Wilhelm Glud, Walter Klempt and Fritz Brodkorb, inventors). Ger. 588,763, Nov. 28, 1933 (Cl. 12a. 11). CO is united with alc. under raised pressure in the presence of alcoholates, the temp. being first high and finally allowed to drop to room temp. Thus,  $\text{MeOH}$  with Na in soln. is heated in an autoclave to 60–65° and treated with CO at 50 atm. After 2 hrs. the temp. is allowed to fall. A 60.5% yield of  $\text{HCOOCH}_3$  is obtained. Other examples are given.

**Phosphoric acid esters.** Curt Schönburg (to I. G. Farbenind. A.-G.). U. S. 1,944,530, Jan. 23. Phosphorus oxychloride together with a large excess of glycol mono-alkyl or -aryl ethers are brought into reaction, producing new tertiary neutral phosphoric acid esters of glycol mono-alkyl (or -aryl) ethers, stable colorless substances of high b. p., difficultly inflammable and suitable for use as plasticizers and softeners with cellulose esters and ethers. The following phosphates are formed by the procedure various details of which are given: tris(ethoxyethyl),  $b_{10}$  225°; tris(butoxyethyl),  $b_{10}$  255°; tris(phenoxyethyl), m. 142°; tris(butoxypropyl),  $b_{10}$  248°; bis(methoxyethyl) butoxyethyl,  $b_{20}$  215–20°; bis(ethoxyethyl) butyl,  $b_{20}$  200° or higher; bis(chloroethyl) ethoxyethyl, chloroethyl methoxyethyl butyl,  $b_{15}$  about 200° and bromoethyl methoxyethyl butoxyethyl,  $b_7$  about 205°.

**Alkyl ethers of  $\omega$ -hydroxyaliphatic acids.** Henry Dreyfus. U. S. 1,943,375, Jan. 16. An ether such as methoxyacetic acid is formed by reaction upon an alkyl ether such as dimethyl ether with  $\text{CO}_2$  at an elevated temp. (suitably about 300–400°).

**Thio ethers and organic alkali thio compounds.** Adolf Stephenson. Ger. 588,584, Nov. 20, 1933 (Cl. 12a. 23.03). Sym. and asym. thio ethers and org. alkali thio compds. are obtained by the action of univalent alkali metal org. compds., in which the metal is directly bound to a C atom, on org. sulfur chlorides or on aliphatic and aromatic 1,2-disulfides, in indifferent solvents. Thus,  $\text{C}_6\text{H}_5\text{SCl}$  is treated with  $\text{LiC}_2\text{H}_5$  in ether to give  $\text{C}_6\text{H}_5\text{SC}_2\text{H}_5$  and  $\text{LiCl}$ . Also, the treatment of  $\text{C}_2\text{H}_5\text{SSC}_2\text{H}_5$  with  $\text{Li-C}_6\text{H}_5$  gives  $\text{C}_2\text{H}_5\text{SC}_6\text{H}_5$  and  $\text{C}_6\text{H}_5\text{SLi}$ .

**Halohydrins.** N. V. de Bataafsche Petroleum Maatschappij. Ger. 590,432, Jan. 5, 1934 (Cl. 12a. 5.04). Addn. products of olefinic compds. and  $\text{HOCl}$  or  $\text{HOBr}$  are prepd. by treating the olefinic compds. in the presence of water with a tertiary alc. ester of  $\text{HOCl}$  or  $\text{HOBr}$ . Thus, a mixt. of *tert*-butyl hypochlorite and water, treated with  $\text{C}_3\text{H}_8$  at 18–22°, yields  $\text{C}_3\text{H}_7\text{OH}$  and  $\text{Me}_2\text{COH}$ . Examples are given also of the prepn. of  $\text{HOCl}$  or  $\text{HOBr}$  addn. products of  $\text{C}_3\text{H}_8$ , isobutylene, isoprene, cyclohexene, oleic acid and cinnamic acid. In certain cases, the olefinic compd. may be formed *in situ*; thus, when aq.  $\text{Me}_2\text{COH}$  is heated with its  $\text{HOCl}$  ester, isobutylene is first formed from the alc. and is then converted into isobutylene chlorohydrin. The esters of  $\text{HOCl}$  and  $\text{HOBr}$  with

tertiary alcs. may be prepd. by leading Cl or Br into the aq. alc. in the presence of alkali hydroxide.

**Halogenated butadiene.** E. I. du Pont de Nemours & Co. Ger. 588,708, Nov. 24, 1933 (Cl. 12a. 19.02). Monovinylacetylene is treated with H halide. Thus, monovinylacetylene is treated with a concd. aq. soln. of HCl to give 2-chloro-1,3-butadiene. If CuCl is present as a catalyst, dichlorobutadiene is also formed, and is transformed to 2-chloro-1,3-butadiene by addn. of HCl. Other examples are given. Cf. C. A. 28, 375<sup>a</sup>.

**Derivatives of di- or tri-methoxybenzoic acids.** Produits Roche (Soc. anon). Belg. 397,131, July 31, 1933. These acids are converted by known methods into their di-Me or di-Et amides.

**Derivatives of 2,3-hydroxynaphthoic acid arylides.** Arthur Zitscher, Heinrich Morschel and Wilhelm Luce (to General Aniline Works). U. S. 1,935,930, Nov. 21. By condensing with a primary or secondary arylamine an alkoxy or alkylthio deriv. of 2,3-hydroxynaphthoic acid which contains the alkoxy or alkylthio group in the non-carboxylated portion of the nucleus, products are obtained, suitable for tinctorial purposes. The following derivs. of 2,3-hydroxynaphthanilide are mentioned: 8-methoxy-, m. 230°, 7-methoxy-, m. 248°, 6-methoxy-, m. 226°, 6-methoxy-2'-methyl-, m. 205°, 7-methoxymethyl-, m. 210°, 6-methoxy-3'-methyl-, m. 201°, 6-methoxy-4'-methyl-, m. 238°, 7-methoxy-4'-methyl-, m. 250°, 8-methoxy-4'-methyl-, m. 235°, 6-methoxy-2',5'-dimethyl-, m. 209°, 6-methoxy-2',6'-dimethyl-, m. 218°, 6-methoxy-2'-chloro-, m. 228°, 6-methoxy-3'-chloro-, m. 230°, 6-methoxy-4'-chloro-, m. 255°, 7-methoxy-4'-chloro-, m. 273°, 6-methoxy-4'-chloro-2'-methyl-, m. 237°, 7-methoxy-4'-chloro-2'-methyl-, m. 253°, 6-methoxy-2',5'-dichloro-, m. 215°, 6-methoxy-2'-methoxy-, m. 195°, 7-methoxy-2'-methoxy-, m. 190°, 6-methoxy-3'-methoxy-, m. 192°, 6-methoxy-4'-methoxy-, m. 254°, 7-methoxy-4'-methoxy-, m. 253°, 6-methoxy-2'-methyl-4'-methoxy-, m. 208°, 6-methoxy-2'-methyl-5'-methoxy-, m. 198°, 6-methoxy-4'-chloro-2'-methoxy-, m. 206°, 6-methoxy-2',5'-dimethoxy-, m. 198°, 7-methoxy-2',5'-dimethoxy-, m. 187°, 7-methylthio-2'-methoxy-, m. 164°, and 7-methylthio-2'-methyl-4'-methoxy-, m. 214°. The following derivs. of 2,3-hydroxynaphthamide are mentioned: 6-methoxy-N-1-naphthyl-, m. 205°, 6-methoxy-N-(4-methoxy-1-naphthyl)-, m. 262°, 7-methoxy-N-1-naphthyl-, m. 228°, 6-methoxy-N-2-naphthyl-, m. 244°, 7-methoxy-N-2-naphthyl-, m. 263°.

**Cyclopentenylmalonic acid derivatives.** Emil Rath (trading as Vial & Uhlmann Inh. Apoth. E. Rath). Brit. 400,452, Oct. 26, 1933. See Fr. 747,207 (C. A. 27, 4880).

**Acenaphthalic acid derivatives.** I. G. Farbenind. A.-G. Brit. 400,069, Oct. 19, 1933. Acenaphthalic acid (I) is sulfonated or halogenated or simultaneously nitrated and oxidized. The products may be subjected to further known reactions. Among examples (1) I is monosulfonated with oleum and the K salt of the product or its anhydride isolated by adding KCl; by oxidation with KMnO<sub>4</sub> and acidification monosulfo-1,4,5,8-naphthalenetetracarboxylic acid or its anhydride is obtained and (2) monochloroacenaphthalic acid is obtained by chlorinating I with a mixt. of POCl<sub>3</sub>, PCl<sub>5</sub> and SO<sub>2</sub>Cl<sub>2</sub>, a little CHCl<sub>3</sub> being added to facilitate stirring; by oxidation with CrO<sub>3</sub> in glacial AcOH the anhydride of monochloro-1,4,5,8-naphthalenetetracarboxylic acid is obtained.

**Acetophenone derivatives.** Helmut Legerlotz. Ger. 520,079, Jan. 8, 1934 (Cl. 12g. 32.20). Hydroxy- or alkoxy- $\omega$ -alkylaminoacetophenones are prepd. by sapon. the condensation products from alkoxy- or acyloxy- $\omega$ -haloacetophenones and salts of *N*-monoalkyl acid amides. Thus, *m*-hydroxy- $\omega$ -methylaminoacetophenone, m. 135° (HCl salt m. 234°), is prepd. by shaking *m*-acetyloxy- $\omega$ -bromoacetophenone with *p*-MeC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>NKMe in acetone, filtering off KBr and boiling the concd. filtrate with aq. HI. Examples are given also of the prepn. of *p*-hydroxy- $\omega$ -methylaminoacetophenone, m. 148° (HCl salt m. 238-40°), and *m*-methoxy- $\omega$ -methylaminoacetophenone-HCl, m. 186-7°.

**Anthracene derivatives.** I. G. Farbenind. A.-G. (Max A. Kunz, Rudolf Siroh and Hermann Dimroth, inventors). Ger. 590,366, Dec. 30, 1933 (Cl. 12g. 37). 9,10-Diaminoanthracene and derivs. thereof are prepd. by reducing anthraquinone-9,10-diimide or -9,10-dianils. Thus, the dianil obtainable from anthraquinone, PhNH and AlCl<sub>3</sub>, when treated with Zn and NaOH, yields 9,10-dianilinoanthracene (I) (cf. Ger. 588,353, C. A. 28, 1546<sup>b</sup>). 9,10-Di-*p*-toluinoanthracene, m. 295°, 1- $\beta$ -sulphonic acid and a reduction product, m. 231°, of the dianil from 1-chloroanthraquinone and *o*-chloroaniline, have also been obtained.

**Anthraquinone derivatives.** I. G. Farbenind. A.-G. (Paul Nawiasky and Berthold Stein, inventors). Ger. 590,053, Dec. 22, 1933 (Cl. 12g. 37). Haloaminoanthraquinones are prepd. by reducing haloazidoanthraquinones in acid, neutral or alk. soln. Thus, 1-azido-2-chloroanthraquinone, treated at 70-80° in pyridine soln. with N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O, yields 1-amino-2-chloroanthraquinone. Other examples are given. The prepn. of the starting material is described in Ger. 580,647 (C. A. 28, 1050<sup>a</sup>).

**Barbituric acid derivatives.** Chem. Fab. von Heyden A.-G. (Rudolf Gebauer, inventor). Ger. 590,174, Dec. 27, 1933 (Cl. 12p. 7.01). Addn. to 589,146 (C. A. 28, 1359<sup>a</sup>). 5,5-Disubstituted barbituric acids, substituted on one or both N atoms with a pyrazolone residue, are prepd. by condensing alkali salts of 5,5-disubstituted barbituric acids with nitroaralkyl halides, and converting the products into pyrazolone derivs. by the reactions described in Ger. 589,146. In the examples, (1) *N*-*p*-nitrobenzyl-5,5-diethylbarbituric acid  $\rightarrow$  the corresponding amino compd., m. 165°,  $\rightarrow$  the pyrazolone deriv., m. 190-3°, the *N*-methyl deriv. of which m. 198°; (2) *N,N'*-di-*p*-nitrobenzyl-5,5-diethylbarbituric acid  $\rightarrow$  the corresponding diamino compd., m. 172°,  $\rightarrow$  the dipyrazolone deriv., m. 220°.

**Barbituric acid derivatives.** I. G. Farbenind. A.-G. (Ludwig Taub and Walter Kropp, inventors). Ger. 590,175, Dec. 27, 1933 (Cl. 12p. 7.01). See Fr. 753,178 (C. A. 28, 781<sup>b</sup>).

**Organic compounds having hydrogenated ring systems.** Otto Diels and Kurt Alder (to I. G. Farbenind. A.-G.) U. S. 1,944,731, Jan. 23. Org. compds. with a system of "conjugated double bonds" such as butadiene, cyclopentadiene, phellandrene, myrcene, etc., easily form condensation products with quinones, maleic anhydride, maleic acid, itaconic anhydride, citraconic anhydride, acrylic acid, acrolein and other unsatd. org. compds. contg. the atomic grouping O=C-C=C in such a

manner that the last named compds. are firmly linked to the systems with conjugated double bonds, the double bond in 1,4-position being opened up. By such reactions, various compds. such as terpenes, sesquiterpenes, alkaloids, camphors and hydrogenated cyclic compds. can be synthesized. Details are given of the production of the following compds.: (1) 3,6-endomethylene- $\Delta^4$ -*cis*-tetrahydrophthalic acid, m. 177-9° (the anhydride m. 164-5°) and being reduced by use of colloidal Pd to 3,6-endomethylene-*cis*-hexahydrophthalic acid; (2) *cis*- $\Delta^4$ -tetrahydrophthalic acid, m. 166° (the anhydride m. 103-4°); (3) 3,6-endomethylene- $\Delta^4$ -tetrahydrophthalic anhydride, m. 147°; (4) 3,6-endomethylene- $\Delta^4$ -tetrahydrobenzaldehyde, a colorless refractive oil  $b_D^{20}$  70-2°, forming a bisulfite compd., a semicarbazone, m. 160°, and a condensation product with cyclohexanone, m. 104-5°; (5) 3,6-endomethylene- $\Delta^4$ -tetrahydrobenzoic acid,  $b_D^{20}$  128-30°; (6) 3,6-endo-*N*-methylimino- $\Delta^4$ -tetrahydrophthalic anhydride, m. 98-9°; (7) 3,6-endo-*oxo*- $\Delta^4$ -tetrahydrophthalic anhydride, m. 125°; (8) 4-isohexenyl-*cis*- $\Delta^4$ -tetrahydrophthalic anhydride, m. 34-5°, and the acid itself; (9) a transparent oil  $b_D^{20}$  143-4° obtained from crotonaldehyde and myrcene; (10) a product  $b_D^{20}$  143-4° from crotonaldehyde and  $\alpha$ -phellandrene; (11) a product from acrolein and  $\alpha$ -phellandrene,  $b_D^{20}$  128-30°; (12) 6-methyl- $\Delta^2$ -tetrahydrobenzaldehyde,  $b_D^{20}$  about 75°; (13) a product from crotonaldehyde and 2,4-dimethylbutadiene,  $b_D^{20}$  81-2°; (14) 3,6-dimethyl- $\Delta^4$ -tetrahydrobenzaldehyde,  $b_D^{20}$

92-3°; (15) 3,4,6-trimethyl- $\Delta^3$ -tetrahydrobenzaldehyde,  $b_{10}$  89°; (16) 3,4-dimethyl- $\Delta^3$ -tetrahydrobenzaldehyde,  $b_{10}$  79°; (17) 3(or 4(?))-methyl- $\Delta^3$ -tetrahydrobenzaldehyde,  $b_{10}$  63-4°; (18) 3(or 4(?))-isohexyl- $\Delta^3$ -tetrahydrobenzaldehyde,  $b_{10}$  140-2°; (19) a reaction product of acrolein and 2,4-dimethylbutadiene,  $b_{10}$  86-8°; (20) a reaction product of maleic anhydride and 1-phenylbutadiene, m. 120°; (21) 3-phenyl-6-methyl- $\Delta^4$ -cis-tetrahydrophthalic anhydride, m. 158-9°; (22) a reaction product of maleic anhydride and 1,4-diphenylbutadiene, m. 207°; (23) 3,6-endomethylene-1,2-dimethyl- $\Delta^4$ -tetrahydrophthalic anhydride, m. 155°; (24) a reaction product of cyclopentadiene and crotonaldehyde (isomers  $b_{10}$  60-85°); (25) a reaction product of ethylideneacetone and cyclopentadiene,  $b_{10}$  76-80°; (26) endoethylenhexahydrobenzenetetracarboxylic anhydride, m. 300.5°.

U. S. 1,944,732 relates to certain of the same products.

**Diazo compounds.** Kalle & Co. A.-G. Fr. 755,908, Dec. 1, 1933. Aromatic diazo compds. are condensed with compds. having a reactive carbonyl group, e. g.,  $\text{CH}_3\text{O}$ ,  $\text{AcH}$ ,  $\text{BzH}$ , anthraquinone, isatin, phenanthrenequinone and aceanthrenequinone. The carbonyl compds. may contain  $\text{NO}_2$ ,  $\text{NH}_2$ ,  $\text{OH}$ ,  $\text{CH}_3\text{O}$  or  $\text{SO}_3\text{H}$  groups and may be used as monomers or polymers. The diazo compds. preferably contain groups which facilitate the condensation such as  $\text{OH}$  or  $\text{NH}_2$ , substituted or not. The products are utilizable for *photochem. applications* and in the *dye industry*.

**Diazoazo salts.** I. G. Farbenind. A.-G. Fr. 755,816, Nov. 30, 1933. See Ger. 586,354 (C. A. 28, 780°) and 587,644 (C. A. 28, 1359°).

**Diazo compounds.** I. G. Farbenind. A.-G. Fr. 755,880, Dec. 1, 1933. See Ger. 586,355 (C. A. 28, 780°).

**Organic antimony salts.** I. G. Farbenind. A.-G. Fr. 755,758, Nov. 30, 1933. Complex trivalent Sb compds. sol. in water are made by causing an org. stibinic compd. to react with a  $\text{C}_6\text{H}_5$  deriv. contg. at least 2 OH groups ortho to one another and at least one acid group capable of forming salts, in the presence of a solvent and a basic substance in amt. such that the final reaction is neutral. Examples are given.

**Organic arsenic compounds.** I. G. Farbenind. A.-G. Fr. 755,583, Nov. 27, 1933. Sol. aminoaryl compds. contg. As are prep'd. by the action of an alkylene oxide or its homologs or analogs, if desired along with  $\text{CH}_3\text{O}$ -bisulfite or  $\text{CH}_3\text{O}$ -sulfoxylate, on compds. of the formula  $(\text{NH}_2\text{Ar.As})_m\text{X}_n$  (X is As, Sb or Bi and  $m$  and  $n$  are whole nos.). Examples are given.

**Aromatic dithiocarbamates.** Albert M. Clifford (to The Goodyear Tire and Rubber Co.). Can. 338,697, Jan. 16, 1934. Compds. of the formula  $\text{R}'\text{NC(S)R}$ , in which  $\text{R}'$  is aryl, are prep'd. by the reaction of an aq. soln. of an aryl diazonium chloride with an aq. soln. of a salt of a disubstituted dithiocarbamate.

**Organic acids from oxidation products such as those derived from paraffin.** Hans Frapzen, Hans Beller and Martin Luther (to I. G. Farbenind. A.-G.). U. S. 1,943,427, Jan. 16. Oxidation products such as those produced from paraffin are treated with an aq. soln. of a saponifying agent such as  $\text{NaOH}$  and there is added to the aq. soln. of crude soaps thus formed a water-insol. non-aromatic org. solvent such as benzene whereby 2 layers of liquid are formed, the lower consisting entirely of soap soln. and the upper contg. also solvent and unsaponifiable substances; the lower layer free from unsaponifiable matter is withdrawn and the remaining emulsion is broken by adding an alc. such as  $\text{MeOH}$  to effect a further sepn. into layers of similar type.

**Aliphatic acids.** British Celanese Ltd., Joseph Billing and Henry Dreyfus. Brit. 400,169, Oct. 17, 1933. Aliphatic acids, e. g.,  $\text{AcOH}$ , are conc'd. by adding a conc'd. soln. of a salt or substance having high affinity for  $\text{H}_2\text{O}$ , e. g.,  $\text{CaCl}_2$ ,  $\text{ZnCl}_2$ ,  $\text{MgCl}_2$  and extg. with a solvent for the acid, e. g.,  $\text{AcOEt}$ ,  $\text{Et}_2\text{O}$ , methylene chloride,  $\text{CHCl}_3$ , ethylene dichloride, benzyl acetate,  $\text{C}_6\text{H}_6$  and mixts. thereof.

**Aliphatic acids and their esters.** E. I. du Pont de Nemours & Co. Brit. 400,189, Oct. 18, 1933. The acids

and esters are produced by passing a mixt. of the vapor of an alc., ether or ester and  $\text{CO}$  over a catalyst comprising free  $\text{H}_2\text{CrO}_4$ ,  $\text{H}_2\text{MoO}_4$ ,  $\text{H}_2\text{WO}_4$  or  $\text{H}_2\text{UO}_4$  (not the corresponding oxides). The acids may be mixed with an adsorbent oxide, e. g.,  $\text{SiO}_2$ -gel, alumina gel or active charcoal. Substances that form alcs. may be used instead of the alc. The catalytic app. may be made of or lined with glass or made of steels contg. a high proportion of Mo, Co, W, Cr, Mn or Ni, or may be internally coated with Cr or Ag.

**Concentrating aliphatic acids.** Julius A. Brachfeld and Albert Smola. Fr. 753,462, Oct. 17, 1933. See Austrian 135,002 (C. A. 28, 782°).

**Acetic acid and acetaldehyde from acetylene.** Wilhelm Heckel and Paul Nashan (to Gutehoffnungshütte Obershausen A.-G.). U. S. 1,943,385, Jan. 16.  $\text{C}_2\text{H}_2$  is mixed with gases contg. free O, small quantities of nitric oxides are also added, and the mixt. is heated to a reaction temp. (suitably about 300°) to form  $\text{HOAc}$  and  $\text{AcH}$ .

**Lactic acid.** Standard Brands, Inc. Brit. 400,413, Oct. 26, 1933. Carbohydrates, e. g., sucrose, are converted into lactic acid by heating to at least 200° under pressure, e. g., 20-35 atm., with an alkali or alk. earth hydroxide. Insol. matter is removed from the product and the lactic acid recovered as such by addn. of  $\text{H}_2\text{SO}_4$  or as Zn lactate by addn. of  $\text{ZnSO}_4$ .

**Oxalic acid.** Consortium für elektrochemische Industrie G. m. b. H. Fr. 756,240, Dec. 6, 1933. See Ger. 588,159 (C. A. 28, 1363°).

**Carboxylic acids.** Consortium für elektrochemische Industrie G. m. b. H. (Wolfram Haeckel and Willy O. Herrmann, inventors). Ger. 588,762, Nov. 27, 1933. (Cl. 12o. 11). High-mol. polymerization or condensation products of aldehydes or similar substances such as  $\text{CH}_2=\text{CHOH}$  or its derivs. are treated with a large excess of alkali, and heated to such temps. that the greatest possible amt. of H is split off. In an example, a powd.  $\text{AcH}$  resin is mixed with powd.  $\text{NaOH}$  and heated for some time. The product is ext'd. with water and treated with  $\text{HCl}$  to ppt. the carboxylic acid. Other examples are given, using polyvinyl alc. as the starting material.

**Carboxylic acids of hydroxydiphenyl ether.** Chemische Fabrik von Heyden A.-G. (Karl W. Rittler, inventor). Ger. 588,650, Nov. 23, 1933 (Cl. 12q. 29.01). Alkali salts of hydroxydiphenyl ethers are treated with  $\text{CO}_2$  under raised temp. and pressure. Thus, 4,4'-dihydroxydiphenyl ether is dissolved in  $\text{NaOH}$  and the product, obtained by evapn., is treated with  $\text{CO}_2$  at 160° and 20 atm. to give 4,4'-dihydroxydiphenyl ether-3,3'-dicarboxylic acid, m. 255-7°. The prep'n. of 4- and 2-hydroxydiphenyl ether-3-carboxylic acid, m. 134° and 142°, resp., is also described.

**Naphthalenecarboxylic acids.** I. G. Farbenind. A.-G. Fr. 756,156, Dec. 6, 1933. Naphthalene-1,4,5,8-tetracarboxylic acid and its derivs. are prep'd. by heating with conc'd.  $\text{H}_2\text{SO}_4$  a pyrene compd. which contains at least one atom of Cl or Br in the 8- or 10-position and at least one other halogen atom of the same kind in the 3- or 5-position and subjecting the pyrenequinone compd. thus obtained to an oxidizing action. Acids which probably contain halogen in the 2-position and the same halogen in the 6- or 7-position are obtained. Cl. C. A. 27, 2457.

**Arylamino-1-hydroxynaphthalene-2-carboxylic acids.** Leopold Laska and Oskar Haller (to General Aniline Works). U. S. 1,943,872, Jan. 16. By heating an alkali metal salt of 1-hydroxynaphthalene, contg. in the 5-, 6-, 7- or 8-position an arylamino group, with  $\text{CO}_2$  under pressure (suitably heating at 200° under 80-100 atm. pressure), products are obtained such as 7-anilino-, m. 199°; 7-p-tolylamino-, m. 203°; 6-anilino-, m. 185°; 6-p-tolylamino-, m. 199°; 5-anilino-, m. 198°; 5-p-tolylamino-, m. 188°, and 8-anilino-1-hydroxynaphthalene-2-carboxylic acid, m. 185°.

**6-Arylamino-2-hydroxynaphthalene-3-carboxylic acids.** I. G. Farbenind. A.-G. Fr. 756,157, Dec. 6, 1933. 2,6-Dihydroxynaphthalene-3,7-dicarboxylic acid is heated with arylamines which contain no  $\text{SO}_3\text{H}$  or  $\text{COOH}$  groups. The products are the same as those made by the process of Fr. 670,462 (C. A. 24, 1868°).

**Purifying crude benzoic acid, naphthalic acid, phthalic acid or their anhydrides or the like.** Alphons O. Jaeger and Lloyd C. Daniels (to Selden Co.). U. S. 1,943,892, Jan. 16. Products such as those formed by catalytic oxidation reactions and which contain impurities more readily oxidized than the salts of the acids or anhydrides desired (such salts not being attacked by hypohalites) are converted into alkali metal salts and an aq. dispersion of the salts is treated with a hypohalite or a peroxide, after which the treated materials are subjected to a further usual sepn. treatment, as by esterification and distn. of the resulting esters. Various examples with details of procedure are given. Cf. C. A. 28, 179<sup>a</sup>.

**Sulfonic acids of phenols and others.** Hermann Friese. Ger. 588,709, Nov. 24, 1933 (Cl. 12o. 23.01). Sulfonic acids of hydrogenated or non-hydrogenated mono- or polyhydric phenols or their ethers are obtained by sulfonation with H<sub>2</sub>SO<sub>4</sub> in the presence of glacial AcOH with subsequent addn. of Ac<sub>2</sub>O. The H<sub>2</sub>SO<sub>4</sub> is added in stoichiometric proportions. Thus, anisole is dissolved in glacial AcOH and treated with the calcd. amt. of H<sub>2</sub>SO<sub>4</sub>. Ac<sub>2</sub>O is added. On pptn. with Ba, the salt Ba(O<sub>2</sub>SC<sub>6</sub>H<sub>4</sub>OCH<sub>3</sub>)<sub>2</sub> is given.

**1,1,2-Trichloroethane.** Julius Söll (to I. G. Farbenind. A.-G.). U. S. 1,944,306, Jan. 23. C<sub>2</sub>H<sub>2</sub> is first caused to react with HCl and the resulting gaseous mixt. contg. vinyl chloride is then caused to react with Cl.

**Formaldehyde.** Lucien H. Roman. Ger. 590,433, Jan. 4, 1934 (Cl. 12o. 7.01). See Fr. 734,065 (C. A. 27, 992).

**Acetaldehyde and acetic acid.** Stefan Goldschmidt. Ger. 590,099, Dec. 22, 1933 (Cl. 12o. 7.02). A mixt. of EtOH and air is passed over Ag maintained at a temp. between 380° and 440°. The Ag is preferably deposited on a support such as asbestos.

**Acetone from acetaldehyde.** Koloman Roka (to Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler). U. S. 1,944,109, Jan. 16. AcH is caused to react with

1 water vapor at 250–660° in the presence of a catalyst consisting of a mixt. of O compds. of metals which can replace one another isomorphously in carbonates, such as compds. of Fe and Mg, Mn or Zn.

**Furfural.** Kemiska Kontrollbyrån A.-B. (G. H. Blomqvist and B. S. Groth, inventors). Swed. 78,502, Oct. 3, 1933. A soln. of furfural is first produced directly by leaching the raw material at a suitable temp. and pressure with H<sub>2</sub>O or an acid aq. soln. and sepd. from the raw material, after which the furfural is sepd. from the soln. in a subsequent operation.

**Dimethylol urea.** I. G. Farbenind. A.-G. (Matthias Schmieling, inventor). Ger. 588,945, Nov. 30, 1933 (Cl. 12o. 17.05). See Fr. 721,828 (C. A. 26, 4007).

**Absorption of isobutylene in strong acids.** N. V. de Bataafsche Petroleum Maatschappij. Ger. 590,483, Jan. 2, 1934 (Cl. 12o. 5.04). See Fr. 716,040 (C. A. 26, 1946).

**Hydrogenated methyl abietate.** Irvin W. Humphrey (to Hercules Powder Co.). U. S. 1,944,241, Jan. 23. Methyl abietate (with or without preliminary isomerization by heating to 225–300° with a small proportion of HCl or H<sub>2</sub>SO<sub>4</sub>) is subjected to catalytic hydrogenation at 140–250° and under a pressure of 10–500 atm. to form products such as methyl tetrahydroabietate which are suitable for use in coating compns. such as those contg. nitrocellulose, gum damar, etc. Various details and modifications of procedure are described.

**Phenol.** F. Raschig G. m. b. H. Ger. 588,649, Nov. 21, 1933 (Cl. 12q. 14.02); Fr. 756,863, Dec. 16, 1933. C<sub>6</sub>H<sub>6</sub> is treated with HCl and O and the resulting C<sub>6</sub>H<sub>5</sub>Cl, in the gaseous phase, is treated with steam with regeneration of HCl. The latter is used to treat more C<sub>6</sub>H<sub>6</sub>. App. is indicated. Cf. C. A. 27, 313.

**Trinitrotoluene.** Imperial Chemical Industries Ltd. Ger. 590,234, Jan. 5, 1934 (Cl. 12o. 3.01). See Brit. 382,322 (C. A. 27, 4253).

PAUL E. HOWE

### A—GENERAL

ARTHUR W. DOX

**Destruction of *l*-, *d*- and *dl*-hyoscine by egg white and rabbit serum.** W. F. v. Oettingen and I. H. Marshall. *Proc. Soc. Exptl. Biol. Med.* 31, 224–5 (1933).—Scopolamine (*l*-hyoscine) and its isomers and atropine (*dl*-hyoscyamine) and its isomers were all destroyed at the same rate when 20 mg. of the alkaloid was dissolved in 2 cc. of water, mixed with 8 cc. of fresh egg white and incubated for 0, 3 and 6 hrs. at 38°; the ratios of destruction for the various incubation periods were ≈5, 21.5–21.9 and 37–37.5%, resp. In similar expts. with rabbit serum the destruction of the various isomers took place at different rates; after 3 hrs. of incubation the destruction of *d*-, *l*- and *dl*-hyoscine was 50, 100 and 79%, resp.; the loss of *d*-, *l*- and *dl*-hyoscyamine was 18, 67 and 37%, resp. After 6 hrs. of incubation the destruction was similar for corresponding compds. and was approx. 100, 57 and 81 %, resp., for the *d*-, *l*- and *dl*-alkaloids. According to Gadamer (*Arch. Pharm.* 239, 300, 663 (1901)), the optical isomerism of these compds. resides in the tropic acid radical; evidently this radical is also responsible for the different resistances of the optical isomers of the same rotation toward decompn. by serum. C. V. B.

**The enzymic splitting of polysaccharides. III. The splitting of chitin by emulsin preparations.** W. Grassmann, L. Zechmeister, R. Bender and G. Tóth. *Ber.* 67B, 1–5 (1934); cf. C. A. 27, 5757–8.—Chitin and its decompn. products are split by mold exts. and emulsin preps. The effect of emulsin preps. of different origins was tested on these chitin derivs. The enzyme which splits chitodextrin tends to disappear with purification. An oil-free enzyme, "Almond powder," acts on both N-

contg. oligosaccharides, the rate of splitting in cellobiose (1) being about the same as in chitodextrin (2). The enzyme also splits cellobiose (3), chitotriose (4) and chitobiose (5). When the enzyme is purified by tannin pptn., the cleavage rate of (1) is considerably increased, although there is still great activity toward (2) and less toward (3), (4) and (5). When the enzyme is purified by fractionation with AgOAc, the activity toward (1) is considerably enhanced, whereas there is little activity toward the others. With Merck's emulsin chitodextrin I (high mol.) is split at a higher rate than chitodextrin II (low mol.); chitotriose and chitobiose are scarcely attacked. A comparison of the different emulsin. preps. in relation to their powers to act as  $\beta$ -glucosidase shows that only the cellobiase activity runs parallel with their action as  $\beta$ -glucosidase (salicin used as substrate). "Almond powder," which shows a greater cleavage of chitodextrin, has lowest  $\beta$ -glucosidase value. When it is treated with alumina cy there is obtained a prepn. active in chitodextrin-splitting enzymes, but almost inactive toward  $\beta$ -glucosidase. The chitin-splitting enzyme is, therefore, often not identical with  $\beta$ -glucosidase.

E. S. G. Barron

**The chemical possibilities of extra-terrestrial life.** E. J. Hartung. *Chem. Eng. Mining Rev.* 26, 173–7 (1934).—An address.

W. H. Boynton

**Changes in the electric potentials and rates of oxidation of the skin subsequent to Röntgen irradiation.** Marvin N. DeWilliams and Charles Sheard. *Radiology* 22, 41–8 (1934).—Measurements on the p. ds. of cross sections of frog skin and on rates of O consumption of skin before and after irradiation with x-rays indicated a seasonal variation in both which paralleled the degree of metabolic activity. The changes in both were more rapid and of greater

magnitude in the dorsal than in the ventral skin. After irradiation by 9000 röntgens both the consumption of O and the p. ds. were increased for 16–18 days. Following this the values decreased until they were below those exhibited normally and remained so on the 30th day. With the lethal dose of 160,000 röntgens, the period of increased activity was less than 3 days for ventral skin and less than 1 day for dorsal skin.

G. L. Clark

The influence of the antiquity of the cell upon cell resistance to radium and x-rays. Robert H. Millwec. *Radiology* 22, 74–6(1934).—Evidence is presented which indicates that those cells which have existed on the earth in an unchanged condition for a long period of time have probably acquired a resistance to short-wave radiation by reason of continued exposure to the radiation of the earth's crust and to cosmic rays. Such cells are to be found in a family of ferns, algae, molds and various other plants and seeds which may have great age from the standpoint of paleontology.

G. L. Clark

Oxalate-containing plants and oxaluria. Arie Goudswaard. *Pharm. Weekblad* 71, 114–19(1934).—The sol. oxalate content is reported for some 50 vegetables and greens. These are classified into 2 lists, one recommended for and the other to be avoided by persons suffering from oxaluria. The Ca oxalate crystals commonly found in plant tissues are insol. in gastric juice and therefore harmless.

A. W. Dox

Cell-bound enzymes of tissues and glands. IV. Pancreatic lyo- and desmo-lipases. Eugen Bamann and Paul Laeverenz. *Z. physiol. Chem.* 223, 1–20(1934); cf. *C. A.* 28, 185<sup>4</sup>.—When fresh or dried pancreas is extd. with 100% glycerol under precautions to avoid autolysis, only 0.1–3.0% of the lipase goes into soln. After autolysis, however, the yield of sol. lipase is 70–80%. Autolysis is thus accompanied by a conversion of desmo- into lyo-enzyme. Different lipase fractions may be distinguished by the degree of activation obtainable by addn. of "compensating activators" such as albumin, Na oleate and CaCl<sub>2</sub>. For example, the lyo-lipase obtained by a single extn. of an unautolyzed dried prepn. undergoes 5000–9000% activation while the residual desmo-lipase is activated only 100%. Successive extns. of lyo-lipase by 100% glycerol give diminishing activation values. The evidence points to the existence of many gradations rather than 2 or more sharply defined lyo-enzymes. While the amylases are distinguished by differences in the mol. carrier of the active grouping, the lipases are differentiated mainly by alterations of the colloidal carrier. Extn. by 100% glycerol gives different percentage yields of the 3 pancreatic enzymes, *e. g.*, nearly 100% amylase, 70–80% trypsin and only 3% lipase. It is probable that the solvent used, especially glycerol of low H<sub>2</sub>O content, causes alterations in the sensitive lipase systems.

A. W. Dox

Lipase and esterase action of the pancreatic juice. H. P. Wolvekamp and K. Griffioen. *Z. physiol. Chem.* 223, 36–42(1934).—The pancreas contains 2 ester-splitting enzymes, one of which hydrolyzes tributyrin and the other EtOAc. They may be demonstrated as sep. entities by their difference in sensitivity toward elevated temp. and unfavorable pH. Exposure of the enzyme mixt. to a temp. of 67° for 45 min. diminishes its activity toward EtOAc to a much greater extent than toward tributyrin. Both enzymes are inactivated about equally by pH 9.92 during 60 min. An acidity of pH 3.3 for 1 hr., however, followed by restoration of the optimum pH of 5.95, destroys the activity toward EtOAc completely and that toward tributyrin only partially. The difference between the 2 enzymes is probably in the colloidal carrier rather than in the active grouping. It is possible that a larger no. of esterases occur in the pancreas, each one sp. for a definite group of esters.

A. W. Dox

Comparison of plant and animal chitin. L. Zechmeister and G. Tóth. *Z. physiol. Chem.* 223, 53–6(1934).—Cellulose occurs in higher plants and lower animals, while chitin occurs in many animals but only in lower plants such as fungi and bacteria which have not advanced in the evolutionary scale. Further evidence of the identity of chitin from plant and animal sources is now presented.

1 Chitin prep'd. from *Boletus edulis* was acetylated by treatment in the cold with Ac<sub>2</sub>O and H<sub>2</sub>SO<sub>4</sub> and a cryst. product obtained which was identical with octaacetylchitobiose obtained from crab shells by similar treatment. Hydrolysis of the crude chitin at 20° by 40% HCl and subsequent neutralization by Ag<sub>2</sub>CO<sub>3</sub> and pptn. by EtOH yielded undecaacetylchitotriose identical with a known prep'n. of animal origin.

A. W. Dox

2 Extractive substances of muscles. XXXVIII. The extractive substances of the muscles of *Dromaeus* sp. N. Tolkachevskaya. *Z. physiol. Chem.* 223, 57–60(1934); cf. *C. A.* 24, 406. —Isolation and identification of the bases present in the flesh of the ratite bird *Dromaeus* affords confirmatory evidence that carnosine and its Me deriv. anserine do not occur simultaneously in the same species of animal. Creatine, xanthine, methylguanidine, anserine, and probably carnitine and choline, were identified but no carnosine could be obtained, although 30 kg. of material was extd.

A. W. Dox

3 Metal complex salts of hematoporphyrin. Fritz Bandow. *Z. physiol. Chem.* 223, 71–3(1934). —The formation of metal complex salts by dil. solns. (1:20,000) of hematoporphyrin in H<sub>2</sub>CO<sub>3</sub>, AcOH, EtCO<sub>2</sub>H and PrCO<sub>2</sub>H was studied spectroscopically. Pb(OAc)<sub>2</sub> did not react, even on heating. Zn(OAc)<sub>2</sub> and Cu(OAc)<sub>2</sub> yielded complexes with the AcOH, EtCO<sub>2</sub>H and PrCO<sub>2</sub>H solns. at room temp. 4 With the H<sub>2</sub>CO<sub>3</sub> soln. Cu(OAc)<sub>2</sub> gave a complex on heating, while Zn(OAc)<sub>2</sub> failed to react. Differences in intensity of the α- and β-absorption bands of the complexes show that the attachment of metal occurs at different places in the porphyrin mol.

A. W. Dox

5 The chemical composition of Herzog's "hematoprostheticin." Felix Haurowitz. *Z. physiol. Chem.* 223, 74–5(1934); cf. *C. A.* 28, 787<sup>1</sup>. —The so-called hematoprostheticin has again been prep'd. in cryst. form and found to have the percentage compn. stated by Herzog. Its reversion to chlorohemin under conditions which exclude the addn. of a C atom refutes H.'s contention that it contains 33 and not 34 C atoms. The analysis corresponds approx. to an equimol. mixt. of hydroxyhemin and its anhydride. The substance is probably identical with Hamsik's cryst. hemi-anhydride of hydroxyhemin (*C. A.* 21, 3628).

A. W. Dox

6 Enzymic amylolysis. III. Crystalline hexaose from starch. Ernst Waldschmidt-Leitz and Max Reichel. *Z. physiol. Chem.* 223, 76–80(1934); cf. *C. A.* 26, 1002. —Pancreatic digestion of erythroamylose, one of the components of starch, comes to a standstill when 65–70% saccharification has occurred. The products then consist of dextrin and maltose and 7–11% of amylohexaose. After removal of dextrin by pptn. with EtOH, the hexaose may be obtained as a viscous oil by addn. of MeAc to the concd. aq. soln., and solidified by repeated washings with Et<sub>2</sub>O. The hexaose has the formula C<sub>36</sub>H<sub>64</sub>O<sub>31</sub>, (α)<sub>D</sub> 183°, m. 258–63° (decompn.) and gives no color with I. It is hydrolyzed by amylase but not by maltase. Amylase splits it into 3 mols. of maltose which are then hydrolyzed by maltase into 6 mols. of glucose. Mutarotation of the maltose formed is in opposite directions according to whether the cleavage is effected by α- or β-amylase, showing that the hexaose contains both α- and β-linkages. The identification of hexaose among the products of partial enzymic hydrolysis is an important argument for the chain structure of starch.

A. W. Dox

7 Influence of electrolytes on the physicochemical properties of colloidal systems as compared to cytoplasm. I. Influence of electrolytes on the viscosity of diluted egg yolk. Br. Zawadzki. *Protoplasma* 19, 485–509(1933). —Na, K, Ca and Mg chlorides, as well as HCl and NaOH, at every concn. used increased the viscosity of dild. egg yolk. HCl and NaOH act many times more strongly than their salts. Of the salts, CaCl<sub>2</sub> exerts the strongest action and KCl the feeblest. The viscosity increases irregularly with increase in salt concn. At about 0.2 M NaCl and KCl and 0.08 M CaCl<sub>2</sub>, the local viscosity max. appears, after which there is for all salts a local min. at 0.4–0.5 M higher than the natural egg yolk viscosity.

F. L. Dunlap

- Measurement of the diffusion of proteins.** Arne Tiselius and David Gross. *Kolloid-Z.* 66, 11-20 (1934).—Application of the Svedberg method (cf. *C. A.* 19, 2768; 20, 1754) at 20° = 0.002° gave the following values for the diffusion const.  $D \times 10^7$ : phycoerythrin 4.00, phycocyan 4.05, CO-hemoglobin 6.93, hemocyanin 1.05, and egg albumin 7.07. The values are corrected to water solns. Salt content of the buffer and protein concn. had little effect on the value for phycoerythrin. At 30°, the value of  $D$  detd. was in good agreement with that calcd. by the Einstein equation. The friction coeffs. calcd. from these consts. are higher than those calcd. from ultracentrifuge expts. except for hemoglobin. Arthur Fleischer
- The hemerythrin of *Sipunculus nudus*.** Jean Roche. *Bull. soc. chim. biol.* 15, 1415-35 (1933).—See *C. A.* 27, 2099. L. E. Gilson
- Hematin content of horseradish peroxidase.** K. A. C. Elliott and D. Keilin. *Proc. Roy. Soc. (London)* B114, 210-22 (1934).—In horseradish preps. a simple relation between hematin content and peroxidase activity does not exist; all the hematin is present in the free state as acid hematin. The N compds. present in the preps. and the free hematin do not combine below  $p_H$  9, and complete combination occurs only above  $p_H$  10.5, at which alky. the peroxidase is nearly inactive. J. S. H.
- Chemistry of the vegetable phosphatides.** E. Bureš and J. Schidlöf. *Časopis Českoslov. Lékárnictva* 13, 229-35 (1933).—"Phosphogramin" has a compn. similar to inositolhexaphosphoric acid; it contains 20.03% of ionizable P and on hydrolysis yields  $H_2PO_4$  and an optically inactive, nonhydrolyzable compd. which seems identical with mesoinositol. William J. Husa
- Experiments on the relationship between bacteria and fungi as regards nutrition and metabolism.** Herbert Bucherer. *Zentr. Bakt. Parasitenk.*, 2 Abt. 89, 273-83 (1933). Carbohydrates which are ordinarily not assimilated by *Asotobacter chroococcum*, such as arabinose, xylose and cellulose, may be utilized in the presence of living or dead cultures of *Penicillium glaucum* or *Aspergillus niger*. John T. Myers
- Directive influences in biological systems. III. The effect of proteases on lipase actions.** K. George Falk. *J. Biol. Chem.* 103, 363-72 (1933); cf. *C. A.* 26, 3270. The addn. of com. papain to exts. of beef kidney, lung or liver decreased the ester-hydrolyzing power of the ext. for all substrates except glyceryl triacetate, which showed increased hydrolysis. Papain alone has some hydrolyzing action on triacetin, and this is increased by adding proteins. Similar results were obtained with exts. of uterine fibroids. Trypsin, however, decreased the ester-hydrolyzing power of all exts. for all substrates. It is suggested that papain acts physiologically as a lipase in the presence of proteins. K. V. Thimann
- The basic amino acids of casein.** Hubert B. Vickery and Abraham White. *J. Biol. Chem.* 103, 413-15 (1933).—Application of the Ag pptn. method of Vickery and Leavenworth (*C. A.* 22, 1606) to purified Hammarsten casein gave histidine, 1.83%, arginine, 3.85% and lysine, 6.25%. K. V. Thimann
- The fractionation of the amino acids of livetin.** Thomas H. Jukes. *J. Biol. Chem.* 103, 425-37 (1933); cf. *C. A.* 27, 740. Existing methods are combined as follows: the bases are removed from the hydrolyzate by the method of Vickery and Leavenworth (*C. A.* 22, 1606), tyrosine is then crystd., and the dicarboxylic acids are pptd. with  $Ba(OH)_2$  and alc., and sepd. as glutamic acid hydrochloride and cupric aspartate. The monoaminomonocarboxylic acids are converted to the Cu salts and sepd. by the methods of Brazier (*C. A.* 25, 309), Kingston and Schryver (*C. A.* 19, 304), Buston and Schryver (*C. A.* 20, 2683, 3703) and Town (*C. A.* 23, 162). With 36 g. livetin, 56% of the N was allocated, i. e., the method is suitable for rather small quantities of protein. Of the total N, 87% was recovered in the various fractions. K. V. Thimann
- The gasometric determination of cysteine and cystine.** W. C. Hess. *J. Biol. Chem.* 103, 449-53 (1933).—In the method of Baernstein (*C. A.* 26, 5977), the cystine contents for a no. of proteins agree with the cystine content detd. by the method of Sullivan (*C. A.* 25, 2449, 3738), but the cysteine content is in all cases addnl. The cystine and cysteine together account for more than the total S of the protein. The apparent cysteine is therefore due to some other compd. On heating a mixt. of amino acids, free from S, with sugar, cysteine was found in small amt. by the Baernstein method, but not by other methods. It is suggested that the apparent cysteine may arise from reaction between amino acids and the small amt. of carbohydrate in protein. K. V. Thimann
- Studies on the phosphatase content of the whole rat and of the vasoligated kidney.** Fredrick W. Kinard and Alfred Chanutin. *J. Biol. Chem.* 103, 461-70 (1933). The phosphatase activity of the whole rat increases from birth to a max. between the 13th and 20th days. Administration of irradiated ergosterol increases the activity at this period but not in adults. In the vasoligated kidney the phosphatase activity falls steadily, reaching zero in about 16 days. K. V. Thimann
- The catalysis of the hydration of carbon dioxide and dehydration of carbonic acid by an enzyme isolated from red blood cells.** Wm. C. Stadie and Helen O'Brien. *J. Biol. Chem.* 103, 521-9 (1933); cf. Meldrum and Roughton, *C. A.* 26, 5584, 5659. The enzyme catalyzing the reaction:  $CO_2 + H_2O \rightleftharpoons H_2CO_3$  is rapidly inactivated at 70° and inhibited by KCN; it is not identical with hemoglobin, hematin or globin. Its effect on the dehydration velocity is only about 38% of that on the hydration velocity. The Michaelis-Menten const. for combination between the enzyme and its substrate is about 90. The velocity consts. are detd. by making one soln. heavier than the other with dissolved sugar, then layering cautiously, and finally detg. the  $p_H$  after rapid mixing, by means of a short-period galvanometer. K. V. T.
- Mechanism of the oxidation processes. XXXVI. Enzymic dehydrogenation of lactic acid, pyruvic acid and methylglyoxal.** Heinrich Wieland, Otto B. Claren and B. N. Pramanik. *Ann.* 507, 203-12 (1933); cf. *C. A.* 27, 4872. Aerobic dehydrogenation of lactic acid (I) proceeds similarly to that of EtOH when impoverished yeast is used. AcOH, EtOH and (mainly)  $CO_2$  are produced; in 2 cases small quantities of succinic acid were isolated. The carbohydrate content and wt. of II do not increase during these expts. Dehydrogenation of I depends more on substrate concn. than does dehydrogenation of EtOH and AcOH.  $O_2$  consumption occurs much more rapidly at the higher concns. studied ( $M/32 - M/4$ ).  $AcCO_2Na$  is first decarboxylated to AcH, which then reacts to give AcOH. A smaller quantity of  $AcCO_2H$ , compared with I, is oxidized completely. The reaction,  $2AcH + H_2O \rightarrow AcOH + EtOH$ , appears to be inhibited by  $AcCO_2H$ . The  $O_2$  consumption is much greater at higher concns.  $AcCHO$  (III) is also dehydrogenated to AcH, principally. Resynthesis of III to carbohydrates does not occur. The course of the dehydrogenation of III appears to differ from that of EtOH,  $AcOH$  or I. C. J. West
- Structure and enzymic reactions. X. Influence of viscosity on the state of aggregation of the dispersed phase.** S. Frajbergerówna. *Acta Biol. Exptl. (Warsaw)* 6, 143-72 (1931) (143 in French).—Gelatin diminishes the amt. of glucose and maltose detd. by Bertrand's method. This amt. is independent of the temp. and the time of contact, and is proportional to the quantity of sugar and gelatin present. The viscosity influences the degradation of starch to a slight degree, with a 4.5% soln. (37°) as starting material. The decompn. of urca starts as late as at 8% gelatin. Starch and amylase do not diffuse through the gel, while urea diffuses with only 10% of the normal rate. Occlusion of starch or amylase in the gel induces a slowing of the reaction, while by a simultaneous occlusion of both ingredients it is not retarded markedly. Shaking accelerates the reaction in the system amylase-starch-gelatin, while EtOH hinders the reaction of amylase-starch, and enhances it in the system amylase-starch-gelatin. The action of EtOH depends on the temp.; at 16° the reaction is accelerated; at 30° it is not. J. W.

**Spreading of insulin and of zein.** E. Gorter and J. van Ormondt. *Proc. Acad. Sci. Amsterdam* 36, 922-6 (1933); cf. *C. A.* 27, 518.—The  $p_H$ -spreading curves of the two proteins were very similar. The min. for insulin was at  $p_H$  3, for zein  $p_H$  3.7. Maxima were at about  $p_H$  2 and 5 for both. The amount of spreading at the isoelec. point may be a function, not of the mol. wt., but of the no. of free COOH and NH<sub>2</sub> groups. J. J. W.

**Enzymes from cereal plants.** George Sperti (to General Development Laboratories, Inc.). U. S. 1,943,633, Jan. 16. For producing a sterile enzymic prepn., growing enzyme-producing cereal plants are subjected to irradiation with ultra-violet light to kill bacteria, etc., while excluding from the light wave lengths short enough to cause injury to the plants, and the enzyme is then extd. from the plant material.

**Amylase preparations.** Kalle & Co. A.-G. Brit. 400,784, Nov. 2, 1933. See Fr. 746,391 (*C. A.* 27, 4551).

## B -METHODS AND APPARATUS

STANLEY R. BENEDICT

**Enzymic histochemistry. VI. A micro method for the estimation of ammonia.** K. Linderstrøm-Lang and Heinz Holter. *Compt.-rend. trav. lab. Carlsberg* 19, No. 20, Spp. (1933); cf. *C. A.* 27, 5356; 28, 5024. L. W. E.

**Estimation of minute traces of bismuth in animal tissues.** G. F. Hall and A. D. Powell. *Quart. J. Pharmacol.* 6, 628-33 (1933).—A no. of the available color reactions for the detection of min. traces of Bi are discussed and criticized. The iodobismuthous acid method is recommended for use for the estn. in animal tissues. This method depends on the characteristic color reaction given by iodobismuthous acid in EtOAc, in which solvent it yields a characteristic pink color. The conditions necessary for the estn. of amts. of the order of 5  $\gamma$  are given, with particular reference to special treatment of certain animal tissues. W. O. E.

**Method for determining calcium in urine.** Harold Gerritz and J. C. Knop. Wash. Agr. Expt. Sta., 42nd Ann. Rept. (*Bull.* 275) 28-9 (1932).—The standard volumetric oxalate method is modified by the addn. of oxidizing agents to facilitate the rapid evapn. to dryness. The oxidation is then completed by heat, the ash taken up with 1:4 HCl and hot water. The soln. is filtered, and the Ca pptd. and detd. according to the standard oxalate method. C. R. Fellers

**Application of the nitric-sulfuric-perchloric acid method of tissue destruction to the toxicological determination of gold.** Ernest Kahane and Victor Stefanescu. *Bull. soc. chim. biol.* 15, 1239-46 (1933).—In the detn. of Au in animal tissues some Au is entrained in the vapors dur-

ing the treatment with HNO<sub>3</sub>-H<sub>2</sub>SO<sub>4</sub>-HClO<sub>4</sub> mixt.; hence the vapors should be passed through a condenser and the condensed liquid examd. for Au. L. E. Gilson

**A colorimetric method for the microdetermination of gold. Its biological application to study of aurotherapy.** B. K. Merejkovsky. *Bull. soc. chim. biol.* 15, 1336-8 (1933).—The HNO<sub>3</sub>-H<sub>2</sub>SO<sub>4</sub> method of destroying org. matter is preferred. A colorimetric method based on the development of a red color by the reaction between Au salts and dimethylaminobenzylidenerhodanine is described. Quantities corresponding to about 0.005 mg. of Au can be detd. L. E. Gilson

**A new "sensitization" reaction for adrenaline.** A. Velicogna. *Compt. rend. soc. biol.* 115, 140-2 (1934). If 3 cc. of a 1% soln. of PhOH in 50% EtOH, 0.6 cc. satd. KIO<sub>3</sub> and 0.3 cc. satd. sulfanilic acid soln. are mixed and heated on a water bath a cardinal-red color develops in 5-10 min. If a trace of adrenaline is added the color develops more rapidly. One part adrenaline in 12,000,000 can be detected. The effects of phenols and related compds. on the reaction are discussed. L. E. Gilson

**Test for iron pigments (hemosiderin) in liver.** J. Guilhaon. *Compt. rend. soc. biol.* 115, 376-7 (1934).—A drop of fresh liver pulp is stirred with 0.5 cc. of HCl (d. 1.19), then a few drops of K<sub>4</sub>Fe(CN)<sub>6</sub> added. If the liver contains hemosiderin a Prussian blue color develops immediately. The reaction is neg. in most animal diseases but is pos. in infectious anemia of horses. L. E. G.

**Extraction method for determination of bilirubin in different body fluids.** Wm. Kerppola. *Acta Med. Scand., Suppl. L.* 277-80 (1932).—Free bilirubin is extd. by CHCl<sub>3</sub> directly; the water-sol. alk. bilirubin is first converted to bilirubin by acid, then extd. by CHCl<sub>3</sub>. Ext. 1 cc. serum or unfiltered urine with 2 cc. CHCl<sub>3</sub>, shake vigorously and centrifuge; bile should be used in 1:1000 diln., while for feces 10 vols. of CHCl<sub>3</sub> should be taken. To ext. the entire bilirubin add to 3 cc. urine or bile 3 cc. 10% AcOH, 1.5 cc. CHCl<sub>3</sub>, shake vigorously and centrifuge. Pptd. bilirubin is dissolved in 0.5 cc. glacial acetic acid extd. with 1.5 cc. CHCl<sub>3</sub> and the acid driven off with an excess of H<sub>2</sub>O. For feces, dissolve 0.5 g. in 3 cc. glacial acetic acid and add 5 cc. CHCl<sub>3</sub> and about 20 cc. H<sub>2</sub>O. For serum, deproteinize 1 cc. by shaking with 2 cc. 96% alc., centrifuge and add to the alc. soln. 2 cc. CHCl<sub>3</sub>, 2 cc. CCl<sub>3</sub>CO<sub>2</sub>H and about 10 cc. H<sub>2</sub>O. Half a cc. of the CHCl<sub>3</sub> ext. is always taken for the colorimetric detn. by the Ehrlich diazo reagent. An aq. 0.05 % K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> soln., which gives the same color as a soln. of 0.0075 mg. bilirubin in 3 cc., is used as a standard. However, the color of the ext. is even a more reliable basis for detn. of bilirubin as the body fluids contain substances interfering with the diazo reaction. S. Morgulis

**Colorimetric determination of phosphoric acid in the presence of arsenate ions.** A. E. Braunstein. *Biochem. Z.* 267, 400-2 (1933).—Polemical against Barronscheen, Banga and Braun (*C. A.* 28, 1929). S. Morgulis

**Titrimetric microdetermination of cholesterol by Gabriel Monasterio.** T. Meuwissen and E. Noyons. *Biochem. Z.* 267, 405 (1933); cf. Monasterio, *C. A.* 28, 7974.—Monasterio's method is not original. S. Morgulis

**Determination of the phenol coefficient by the cover-slip method.** Vilh. Jensen and Elsa Jensen. *J. Hyg.* 33, 485-94 (1933).—See *C. A.* 27, 5367. John T. Myers

**A micro method for the determination of fatty acids from small amounts of whole blood.** Margaret Elizabeth Smith and M. C. Kik. *J. Biol. Chem.* 103, 391-8 (1933).—The methods of Bloor, Pelkan and Allen (*C. A.* 16, 2341) and Stoddard and Drury (*C. A.* 24, 875) are combined and modified for use with 0.5 cc. of blood. The pptd. fatty acids are finally extd. with hot benzene, washed with water, and titrated with 0.02 N KOEt. K. V. T.

**The determination of the bases of serum and whole blood.** Pauline M. Hald. *J. Biol. Chem.* 103, 471-94 (1933).—For total bases the material is ashed in a muffle furnace with H<sub>2</sub>SO<sub>4</sub> and Fe<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> and the sulfate then detd. by the benzidine method. For detg. the sep. bases the Fe is omitted from the ashing, the Ca is pptd. as the oxalate and the Mg as phosphate. The soln. is then freed

from phosphate with Fe, the K pptd. as chloroplatinate and the Na as the Zn uranyl acetate,  $(\text{UO}_2)_2\text{ZnNa}(\text{AcO})_6 \cdot 6\text{H}_2\text{O}$ . By using sintered glass filters the whole soln., and not aliquots, may be used throughout, this greatly facilitating the procedure. Extensive details and a no. of analyses of serum are given. The sum of the acids of serum in nearly every case significantly exceeded the total base.

K. V. Thimann

**Studies on cerebrospinal fluid. I. Chemical and spectrographic detection of lead.** I. M. Rabinowitch, Andrew Dingwall and R. H. Mackay. *J. Biol. Chem.* 103, 707-23(1933); cf. Fairhall, C. A. 17, 3885. Details for the prepn. of Pb-free reagents and procedure for the detection of  $10^{-4}$  mg. of Pb by the  $\text{K}_2\text{CuPb}(\text{NO}_3)_6$  method are given. With 6 cc. of cerebrospinal fluid, the spectrographic method was found to detect 1 part of Pb in  $10^6$ , and can therefore be used as a control for the chem. method.

K. V. Thimann

**Microchemical detection of lead: modifications of the Fairhall method.** Robert U. Harwood and Doris Brophy. *J. Ind. Hyg.* 16, 25-8(1934).—Modifications of the hexanitrite test (C. A. 17, 3885) are described, including the substitution of wet for dry ashing. With the modified procedure, 0.5  $\gamma$  of Pb can be estd. in 5 cc. of cerebrospinal fluid. Cf. preceding abstr.

## C BACTERIOLOGY

CHARLES B. MORREY

**Further studies on the specific carbohydrates of *Vibrio cholerae* and related organisms.** Richard W. Linton and D. L. Shrivastava. *Proc. Soc. Exptl. Biol. Med.* 31, 406-9(1933); cf. C. A. 27, 769, 5400. The method of Furth and Landsteiner (cf. C. A. 22, 986) was used in extg. the sp. carbohydrates of cholera-like vibrios from Bengal. In the majority of vibrios from cholera galactose was the characteristic sugar; others contained arabinose; the groups were similar in agglutinability and in virulence. A 3rd group derived from water was nonagglutinable and contained arabinose. Polysaccharides contg. both arabinose and galactose were isolated from "rice water" stools of cholera patients. Both types of carbohydrate were antibacteriolytic.

C. V. Bailey

**Use of peptone as nutrient substrate for aerobic bacteria. Utilization of peptone by *Staphylococcus aureus*.** Julius Hirsch and Adolph W. Müller. *Z. Hyg. Infektionskrankh.* 115, 443-94(1933).—Peptone is not only a source of N but a source of energy for microorganisms. The production of  $\text{NH}_3$  from peptone by *Staph. aureus* depends on active utilization of the peptone and is inhibited by dextrose. This production of  $\text{NH}_3$  occurs through the deamination of free amino groups. With

ordinary O supply the amt. of growth and  $\text{NH}_3$  production are proportional to the concn. of peptone. The latter is not only a source of energy and food but also a stimulus to reproduction.

Rachel Brown

**The nature of the bactericidal and hemolytic constituents of pyocyanus lipoids.** I. H. O. Hettche. *Klin. Wochschr.* 12, 1804-5(1933).—Of the "lipoids" in a petroleum ether ext. of *Ps. aeruginosa*, 90% is a neutral fat yielding both liquid and solid fatty acids on hydrolysis. The remainder is a fatty acid possessing hemolytic bacteriostatic and weakly bactericidal properties, unlike the neutral fat. The bactericidal action of unsatd. higher aliphatic acids on staphylococci is proportional to the no. of double bonds.

Harry Eagle

**The effect of age of stock cultures on losses of Kjeldahl nitrogen from bacterial cultures.** M. Lemoigne and R. Desveaux. *Compt. rend.* 197, 1697-9(1933).—Irregular losses in N detd. by the Kjeldahl method were observed in following the growth of a no. of strains of bacteria in liquid peptone media. One of the most important causes was the age of the stock culture used. Older cultures showed less variability in N loss.

James C. Munch

**The influence of cations on aerobic sporogenesis in a liquid medium.** F. W. Fabian and C. S. Bryan. *J. Bact.* 26, 543-58(1933).—Cations of the univalent chloride salts, NaCl, LiCl, NH<sub>4</sub>Cl, KCl, and also Na lactate stimulated aerobic spore formation in a liquid medium. Cations of the bivalent chloride salts,  $\text{MgCl}_2$ ,  $\text{MnCl}_2$ ,  $\text{BaCl}_2$ ,  $\text{CoCl}_2$ ,  $\text{PbCl}_2$  and  $\text{NiCl}_2$ ; of the trivalent salts,  $\text{AlCl}_3$ ,  $\text{CeCl}_3$  and  $\text{FeCl}_3$ ; and of a quadrivalent salt  $\text{SnCl}_4$  had no effect on such sporulation. Spore formation was most abundant at the point of max. stimulation of viability. This would indicate that sporulation is not due to a deficiency of nutrient materials or to an accumulation of metabolic products, but that it is a physiol. process occurring when certain conditions are present. The pH of the medium did not materially affect sporulation within a favorable growing range of 5.0-7.5, but an acid reaction was slightly more favorable.

John T. Myers

**The bacteriostatic action of gentian violet and its dependence on the oxidation-reduction potential.** Mary A. Ingraham. *J. Bact.* 26, 573-98(1933); cf. C. A. 27, 1906. —The bacteriostatic concns. of gentian violet affect growth only during the lag phase. The dye must affect the cells indirectly through a mechanism which is adjusted during the lag phase. Bacteriostatic concns. of gentian violet poise the oxidation-reduction potential of the medium within rather wide limits. Bacteriostatic action is related to the initial oxidation-reduction potential and the poisoning action of the dye. Other poisoning agents used also differentiate between bacterial species.

John T. Myers

**A simple method for the preparation of the specific soluble substance of type I pneumococcus.** Harold W. Dudley and Wilson Smith. *J. Path. Bact.* 37, 341-4(1933).—Heating a soln. of the crude carbohydrate in 0.5 N NaOH lowered the precipitating activity. The following is a better method of purification: Dissolve 0.5 g. of the carbohydrate in 40 cc. of 0.05 N  $\text{Na}_2\text{CO}_3$  contg. 10 mg. of trypsin. Add a few drops of toluene and incubate 24 hrs. at 37°. Centrifuge and make acid to Congo red with AcOH. Add 60 cc. of 96% alc. Collect, wash and dry the ppt. The dried product weighed 0.243 g., contained 5.35% N and retained the total activity of the original 0.5 g.

John T. Myers

**The serological grouping of the starch-fermenting strains of *C. diphtheriae*.** Jean. O. Ewing. *J. Path. Bact.* 37, 345-51(1933).

John T. Myers

**Further observations on the specificity of the bactericidal properties of normal serum.** M. H. Finkelstein. *J. Path. Bact.* 37, 359-65(1933).—A sol. substance readily liberated from bacterial growths may annul in a non-sp. manner the bactericidal activity of normal guinea-pig serum.

John T. Myers

**A note on the influence of sodium lactate in the production of green discoloration (hydrogen peroxide formation) by streptococci.** J. Gordon. *J. Path. Bact.* 37, 501-2(1933).—Certain strains of non-green-producing

streptococci grown on blood agar contg. 0.2-0.5% Na lactate become green formers. This is assoc. with the production of  $H_2O_2$ .

John T. Myers

**Transmissible lysis as a function of bacterial respiration. II. Does transmissible lysis influence bacterial respiration?** C. Hallauer. *Zentr. Bakt. Parasitenk.*, I Abt. 130, 194-206(1933); cf. C. A. 27, 5366.—During lysis neither the respiratory quotient nor aerobic glycolysis is markedly influenced. Anaerobic glycolysis is affected even less. **III. Lysin formation during oxidation of definite chemical substances.** *Ibid.* 206-13.—In the presence of C sources as dextrose, levulose, maltose and mannitol, lysin regeneration occurs during oxidation but not during glycolytic splitting of these substances.

John T. Myers

**The influence of reduced iron on the aerobic bacterial flora of the intestine.** Gottfried Handke. *Zentr. Bakt. Parasitenk.*, I Abt. 130, 240-7(1933).—Large doses of reduced Fe markedly reduce the no. of bacteria in the intestine.

John T. Myers

**The influence of anaerobiosis and of several gases on the growth and virulence of diphtheria bacilli.** Adolf Beck. *Zentr. Bakt. Parasitenk.*, I Abt. 130, 287-300(1933).—Growth *in vacuo*, in an atm. of  $O_2$  or of  $CO_2$  had no effect on the rate of growth or virulence, but it produced the morphology of pseudo-diphtheria bacilli. Growth in an atm. of  $H_2S$  increased the rate of growth and the formation of granules, but did not influence virulence.

John T. Myers

**Variants of paratyphosus-B (type Schottmüller) which form no gas from dextrose. III.** A. W. Pot and A. Tasman. *Zentr. Bakt. Parasitenk.*, I Abt. 130, 357-66(1933).—See C. A. 27, 5771.

John T. Myers

**The polysaccharide-forming mouth streptococci and the "frog egg" streptococci of sugar factories.** Friedrich Bl. Koch. *Zentr. Bakt. Parasitenk.*, I Abt. 130, 381-90(1933).

John T. Myers

**The nutrition physiology of diphtheria bacilli.** Hans Schmidt. *Zentr. Bakt. Parasitenk.*, I Abt. 130, 391-418(1933).—Five strains could use salts of acetic, lactic and succinic acids, and glycerol as a source of C. Na asparaginate was a good source of N, but asparagine and glutamic acid would also serve. The following were not utilizable as sources of N: glycocoll, sarcosine, alanine, serine, valine, leucine, proline, phenylalanine, tyrosine, tryptophan, histidine, arginine and glycylglycine. Cystine would not serve as a source of C or N. Virulence was maintained in synthetic media.

John T. Myers

**A method for the quantitative recovery of bacterial dry material in a liquid culture medium.** Ernst Grundmann. *Zentr. Bakt. Parasitenk.*, II Abt. 89, 318-23(1933).—For bacteria of the size range of coli and mycoides, the membrane filter of Zsigmondy with a maximal porosity of  $0.75 \mu$  will remove the bacteria quantitatively and they can be dried for analysis.

John T. Myers

**The chemistry of the lipides of tubercle bacilli. XXXVII. The synthesis of phthiocol, the pigment of the human tubercle bacillus.** R. J. Anderson and M. S. Newman. *J. Biol. Chem.* 103, 405 12(1933); cf. C. A. 28, 1941.

By oxidizing 2-methylnaphthalene with chromic acid there was obtained 2-methyl-1,4-naphthoquinone, I, m. 104-6°; oxime, m. 166-8°. Since I could not readily be acetylated, it was converted in 90% yield to the diacetate, II, m. 114°, by refluxing with NaOAc,  $Ac_2O$ , AcOH and Zn dust. By then treating II with alc. KOH or NaOEt and distg. in steam, 12% of 2-methyl-3-hydroxy-1,4-naphthoquinone, III, was obtained. The substance III, m. 173-4°, is identical with phthiocol, the yellow pigment of the human tubercle bacillus (cf. C. A. 28, 1941). Its oxime m. 199-200°; monoacetate m. 106°; triacetate m. 148° in an opaque liquid which clears at 158-9°. On oxidation of III phthalic acid was obtained.

K. V. Thimann

**Specific inhibition of bacteriophage action by bacterial extracts.** Philip Levine and A. W. Frisch. *J. Exptl. Med.* 59, 213-28(1934).—Expts. are presented demonstrating sp. inhibition of phage by sol. products of bacteria; the inhibition proceeds more rapidly when the phage and bacterial exts. are incubated at 37° than at 0°. The

specificity of the reaction in the instances studied is probably connected with the presence of sp. sol. carbohydrates. A reaction is available for the study of the chemistry of bacillary antigens in terms of bacteriophage. C. J. W.

## D—BOTANY

THOMAS G. PHILLIPS

**Nutrition of Euglena. I. Euglena gracilis.** H. Dusi. *Ann. inst. Pasteur* 50, 550-97(1933).—Cultures can be grown in a synthetic medium in which the source of N is a nitrate or an  $NH_4$  salt, the initial  $pH$  being 6.5-7.5. With  $(NH_4)_2SO_4$  and an initial  $pH$  of 7.0, acid is produced, and the final  $pH$  after 17 weeks is 4.2.  $Ca(NO_3)_2$  cannot be utilized, and Ca ions appear to be unnecessary for development. Of a large no. of  $NH_4$  acids utilized as a source of N, only the simple aliphatic acids, asparagine, histidine and phenylalanine yielded good cultures. Peptone produces the best results. In the dark, media contg. peptones or polypeptides as the source of N are rendered more effective by the addn. of NaOAc. Only those fatty acids having more than 7 C atoms were able to replace AcOH. Strains grown in the light do not require the addn. of a fatty acid to the medium. B. C. A.

**The influence of magnesium on the growth and the activity of Saccharomyces cerevisiae.** Hansen. D. Rabinovitz-Sereni. *Boll. staz. patol. vegetale* [N.S.], 13, 309-23(1933); cf. C. A. 27, 5774.—In the absence of Mg or in the presence of small quantities, the growth of *S. cerevisiae* (on a modified Leberle-Will's soln.) is very poor: the sugar of the medium is not utilized, the acidity is slightly modified and the fermentation is slow in starting and soon ceases. The addn. of small quantities of Mg stimulates the growth, the formation of a superficial layer formed by aerobic enzymes and the respiration. The mycelites grow well in solns. contg. not over 40%  $MgSO_4$ . The growth of some thallophytes in solutions containing a large amt. of magnesium. *Ibid.* 338-45.—Eumycetes, Schyzomycetes, Cyanophyceae and Chlorophyceae were cultivated in solns. contg. increasing doses of Mg. Some of these can live in solns. contg. 20%  $MgSO_4$ , and *Botrytis cinerea*, *Fusarium sp.*, *Coniosporium bambusae* Sacc., and *Rhizodonia solani* Kuhn resist even a medium with 40%

$MgSO_4$ . **Observations on the toxicity of magnesium for the higher plants.** *Ibid.* 346-66. Mg salts exceeding the normal concns. used by the plants and not balanced by Ca produce a strong poisoning of higher plants; the troubles are probably due to altered caryokinetic and respiratory processes. The action of the catalases is counteracted by high concns. of  $MgSO_4$  in the nutrient solns., while the action of the peroxidases is stimulated. **The sensitivity of plants to the action of oxalic acid and of magnesium salts.** *Ibid.* 367-78.—Lower plants (thallophytes) show a good resistance to the action of oxalic acid, but the seeds of higher plants do not grow in solns. contg. >0.05%. The behavior is identical with that of Mg salts. The action of the two substances is explained by supposing that they remove Ca compds. from the living cells. G. A. Bravo

**Amylase of mulberry leaves.** Suemi Matsumura and Takuroh Kasuga. *Bull. Sericult. Silk-Ind. Japan* 6, No. 2, 6(1933).—The optimum  $pH$  for the action of amylase of mulberry leaves is about 5.8 and the optimum temp. for activity 40-50°. Heating at 60° for 60 min. or 70° for 30 min. destroys the enzyme activity, while 50° for 30 min. reduces it markedly. Small amts. of NaCl favor amylase activity. There are species differences. More amylase is found in tender than in mature leaves and in midnight than in mid-day leaves. Leaves sheltered from sunshine for a long time and leaves grown after several gatherings contain less amylase than normal ones. Storage of the leaves decreases enzyme activity. R. B.

**The postmortem color absorption of plant cell walls.** Leo Brauner. *Flora* 27, 190-214(1933).—Living algae cells may remain several hrs. in certain dye solns. as methylene blue and Janus green without absorbing the dye; dead cells, however, are quickly colored. The causes of the difference are probably: (a) the lethal agent changes

the gel structure and permeability of the cell wall; (b) the death of the protoplast may bring about a release of the vacuole contents which impregnate the cell wall. When tannins are thus released they act as mordants and increase the affinity of the cellulose of the cell wall toward the dye. R. C. Burrell

Seasonal variations of the osmotic value of different ecological types in the vicinity of Heidelberg. Robert Thren. *Z. Botan.* 26, 449-520(1933).—According to the type of seasonal variation in the osmotic values of their saps, T. distinguishes 6 ecological groups. Transpiration studies were also made with several species of plants during short cold periods. Winter injury does not seem to be a direct effect of the cold but rather results from water loss in consequence of winter transpiration. R. C. B.

Examination of the pigments of *Capsicum annuum* by adsorption methods. László Cholnoky. *Magyar Gyógyszerésztud. Társaság Értesítője* 9, 400-23(1933).—Crude capsanthin (6.2 g.) extd. with lukewarm  $\text{CS}_2$  gave 0.32 g. of substance A; at  $0^\circ$  5.1 g. substance B was produced. Chromatograms are shown. A consisted of 76% zeaxanthin and 21% capsanthin. B after 3 crystns. gave 3.2 g. of a product consisting of 87% capsanthin and 9% zeaxanthin. Further crystns. from MeOH and  $\text{CS}_2$  gave a product contg. 95% capsanthin and 2.5% zeaxanthin. Artificial mixts. of capsanthin and zeaxanthin could be sepd. by a simple adsorption. Pure zeaxanthin,  $\text{C}_{40}\text{H}_{56}\text{O}_2$ , yellow glittering needles, m. 206,  $[\alpha]_D^{20}$   $-54^\circ$ , gave spectrum lines at 527-508 and 492.5-473  $\text{m}\mu$ . Lutein,  $\text{C}_{40}\text{H}_{56}\text{O}_2$ , glittering carotene-like crystals, m. 192,  $[\alpha]_D^{20}$   $163^\circ$ , gave spectrum lines at 516.5-500 and 485-67  $\text{m}\mu$ . Capsanthin, m. 174.5-176,  $[\alpha]_D^{20}(\text{CHCl}_3)$   $-63$ -68, gave spectrum lines at 552, 554-532, 533, 513 and 514-493  $\text{m}\mu$ . For analysis of paprika pigments, ext. 2.5-5 g. powd. drug with petr. ether, add 10 cc. 10% KOH-MeOH and saponify at  $40$ - $50^\circ$ . Wash in a sepg. funnel with 100 cc. ether, dry and evap. *in vacuo*. Dissolve in  $\text{CS}_2$  and adsorb on  $\text{CaCO}_3$ . The polyene alcs. are adsorbed and carotene is washed out. One kg. dry drug gave 0.5 g. carotene, 1.3 g. capsanthin and 0.6 g. xanthophyll (= lutein + zeaxanthin). S. S. de Finály

The petal pigment of *Calendula officinalis*. László Zechmeister and László Cholnoky. *Matematik. Természettud. Értesítő* 49, 181-8(1932).—Extn. of the petals with alc. and sapon. of the ext. with MeOH-KOH gave xanthophylls, carotene and lycopene; the last was found for the first time in non-fruit material. Carotene has spectrum lines at 530-12 and 495-6  $\text{m}\mu$ ,  $[\alpha]_D^{20}$  (benzene)  $20^\circ$ . Lycopene has spectrum lines at 554-38, 516-497 and 482-67  $\text{m}\mu$ . The xanthophyll showed lines at 510-493 and 481-63  $\text{m}\mu$ ; its ether soln. when underlayered with a 25% HCl soln. gave a beautiful dark blue color. S. S. de Finály

Growth of *Lupinus albus* seedlings in solutions of some amino acids. David I. Macht. *Am. J. Botany* 21, 72-6 (1934); cf. *C. A.* 27, 2175. The growth of *L. albus* seedlings was studied in dil. solns. of stereoisomeric forms of leucine, cystine, alanine, valine and aspartic acid in Shive soln. Such solns. may either inhibit or stimulate growth of plants, depending on the concn. The *l*-forms exhibit the greatest physiol. activity and the *d*-forms the least, with *dl*-forms intermediate, but certain mixts. of isomers may produce a synergistic potentiation in some cases and an antidyamic effect in other cases. L. E. G.

[Report on] biochemistry. W. A. Roach. East Malling Research Sta., *Ann. Rept.* 1931, 34-5(1932).—Causes of resistance to woolly aphids.—When woolly aphids were grown on artificial media contg. exts. from the bark of apple trees, there were indications that in the prepn. of the media, both from susceptible and immune bark, some substance toxic to the nymphs but nontoxic to the adult insects had been produced or liberated. *Chem. examn. of apple bark*.—Alc. exts. of apple-tree bark yielded, by fractional pptn. with Pb salts, red and yellow substances, apparently anthocyanins, which gave green and yellow Pb salts, resp. The distinctive red and yellow colors of the shoot barks of certain apple rootstocks are due to the presence of these substances, and the color of

the Pb ppt. is a fairly const. characteristic of apple, rose and cherry stocks. Similar ppts. from apple and rose roots varied according to the variety from lemon-yellow to reddish brown. K. D. Jacob

The effect of yeast extract on the blooming of plants. Artturi I. Virtanen and Synnöve v. Hausen. *Acta Chem. Fennica* 7B, 75(1934)(in English).—Yeast ext., prepd. by heating an aq. suspension of yeast in an autoclave at  $120^\circ$ , stimulates the blooming of peas to a remarkable extent. The stimulating factor is sol. in  $\text{Et}_2\text{O}$ , since an  $\text{Et}_2\text{O}$  ext. has a marked effect on the development of blossoms. The amt. of ext. necessary is very small; so the factor in question probably belongs to the hormone group. Follicular hormone has no stimulating effect on the development of blossoms. S. A. Karjala

The crystalline glucoside of *Gnidia polyccephala* (Januarie Bossie). M. Rindl. *S. African J. Sci.* 30, 455-7 (1933).—The impure glucoside (ether ext.) on extn. with dry MeOH yielded a thick brown residue, which was extd. with boiling  $\text{H}_2\text{O}$  (yield of cryst. glucoside 0.63%). To sep. traces of daphnin, the product was boiled with rectified spirits and, after removal of the solvent, was repeatedly extd. with abs. alc. On percolating in a Soxhlet app. with  $\text{EtOAc}$  a very small quantity of material m.  $206$ - $8^\circ$  was obtained (suspected of being daphnin). The glucoside is slightly *d*-rotatory in MeOH solns. and *l*-rotatory in  $\text{H}_2\text{O}$ . At  $22.8^\circ$  0.1520 g. dissolves in 61.65 g.  $\text{H}_2\text{O}$ , or 0.246%. The glucoside is hydrolyzed by emulsin and hence belongs to the  $\beta$ -series. Mol. wt. from  $\text{H}_2\text{O}$  solns. gave 461 and 433 (calcd. for  $\text{C}_{15}\text{H}_{11}\text{O}_5 \cdot \text{H}_2\text{O}$  358). H. E. Messmore

Chemical composition of the fruits of two species of *Dialium*. E. Castagne. *Bull. agence gén. colonies* 26, 1315-23(1933).—A study of the compn. of the fruits of *Dialium yambataense* Veru. and of *D. corbisieri* Stamer, both from the Belgian Congo. Results are on the dry basis (except  $\text{H}_2\text{O}$ ). *Pods.*:  $\text{H}_2\text{O}$  7.73, 8.81; N 1.03, 0.72, crude protein 6.44, 4.50; crude fiber 32.62, 33.83; petr. ether ext. 0.35, 0.66; pentosans 17.87, 12.88; sugars after hydrolysis by 3%  $\text{H}_2\text{SO}_4$  40.80, 24.60; ash 3.72, 2.69%. The ash of the pods had the compns.:  $\text{SiO}_2$  61.98, 33.22;  $\text{SO}_3$  1.45, 2.07;  $\text{P}_2\text{O}_5$  5.00, 4.27;  $\text{K}_2\text{O}$  8.94, 31.61;  $\text{Fe}_2\text{O}_3$  +  $\text{Al}_2\text{O}_3$  1.01, 2.04;  $\text{CaO}$  15.44, 11.28;  $\text{MgO}$  1.28, 3.79;  $\text{Na}_2\text{O}$  1.14, 3.01%. *Endocarp.*— $\text{H}_2\text{O}$  28.24, 19.12; N 0.70, 0.60; crude protein 4.38, 3.75; crude fiber 2.80, 4.50; petr. ether ext. 0.20, 0.42; pentosans 3.96, 7.57; reducing sugars (without hydrolysis) 59.10, 59.35; *d*-tartaric acid 10.7, 6.5; ash 2.94, 3.52%. The ash of the endocarp had the compns.:  $\text{SiO}_2$  0.86, 6.45;  $\text{SO}_3$  3.45, 2.29;  $\text{P}_2\text{O}_5$  8.42, 12.30;  $\text{K}_2\text{O}$  53.31, 43.30;  $\text{Fe}_2\text{O}_3$  +  $\text{Al}_2\text{O}_3$  1.75, 2.80;  $\text{CaO}$  5.60, 5.26;  $\text{MgO}$  2.17, 3.30;  $\text{Na}_2\text{O}$  0.85, 1.55%. *Albumen.*— $\text{H}_2\text{O}$  9.29, 14.49; N 1.16, 1.08; crude protein 7.25, 6.85; crude fiber 3.20, 5.81; petr. ether ext. 0.03, 0.05; pentosans 4.32, 5.52; preformed reducing sugars 0.40, 0.14; reducing sugars after hydrolysis with 3%  $\text{H}_2\text{SO}_4$  (consisting of galactose and mannose) 75.18, 64.02; reducing sugars after inversion with invertin 2.25, 1.20; ash 1.32, 1.20%. *Compns. of albumen ash*:  $\text{SiO}_2$  6.62, 4.49;  $\text{SO}_3$  6.68, 7.00;  $\text{P}_2\text{O}_5$  12.12, 11.47;  $\text{K}_2\text{O}$  34.48, 34.78;  $\text{Fe}_2\text{O}_3$  +  $\text{Al}_2\text{O}_3$  2.50, 2.16;  $\text{CaO}$  16.93, 5.33;  $\text{MgO}$  10.00, 12.98;  $\text{Na}_2\text{O}$  4.54, 4.05%. *Embryo.*— $\text{H}_2\text{O}$  5.51, 6.30; N 8.49, 8.22; crude protein 52.79, 51.37; crude fiber 11.72, 12.70; petr. ether ext. 8.75, 13.02; pentosans 6.40, 6.76; preformed reducing sugars 0.23, 0.47; sugars hydrolyzable by 3%  $\text{H}_2\text{SO}_4$  (sucrose) 10.80, 15.80; sugars hydrolyzable by invertin 7.05, 7.89; ash 4.54, 4.90%. *Compns. of embryo ash*:  $\text{SiO}_2$  0.46, 2.92;  $\text{SO}_3$  4.90;  $\text{P}_2\text{O}_5$  30.85, 38.05;  $\text{K}_2\text{O}$  36.17, 19.34;  $\text{Fe}_2\text{O}_3$  +  $\text{Al}_2\text{O}_3$  0.91, 2.01%;  $\text{CaO}$  10.74, 11.90;  $\text{MgO}$  11.39, 15.30;  $\text{Na}_2\text{O}$  1.17, 0.92%. The embryos of each species contain a small quantity of very viscous oil having the following characteristics: acid no. 3.62, 3.7; sapon. no. 186.7, 192.9; I no. 107.33, 104.9; Ac no. 12.22, 25.16;  $d_4^{20}$  0.9284, 0.9201. Total aliphatic acids of the oil of *D. yambataense* had the following consts.: neutralization no. 178.33, sapon. no. 217.1, I no. 108.13, Ac no. 37.59, m. p.  $31.3^\circ$ . The liquid acids of the oils of *D. yambataense* and *D. corbisieri*, resp., had the following consts.: neutralization no. 167.5,

175.5; sapon. no. 205.9, 219.1; I no. 121.44, 126.5; Ac no. 38.87, 98.4. The const. of the solid acids were: neutralization no. 202.1, 208.6; sapon. no. 219.1, 215.9; I no. 5.64, —; m. p. 54.7°, 52.2°. The fruit of neither species contained starch, glucosides or alkaloids.

A. Papineau-Couture

**Occurrence of cyanogenetic glucosides in Nelson pasture plants.** T. Rigg, H. O. Askew and E. B. Kidson. *New Zealand J. Sci. Tech.* 15, 222-7 (1933).—HCN in plants was detd. by grinding, digesting 20-4 hrs. with water, filtering and distg. in the presence of a few cc. 2 N H<sub>2</sub>SO<sub>4</sub> soln. The alk. distillate, not less than 100 cc., was titrated with AgNO<sub>3</sub> soln. For grasses, red clover, alsyke, subterranean clover and *Lotus major* the HCN varied from 0.0001 to 0.0005%; for white clover from 0.0016 to 0.0124%, averaging 0.0045%.

P. S. Roller

**Determination of hydrocyanic acid in white clover.** H. O. Askew. *New Zealand J. Sci. Tech.* 15, 227-33 (1933); cf. preceding abstr.—Digestion in H<sub>2</sub>O for 24 hrs. at ordinary temp. or heating at 45° for 4 hrs. gives the highest titration figures for HCN. Distn. of the digested mash was carried out in the presence of a large amt. of H<sub>2</sub>O (one l. for a 50-g. sample) to avoid formation of undesirable compds. Cool storage of samples up to 6 days did not decrease the yield. The HCN content varies seasonally and is greater for the leaf than for the stem.

P. S. Roller

**Water culture experiments with progynon.** K. Scharer and W. Schropp. *Z. Pflanzenernähr., Düngung Bodenkd.* 13B, 1-9 (1934).—Progynon, prepd. from the urine of pregnant mares, contains the  $\alpha$ -follicular hormone of Butenandt (C. A. 27, 4286) with NaCl and lipoids as impurities. The hormone has been isolated from plants and according to Schoeller and Goebel (C. A. 27, 5882) treatment of seed therewith hastens blooming and increases growth. The authors conducted triplicate tests with cereals and peas in Crone's soln. contg. 0, 100 and 300 mouse units per l. of the hormone, with NaCl and lipoids added to controls, since the latter have an effect upon plant growth. The results indicated that the hormone has a very favorable effect upon the growth of peas and summer wheat, and is beneficial to summer barley and corn, as shown by increases in root growth and plant height, resp. Growth of oats and winter rye was not significantly affected. Twelve references. C. J. S.

**The influence of growth-promoting substances (hormones) upon plant growth.** O. Lemmermann and W. U. Behrens. *Z. Pflanzenernähr., Düngung Bodenkd.* 13B, 9-12 (1934).—Expts. with oats grown to maturity in Mitscherlich pots of sandy loam with uniform addns. of P<sub>2</sub>O<sub>5</sub>, K<sub>2</sub>O and N as salts, synthetic urea and urine of various animals, pregnant and nonpregnant, in some instances extd. by Et<sub>2</sub>O and CHCl<sub>3</sub> to remove hormones, and graduated addns. of progynon (cf. preceding abstr.) were neg. with respect to possible effects of growth-promoting substances. Similar later expts. with mustard, for comparison of urea and human urine as sources of N, indicated a slight superiority for the latter. C. J. S.

**Mesothorium  $\gamma$  [radiation] in the [genus] *Lemna*.** V. Vernadskii, B. Brunovskii and C. Kunaseva. *Compt. rend.* 197, 1556-7 (1933); cf. C. A. 26, 167.—Burker's (C. A. 25, 3692) report of Th in plants seems unlikely in view of the probable absence of Th in natural waters. V. has shown (C. A. 26, 5007) the absence of Th in deep subterranean waters rich in Ra which contain at the same time MsTh I. Possibly some such condition exists in regard to plants and detn<sup>9</sup>. of Th were made in *Lemna trisulca*, *L. minor* and *L. polyrrhiza* with this end in view. The quant. results show an increase with the age of the specimens in accordance with the increase calcd. if MsTh I existed in the living plant and RaTh was formed from it in the stored samples. Conclusion: No isotope of Th (Th or RaTh) exists in living *Lemna* but only isotopes of Ra (Ra, MsTh I and Th X). Oden E. Sheppard

**A study of three species of Philippine Derris.** Virginia B. Uichanco. *Univ. Philippines Natural and Applied Sci. Bull.* 3, 129-239 (1933).—From the ether ext. of powd. roots of a *Derris* sp. was obtained 2% of pure

rotenone, m. 163°, while from *D. elliptica* and *D. philippinensis* the yields were less than half of this. Extn. with CHCl<sub>3</sub> or EtOH was not successful. A useful review of the botany, chemistry and application of derris, with 103 references, is given.

K. V. Thimann

**Oxidase and dehydrase in phytopathogenic fungi.** Shigekatsu Hirayama. *Proc. Imp. Acad. (Tokyo)* 9, 439-42 (1933).—Twenty-five parasitic fungi were investigated for oxidase and 20 for succinodehydrase. In *Colletotrichum circinans*, *C. spinaciae*, *Gibberella fujikuroi*, *Piricularia oryzae* (I), *Fusarium* sp. No. 13 (watermelon wilt) (II), *Fomes ulmarius* (III) and *Polyporus mikadoi* the oxidase reaction is very strong. Very strong reducing power was proved in I, II, III, and *Polystictus sanguineus*. The two enzymes are not universally distributed in the filamentous fungi which cause the plant diseases or wood decay. The activity of the enzymes varies markedly in each species.

C. J. West

**The influence of temperature on the physiological reaction of ammonium nitrate.** P. Strebeyko. *Polish Agr. Forestal Ann.* 28, 357-70 (1932) (369-70 in English).—The physiol. reaction of NH<sub>4</sub>NO<sub>3</sub> as expressed by the ratio NH<sub>4</sub>:NO<sub>3</sub> taken in simultaneously by corn in H<sub>2</sub>O cultures is very unsteady. It is affected primarily by the pH of the medium and the temp.: the higher the temp. the more NO<sub>3</sub> ions are taken in, while the amt. of NH<sub>4</sub> ions absorbed is const. The physiol. reaction is, therefore, more basic at elevated temps.

J. Wiertelak

**Relative amount of zinc in green and etiolated leaves.** Gabriel Bertrand and M. Andreicheva. *Compt. rend.* 197, 1374-6; *Compt. rend. acad. agr. (France)* 19, 1101-4 (1933); cf. C. A. 23, 1696.—Ten varieties of edible leaves were analyzed for Zn. The green leaves of any one variety had about twice the Zn content of the yellow. The amt. of Zn roughly paralleled the chlorophyll content.

J. J. Willaman

**The dark-colored duramen of ebony.** K. Griffioen. *Proc. Acad. Sci. Amsterdam* 36, 897-8 (1933).—Extn. with NaOH gave a brown substance which was very similar to the ulmic acid isolated from brown coal. In the transition from sapwood to heartwood the lignin is converted to ulmic acid.

J. J. Willaman

**Physiol. spotting of apples (Suit) 12.** Plant physiology section, G. A. R. S., Report (Crowther) 15. Distribution of the P in wheats (Feyte) 12. Effects of Bordeaux mixt. on transpiration (Wilson, Runnels) 15. Internal brown fleck of potatoes (van der Plank) 15. I compds. in seaweed (Masuda) 10. ## E—NUTRITION

PHILIP B. HAWK

**Alcohol-extractable substances from rice and their relation to vitamins.** C. Scaglioni. *Arch. ist. biochem. ital.* 5, 303-20 (1933).—Alc.-extd. substances from polished rice enhance polyneuritic manifestations of beriberi, while exts. from whole rice attenuate and even cure these manifestations. Both exts., when given together, shorten the period of the disease in pigeons. They are inactive, however, when the animals are kept on a vitamin-free diet.

E. S. G. Barron

The 1-cc. group shows only a slightly higher score for the canned juice. There is evidently a slight destruction of vitamin C in the canned juice. Sealing the cans under an addnl. mech. vacuum is not essential. The tooth sections confirm the findings of the Sherman method for the 1932 pack and serve as an addnl. check on the vitamin C content of the canned juice as compared with the fresh.

F. L. Dunlap

**Fat metabolism. III.** P. E. Verkade and J. van der Lee. *Proc. Acad. Sci. Amsterdam* 36, 876-87(1933); cf. C. A. 27, 3974.—A discussion of diafat, intarvin and elm-seed oil. Intarvin feeding produced no dicarboxylic acids in the urine. Sebatic acid resulted from the feeding of the elm-seed oil. It depends on the nature of the fat or oil whether diacidosis or diaciduria is produced. According to the authors, oils and fats which produce moderately strong to strong diacidosis and diaciduria are wholly unfitted for normal use as foods. Intarvin is considered to be composed principally of mixed glycerides. The largest proportion of elm-seed oil is likewise considered to be made up of mixed glycerides, which contain the diacidogenic capric acid together with other non-diacidogenic fatty acids. So far as producing diacidosis or diaciduria, it is immaterial whether the fat or oil is a simple or mixed glyceride. F. L. Dunlap

**The effect of alcohol upon the appearance of B avitaminosis.** August Meyer. *Klin. Wochschr.* 12, 1811-13 (1933).—The addn. of EtOH delays the appearance of the avitaminotic symptoms in rats on a B-deficient diet.

Harry Eagle

**The blood iodine values in human rickets and tetany.** A. Nitschke and H. Doering. *Klin. Wochschr.* 12, 1910 (1933).—The blood I in normal children is approx. 9 γ %, decreased to 3 γ % in extreme rickets, and to 2.8 γ % in latent or manifest tetany. These are av. values, individual cases varying widely. The basal metabolism is also low. Under treatment with vitamin D (vigantol), the blood I returns to normal within 10-20 days. A preliminary report.

Harry Eagle

**Stereochemical structure and the selective absorption of carbohydrates.** Physiology of nutrition. Günther Malyoth. *Klin. Wochschr.* 12, 1930-2(1933).—Malt amylase splits starch with the formation of β-maltose in the early stages of hydrolysis, while pancreatic amylase tends to split off the α-modification first. Necessarily, the 2 dextrans so formed also differ in their stereochem. conformation. Enzymes prep'd. from *Aspergillus* act like pancreatic amylase in that they first split off the α-form, with the added advantage that they contain a phosphatase which decomposes the amylopectin of starch. A dried dextrin-maltose mixt. formed from starch by *Aspergillus* enzymes had a better effect upon the weight curves of infants when added to the milk than the dextrin-maltose mixt. now available produced with malt amylase.

Harry Eagle

**Vitamin A content of ghee.** K. Singh Grewal. *Quart. J. Pharm. Pharmacol.* 6, 650-4(1933).—Ghee prep'd. from centrifuged butter contained a large amt. of vitamin A. Prep'd. by the Indian method ghee showed loss of some of the vitamin A content. Of the 2 samples of ghee, one prep'd. in spring and the other in winter under the same technic, the latter was found to be poorer in vitamin A than the former. The vitamin A content of ghee is not diminished by storage during the summer under conditions.

W. O. E.

**Effect of calcium-deficient roughages upon milk production and welfare of dairy cows.** R. B. Becker, W. M. Neal and A. L. Shealy. *Fla. Agr. Expt. Sta., Bull.* 62, 3-28(1933); *J. Dairy Sci.* 17, 1-10(1934); cf. C. A. 27, 5793.—Grass forages and silages grown on acid sandy soils contain relatively small amts. of Ca. Dairy cows dependent upon these home-grown roughages withdrew mineral matter from the bones to such an extent that they were weakened and easily broken. Under these conditions, less milk was produced, even when the cows received high-protein concentrates in such amts. that the animals were in good flesh. A 2% addn. of bone meal to concentrates and a daily allowance of 5 lb. of alfalfa

hay resulted in substantial increase in milk production without the cows' becoming fat. Minerals were stored in the skeleton to the point that the shaft bones were above av. strength. Reproduction is a far smaller drain on Ca and P than is lactation. With Jersey cows producing approx. 6000 lb. of milk per lactation, a 2% level of bone meal was slightly in excess of the current requirements when used with the type of low-Ca rations commonly used in Fla.

C. R. Fellers

**Vitamin content of Chinese cabbage.** Carey D. Miller and Ruth C. Robbins. *Hawaii Agr. Expt. Sta., Rept.* 1932, 18-19(1933); cf. C. A. 27, 3741.—Chinese cabbage is an excellent source of vitamin A. Approx. 1/3 of this vitamin is lost in the process of pickling in a NaCl-rice-bran paste. The plant is a fair source of vitamin B, about 4.5 g. daily giving a weekly wt. gain in rats of 3.5 g. The vitamin B content was increased about 10 times after pickling in the NaCl-rice-bran paste. The paste acts as an absorbing agent for vitamin B from the bran. The fresh Chinese cabbage had a  $pH$  of 6.38, but after pickling there was a decrease to 4.74.

C. R. Fellers

**Vitamin content of opihī (Australian limpet).** Carey D. Miller and Ruth C. Robbins. *Hawaii Agr. Expt. Sta., Rept.* 1932, 19(1933).—The opihī, *Heliconiscus exerula*, and more particularly the internal organs, are richer in vitamin A than cod-liver oil. The sperm is richer in vitamin A than the eggs. Two 3 g. of opihī or 1 g. of the organs daily cured rachitic rats, indications of good vitamin D values. The percentage compn. of opihī is fat 1.15, protein 2.76, moisture 77.2, Ca 0.28, P 0.17, Fe 0.0134 and Cu 0.00023.

C. R. Fellers

**Vitamin content of mountain apples, *Eugenia malaccensis*.** Carey D. Miller and Ruth C. Robbins. *Hawaii Agr. Expt. Sta., Rept.* 1932, 20(1933).—Mountain apples were fair sources of vitamin C but were deficient in vitamins A, B and G. The min. protective dose for guinea pigs in the vitamin C expts. was approx. 10 g.

C. R. F.

**The assimilations of calcium and phosphorus from different mineral compounds and their effect on range cattle.** J. L. Lantow. *New Mex. Agr. Expt. Sta., Bull.* 214, 5-30(1933); cf. C. A. 27, 3993.—Ca and P were beneficial as supplements and were profitable to feed. On the expt. range, no animal suffered macroscopic mineral deficiency disease. Ca and P were assimilated from compds. other than Ca phosphates. Minerals do not provide the benefit derived from the protein of cottonseed meal or cake in winter. In general,  $CaH_2(PO_4) \cdot H_2O$  was a very satisfactory mineral supplement and its use on the range can be recommended. Fifty-one references.

C. R. F.

**Digestion and mineral balance trials on range cattle with native New Mexico range hay, cottonseed meal, and mineral supplements.** W. E. Watkins. *N. Mex. Agr. Expt. Sta., Tech. Bull.* 212, 3-32(1933).—The range hay had a Ca content of 0.257% and a P content of 0.211%. Cottonseed meal was a very efficient supplemental feed for furnishing both protein and P. The feeding of 14.7 g. of P per steer per day furnished by the feed and by  $Na_2HPO_4$  resulted in uniformly pos. P balances. A ration consisting of range grasses and NaCl did not supply sufficient Ca or P for growing steers 18 months old. This ration furnished only an av. of 11.6 g. of Ca and 8.5 g. of P daily per steer. With growing steers, a pos. N balance is usually accompanied by a daily gain in live wt. of approx. 0.5 lb. The gross energy of the hay was 4227.8 cal. as compared with 5111.4 for cottonseed meal. In spite of deficiencies in protein, P and Ca, range grass, when supplemented with cottonseed meal, bone-meal and some source of Ca, is a valuable feed for range cattle. Cf. C. A. 27, 1659.

C. R. Fellers

**Rickets in calves.** S. I. Bechdel, K. G. Landsburg and O. J. Hill. *Pa. Agr. Expt. Sta., Tech. Bull.* 291, 2-41(1933); cf. C. A. 27, 1660.—Four years' investigation showed that the lack of the antirachitic factor in the rations of calves caused a decreased growth rate, abnormal bone development, swollen joints, slight paralysis of the rear quarters and a bowed back. These conditions were assoc. with a low percentage of ash in the bones. In calves the decrease in bone ash due to rickets was con-

- siderably less than in rats. Direct irradiation of the calves or their feed was equally effective in curing rickets and in increasing ash content of the bones. Cod-liver oil promoted growth and thriftiness slightly better than ultra-violet-light treatments. Feeding expts. with both calves and rats showed that light treatments produced a slightly superior grade of bone to that produced by cod-liver oil. Sun-cured alfalfa hay was appreciably richer in vitamin D than dehydrated hay (cured without exposure to sunlight). This was proved by both calf- and rat-feeding trials. When 1 lb. of dehydrated alfalfa hay was added daily to the basal diet of skim milk and grain mixt., severe rickets resulted in 6 months; under the same conditions with sun-cured alfalfa mild rickets resulted; 2 1/2 lb. of sun-cured alfalfa entirely prevented rickets. Activated ergosterol was highly effective in preventing rickets in calves and in restoring calves in a rachitic state to a normal condition. Calf- and rat-feeding trials showed oat straw to have a considerable antirachitic potency. C. R. Fellers
- Effect of sunlight on vitamin D of cow milk.** T. M. Olson. S. Dak. Agr. Expt. Sta., *Annual Rept.* 1932, 15(1933).—Milk from cows on pasture was richest in vitamin D and gave the greatest wt. gains in rats as compared with milk from "no-sunlight" cows with or without cod-liver oil. Rats receiving milk in addn. to cod-liver oil gave the greatest gain in wt. The results obtained in the blood analysis of the several groups of rats were inconclusive. C. R. Fellers
- Feeding value of artificially dried forage crops.** R. E. Hodgson and J. C. Knott. Wash. Agr. Expt. Sta., *42nd Annual Rept. (Bull. 275)* 29-30(1932); cf. C. A. 27, 527.—Mixed pasture grasses and clovers which were artificially dried at 38-44° gave the following chem. compn. (dry basis): crude protein 24.64, N-free ext. 39.19, Et<sub>2</sub>O ext. 3.5, crude fiber 18.09, ash 11.18, Ca 0.78 and P 0.65%. In a 15-day collection period, heifers made an av. daily wt. gain of 1.32 lb. The digestibility of the protein and N-free ext. was 74-5, of the crude fiber 72.7 and of the Et<sub>2</sub>O ext. 21.9%. Vitamin D was not injured by the drying process. Rats receiving 3, 6 and 9% of green grass (dry basis) in their daily rations gave as high ash content of femurs as the pos. controls. C. R. F.
- Fish oils as a source of vitamin D for growing chicks.** J. S. Carver, J. L. St. John, F. W. Frasier and William Athow. Wash. Agr. Expt. Sta., *Tech. Bull.* 284, 5-32 (1933).—Results are based on feeding tests on 60 lots of chicks totalling 980 individuals. The W. S. C. biol. all-mash ration consisting of ground yellow corn 52 lb., wheat middlings 20 lb., wheat bran 5 lb., skim-milk powder 20 lb., steamed bone meal 2.5 lb. and salt 0.5 lb. was used in all tests; it contained 16.7% protein, 1.6 % crude fiber, 0.94% Ca, 0.68% P and a Ca:P ratio of 1.4:1. This ration produced well-defined rickets in 4-5 weeks. At the 0.25 and 0.5% levels several samples of sardine and pilchard oils did not give chicks protection from rickets; 1% of either oil or 0.125% of a concd. cod-liver oil gave full protection when used with the above ration. The W. S. C. com. poultry ration with its level of 0.8-1.0% P does not require the addn. of supplementary P when the meat scrap used in the ration contains 25-30 % total ash. In order to promote max. growth and calcification in chicks fed the com. ration with added vitamin D, the addn. of 1% oyster-shell flour was necessary. Excellent growth and calcification were secured with a Ca level of 1-1.8% and a P level of 0.8-1.0%. The addn. of 0.5% of sardine oil to the W. S. C. com. ration effectively prevented rickets. C. R. Fellers
- Effect of storage on the vitamin C of potatoes.** Elizabeth J. McKittrick and Emma J. Thiessen. Wyo. Agr. Expt. Sta., *42nd Annual Rept.* 28-6(1932).—Approx. 5 g. is the min. protective amt. of Irish potatoes (raw or cooked) which protected guinea pigs from scurvy. There was some loss after storage 6-8 months. Cooking did not destroy the vitamin C, and in potatoes which had been stored 6 months, less cooked potato than raw was required for protection from scurvy. Potatoes grown under irrigation seemed to hold their vitamin C content during storage better than those grown without irrigation. C. R. Fellers
- The partition of metabolic nitrogen among the urinary constituents and its physiological significance.** V. Metabolism of exogenous protein. Emile F. Terroine and Germaine Boy. *Bull. soc. chim. biol.* 15, 1163-220 (1933).—See C. A. 28, 810<sup>a</sup>. L. E. Gilson
- Influence of unbalanced mineral diet on the growth and chemical composition of the white rat. Variations in potassium and calcium.** Lise Emerique. *Bull. soc. chim. biol.* 15, 1221-34(1933); cf. C. A. 28, 807<sup>a</sup>.—The effects of adding an excess of K or Ca salts to an otherwise balanced diet were detd. Influence of unbalanced mineral diet on the chemical composition of white rats deprived of vitamin A. *Ibid.* 1235 8.—The effects of varying the K and Ca of the diet were detd. L. E. G.
- From irradiated ergosterol to crystallized vitamin D. Progress since the works of Bourdillon and Windaus.** G. Tanret. *Bull. soc. chim. biol.* 15, 1346-64(1933). A review. L. E. Gilson
- Lipides and vitamins B. I. Role of vitamins B in the utilization of lipides.** Raoul Lecoq. *Bull. soc. chim. biol.* 15, 1498-507(1934).—See C. A. 27, 1035. II. Influence of the constitution of lipides on the production of avitaminosis B and the need of vitamin B in the utilization of lipides by pigeons. Raoul Lecoq and Jean Savare. *Ibid.* 1508-16.—See C. A. 27, 4834. III. Are the alcohol- and water-soluble vitamins B also fat soluble? Jean Savare. *Ibid.* 1517-19.—The vitamins B from beer yeast are not appreciably sol. in olive oil. L. E. G.
- Interference with calcium fixation by certain carbonates in the diet of white rats.** Raoul Lecoq and Henri Villette. *Compt. rend. soc. biol.* 114, 1094-6(1933); cf. C. A. 27, 3503, 5792.—When rachitic rats were placed on a curative diet contg. phosphates of Na and Ca, Ca fixation by the tissues was prevented or decreased by the addn. of sufficient carbonate of Ca, Mg, Sr, Fe or Mn to the diet. Influence of the metal on the antirachitic activity of orthophosphates. *Ibid.* 1096 8.—The effects of phosphates of K, Na, Mg, Ca, Sr, Fe, Mn and Bi in the diet were studied. L. E. Gilson
- Excretion of iodine in the bile [of rabbits] during fasting and after feeding.** A. W. Elmer and Z. Luczynski. *Compt. rend. soc. biol.* 114, 1340-2(1933); cf. C. A. 28, 515<sup>a</sup>. Bile secreted during fasting periods contained 4-14  $\gamma$  l in 100 cc. After feeding (normal diet, no added I) the bile contained 27-69  $\gamma$  in 100 cc. L. E. Gilson
- Potassium and sodium of muscles and brain tissue during avitaminosis B and pellagra.** L. Ballif and I. Gherseu vici. *Compt. rend. soc. biol.* 115, 75-6(1934).—The values found, in parts per 1000, were for normal pigeons, muscle K 4.0, brain K 2.4, muscle Na 0.72 and brain Na 1.48. The corresponding values for starved pigeons were 3.18, 2.1, 0.70, 1.5, and for pigeons on a vitamin B-deficient diet 5.9, 3.6, 0.1 and 0.85. In the case of men dying of pellagra the values were 5.0, 3.0, 0.05 and 1.0, while the averages for specimens from men dying of various other diseases were 3.8, 2.4, 0.6 and 1.4. Thus in both pellagra and lack of vitamin B there is a very large increase in the K of the muscles and brain and a large decrease in Na. L. E. Gilson
- Growth experiments with carotenoids.** H. v. Euler, P. Karrer and A. Zubrys. *Helv. Chim. Acta* 17, 24 9 (1934).—Zeaxanthin and xanthophyll have no vitamin A activity. Treated with PBr<sub>3</sub> in PhH, each yielded a resinous product contg. 2-5% Br, sol. in petr. ether, and having a different absorption spectrum from the parent substance. The substance prep'd. from zeaxanthin promoted growth in young rats when 20-40  $\gamma$  per day was fed; 10  $\gamma$  daily of the product from xanthophyll caused a gain in wt. of 0.8 g. per day. Under the same conditions feeding 0.75  $\gamma$  per day of  $\alpha$ -carotene caused a gain of 0.48 g. per day and the same dose of  $\beta$ -carotene a gain of 0.72 g. per day for 5 weeks. These effective doses of carotene are smaller than any heretofore reported. Very pure vitamin A was treated with Ca(OH)<sub>2</sub>. A small fraction ( $\alpha$ -fraction) was adsorbed. This  $\alpha$ -fraction, treated with SbCl<sub>3</sub>, showed an absorption band with a max. at 5

$m\mu$  which soon faded and was replaced by a band at 620  $m\mu$ . The unadsorbed fraction ( $\beta$ -fraction) with  $SbCl_3$  showed a band with a max. at 622  $m\mu$ . This  $\beta$ -fraction had the characteristics of vitamin A and promoted a gain of 0.7 g. per day when 0.3  $\gamma$  was fed daily. The  $\alpha$ -fraction, to which the name *hepaxanthin* is given, has a much weaker growth-promoting power than the  $\beta$ -fraction and it is uncertain whether it is active *per se* or contains some of the  $\beta$ -fraction, to which its activity might be due. L. E. Gilson

**Relations of the vitamin-B-complex (especially vitamin B<sub>1</sub>) to carbohydrate metabolism.** E. Abderhalden and E. Wertheimer. *Arch. ges. Physiol. (Pflügers)* 233, 395-415 (1933).—In the avitaminosis-B<sub>1</sub> of pigeons high liver glycogen values were found even when the diets were free from carbohydrate. This abnormal storage of glycogen is prevented by antineuritic substances. Neuritic symptoms only occurred in animals in which high liver glycogens were also found. Arthur Grollman

**Application of the capillary resistance test as a measure of vitamin C nutrition.** Ruth E. Stocking. *Arch. Pediatrics* 50, 823-31 (1933).—In a group of normal children (41 boys and 38 girls) 2-14 yrs. of age, the capillary strength was within normal limits. However, a slightly reduced capillary resistance apparently existed in the springtime when the supply of foods rich in vitamin C was less plentiful. Joseph S. Hepburn

**Diet in relation to dental problems.** George R. Cowgill. *Dental Cosmos* 76, 223-35 (1934).—An address (with a bibliography of 55 references) devoted to factors detg. adequate nutrition, growth and maintenance, compn. of the teeth, Ca, P and vitamin factors, carbohydrates and bacteria. Joseph S. Hepburn

**Does pasteurized milk cause variation from normal in the crystal structure of enamel formed during the period of use of such milk?** P. C. Kitchin and R. D. McFarland. *J. Dental Research* 13, 359-62 (1933).—"There were no significant optical differences between enamel of control rats and of milk-fed rats nor between enamel of animals fed pasteurized milk and of those on raw milk from the same supply." J. S. Hepburn

**Calcium and phosphorus studies. VIII. The incidence of caries-like lesions in the rat.** David H. Shelling and Dorothy E. Asher. *J. Dental Research* 13, 363-78 (1933); cf. C. A. 27, 4559. Study was made of the occurrence of caries-like lesions in 1150 rats fed various diets. Such lesions were infrequent below the age of 100 days, showed a high incidence in rats whose ration contained a large percentage of coarsely ground corn, and were absent when the ration contained casein and starch or grains with particles finer and softer than those of corn. The occurrence of the lesions had no relationship to either the Ca and P contents of the ration, or the Ca and inorg. P contents of the blood serum, and was attributed to phys. injury by corn particles in the ration. The efficacy of vitamin D in the prevention of dental caries cannot be evaluated by such expts. The production of these lesions in the rat by this procedure is not necessarily related to the etiology of human dental caries. J. S. H.

**Studies, in the rat, of susceptibility to dental caries. III. The experimental production of typical dental fissure-carries and other lesions in rats, and preliminary studies of their etiology.** Theodor Rosebury, Maxwell Karshan and Genevieve Foley. *J. Dental Research* 13, 379-98 (1933); cf. C. A. 27, 748, 2204. In rats fissure caries of 2 types may occur, the one due to forcible impaction on dense food, particles by teeth weakened by rachitic deficiency, the other histologically similar to human fissure caries. Fissure caries occurred in rats on rations deficient in protein, minerals and vitamin D, and in rats on rations with these deficiencies fully corrected; however, the adequate rations delayed the occurrence of the lesions. Joseph S. Hepburn

**Effects of diets containing fluorine on jaws and teeth of swine and rats.** R. M. Bethke, C. H. Kick, T. J. Hill and S. W. Chase. *J. Dental Research* 13, 473-93 (1933).—Addn. of F compds. to the ration of swine and rats produced hypoplasia of the enamel and dentine. The sever-

ity of this hypoplasia was proportional to the amt. of F ingested, and varied according to the F compd. used. With doses of equiv. F content, the deleterious effects upon the teeth were greatest with NaF, intermediate with rock phosphate and phosphatic limestone, and least with CaF<sub>2</sub>. Rations high in F produced no significant departure from normal in the size or proportions of the skull in rats. In swine, rations contg. rock phosphate or NaF produced material increases in the thickness of the mandible and the size of the medullary spaces, and increased the width of the dental arch. J. S. H.

**Effects of diet on salivary phosphate.** Walter H. Eddy, Hattie L. Heft, Samuel Rosenstock and Ruth Ralston. *J. Dental Research* 13, 511-19 (1933).—Samples of saliva were collected from each of 3 human subjects throughout the day at intervals of 30-60 min. The variations in P content were appreciably greater than those in pH. In human subjects, the P concn. of the saliva was decreased by ingestion of sugar (candy), other carbohydrates (farina, bananas), or protein (boiled eggs), unaffected by ingestion of fat (cream) and increased by ingestion of inorg. (Ca) phosphate. In fasting rats, ingestion of sugar decreased P concn., increased pH and produced little change in Ca concn. of the blood. The diet can influence the compn. of the saliva. J. S. H.

**Biochemical studies of soy-bean milk and chicken protein.** Joseph S. Hepburn, Keum S. Solin and Laurence P. Devlin. *J. Franklin Inst.* 217, 213-21 (1934).—Soy-bean milk, prepd. according to the Korean method, had the following percentage compn.: H<sub>2</sub>O 93.08, crude fat 2.35, crude fiber none, crude protein 3.50, ash 0.46, N-free extractives 0.61, Ca 0.034, P<sub>2</sub>O<sub>5</sub> 0.091; it curdled spontaneously at a lower acidity than cow milk. In feeding expts. with young albino rats over a period of 69 days, the ration proper contained corn meal 15, whole wheat flour 15, soy-bean milk 70%; control rats received a ration contg. corn meal 15, whole wheat flour 15, cow milk 70%. The soy-bean milk ration produced gain in body wt. less rapidly and less efficiently. The av. wt. of a rat on the soy-bean-milk ration increased 174.0% of its initial value; and 25.9 g. of ration was consumed for each g. of gain. The av. wt. of a rat on the cow-milk ration increased 359.6% of its initial value; and 13.9 g. of ration was consumed for each g. of gain. In feeding expts. with young albino rats, chicken protein was a less efficient protein than casein. The final ration contained protein (chicken protein or casein) 18, sucrose 15, starch 29.5, powd. agar 5, salt mixt. 2.5, hydrogenated vegetable oil 20, butter fat 10, cod-liver oil 4.3, dried ale yeast 7.5 g. The feeding period was 57 days. On the chicken-protein ration, the av. body wt. increased 141.3% and 4.37 g. of ration was consumed per g. of gain. On the casein ration, the av. body wt. increased 176.2% and 3.97 g. of ration was consumed per g. of gain. J. S. H.

**The digestion and utilization of crude fiber.** Ernst Mangold. *Nutrition Abstracts and Rev.* 3, 647-56 (1934).—A review. E. H.

**Clinical and experimental study on a dietetic therapy for gallstones.** Sanetoshi Saiki. *Japan. J. Gastroenterol.* 5, 79-83 (1933).—A bile sample taken from a Korean girl having rickets showed small stones. Pieces of stone were placed in the gall bladders of 3 dogs. In one case on a complete diet the piece disappeared after 186 days, but in the other two on deficient diets the stones had increased when observed after 10 and 96 days, resp. In 3 addnl. dogs treated similarly, one was fed a vitamin A supplement, another cod-liver oil and the 3rd a vitamin-deficient diet. After 115 days the stones decreased slightly in size in all cases. C. M. McCay

**Some effects of fasting on the composition of the blood and respiratory exchange in fowls.** K. M. Henry, H. E. Magee and E. Reid. *J. Exptl. Biol.* 11, 58-72 (1934).—No relation exists between the 4-day peak for blood glucose in fasting chickens and the changes in cholesterol, lipide P, uric acid and nonprotein N. Liver glycogen may start at a level of 2.6% and drop to 0.13% after 24 hrs. of fasting. It then remains quite const. At the same time the lipide P dropped from 18.7 mg. to 13.4 on

the 3rd day, after which it ranged from 16.1 to 17.9 mg. per 100 cc. of blood during the remaining 7 days of fasting. Glucose ingestion decreased the hyperglucemia during fasting. Adrenaline produced a greater hyperglucemia in fowls that had fasted for 96 hrs. than for shorter periods. Only a quarter of this extra sugar could have come from glycogen stores. During 7 days' fasting the R. Q. dropped below 0.7. It was not altered by protein feeding but increased after fat feeding. During fasting uric acid was 50% of urinary N and after a protein meal 30%. This indicates that the low R. Q. during fasting is due to uric acid synthesis.

C. M. McCay

**Cupremia in anemias.** A. Fieschi and E. Storti. *Boll. soc. ital. biol. sper.* 8, 1363-6(1933).—There is an increase of Cu in the blood of anemic individuals; in pernicious anemia the increase is often 2-3 times the normal amt.

Peter Masucci

**Retention of calcium and phosphorus in rations with a wide CaO:P<sub>2</sub>O<sub>5</sub> ratio.** J. H. W. Th. Reimers. *S. African J. Sci.* 30, 447-51(1933).—Four pigs were fed rations for 4 weeks with a variable CaO:P<sub>2</sub>O<sub>5</sub> ratio to det., if possible, the results of such feeding. In the normal ration the ratio was about 1:2.2, which could be decreased by adding NaHPO<sub>4</sub> with no increase in lime. Records were kept as to the CaO and P<sub>2</sub>O<sub>5</sub> contents of the rations, feces and urine; also the weights of each were recorded to det. the total CaO and P<sub>2</sub>O<sub>5</sub> involved. A ration having a CaO:P<sub>2</sub>O<sub>5</sub> ratio between 1:2 and 1:3 has no harmful effect on the development of young pigs provided the amts. of both materials are sufficient to support normal growth. The retention of a normal amt. of Ca in the body seems to be dependent upon the presence of P. A very large amt. of Ca in proportion to the P has a harmful influence. The reverse does not hold true, in that the animal may retain large amts. of P without increasing the retention of Ca. The excretion of P above a certain level seems to take place through the kidneys, especially when the ration has a low Ca:P content.

H. E. Messmore

**Vitamin B and carbohydrate metabolism.** Marcel Labbé, Floride Nepveux and J. D. Gringoire. *Bull. acad. méd.* 109, 689-702(1933).—Vitamin B favors glycogen formation in the liver. It reduces glucemia and glucosuria, but the action is slow.

A. E. Meyer

**The influence of fats in protein utilization.** F. Maignon. *Presse méd.* 41, 625-7(1933).—See C. A. 27, 2166.

A. E. Meyer

**Diet and the pH of the urine.** P. L. Violle. *Presse méd.* 41, 772-4(1933).—The pH can be influenced by proper selection of the diet, but frequently the addn. of medicinal substances is necessary.

A. E. Meyer

**Lack of copper as cause of sickness among plants and animals.** B. Sjölema. *Biochem. Z.* 267, 151-6(1933).—The occurrence of the sickness "salt lick" among the cattle in the sandy regions of Holland is attributed to the poor Cu content of the hay, and this condition in the cattle is also reflected in the wide-spread disease of various grain crops (oats, rye, wheat) in the same localities which is checked by the addn. of CuSO<sub>4</sub> to the fertilizer. The blood of the affected animals shows a distinct lowering of its dry matter, 13-14% instead of the usual 18-20%; very low hemoglobin and Fe content. The low dry matter of the blood is entirely due to a lessening of the hemoglobin since the plasma protein content is not affected. The disease is thus an anemia. Actually the hay of those regions shows a Cu content of 2-3 mg. (even as low as 1 mg.) per kg. whereas from unaffected regions the Cu content is 7.5 mg. per kg. on the average. Addn. of CuSO<sub>4</sub> alone or in combination with Fe salts brought about remarkable changes in the affected animals, but the primary effect is not on the hemoglobin but on the appetite. The hypothesis that the Cu may produce a favorable alteration in the intestinal flora is discussed and rejected.

S. Morgulis

**Identification of vitamin C in biological fluids.** N. Bezsonov and A. Delire. *Compt. rend.* 197, 1774-5(1933); cf. C. A. 27, 4560. —Titration with 0.0001 N 2,6-chlorophenolindophenol showed that guinea pigs given

20 antiscorbutic doses eliminated 2% in the urine, a man given 0.4 scorbutic doses eliminated 42% and after 1.2 doses, 74%. No vitamin C was found in the urine of patients suffering from vitamin C deficiency. The titration curve of sauerkraut juice differed from that for citrus or tomato juice.

James C. Munch

**Clinical and biochemical observations on hunger osteopathy, juvenile and late rickets (osteomalacia).** A. Muir Crawford and David P. Cuthbertson. *Quart. J. Med.* [N. S.], 3, 87-104(1934).—The essential difference between osteopathy and the rachitic conditions is that the former rapidly stores Ca, P and Mg without the addn. of irradiated ergosterol, increased mineral intake leading to increased retention; while rachitic conditions recover only on the administration of irradiated ergosterol.

John T. Myers

**Dietary requirements for lactation. I. Failure of lactation on an apparently complete synthetic diet.** Waro Nakahara and Fumito Inukai. *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 22, 301-7(1933).—Rats fed a diet consisting of 75% polished rice powder, 10% fish protein, 10% butter and 5% McCollum's salt mixt., supplemented with 5 g. brewers' yeast per 100 g. of the above diet, grew normally, but failed to suckle their young. The cause of this failure is not yet known.

W. Gordon Rose

**Growth of transplanted tumors in albino rats maintained on a diet with protein hydrolyzates as substitute for protein.** Umetaro Suzuki, Waro Nakahara, Nabetaro Hashimoto and Ryosuke Ikeda. *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 23, 1-8(1933).—No difference was noted in the growth of transplanted tumors in rats fed a diet contg. protein or rats fed a diet in which the protein was replaced by the products of hydrolysis of protein. This supports the conclusion that the protein hydrolyzates are nutritionally equiv. to the proteins.

W. G. R.

**The influence of alcohol on the growth of transplanted tumors in rats.** Umetaro Suzuki, Waro Nakahara, Nabetaro Hashimoto and Ryosuke Ikeda. *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 23, 9-15(1933). Growth of tumors in rats fed a carbohydrate-free diet was increased by replacing 10% of the lard in the diet with EtOH. Five % MeOH also caused a slight increase in the growth of the tumor. Replacement of starch by 10% EtOH in a diet contg. carbohydrate was without effect on the growth of transplanted tumors.

W. G. R.

**Effect of the calcium-phosphorus relationship of the ration on growth and bone formation in the pig.** R. M. Bethke, B. H. Edgington and C. H. Kick. *J. Agr. Research* 47, 331-8(1933).—The Ca-P ratio of the ration is a factor in growth and bone formation in the pig. In general, the best results are obtained with a Ca-P ratio between 1.0 and 2.0. When the proportion of Ca to P is greater than 3.0, pigs become more rachitic and the requirements for vitamin D are increased. The concn. of Ca and P in the ration also exerts an effect on growth and bone formation. The P content of the ration should not be less than approx. 0.6% for good growth and bone formation in the absence of added vitamin D. The requirement of the pig for vitamin D can be minimized by properly adjusting the Ca and P contents of the ration.

W. H. Ross

**Changes in quantity and composition of fat in hogs fed a peanut ration followed by a corn ration.** N. R. Ellis. *U. S. Dept. Agr., Tech. Bull.* 368, 1-13(1933).—Two groups of hogs were compared in a study of the quant. relationship of storage of fat to firmness as influenced by the use of peanuts and of corn in successive feeding periods. A higher rate of fat storage prevailed during the period the hogs were on the peanut ration than when they were on the corn ration. Hogs which continued on the hardening ration until the gains reached multiples ranging from 2 to 5 times the amt. stored on the softening ration generally showed increasing firmness. The gain in total fat was generally more closely related to firmness than the gain in live wt. Analyses of fat samples showed marked decreases in satn. as a result of peanut feeding and an increase in satn. or firmness after the feeding of the corn

ration. The addn. of hard fat, formed from the nonfatty constituents of the hardening ration, to the oily fat already formed during the peanut-feeding period produced a gradual hardening of the body fat as a whole. The group of satd. acids replaced linoleic as second to oleic acid when the corn ration was substituted for the peanut ration. W. H. Ross

**Comparative vitamin A content of nut margarines and butter.** Charles F. Poe and Hazel A. Fehlmann. *J. Dairy Sci.* 16, 559-64 (1933); cf. *C. A.* 27, 1955.—Rats depleted of their body store of vitamin A were given varying amts. of uncolored nut margarine of several brands, or pasteurized or unpasteurized butter, as supplements to a vitamin A-free diet in which the total fat was kept const. The highest daily level of margarine given (1 g.) was not sufficient to maintain growth for longer than 30 days and with some margarines wt. decrease began after 7-8 days. On the other hand the feeding of as little as 0.05 g. of butter maintained growth for at least 60 days. The samples of butter used showed 32-40 Sherman units of A and therefore were high in this vitamin. The margarines showed a variation in fat content from 78.12 to 92.54%. H. K. Salzberg

**Inhibition of stimulating effect of red light on testis activity in *Sturnus vulgaris* (starling) by a restricted diet.** Thomas H. Bissonnette. *Biol. Bull.* 65, 452-68 (1933).—Starlings exposed to 1.7 foot-candles of red light for 6 hrs. per night for 23 nights showed a large increase in testis size if on a complete diet. If fed meanwhile on a diet of "middlings mash" the increase was only slight. The effect is apparently related to more general effects of diet on the sexual cycle. K. V. Thimann

**Fat-soluble vitamins. XXXVIII. Microorganisms and the synthesis of carotene and vitamin A.** Carl A. Baumann, H. Steenbock, Mary A. Ingraham and E. B. Fred. *J. Biol. Chem.* 103, 339-51 (1933); cf. *C. A.* 27, 3975.—Synthesis of carotene, together with other pigments, was accomplished by 4 species of bacteria growing on a glucosyeast agar medium. The dried bacteria were active in promoting growth in rats, but only by virtue of their carotene content, vitamin A being absent by the spectrophotometric test in each case. Of a large no. of bacteria, yeasts and molds tried, none was able to convert carotene into vitamin A in culture. K. V. Thimann

**Sparing action of fats on the vitamin B content of animal tissues.** A. R. Kemmerer and H. Steenbock. *J. Biol. Chem.* 103, 353-62 (1933); cf. Evans and Lepkovsky, *C. A.* 26, 3548.—On diets low in vitamin B, rats lost less wt. when the fat content of the diet was high than when it was low. Muscle or liver from rats, chickens or pigs which had been fed diets low in vitamin B contained less of the vitamin than the same tissues from animals fed on diets adequate in the vitamin. However, when a diet low in vitamin B and high in fat was fed, the tissues did not contain any more vitamin than when a diet low in vitamin B and low in fat was fed. This shows that the sparing action of fat on vitamin B is not due to increased conservation by the tissues. K. V. Thimann

**The availability of mesocystine for promotion of growth in connection with cystine-deficient diets.** Hubert S. Loring, Ralph Dorfmann and Vincent du Vigneaud. *J. Biol. Chem.* 103, 399-403 (1933); cf. *C. A.* 27, 5721.—Mesocystine, the internally compensated inactive form of cystine, had the same power of promoting the growth of rats on a cystine-free diet as the externally compensated *d*-form. Under the same conditions *d*-cystine had no growth-promoting effect. It is suggested that the first step in utilization of mesocystine is reduction to *d*- and *l*-cysteine, the *l*-form being then metabolized. K. V. T.

**The influence of fasting on the concentration of blood lipids in the albino rat.** Barnett Sure, M. C. Kik and Anna E. Church. *J. Biol. Chem.* 103, 417-24 (1933).—In the albino rat during fasting the fatty acids of the blood decrease by about 50% and the lecithin by about 20% in 20 days; the blood cholesterol does not change. K. V. Thimann

**Synthesis and destruction of cholesterol in the organism.** Rudolf Schoenheimer and Fritz Breusch. *J. Biol. Chem.*

103, 439-48 (1933).—Mice were grown on a weighed amt. of wool in a wide-necked flask, and after a period on the exptl. diet were killed with ether, and mice, wool, feces and uneaten food dissolved in alc. NaOH. Soln. was almost complete except for the bones. Correction for the amt. of cholesterol, I, contained in the wool thus enabled complete balances of I to be carried out over long periods. In trials, results agreed with those calcd. from the previously detd. av. cholesterol content of mice to within 4%. On a diet of bread alone the synthesis of I averaged 1.8 mg. per mouse per day. The synthesis was less when I was included in the diet in small amts.; when given in large amts. there was considerable destruction. Fat or carotene had no effect on the balance of I, but bile acids increased the destruction. In the tissues I is therefore being continually formed and destroyed. K. V. T.

**The stability of carotene in ethyl esters of fatty acids, and in liver and vegetable oils.** Francis G. McDonald. *J. Biol. Chem.* 103, 455-60 (1933).—Solns. of carotene in various oils decompd. very rapidly both in the dark and in light, but at 5° the decompn. was markedly retarded. Et butyrate and laurate led to the most rapid decompn., maize oil and Wesson oil to the least. K. V. Thimann

**Newly formed hemoglobin and protein catabolism. Conservation of intermediates in the anemic dog on a protein-free diet.** Floyd Shelton Daft, Frieda S. Rohscheit-Robbins and G. H. Whipple. *J. Biol. Chem.* 103, 495-510 (1933).—On a diet free from protein, anemic dogs continued to synthesize hemoglobin, the synthesis being increased by the addn. of Fe to the diet. About 150 g. hemoglobin was synthesized in a 7-week period. The excretion of urea and  $\text{NH}_3$  decreased greatly at the same time, N being presumably retained for hemoglobin synthesis. The total N metabolism appeared to be somewhat higher in anemic than in control dogs. K. V. T.

**Studies on vitamin G ( $\text{B}_2$ ). I. Yeast and liver preparations as a source of vitamin G ( $\text{B}_2$ ).** Richard J. Block and Lucille R. Farquhar. *J. Biol. Chem.* 103, 643-9 (1933).—Rats were fed on a purified diet lacking in vitamin  $\text{B}_2$ , and various com. prepn. were added as source of this vitamin. Gains in wt. of 4.5-6 g. per day were obtained with various yeast and liver prepn. The vitamin is not destroyed by heating dry yeast at 95-100° for 4 weeks or by treatment with alkali in the cold. Unlike the antianemic factor it is not increased in activity by enzymic digestion or autolysis of liver. K. V. T.

**New nutritional factors required by the chick.** J. A. Keenan, O. L. Kline, C. A. Elvehjem, E. B. Hart and J. G. Halpin. *J. Biol. Chem.* 103, 671-85 (1933).—Day-old chicks on a diet of casein, dextrin, salts, yeast and cod-liver oil fail to grow normally and at 3 weeks develop paralysis with degeneration of the brain. The condition was cured by the addn. to the diet of 18% of ether-extd. vacuum-dried hog liver. The action of the liver involves 2 factors: one, a water-sol. substance, preventing paralysis, destroyed on autoclaving, the other, water-insol., heat-stable and necessary for normal growth. The former is probably identical with vitamin  $\text{B}_4$  (cf. Reader, *C. A.* 24, 402, 5801). Both factors are present in the aq. ext. of fat-free blue grass, and to a smaller extent also in the similar ext. of alfalfa. K. V. Thimann

**The distribution of vitamin C in plant and animal tissues, and its determination.** Otto A. Bessey and C. G. King. *J. Biol. Chem.* 103, 687-98 (1933).—Comparison of the 2,6-dichlorophenolindophenol titration (*C. A.* 26, 5324) with the I titration and the animal assay for vitamin C shows excellent agreement. Cysteine, glucic acid and heated sugar solns. interfere with the titration, but interference is minimized if a distinction is made between the rapid reduction of the dye by vitamin C and the slow reduction by sulfhydryl compds., etc. The distribution of the vitamin in various tissues is tabulated, the lowest amts. being in muscle (0.04 mg. per g.), the highest in the adrenals and corpus luteum (1.4-2.3 mg. per g.). A study of the distribution in plant tissues shows peppers and parsley to be the richest sources (1.8-2.3 mg. per g.), lettuce the poorest (0.07 mg. per g.). The distribution in

exptl. animals corresponds with that in human tissue.

K. V. Thimann

**Diet and the blood lipides. II. The effect of occasional overfeeding on the postabsorptive level.** W. R. Bloor. *J. Biol. Chem.* 103, 699-705(1933); cf. *C. A.* 26, 4363.—The plasma lipides of dogs, detd. in the postabsorptive state, were approx. const. over periods of 2 years when the diet was fairly const. A single overfeeding with fat or carbohydrate to the extent of 50% of the normal caloric intake increased the phospholipides by 20-40% and the fat by 20-100% for about 2 days. The cholesterol was not changed. Overfeeding with protein had no such effect.

K. V. Thimann

**Calcium and phosphorus studies in the chick.** C. A. Elvehjem and B. E. Kline. *J. Biol. Chem.* 103, 733-44 (1933).—Day-old chicks have 12 mg. Ca per 100 g. whole blood. If ample vitamin D is given in the diet this increases to 13-14 mg. per 100 g. during the 1st week of life; if vitamin D is not given the Ca falls to 9-10 mg. per 100 g. during the same period. At 4 weeks with vitamin D the value is 10-11 mg.; without vitamin D, 7-8 mg. In chicks on a rachitogenic diet similar relationships hold for P and for the total ash of the bones.

K. V. T.

**The nutritive value of pure fatty acid esters.** Warren M. Cox, Jr., with the technical assistance of Sarah Neale. *J. Biol. Chem.* 103, 777-90(1933).—Mixed Rt esters of fatty acids, incorporated in the diet of rats, gave as good growth as the mixed triglycerides, but individual satd. fatty acid esters were not as effective as mixts. Rt caprate and Et laurate led to sudden death within 2 weeks, without any special pathol. changes being noted. The toxicity varied with the amt. fed. For a different reason Et palmitate and Et stearate also led to death, for the free acids, being solid at body temp., were excreted unchanged. Satd. fatty acids of mol. wt. less than  $C_{10}$  do not appear in the depot fat but give rise to fats of higher mol. wt. When the mol. wt. is greater than  $C_{10}$  then the unchanged acids appear in the depot fat (cf. Powell, *C. A.* 26, 2771, Reckstein, *C. A.* 24, 401).

K. V. Thimann

**Extractability of vitamin G ( $B_2$ ) from yeast by various acetone-water and methanol-water mixtures.** Paul I. Day. *J. Am. Chem. Soc.* 56, 452-4(1934).—Dried bakers' yeast was subjected to extn. with various  $Me_2CO-H_2O$  and  $MeOH-H_2O$  mixts. The vitamin G contents of the untreated yeast, the yeast residues and the yeast exts. were detd. by feeding expts.  $Me_2CO$ , 99.5 and 80% by wt., did not ext. appreciable amts. of vitamin G; 80%  $Me_2CO$  by wt. extd. about 50% of the vitamin G contained in the yeast. Abs.  $MeOH$  did not ext. an appreciable amt. of vitamin G; treatment with 80% (by wt.)  $MeOH$  extd. about 20% of the vitamin, while 60%  $MeOH$  extd. approx. 50% of the vitamin G contained in the yeast. The growth-promoting properties of the various yeast residues and exts. were similar to their cataract-preventive properties. Those yeast preps. that promoted growth in exptl. animals prevented the development of cataract, while cataract appeared in animals receiving preps. that did not promote growth.

## F—PHYSIOLOGY

HOMER W. SMITH

**Absence of compensatory hypertrophy of Cowper's glands in the albino rat.** H. E. Shih. *Proc. Soc. Exptl. Biol. Med.* 31, 423-4(1934).—Rats aged 250 days were used; 20 days after the removal of 1 gland the remaining Cowper's gland had undergone no compensatory hypertrophy.

C. V. Bailey

**The dehydration of the follicular hormone.** A. Butenandt and W. Thompson. *Ber.* 67B, 140 4(1934).—The formula I was suggested for the follicular hormone; this is analogous to the skeleton of sterols and bile acids. This assumption was supported by the production of a hydrocarbon,  $C_{27}H_{48}$ , by distn. of the hormone over electrolytic Zn dust and successive fractional crystn. This hydrocarbon had the same m. p. and the same spectrum as the hydrocarbon chrysene. The yield was very small: 5 mg. from 5.4 g. of cryst. hormone.

R. S. G. Barron

**Researches on the secretion of Harder's gland.** Aldo Costantini. *Pathologica* 25, 836-40(1933); cf. Belfanti (*C. A.* 20, 447), Derrien and Turchini (*C. A.* 19, 322) and Taddei (*Arch. sci. med.* 29, 319(1900)).—Glands extd. from rabbits are only partially stainable by Sudan III and Nile blue, and are composed of (I) a pink, birefringent part and (II) a white part, which contains only traces of birefringent substances. The av. analyses of I and II, resp., are unsaponifiable matter (cholesterol) 5.35, 3.79; neutral fats 6.28, 1.13; esters of cholesterol 0.52, 2.80; soaps 0.56, 0.60; phosphatides (calcd. as distearolecithin) 0.68, 1.17; loss by drying 64, 76%.

G. A. Bravo

**Experimental investigations on the calcium content of exudates and transudates.** Franz Pagliani and Giorgio Perazzo. *Pathologica* 25, 868-77(1933).—The Ca content in the purulent exudates is greater than the normal blood Ca content, and is less in transudates. Generally there is no relation between Ca content and reaction of the fluids.

G. A. Bravo

**Influence of the (substances of the) endocrine glands on the cholesterol and lecithin contents of the blood.** Experimental investigations. Egle Inglese. *Pathologica* 25, 877-85(1933).—By injection of thyroxine in dogs, the cholesterol (I) and lecithin (II) contents of the blood decrease; by injection of adrenaline, I increases and II decreases; by injection of hypophysis, there is a contrary effect; and insulin injections do not act uniformly.

G. A. Bravo

**Visual purple.** Hans v. Euler and Erich Adler. *Arkiv Kemi, Mineral. Geol.* 11B, No. 20, 6 pp.(1933).—The visual purple from the retina of a pike differs considerably from that of cattle. The former is more stable to glacial acetic acid and less sensitive to light. Colorimetric measurements showed 95  $\gamma$  and 240  $\gamma$  carotene, resp., in 20 beef retinas and 20 pigmented epithelium layers.

A. W. Dexter

**The detection of lyochrome in the pigmented epithelium of the eye.** Hans v. Euler and Erich Adler. *Arkiv Kemi, Mineral. Geol.* 11B, No. 21, 4 pp.(1933).—On extg. the retina of cattle eyes not hardened with alum, the acetone soln. is a greenish yellow. On standing 2 days, it fluoresces a brilliant blue. Lyochrome and carotene are both present in the pigmented epithelium of cattle eyes. Only lyochrome is found in the epithelium

of fish eyes. Large amts. of lyochrome are found in fish eyes but only a little in cattle eyes. The opposite is true for carotene. The lyochrome soln. obtained from shellfish eyes shows an absorption max. at 447 mμ, suggesting lactoflavine. An unstable yellow pigment was found in the iris of pike eyes.

A. W. Dexter

**Cystine requirements of fleece growth.** A. T. King and J. E. Nichols. *Nature* 132, 906(1933).—The inner root sheath material, which is ordinarily lost, gave strongly pos. tests for cystine. This cystine does not appear in the food cystine-wool cystine balance sheet.

A. W. D.

**The glutathione content of normal human blood.** Gilberto G. Villela and J. Gomez Campos. *Compt. rend. soc. biol.* 115, 83-4(1934).—Samples from normal persons 18-50 years old were tested by the method of Woodward and Fry (*C. A.* 27, 5509). In mg. per 100 cc. oxalated blood the values were, for men, reduced glutathione 17-37, av. 27; oxidized, 2-12, av. 6.6; total, 19-41, av. 33.6; and for women, 16-36, av. 28.4; 3-13, av. 7.8; 27-50, av. 36.2.

L. E. Gilson

**Action of corpus luteum hormone on the duration of gestation in rabbits.** Kai Portman. *Compt. rend. soc. biol.* 115, 89-90(1934).—The corpus luteum hormone keeps the uterine muscles in a state of repose. The daily injection of 3 rabbit units (from sow ovaries) into rabbits beginning 2-6 days before the calcd. date of parturition extended the period 3 days (living young produced). By giving 4-6 units daily the period was extended as long as 30 days in some cases (mummified young).

L. E. Gilson

**Action of injections of urine of pregnant women on the blood cholesterol of guinea pigs.** P. Lépine and Mme. Z. Mélas-Joannides. *Compt. rend. soc. biol.* 115, 129-31(1934).—The conclusion of de Potter (*C. A.* 27, 5390) is confirmed.

L. E. Gilson

**Biochemical investigation of the role of the placenta.** E. Lévy-Solal, Jean Dalsace, and C. Gutman. *Compt. rend. soc. biol.* 115, 269-72(1934).—At the time of childbirth the blood plasma of women averages, in g. per l., total solids 85.3, ash 7.97, total lipides 7.9, proteins 62.8. The corresponding values for the plasma of the infants are 64.7, 9.25, 2.6, 49.1. Other analytical data are given. It is evident that the placenta is an impassable barrier for all except very diffusible substances.

L. E. Gilson

**Do the hormones of pregnancy penetrate the placenta?** E. Lévy-Solal, Paul Walther and Jean Dalsace. *Compt. rend. soc. biol.* 115, 272-3(1934).—In 30 of 32 cases the hormone of the anterior hypophysis, so abundant in the blood of the mother, was absent in the blood of the umbilical cord of the infant. In the other 2 cases it was present; these cases differed in that the mother exhibited a marked albuminuria during pregnancy.

L. E. Gilson

**Post-partum azotemia.** B. Estienny and J. Lasserre. *Compt. rend. soc. biol.* 115, 280-3(1934).—During the last 15 days of pregnancy the blood urea of 22 women averaged 0.028%. For the first 15 days post partum the av. was 0.043%. The relation of the increase to resorption of uterine tissue is discussed.

L. E. Gilson

**Experiments on the humoral antagonism of the ovaries using international standard crystallized folliculin.** R. Courrier and R. Raynaud. *Compt. rend. soc. biol.* 115, 299-302(1934).—Many folliculin preps. are impure and produce irregular effects. The effects of graduated doses of very pure crystd. folliculin on female rabbits are described.

L. E. Gilson

**Additional data and discussion on the chalone of the sex glands [of birds].** C. Champy. *Compt. rend. soc. biol.* 115, 358-61(1934); cf. *C. A.* 27, 4572.

L. E. G.

**The antitrypsin of the blood serum after transplantation of endocrine glands.** V. Passek and M. Rubinstein. *Compt. rend. soc. biol.* 115, 361-3(1934).—The resorption of endocrine glands grafted into animals is accompanied by an increase in the antitryptic power of the serum. The increase is proportional to the resorption of the tissue and is due to the introduction into the blood of proteolytic and autolytic enzymes from the tissue.

L. E. Gilson

**Conditions for the determination of the basal metabo-**

**lism of adult rabbits.** Temperature of thermal neutrality. Elimination of movements. Eliane Le Breton. *Compt. rend. soc. biol.* 115, 397-8(1934).—Basal metabolism of adult rabbits. [Absence of] nycthemeral rhythm. Specific dynamic action. *Ibid.* 399-400.

L. E. Gilson

**Spectroscopic determination of fluorine in bones, teeth and other organs in relation to fluorine in drinking water.** C. H. Boissevain and W. F. Drea. *J. Dental Research* 13, 495-500(1933).—The av. F content of the enamel and dentine of persons living in Colorado Springs (F content of drinking water 2 parts per million) was 0.065 and 0.112%, resp., of persons resident in New York City 0.00 and 0.008%, resp. The av. F content of human bones from Colorado Springs was 0.7% by spectroscopy and 0.27% by chem. analysis, of human bones from the region east of the Appalachian Mountains 0.13% by spectroscopy and 0.07% by chem. analysis. The F content of animal bones corresponded with that of the water used. Fossil bones contained as much as 3.5% F. No organ other than bones and teeth was found to contain F. Ingested F was excreted in the urine and feces; F was not found in the milk or saliva.

J. S. H.

**The resorption of calcium sulfate in the digestive tract.** Artturi I. Virtanen and J. Tikka. *Acta Chem. Fennica* 7B, 75(1934)(in English).—CaSO<sub>4</sub> is assumed to pass through the intestinal tract practically unresorbed. However, feeding trials showed that 100-250 g. per day to cows was resorbed for the most part by the intestines. The sulfate was removed mainly in the urine, and the Ca<sup>++</sup> almost quantitatively in the feces, which is attributable to the diffusion of CaSO<sub>4</sub> through the walls of the colon. The above amts. of CaSO<sub>4</sub> had no harmful effects on the health or production of the cows. These data are of importance in the development of the A. I. V. process for fodder preservation.

S. A. Karjala

**Action of thyroxine on the coagulation of blood.** E. Zunz and Gabriel Sanchez de la Cuesta. *Arch. intern. physiol.* 37, 241-73(1933).—See *C. A.* 27, 3525.

C. M. McCay

**Difference between the blood chlorides of the afferent and efferent vessels at the level of the gastric, superior mesentery and renal vessels.** J. Bottin. *Arch. intern. physiol.* 37, 304-9(1933).—At the level of the stomach the difference in chlorides is 5 7% and most marked during gastric secretion. At times it disappears. In the superior mesenterics the difference is the same but here the efferent vessels have higher chlorides showing absorption. In the renal vessels no differences occur.

C. M. McCay

**The mode of formation of cerebrospinal fluid.** Action of methyl violet, uranium nitrate and sodium citrate. Ch. Massaut. *Arch. intern. physiol.* 37, 310-16(1933).—See *C. A.* 28, 528.

C. M. McCay

**Absence of specificity of the secretion of the ray and of swine.** J. Ledrut and G. Alechinsky. *Arch. intern. physiol.* 37, 329-36; *Bull. sci. acad. roy. Belg.* 19, 1188-97(1933).—Secretion from *Raia clavata* stimulates the dog pancreas and produces hypoglycemia in the same degree as that from swine.

C. M. McCay

**The electrical properties of isolated frog skin. II. The relation of the skin potential to oxygen consumption and to the oxygen concentration of the medium.** W. L. Francis. *J. Exptl. Biol.* 11, 35-47(1934).—The O<sub>2</sub> concn. is directly related to the elec. potential across isolated frog skin in Ringer soln.

C. M. McCay

**Changes in the composition of fluids injected into the peritoneal cavity.** Abraham J. Schechter, M. Katherine Cary, Anthony L. Carpentieri and Daniel C. Darrow. *Am. J. Diseases Children* 46, 1015-26(1933).—Solns. contg. various concns. of NaCl, NaHCO<sub>3</sub>, CaCl<sub>2</sub> and Na lactate injected into the peritoneal cavities of dogs and guinea pigs undergo changes in electrolyte concn. which indicate that their compn. tends to approach that of interstitial fluid. Solns. of electrolytes are absorbed at an approx. equal rate. A 5% soln. of dextrose increases in vol. before absorption.

E. R. Main

**Concentration of calcium and phosphorus in the serum**

of children. Ludwig Schoenthal and Dorothy K. Lurie. *Am. J. Diseases Children* 46, 1038-44(1933).—The Ca content of the blood serum of normal children does not vary with age. The P content decreases after the 15th yr., the decrease being more marked in the serum of girls than in that of boys. The Ca and P levels do not appear to be related to growth and are not consistently increased by administration of 1 qt. of milk per day or viosterol in doses of 10-40 drops per day. E. R. Main

Action of folliculin and prolactin on the reproductive organs of the bat during hibernation. Bernhard Zondek. *Lancet* 1933, II, 1256-7.—The administration of folliculin and prolactin to bats during the winter causes the appearance of all of the phases of the generative process. E. R. M.

Studies of reproduction in the rat. I. The effect of changes in the protein upon fertility, pregnancy and lactation. Donald Macomber. *New Engl. J. Med.* 209, 1105-9(1933).—A reduction in the protein intake from 2.9 to 0.83 g. per day had no appreciable effect on pregnancy in rats, but somewhat lowered the fertility. Rats maintained on the low-protein diet during the period of lactation raised a smaller no. of young, the av. wt. at weaning being lower than normal. The percentage of food utilized by growth, which is normally increased during lactation, was markedly decreased by the low-protein intake. II. The effect of changes in energy production upon fertility, pregnancy and lactation. *Ibid.* 1160-2.—A 30% reduction in the total amt. of food consumed induced temporary sterility, the rats appearing to be normal in other respects. Reproduction became normal when a normal food intake was resumed. III. Vitamin E—neutralized when mixed with lard. *Ibid.* 1235-6.—Wheat germ, in quantities of 0.5 g. or more, mixed with diets contg. 20% lard failed to protect against sterility. Lettuce fed separately afforded protection although the diets still contained 20% lard. IV. The occurrence of spontaneous amputation in young growing rats whose mothers were on certain diets. *Ibid.* 1277-9.—The young of approx. 40% of the rats maintained on diets contg. adequate amts. of protein and vitamins with wheat germ as a source of vitamin E developed severe lesions of the tails or toes, frequently leading to spontaneous amputation. Upon substitution of lettuce for the wheat germ, the same mothers reared normal litters. The effect appeared to be due either to a toxic constituent of the wheat germ or to the failure of wheat germ to supply some nutritional substance which is present in lettuce and is essential for normal growth. E. R. M.

The functions of Brunner's glands and the pyloric end of the stomach. H. W. Flörrey and H. E. Harding. *J. Path. Bact.* 37, 431-53(1933).—The secretion of Brunner's glands is alk., about  $pH$  8, rising rapidly to 9 on exposure to the air. It is at least equiv. to 0.1 N NaOH, because of its bicarbonate content. It has the consistency of egg white and is clear or slightly opalescent. Brunner's glands of the cat, rabbit, guinea pig and rat are activated by passing HCl over them. Those of the rabbit respond to mustard oil stimulation. Its function may be to protect the gastric mucosa and its absence may be a factor in the production of peptic ulcer. J. T. M.

Osmotic properties of the erythrocyte. VI. Influence of the escape of salts on hemolysis by hypotonic solutions. M. H. Jacobs and Arthur K. Parpart. *Biol. Bull.* 65, 512-28(1933); cf. *C. A.* 27, 3979.—The degree of hemolysis of ox erythrocytes is not appreciably influenced by short previous exposure to hypotonic solns. Leaking out of electrolytes therefore occurs far too slowly to account for the resistance to hemolysis observed (*C. A.* 24, 5355; 25, 2750). Exposure to sucrose solns., however, increases the resistance to hemolysis, which is in general ascribed to an exchange of anions from the cell for OH ions from the soln., this leading to an increase in the base bound by the hemoglobin and hence a decrease in the total osmotic pressure in the cell. Such an effect would be numerically large enough to explain most of the apparent resistance to hemolysis. K. V. Thimann

The forms of magnesium in serum and milk. Helen Rivkin Benjamin, Alfred F. Hess and Joseph Gross.

*J. Biol. Chem.* 103, 383-90(1933).—The total Mg in the sera of various animals varied from 2.2 to 4.9 mg. per 100 cc. From 50% to all of this was ultrafilterable. The non-filterable form, probably representing Mg combined with protein, was not adsorbed by  $BaSO_4$ , but a part of the filterable form was adsorbed in most cases. The Mg can thus be divided into 3 fractions; filterable, not adsorbed (Mg ions); filterable, adsorbed (Mg combined with weak acids); and non-filterable (Mg-protein compds.). In hypercalcemia the adsorbable fraction was greatly reduced, often to zero. Artificial ultrafiltrates consisting of  $NaHCO_3$ , KCl, NaCl,  $KH_2PO_4$ ,  $MgSO_4$ , and  $CaCl_2$ , brought to  $pH$  7.4 with  $CO_2$ , also contained adsorbable Mg, the amt. of which varied directly with the P:Ca ratio. In the absence of Ca the adsorbed fraction was 53% of the Mg; with a Ca:P ratio of 3 it was 29% and with a Ca:P ratio of 1 it was from 10 to 25%. In milk only minute amts. of Mg are so adsorbable.

K. V. Thimann

The relation of filterable to non-filterable calcium in chicken blood. John T. Correll and J. S. Hughes. *J. Biol. Chem.* 103, 511-14(1933).—Independent of sex and egg-laying activity the filtrate fraction of the serum Ca of the chicken was 6.4 mg. per 100 cc. However, the total serum Ca increases 2-3 times during laying.

K. V. Thimann

The metabolism of azelaic acid. H. Gregg Smith. *J. Biol. Chem.* 103, 531-15(1933); cf. Baer and Blum. *Arch. expl. Path. Pharmacol.* 60, 80(1907).—About 60% of ingested azelaic acid was recovered from the urine of dogs. In a few cases recovery was 90% of the amt. fed. Since most natural fatty acids, if broken at the double bond, would give rise to azelaic acid, it follows that this cannot be the path of breakdown in the animal body.

K. V. Thimann

The hemoglobin content of chicken blood. Arthur D. Holmes, Madeleine G. Pigott and Percy A. Campbell. *J. Biol. Chem.* 103, 657-64(1933).—The hemoglobin content of the blood of well-fed chicks is 9.5-10.5 g. per 100 cc. of blood. It is about 5% lower in pullets than in cockerels, and is unaffected by crate fattening.

K. V. Thimann

The distribution of sugar and rate of glucolysis in the blood of some mammals. Michael Somogyi. *J. Biol. Chem.* 103, 605-70(1933).—The partition of sugar between corpuscles and serum of various animals was redetd. in view of confusion in the past between true or fermentable sugar and merc reducing substances. The methods of *C. A.* 25, 2165, 2180 were used for fermentable sugar. Sugar is absent from the corpuscles of the pig. The ratio of sugar distribution showed no parallelism with the rates of glucolysis in the various species. Discrepancies in the literature are ascribed either to the use of total reducing values or to washing of the corpuscles, which rapidly removes the sugar contained in them. K. V. Thimann

The diffusibility of plasma calcium after parathormone administration. Comparison of the calcium, phosphate and protein concentrations of serum and edema fluids. D. Rourke Gilligan, Marie C. Volk and Mark D. Alt-schule. *J. Biol. Chem.* 103, 745-56(1933).—On administration of parathyroid hormone to human beings the phosphate of the serum and edema fluid decreased 24-48 hrs. before the max. increase in serum Ca. The increase in serum Ca is paralleled by an increase in the Ca of edema fluid, indicating that the increased Ca is principally of the diffusible type. The absence of such parallelism between serum and cerebrospinal fluid indicates that the latter is not a simple dialyzate of blood, confirming the results of Merritt and Bauer (*C. A.* 25, 1568); cf. also Cameron and Moorhouse, *C. A.* 19, 2078. K. V. Thimann

Studies on urinary acidity. II. Sergius Morgulis. With the technical assistance of I. Bercovici. *J. Biol. Chem.* 103, 757-61(1933).—The views of Berg in *Kontrolle des Mineralstoffwechsels* (*C. A.* 25, 990) are shown to be untenable. The primary and secondary phosphates of urine, as detd. by the method of Kugelmass and Rothwell, agree with the values calcd. from the total P and the urinary  $pH$ . Primary and secondary phosphates

added to urine were satisfactorily recovered by the same method. At  $p_H$  less than 6.0, however, the method is unreliable. There is thus no question but that primary phosphates do exist in biol. fluids. K. V. Thimann

**The calcium content of ultrafiltrates of plasma and the influences of changes in hydrogen and bicarbonate ion concentrations upon it.** Lucius M. Dillman and Maurice B. Visscher. *J. Biol. Chem.* 103, 791-9(1933).—The fraction of plasma Ca which passes into the ultrafiltrate varies with  $p_H$ , being 59% at  $p_H$  7.0 and 45% at  $p_H$  7.6 for dog plasma. This result agrees with various earlier observations that bubbling  $CO_2$  through plasma increases the diffusibility and ion activity of Ca. K. V. T.

**Action of bile acids on the metabolism of carbohydrates and fats.** J. V. Supniewski and J. Hano. *Med. Doświadczenia i Społeczna* 16, 310-37(1933).—Na cholate in subcutaneous doses of 0.04-0.06 g. per kg. of rabbit causes hypoglycemia. The max. effect is noticed 2 hrs. after injection. Given intravenously the same dose causes hyperglycemia; 0.1 of the dose produces hypoglycemia. Na desoxycholate and dehydrocholate act similarly. The same effects are observed in pigeons and depancreatized dogs. The blood-sugar level and urinary sugar output were lowered in the dog. The mechanism of hypoglycemia is not concerned with liver cell function. Cholic acid unites with glucose, inactivating the aldehyde group. Parenteral administration of bile acid to pigeons and rabbits caused a decrease in blood fatty acids (kept low for several days by a dose of 0.04-0.06 g. per kg.) accompanied by a fall in ionized P and ester P with an increase in blood phosphatides (the same effects are observed in hyperglycemic and lipemic dogs) and a fall in blood cholesterol, then a rise (when the fatty acid level is low) followed by a return to normal. Perfusion expts. on isolated frog and rabbit livers show cholic acid to be weakly glycogenolytic. Na cholate 1:10,000 does not augment the permeability of rabbit erythrocytes toward glucose. No apparent effects on metabolic rate of the rat could be observed. Normal and curarized frogs could not be used in metabolic studies. C. T. Ichniowski

**Chloropenia and osmotic regulation.** Edmund Kerpel-Fronius. *Z. ges. expil. Med.* 90, 676-83(1933).—Pups fed for 8-10 days on carbohydrate-rich, salt-free diets develop a marked blood and tissue chloropenia. No change of blood N or alkali reserve occurred. The brain was affected as in hydermia. Milton Levy

**Brocq-Rousseu and Roussel, G.: Le sérum normal.** Paris: Masson & Cie. 364 pp. F. 75.

**Palies, A. L. C.: Emotie, Bloedsuiker en Hersenstam.** Een experimenteel Onderzoek naar den Involod van de Emotie op het Bloed suikergehalte. Assen: Van Gorcum & Co. 82 pp. Fl. 2.90.

## G—PATHOLOGY

### II. CIDRON WELLS

**Effect of sodium cyanide on complement hemolysis.** W. H. Randall. *Proc. Soc. Exptl. Biol. Med.* 30, 1412-13(1933).—The addn. of neutralized NaCN soln. to red cells, sp. hemolysin and complement inhibits hemolysis. When red cells were washed after contact with hemolysin and NaCN, the addn. of complement caused hemolysis. The effect of NaCN in inhibiting hemolysis is upon the complement and is independent of the  $p_H$  of the cyanide. The results are contrary to those of Jarno and Suranyi (*et C. A.* 24, 420; 25, 3080). C. V. Bailey

**Creatine content of the heart in experimental cardiac hypertrophy.** D. W. Cowan. *Proc. Soc. Exptl. Biol. Med.* 31, 417-18(1934).—Growing rats were maintained in a state of nutritional anemia for 68-75 days; the av. wt. of the ventricles was 36% higher than in the litter mate controls; the av. body wt. was 47% below normal. The total amt. of creatine in the ventricles was the same for the 2 series; the concn. in the hypertrophied ventricles was 26.6% lower than in the controls. In normal growth hypertrophy, the concn. of creatine in the ventricles was approx. const. C. V. Bailey

An attempt to reactivate mercuric chloride-inactivated

**vaccinia virus.** M. I. Beattie and D. M. Baldwin. *Proc. Soc. Exptl. Biol. Med.* 31, 421-2(1934).—The least amt. of  $HgCl_2$  which would inactivate dermovaccine and neurolapine was detd.; these amts. were added to the suspensions of the viruses and kept at room temp. for 24 hrs. In each instance the addn. of  $H_2S$  to the virus- $HgCl_2$  mixt. did not render the mixt. active when inoculated intradermally in the rabbit. The addn. of  $H_2S$  to virus saline mixts. did not destroy the virus. C. V. Bailey

**A method of obtaining undiluted tissue juice for the study of tissue antibody titer.** Beatrice Carrier Seegal and Devorah Khorazo. *Proc. Soc. Exptl. Biol. Med.* 31, 435-7(1934).—Pieces of tissue are mixed with a large vol. of filter paper and the mass is subjected to a pressure of 10,000 lb. per sq. in. in an hydraulic press. Approx. 15-20% of the tissue wt. is recovered as fluid; this is kept in the ice-box overnight and centrifuged while cold to remove fats. A special compression chamber is used in the press. C. V. Bailey

**Phosphatase activity of the bones and kidneys in thyrotoxicosis.** Merritt B. Low, Robert O. Wilson and Joseph C. Aub. *Proc. Soc. Exptl. Biol. Med.* 31, 447-50(1934).—In the white rat, 0.2-0.4 mg. of cryst. thyroxine was injected intramuscularly daily for 10-18 days; the kidneys were increased in size and the av. phosphatase activity per g. of tissue was slightly diminished; the phosphatase activity of the bones was similar to that of controls. C. V. Bailey

**Antibody to ovalbumin in the blood of allergic subjects.** P. Woring. *Ann. inst. Pasteur* 1933, 270-81.—Two antibodies (A and B) to ovalbumin have been characterized, only one of which (A) is characteristic of congenital allergy. The optimal zones for the fixation of complement by A and B differ widely. An approx. idea of the content of A of a serum is obtained as follows: Egg white is added in proportions varying from 1:500 to 1:5 × 10<sup>6</sup> and the mixts. are injected in a normal subject. The following day an injection of egg white is given and the limits are noted within which an urticarial reaction is produced. There is no fundamental difference between allergy and immunity. B. C. A.

**Some blood chemical findings and their interpretations in diseases of animals.** Jesse L. Bollman and Carl F. Schlotthauer. *J. Am. Vet. Med. Assoc.* 37, 151-60(1934).—Review. Rachel Brown

**The lipolytic activity of normal and tuberculous hog liver.** M. Ghiron. *Ann. chim. applicata* 23, 495-501(1933).—The lipolytic activity of liver from normal and tuberculous hogs was detd. by hydrolysis of tributyrin, Me butyrate, neutral olive oil and fat extd. by acetone from Koch's bacillus. Liver ext. from young hogs has a low activity, hydrolyzing only 1.3%  $PrCO_2Me$ , while from a tuberculous hog of the same age, a much more active lipase is obtained, which splits up to 48% of this ester. Liver exts. from tuberculous hogs also hydrolyze 50-100% tributyrin, attack olive oil, not affected by ext. from normal subjects, and show a particular activity toward fat from Koch's bacillus. Fully grown hogs show marked lipid activity and high resistance to tuberculous infection. There is apparently a direct relation between lipid activity and resistance to tuberculous infection. A. W. Contieri

**Isoelectric points of the blood serum in pulmonary tuberculosis.** Lopo de Carvalho and Herculano de Carvalho. *Compt. rend. soc. biol.* 114, 843-5(1933).

**Acidosis of experimental nephritis and renal excretion of bases and acids.** L. Brull, J. Lambert and C. Roersch. *Compt. rend. soc. biol.* 115, 182-4(1934).—U nephritis is accompanied by a severe acidosis although the ratio of acids to bases excreted in the urine is greatly increased. Complete analyses made daily on the urine of an exptl. dog are given for a 10-day period. L. E. Gilson

**Action of diphtheria toxin on blood plasma. Anticoagulant power of the toxin.** H. Goldie. *Compt. rend. soc. biol.* 115, 287-90(1934). L. E. Gilson

Remarks on the technic of extracting the antigenic

polysaccharide complex from *Aertrycke's bacillus*. André Boivin and Lydia Mesrobianu. *Compt. rend. soc. biol.* 115, 304-6(1934); cf. *C. A.* 28, 1933, 5029.---Extraction of toxic and antigenic polysaccharide complexes from various bacteria other than *Aertrycke's bacillus*. André Boivin, Ion Mesrobianu, Lydia Mesrobianu and Barbu Nestorescu. *Ibid.* 306 8.---Stability of the toxic and antigenic polysaccharide complexes found in bacteria. André Boivin and Lydia Mesrobianu. *Ibid.* 309-10.

L. E. Gilson

Bromine of the cerebrospinal fluid and the blood serum, plasma and corpuscles. C. I. Urechia and Alexandrine Retezcanu. *Compt. rend. soc. biol.* 115, 312-15(1934).---In a series of sane pathol. cases the Br content of spinal fluid taken from the suboccipital region was 0.58-0.89 mg. % or nearly that of the blood; in spinal fluid from the lumbar region it was 0.5-0.76 mg. %. In manic depressive psychosis the corresponding values were often slightly lower. In 20 diversified pathol. cases plasma Br ranged from 0.11 to 0.98 mg. %, serum Br was slightly lower, and corpuscle Br 0.19-0.41, av. 0.27 mg. %.

L. E. Gilson

Comparison of the antigenic properties of whites of hen eggs from different sources. Pierre Woringer. *Compt. rend. soc. biol.* 115, 389-91(1934).---Whites of eggs from different breeds of hens all had the same antigenic property.

L. E. Gilson

Isoelectric points of the blood serum in the successive stages of tuberculosis. N. Bernstein. *Compt. rend. soc. biol.* 115, 401-3(1934).

L. E. Gilson

Action of lecithin on the fractionation of antitoxic sera and the transformation of pseudoglobulin into euglobulin. I. Pirotsky and F. Modern. *Rev. inst. bacteriol. dept. natl. hig.* (Buenos Aires) 6, 51-6(1933); cf. *C. A.* 28, 8189.---Other workers have suggested that euglobulin is a lecithin-pseudoglobulin complex. Lecithin added to antidiphtheritic serum did not affect the fractional pptn. of the proteins by  $\text{Na}_2\text{SO}_4$ . A lecithin-pseudoglobulin complex was prepd. *in vitro*. Injected into guinea pigs it caused shock only in those sensitized to pseudoglobulin and had no effect in those sensitized to euglobulin.

L. E. Gilson

Allergic reactions to foods and their avoidance. M. J. Gutmann. *Deut. med. Wochschr.* 59, 1429-31(1933).---Idiosyncrasy to coffee may result from allergic reactions to its caffeine content or to other constituents. Subjects manifesting allergic reactions to one brand of coffee may be immune to other varieties.

Arthur Grollman

Formation of cavities in molar teeth of rats. Basil G. Bibby and H. Jobe Sedwick. *J. Dental Research* 13, 429-41(1933).---Dental caries developed in 82% of 50 rats fed a ration of ground yellow corn, wheat gluten,  $\text{CaCO}_3$  and  $\text{NaCl}$ ; an adequate supply of cod-liver oil did not decrease the susceptibility. The caries originated as fractures, the development of which was promoted by the presence of coarse hard particles in the ration.

Joseph S. Hepburn

The effect of iodine vapor on the growth of fibroblasts of embryonic chick heart and malignant tumor cells *in vitro*. Albert Strickler and Ona M. Fowler. *Am. J. Cancer* 19, 789-816(1933). Cultures of normal fibroblasts grown in the presence of small amts. of I vapor become partially fixed, but after several transfers to new media show cell proliferation and attain normal growth areas. The growth areas attained by malignant cell cultures become smaller during cultivation for several generations. Exposure to I vapor causes a more rapid decrease in areas of growth and the earlier appearance of evidences of cell degeneration.

E. R. Main

Basal metabolism in asthma and in epilepsy. Anne Topper and Hannal Mulier. *Am. J. Diseases Children* 46, 963-8(1933).---The basal metabolic rate of children tends to be lower than normal in asthma and in epilepsy.

E. R. Main

Choosing a serum test for syphilis. Wm. A. Hinton. *J. Lab. Clin. Med.* 19, 275-80(1933).---The choice of a serum test for syphilis should be based on statistical studies rather than on simple comparisons with the

Wassermann reaction. Flocculation methods appear to fulfil the requirements of high degree of sensitivity, specificity and dependability.

E. R. Main

The catalase content of the blood in cancer. L. Deutsch and J. Frankl. *Z. Krebsforsch.* 40, 98-104(1933). The catalytic index of the blood (the vol. of O in cc. liberated by the catalytic action of the vol. of blood which contains 1 million erythrocytes) detd. after a 15-min. period of reaction is normally 0.68 and after a 30-min. period 1.28. Indexes lower than normal are indicative of malignant growth.

E. R. Main

Photosensitization with special reference to the problem of geeldikkop among small stock in South Africa. J. I. Quin and C. Rimington. *S. African J. Sci.* 30, 461-71(1933).---Geeldikkop, a disease characterized by the sudden onset of edematous swelling of the exposed parts of the head and ears of sheep and angora goats, is caused by eating *Tribulus terrestris*. The swelling of the skin is not present in black-faced sheep. When fresh green or dried *Tribulus* was fed to sheep no symptoms developed. Aq. exts. of powd. *Tribulus*, or expressed green juice, when fed caused death. Alk. solns. of hematoporphyrin when injected into sheep provoked intense irritation as soon as the animals were exposed to sunlight. If these animals were kept stabled or if the head was protected by a dye, as Bismarck brown, or even naturally pigmented, no effects were shown. Ultra-violet rays failed to cause symptoms in sheep injected with hematoporphyrin. Eosin, erythrosin, rose bengal and acriflavine when injected cause well-marked photosensitization but no icterus. Methylene blue, methylene violet or thionine produced photosensitization without icterus. Quinine salts caused hemolysis without photosensitization. After ligation and cutting of the common bile ducts marked photosensitization became evident from the 5th to 14th day. The animals made all possible efforts to get the exposed parts into the shade. In the serum a phylloerythrin was identified; this seemed to be responsible for the photosensitivity. It was obtained also from geeldikkop bile. *Lippia rehmanni* also was capable of giving rise to a syndrome indistinguishable from geeldikkop, except in degree and duration.

H. E. Messmore

Presence of a lethal factor in certain members of the plant genus *Tribulus*. Claude Rimington and J. I. Quin. *S. African J. Sci.* 30, 472-82(1933).---Sheep when fed the juice from *Tribulus* acquired geeldikkop, and death followed in about 8 hrs. The blood contained methemoglobin. Although nitrite is absent from the dry, powd. plant, it is rapidly formed during the soaking of the dried plant in  $\text{H}_2\text{O}$  in a closed vessel. Nitrite in the plant juice, when dried, is oxidized to nitrate. When the dried plant is extd. with  $\text{H}_2\text{O}$  an enzymic reduction yields nitrite. Samples of the dried plant gave 1.20-3.39%  $\text{KNO}_3$ . The nitrate-reducing agent is retained at least to some extent in the plant material and is not washed out by  $\text{H}_2\text{O}$ . The best substances for combating *Tribulus* poisoning are: toluene,  $\text{CHCl}_3$  0.2%,  $\text{Et}_2\text{O}$  0.4% or  $\text{HCHO}$  0.2%. The nitrate content varies widely not only in different species of *Tribulus*, but also in different plants of the same species and growing in the same locality, and even in different parts of the same plant.

H. E. M. Calcification of the Twort mouse carcinoma (in vivo) by means of viosterol. John W. Spies and George P. Lyman. *Arch. Surg.* 27, 588-601(1933).---Toxic doses of viosterol produced calcification in actively growing mouse carcinomas and their metastases. There was also increased calcification in certain viscera.

J. T. M.

Return of gastric acidity after subtotal gastrectomy and double vagotomy. Philip F. Shapiro and Benjamin N. Berg. *Arch. Surg.* 28, 160-79(1934).

J. T. M.

Absorption of urea from the bladder. Frederick A. Fender. *Arch. Surg.* 28, 180-8(1934).---The inflamed bladder mucosa transmits urea in quantities sufficient to raise the nonprotein N of the blood appreciably. This may be a factor in the development of uremia in patients with neurologically incapacitated bladders.

J. T. M.

The selection of noncarcinogenic from carcinogenic oils. C. C. Twort and R. Lyth. *J. Hyg.* 33, 464-73

(1933).—There is a correlation between field of origin and carcinogenic potency, field of origin and refractivity, and carcinogenic potency and refractivity. The third can be deduced when there is a definite knowledge of any 2 of them. Mule spindle lubricating oils should have a refractivity below 5520 when the sp. gr. is above 895 or a refractivity below 5550 when the sp. gr. is below 895.

John T. Myers

A study of the antihemolytic titer of sera of man and animals following staphylococcal infection. J. I. Connor and Margot McKie. *J. Path. Bact.* 37, 353-7(1933).—There is a marked rise in antihemolysins in superficial staphylococcus infections.

John T. Myers

Edema in nephritis. J. Basil Reunie. *Quart. J. Med.* [N. S.], 2, 521-38(1934).—There is reduction in serum albumin in cases of cardiac failure with edema. In nutritional edema, diminution of serum osmotic pressure is directly responsible for the edema. Fall in serum osmotic pressure was a const. finding in the nephrotic syndrome but the development of edema was in certain cases prevented by a salt-free diet. In acute nephritis edema may be due to the rise in blood pressure and fall in serum osmotic pressure jointly. The level of the serum proteins is a valuable prognostic index, for in cases where the serum osmotic pressure is not marked, edema is a very transient feature. The early and gross reduction of serum osmotic pressure in some cases militates against the view that the diminution of serum proteins is entirely due to proteinuria, while the well-nourished condition of such cases rules out malnutrition as an important factor in the production of edema in acute nephritis. Serum proteins may be restored to normal whether the patient is on an adequate protein diet or not. These facts suggest that defective synthesis of serum protein is the important immediate factor in the reduction of serum osmotic pressure.

John T. Myers

Calcification of the kidneys in pyloric stenosis. A. M. Cooke. *Quart. J. Med.* [N. S.], 2, 539-48(1934). The renal changes were attributed to alkalosis. J. T. M.

Pituitary secretion in high blood pressure. Clifford Hoyle. *Quart. J. Med.* [N. S.], 2, 549-60(1934).—It is not possible to detect pituitrin in normal unconed. spinal fluid obtained by lumbar puncture even if sufficient be taken to make it probable that it came from the cerebral cysterns. Patients with essential hypertension or with hypertension assocd. with renal insufficiency do not usually show an increase in pituitrin in such spinal fluid. Pituitrin may be detected occasionally, but only traces are found. This suggests that hyperpituitarism is not a factor in these varieties of hypertension. John T. Myers

The diagnosis of anemia with special reference to cell volume and blood-iron estimation. Harold W. Fullerton, Alexander Lyall and L. S. P. Davidson. *Quart. J. Med.* [N. S.], 2, 561-81(1933).—In all types of anemia, the cell-vol. index, and particularly the Ie index, gave higher readings than the color index. The color index is sufficient for clinical purposes but for research or for difficult cases, the other indexes are useful. J. T. M.

Blood-urea clearance before and after giving urea. Frank S. Powweather. *Quart. J. Med.* [N. S.], 3, 63-77(1934).—The blood-urea clearance test of Van Slyke after the administration of 15 mg. of urea by mouth seems to be a valuable method for the investigation of renal function.

John T. Myers

A further note on the plasma cholesterol in nephritis. James Maxwell. *Quart. J. Med.* [N. S.], 3, 79-86(1934); cf. C. A. 22, 1391.—In acute nephritis plasma cholesterol seems roughly proportional to the degree of edema but it adds little to clinical findings as regards prognosis. In chronic renal disease cholesterol bears no relation to the clinical course.

John T. Myers

The production of specific precipitating sera. Dorothea Hallmann. *Zentr. Bakt. Parasitenk.*, I Abt. 130, 234-9(1933).—Sp. precipitins can be absorbed from immune sera by the homologous alc.-pptd. antigen. Heterologous precipitins can be absorbed by the corresponding alc.-pptd. antigens, leaving the homologous precipitins.

John T. Myers

Electrophoretic investigations on the virus of fowl plague. S. Seidenberg. *Zentr. Bakt. Parasitenk.*, I Abt. 130, 335-8(1933).—The virus migrates toward the anode and hence carries a neg. charge, but there is no demonstrable increase in concn. of the virus at the anode or titratable decrease at the cathode. John T. Myers

The utility of newer disinfectants for sterilizing vaccines, with special reference to their antigenic activity. A. Beck and K. F. Wolff. *Zentr. Bakt. Parasitenk.*, I Abt. 130, 435-9(1933).—Carvasept kills staphylococci at dilns. of 1:3000 and coli at 1:500-750 in from 15 min. to 3 hrs. Hexylresorcinol kills these organisms at 1:200 in 30 min. Bacteria have a greater antigenic activity when killed with these substances than when killed by heat.

John T. Myers

The lead content of the blood and urine, its relation to symptoms and its diagnostic value. St. Litzner and P. Weyrauch. *Arch. Gewerbepath. Gewerbehyg.* 4, 74(1933).—Pb between 0.01 and 0.03 mg. % in the blood shows a normal (0.06 per 1000 cc.) value in urine. These are the clinically neg. cases. Over 0.04-0.06 mg. % of Pb in blood showed 0.05-0.1 mg. urinary Pb. Many of these cases showed definite symptoms. Patients with 0.15 mg. per 1000 cc. of urine showed symptoms of definite Pb poisoning. However, definite symptoms may be observed with only a normal urinary Pb content. There is no relationship between urinary and blood Pb. In all pathol. cases there is an increase in the blood Pb.

H. Tauber

Silicic acid content of lungs of silicon workers in Steir-mark. Hans Lieb and Erwin Schadendorff. *Arch. Gewerbepath. Gewerbehyg.* 4, 576-615(1933).—The SiO<sub>2</sub> content of pathol. lungs was found to be 0.3-1.46% if dried at 120° and 4.6-22.8% of the ashed tissue. Normal lung tissue showed values of 0.08-4.0%. Pathol. findings correspond with the analytical results. A practical method is given for the detn. of SiO<sub>2</sub> in tissue.

H. Tauber

Metabolic studies of children with dental caries. Julian D. Boyd, Charles L. Drain and Genevieve Stearns. *J. Biol. Chem.* 103, 327-37(1933).—In a group of about 100 children there was no correlation between the Ca and P of the serum or of the saliva and the extent of dental caries. On the other hand, the retention of Ca and P was greatest in the group without caries, so that there is pos. correlation between incidence of caries and Ca and P retention. That diet can exert any effect on caries is thus considered to be very doubtful.

K. V. Thimann

The forms of calcium and inorganic phosphorus in human and animal sera. III. A comparison of physiological and experimental hypercalcemia. Helen R. Benjamin and Alfred F. Hess. *J. Biol. Chem.* 103, 629-41(1933); cf. C. A. 27, 2480.—Physiol. hypercalcemia in hens during laying is due principally to an increase in the non-filterable Ca of the serum, the adsorbable and non-adsorbable fractions of this being increased 5-6 times while the ionic Ca is increased less than 50%. The serum P remains unchanged both in amt. and in distribution. In exptl. hypercalcemia of dogs, on the other hand, whether caused by Ca gluconate, parathyroid hormone or irradiated ergosterol, both the filterable and the non-filterable Ca fractions increase, the proportions remaining about const. At the same time the total P increases about 33%, and its filterability decreases 10%.

## H—PHARMACOLOGY

A. N. RICHARDS

Fate of acacia after acacia-saline injections. Marie Andersch and Robert B. Gibson. *Proc. Soc. Exptl.*

*Biol. Med.* 30, 1848-9(1933).—Rabbits were given intracardial injections of 3-4 cc. of a 30% soln. of acacia every 3rd day until 4.8 g. had been given; 60% of the acacia was retained in the liver, a smaller amt. in the spleen and much smaller amts. in the kidney and muscle. C. V. B.

**Bronchodilator activity of tyramine and its N-methyl derivatives.** Gordon A. Alles. *Proc. Soc. Exptl. Biol. Med.* 31, 385-6(1933).—Tyramine and methyltyramine were equally effective as pressors and bronchodilators when given in intravenous doses as small as 0.001 mm. per kg. of body wt. Similar results were obtained with hordenine when given in 5-10 times this dose; hordenine methiodide is 50 times more active than hordenine; these compds. have an effect similar to that of nicotine and their mode of action is different from that of tyramine or methyltyramine. C. V. Bailey

**Hematopoietic reactions to antimonyl antimony.** S. P. Lucia and J. W. Brown. *Proc. Soc. Exptl. Biol. Med.* 31, 420-8(1934). Normal adult rabbits were injected intravenously with a freshly prepd. 1% soln. of  $K_2SbO_3 \cdot C_4H_4O_6$  (6 mg. per kg. of body wt.). Within 5 min. the leucocyte count was reduced 50%; there was no subsequent leucocytosis in 28 hrs. Normoblasts were moderately increased; the blood platelet count remained unchanged. It is suggested that Sb like As might be used to depress abnormal leucocytoses of myeloid cells. C. V. Bailey

**In vitro leprocidal activity of some non-chaulmoogryl compounds.** G. A. Emerson and A. J. Salle. *Proc. Soc. Exptl. Biol. Med.* 31, 428-33(1934).—In a survey of the *in vitro* leprocidal effects of some 200 dyes, organic metallic compds., fatty acids and miscellaneous compds., high activity was found especially for merthiolate, metaphen, mercurochrome, solganol, triphenylmethane dyes, methylene blue and octyl resorcinol. Trypan blue and the aliphatic alcs. were surprisingly inactive. While some correlation between therapeutic value and leprocidal activity may exist, simple bactericidal tests are by no means a satisfactory excuse for clinical trial but are necessarily preliminary to a comprehensive pharmacol. evaluation of the compds. C. V. Bailey

**Ergotoxine excitement.** Alfred Gilman. *Proc. Soc. Exptl. Biol. Med.* 31, 468-70(1934).—In the unanesthetized cat, the intracardial injection of ergotoxine ethanesulfonate (1 mg. per kg. of body wt.) caused an immediate sympathetic stimulation, wide dilation of the pupil and piloerection; 1 min. after the injection the reflexes were hyperactive and the animal exhibited marked rage and apprehension. The signs persisted for 1 hr. with diminishing intensity and were not followed by any extreme depression. The emotional changes were not diminished by sympathetic paralysis. C. V. Bailey

**Spinal anesthesia in winter frogs.** Raymond N. Bieter and James W. Brown. *Proc. Soc. Exptl. Biol. Med.* 31, 472-4(1934); cf. C. A. 26, 4878.—The anesthetics were injected intraspinaly in winter frogs kept at 10-12°. Based on the min. anesthetic dose the anesthetics are arranged in a decreasing order of sensitivity: pantocaine > nupercaine > panthesine > metycaine > larocaine > tutocaine > procaine. Based on the M. L. D. the drugs are arranged in an increasing order of toxicity: tutocaine < procaine < larocaine < panthesine < metycaine < pantocaine < nupercaine. Larocaine, panthesine and tutocaine gave the highest therapeutic coeffs. C. V. Bailey

**Classification of 24 ions in chemical groups according to their vasomotor action in transcerebral "dielectrolysis."** G. Bourguignon. *Ann. physiol. physicochim. biol.* 9, 817-29(1933).—The changes produced in the body when a continuous current passes through the tissues after the introduction of certain ions is called "dielectrolysis." When one electrode was placed on the eye and the other on the occipital protuberance, there were produced vasomotor effects in the arm, due to elec. stimulation of the cerebral vasomotor centers. These effects were measured by means of an oscillogram. Of the 24 ions tested, the inactive ions were: Li, Na, K, Pb, Cu, Ag, Hg,

B, H and the active ions were: Ca, Sr, Mg, Zn, Al, Mn, Fe, Cr, Pt, Au, Cl, Br, I, C, Si. E. S. G. Barron

**The influence of intravenously injected hypertonic sodium chloride solution upon the movements of the stomach.** L. B. W. Jongkees. *Nederland. Tijdschr. Geneeskunde* 77, IV, 5493-9(1933).—After injection of a 20% NaCl soln. into a cat the stomach showed strong peristalsis, spastic occlusion of the pylorus and of the antrum of the pylorus as shown by radioscopic observations. The evacuation of the stomach was not accelerated by the salt injection. R. Heutner

**A rational digitalis therapy upon a pharmacological basis.** R. A. Hoekstra. *Nederland. Tijdschr. Geneeskunde* 77, IV, 5672-7(1933).—The therapeutic effect following the use of standardized digitalis preps. are due to their saponin content, which prevents cumulation. For this reason exts. from whole digitalis are better for practical use than the pure glucosides. R. B.

**Chemotherapy of mycoses. III. Mucor mycoses. 2 Experiments in vivo.** G. Dessy. *Boll. soc. intern. microbiol. Sez. ital.* 5, 201-6(1933).—The dyes and the salts previously examd. (cf. C. A. 27, 5774) have no therapeutic power in the exptl. infection of rabbits, inoculated by the *Mucor* cited. G. A. Bravo

**Experimental investigations on acute poisoning by lead tetraethyl, by inhalation.** V. Cesaris-Demel, D. Corbi and V. Costanzi. *Pathologica* 25, 685-90(1933). Pb was not detected in the animals kept in an atm. of Et<sub>4</sub>Pb because the Et groups cause the death so early, that there is not time for the establishment of the symptoms and lesions characteristic of saturnism. G. A. Bravo

**Testing and treatment for bilharzia disease.** F. C. Cawston. *J. Trop. Med. Hyg.* 37, 22-4(1934).—Toxic effects from K antimonyl tartrate therapy may be controlled by regulated doses of the K salt in fresh soln. Excessive doses may be toxic. When Na antimonyl tartrate or foudadin is used the toxic effects may be explained by the Na content. Rachel Brown

**Hygiene of carbon monoxide.** K. Supflic, P. Hofmann and J. May. *Z. Hyg. Infektionskrankh.* 115, 623-62(1933).—The CO-hemoglobin content of the blood was detd. by spectrographic means, and small amts. of CO in the air were detd. by the I<sub>2</sub>O<sub>5</sub> method. Conclusion: 6 Const. exposure to CO in small amts. gives rise to changes which follow partial O want. Exposure of dogs for 6 hrs. daily for a month to amts. of CO up to 0.01%, which are encountered in daily life, did not have harmful action. Rachel Brown

**Lead poisoning in infants and children.** E. C. Vogt and C. F. McKhann. *Radiology* 22, 87-92(1934). A brief description is presented of the sources of Pb and symptomatology together with evaluation of certain signs and tests to det. the proper place of roentgenologic findings as aids in diagnosis. Conclusion: Prevention of the ingestion of Pb and diagnosis of the disorder before the development of cerebral involvement are of the utmost significance. G. L. Clark

**The effect of radon implants on the cytology of the liver of the albino rat.** J. C. T. Rogers and G. M. Higgins. *Radiology* 22, 93-8(1934). Au-filtered Rn seeds were implanted in the livers of albino rats and a histological study was made of the irradiated tissue at periods varying from 6 hrs. to 60 days. G. L. Clark

**Acceleration of tissue respiration by a nitrophenol.** E. C. Dodds and G. D. Greville. *Nature* 132, 966-7(1933). 4,6-Dinitro-*o*-cresol causes large increases in the respiration of thin slices of surviving rat tissue when added to the medium in which they are respiring (optimum concn. 10<sup>-5</sup> m.). A. W. Dexter

**The toxicology of chromium.** Keiji Akatsuka and Lawrence T. Fairhall. *J. Ind. Hyg.* 16, 1-24(1934). As much as 1 g. Cr per day was ingested as chromic phosphate, and amts. up to 200 mg. were inhaled as chromic carbonate dust over a period of 17 weeks without causing illness, loss of wt. or tissue damage in cats. The contrast with the toxicology of hexavalent Cr compds. is emphasized (One hundred and sixty-one references. L. W. Elder

*Bryonia cretica*: its action and value in diabetes.

M. A. F. Sherif. *Quart. J. Pharm. Pharmacol.* 6, 634-42 (1933).--The drug is depressant to the heart muscle as well as to plain muscle. The resin given by mouth to dogs produces gastrointestinal irritation. The M. L. D. is 100 mg. per kg. when given intravenously to dogs. There is no effect on blood sugar in human diabetics, but there is a diminution in the amt. of urine. No reduction in blood sugar in normal rabbits was found. The diuresis produced by glucose injection was not affected by the drug. After a const. flow of urine had been induced in dogs by intravenous injections of  $\text{Na}_2\text{SO}_4$ , intravenous injection of the drug was followed by a slight increase in the degree of diuresis. W. O. E.

**Action of 1-phenyl-4-hydroxy-5-methylpyrazole.** J. W. C. Gunn. *Quart. J. Pharm. Pharmacol.* 6, 648 9(1933).--Certain actions of antipyrine and 1-phenyl-4-hydroxy-5-methylpyrazole (I) are compared. The general action and effects on the circulatory system are similar. I is more toxic to mice and has a greater antipyretic action in exptl. pyrexia produced by *Es. coli* toxins in rabbits. W. O. E.

**Action of various salts on red corpuscles.** R. Dujarric de la Rivière and N. Kossovitch. *Compt. rend. soc. biol.* 115, 30 2(1934); cf. *C. A.* 27, 2202. The hemolytic or other effects of very dil. solns. of arsenobenzene and Hg and Bi salts on washed human and animal corpuscles were studied. Corpuscles from syphilitic blood were more resistant than those from normal blood. Bordet-Wassermann reaction of blood previously treated with certain salts [in vitro]. *Ibid.* 32-4.--After treatment with the above salts Bordet-Wassermann neg. serums still tested neg., but many of the serums which gave a pos. test before treatment tested neg. after treatment. The results were too irregular to permit definite conclusions. L. E. Gilson

**Action in vitro of certain gold salts on Koch's bacillus cultivated in Korchner's liquid medium.** Pierre Martin. *Compt. rend. soc. biol.* 115, 45 6(1934). Growth was inhibited by crisalbin (Au Na thiosulfate) in concns. greater than 1:10,000 and by allochrysin (Au Na thiopropanol-sulfonate) only in concns. greater than 1:500. L. E. Gilson

**Experiments in antihelminthic chemotherapy.** J. Rodham and M. T. Van Hoof. *Compt. rend. soc. biol.* 115, 192 4(1934). Frogs infected with the lung-inhabiting trematode, *Distomum cyathraceum* Zinder, were used. Fouadine, K Sb tartrate, Dn 7 (antimonyl-bisoxiquinoline diethylamine sulfate), cinetine and tetrachloroethane in near-toxic doses were all ineffective. L. E. Gilson

**Vagotonic action of essential oil of *Origanum majorana*.** L. Gurrelon and R. Thuilliant. *Compt. rend. soc. biol.* 115, 230 2(1934). L. E. Gilson

**Rhynchophylline.** Raymond-Hamet. *Compt. rend. soc. biol.* 115, 255 7(1934). Rhynchophylline, an alkaloid from *Ouroparia rhynchophylla* Mats., is a methoxy-yohimbine, isomeric with corynanthine. Its physiol. action is similar to that reported for mitraphylline (*C. A.* 28, 830<sup>h</sup>). L. E. Gilson

**Central and peripheral action of amyl nitrite on the vasomotor system.** A. Tournade, J. Malinjac and L. Roelchisani. *Compt. rend. soc. biol.* 115, 297 9(1934).--In chloralosed dogs the central action was vasoconstrictor and the peripheral action vasodilator. L. E. Gilson

**Adrenaline-chloroform syncope.** Victor Papilian, Ion Cosma and Ioan G. Russu. *Compt. rend. soc. biol.* 115, 311 12(1934).--Adrenaline, 0.01-0.02 mg./kg., causes syncope in dogs anesthetized with  $\text{CHCl}_3$  but not in those anesthetized with  $\text{Et}_2\text{O}$ . Removal of the spleen or ligation of the splenic vein does not prevent the syncope. If both spleen and pancreas are removed in the  $\text{CHCl}_3$ -anesthetized dog doses of adrenaline as large as 0.1 mg./kg. cause a prolonged rise in arterial pressure but no syncope. L. E. Gilson

**Estrogenic activity of some condensed ring compounds in relation to their other biological activities.** J. W. Cook, F. C. Dodds, C. L. Hewett and W. Lawson. *Proc. Roy. Soc. (London)* B114, 272 80(1934).--Estrogenic activity was detd. by injection into ovariectomized rats of a soln.

of 100 mg. of a given compd. in 3 cc. of sesame oil, 1 cc. being administered on each of 3 successive days. The most active compds. were 9,10-dihydroxy-9,10-dialkyl-9,10-dihydro-1,2,5,6-dibenzanthracene (in which the alkyl group was either Et, Pr or Bu) and, to a smaller extent, 1-keto-1,2,3,4-tetrahydrophenanthrene. Other compds. possessing this activity were 5,6-cyclopenteno-1,2-benzanthracene, 1,2-benzopyrene, ergosterol, neoergosterol, calciferol, 1,9-dimethylphenanthrene, clupanodonic acid after treatment with Br, and coal ulmins. Apparently a whole group of compds. of rather widely differing structures exists, each member of which produces estrus. Three of these compds. (1-keto-1,2,3,4-tetrahydrophenanthrene, 9,10-dihydroxy-9,10-dibutyl-9,10-dihydro-1,2,5,6-dibenzanthracene and 5,6-cyclopenteno-1,2-benzanthracene) were tested and found to lack antirachitic power.

Joseph S. Hephurn

**Sex change in the plumage of brown Leghorn capons following the injection of certain synthetic estrus-producing compounds.** J. W. Cook, E. C. Dodds and A. W. Greenwood. *Proc. Roy. Soc. (London)* B114, 286 90(1934).--Intramuscular injection of 0.65 g. of 1-keto-1,2,3,4-tetrahydrophenanthrene, dissolved in sesame oil, in divided doses over a period of 9 days, into adult brown Leghorn capons produced feathers of the female type. Similar estrus-producing action was exerted by this compd. on an ovariectomized hen of this variety, and by 9,10-dihydroxy-9,10-dibutyl-9,10-dihydro-1,2,5,6-dibenzanthracene on a capon of this variety. No action was exerted on the combs of the capons. Joseph S. Hephurn

**Importance of the chemical constitution for the pharmacological action of phenoxyethylamine and phenoxyethylpiperidine derivatives, especially on the pharmacological importance of a methoxy group in the *m*- or *p*-position in the side chain.** I. Poisonous action on mice and rabbits. Yoshiaki Fujimoto. *Folia Pharmacol. Japon.* 17, No. 1, Opera Orig. 1 13(1933). The poisonous action of these derivs. was detd. on mice and rabbits by injecting them subcutaneously and intravenously. Marked respiratory depression accompanied by epileptiform convulsions followed. In mice the convulsions were accompanied by a typical tail reaction. The drugs showed a marked affinity for the central nervous system; the cord had nothing to do with the production of convulsions. Death was due to respiratory failure. Introduction of the methoxy group in the *m*- or *p*-position of the side chain increased the action of the phenoxyethylamine derivs., but had the reverse effect on the phenoxyethylpiperidine derivs. The *m*-compd. was about 4 times as active as the *p*-compd. G. H. W. Lucas

**The influence of sinomenine, parasinomenine and quinine on the action which adrenaline, calcium, nicotine, yohimbine and ergotoxine exert on the blood-sugar picture in rabbits.** Yoshizo Arakawa. *Folia Pharmacol. Japon.* 17, No. 1, 1 12(Breviaria 1)(1933); cf. *C. A.* 28, 528<sup>h</sup>. The hyperglucemia which follows the injection of adrenaline 0.0001,  $\text{CaCl}_2$  0.1, nicotine tartrate 0.005, yohimbine-HCl 0.02 or ergotoxine tartrate 0.0015 g. per kg. in rabbits was arrested by the injection of 0.02 g. per kg. of sinomenine, parasinomenine and quinine. Quinine showed the greatest effect and sinomenine the least. Ergotoxine was an exception in that its action was increased by the 3 drugs. The influence of sinomenine, parasinomenine and quinine on the action which diuretin, pilocarpine, glucose and insulin exert on the blood-sugar picture in rabbits. *Ibid.* 13-20(Breviaria 1-2).--The hyperglucemia produced by injecting diuretin 0.5 g. and pilocarpine 0.02 g. per kg. subcutaneously was decreased by 0.02 g. per kg. of sinomenine, parasinomenine and quinine; the action of quinine was strongest and that of sinomenine the weakest. The 3 drugs in relatively small doses increased the hypoglycemia produced by insulin and not only lowered but shortened the hyperglucemia produced by intravenous glucose. G. H. W. Lucas

**The influence of preliminary treatment with colloids which by intravenous injection may cause death.** Makoto Kuse. *Folia Pharmacol. Japon.* 17, No. 1, 21 33(Breviaria 2 3)(1933).--The semicolloidal substances, saviol

Na and collargol, injected into rabbits in certain doses always cause death. This effect may be avoided if, 24 hrs. before the lethal dose is injected,  $1/r^{1/4}$  of the lethal dose of these colloids or other colloids is injected. Similarly, a small dose of gelatin soln. injected before a lethal dose of arspenamine prolongs, and may even save, life; it is not as effective, however, as the other colloids mentioned. Glucose injections about 24 hrs. after injections of lethal doses of the colloids prolong life. G. H. W. L.

The influence of the rapidity of intravenous adrenaline injections on the strength of the action. Makoto Kuse. *Folia Pharmacol. Japon.* 17, No. 1, 34-48 (Breviaria 3) (1933).—The increase in blood pressure varies directly with the rate of injection of adrenaline. The height of pressure remains longer when the adrenaline is more slowly administered. G. H. W. Lucas

The influence of dopa (dihydroxyphenylalanine) on the adrenaline glycogenesis in the surviving toad liver. Jiro Horimi. *Folia Pharmacol. Japon.* 17, No. 1, 90-103 (Breviaria 6) (1933). The toad liver perfused with "Merck" racemic dopa showed in certain concn. an adrenaline-like glycogenesis, but not so pronounced. The effect of dopa and adrenaline together appeared to be a potentiation. G. H. W. Lucas

The influence of amino acids on the vascular action of adrenaline. Hideo Nishiyama and Tokujiro Otsuda. *Folia Pharmacol. Japon.* 17, No. 1, 104-119 (Breviaria 6 7) (1933); cf. C. A. 27, 5423. Glycine, glutamic acid, leucine, alanine, phenylalanine and tryptophan are more or less vasodilators, whereas histidine is a vasoconstrictor. Cystine has no action in weak concn. Each amino acid used in an almost inactive quantity increases the vasoconstrictor action of adrenaline. G. H. W. Lucas

The behavior of fibroblast and staphylococcus in a medium containing tryptaflavine or rivanol. Kenosuki Kawashima. *Folia Pharmacol. Japon.* 17, No. 1, 120-8 (Breviaria 8) (1933). Above a certain concn. these drugs always decrease the growth of fibroblast and staphylococcus. High concn. very rapidly produce degeneration and death. The degenerative changes are described. Tryptaflavine is the stronger of the two. G. H. W. L.

The influence of various synthetic thymol and carvacrol derivatives on sugar metabolism, and the point of attack of these derivatives, with especial reference to the relation between their chemical structure and pharmacological action, together with a comparison of the action of ergotamine with the action of these derivatives. Utaka Asakura. *Folia Pharmacol. Japon.* 17, No. 1, 129-70 (Breviaria 9-10) (1933).—The action of 5 thymol and 4 carvacrol derivs. has been studied on the sugar metabolism of the rabbit. In small doses all produce hypoglycemia. The derivs. in which the H in the ethylamine group of the side chain is replaced by a Me group are the most active; when Et or alkyl groups are introduced in these places, the derivs. are next in activity. The derivs. in which the side chain contains ethylpiperidine in place of ethylalkylamine are the weakest. The thymoxyethylamine deriv. with an alkyl group introduced is the most active, but is somewhat labile in its action. Thymol derivs. are stronger than the corresponding carvacrol ones. The 9 derivs. like ergotamine in a certain concn. decrease adrenaline hyperglycemia, but are weaker in action, although the action mechanism is similar. The derivs. depress the end app. of the sympathetics in smooth muscle. G. H. W. Lucas

The behavior of lead in the animal organism. III. Colloidal lead compounds. Robert A. Kehoe and Frederick Thammann. *J. Lab. Clin. Med.* 19, 178-94 (1933); cf. C. A. 25, 3081.—Within a few min. to a few hrs. after the intravenous injection of  $H_2O$ -sol. Pb salts into rabbits Pb was detected in all tissues, the highest concns. being found in the blood, kidneys, liver and spleen. During the 1st 14 days after the injection gradual changes in distribution of Pb occurred with a gradual loss from the tissues until an eq. lib. was established between the amt. excreted and that absorbed with food. Colloidal Pb reacted in a similar manner and thus appeared to be rapidly

converted into the compds. formed when sol. Pb salts were injected. Pb, injected as suspensions or colloidal preps. of the secondary and tertiary phosphates, showed approx. the same distribution as the sol. Pb salts in the 1st few hrs., but the compds. formed were not sufficiently mobile to be redistributed or excreted in large amts. After 37 days approx. 0.5 of the Pb injected was found in the liver. A large proportion of the Pb, which had been injected as the orthophosphate into a human subject, was found in the liver and very little in the skeleton. Colloidal Pb, injected intravenously into a human subject, was found to be more widely distributed, appreciable amts. being found in the skeleton. E. R. Main

The effect of salyrgan and x-ray on the rate of disappearance of thrombophlebitic edema. L. M. Zimmerman, J. T. Gault, S. S. Halpern and G. de Takats. *J. Lab. Clin. Med.* 19, 243-8 (1933).—Acute thrombophlebitic edema is produced in dogs by the injection of tissue exts. into the femoral vein. The intravenous injection of 1 cc. doses of salyrgan or treatment with x-rays causes a marked increase in the rate of disappearance of the edema. E. R. Main

A comparative study of certain xanthine diuretics. A. Richard Bliss, Jr., and R. W. Morrison. *J. Lab. Clin. Med.* 19, 248-65 (1933). Theobromine, theophylline and their salts appear to be equally satisfactory as diuretic agents for rabbits. They induce increased elimination of solids, chiefly chlorides and uric acid, and maintain the diuretic action for 2-5 days. Large doses of the agents cause gastroenteritis, nephritis and subsequent death. The max. effective and safe doses of theobromine, theophylline, theophylline Na acetate, theobromine Ca salicylate and theophylline Ca salicylate are 40, 50, 30, 50 and 60 mg., resp. Theophylline Ca salicylate in doses of 50-60 mg. appears to be the most efficacious; theophylline in doses of 50 mg. ranks next. E. R. Main

The influence of acid reagents upon the reaction of normal and malignant tissues as determined by means of the glass electrode. Anna Goldfeder, H. M. Partridge and J. A. C. Bowles. *Z. Krebsforsch.* 40, 186-91 (1933). The  $pH$  of the liver tissue of tumor-bearing rats and mice treated with  $CH_3COOH$  and  $NH_4Cl$  (cf. C. A. 28, 5306) is lower than that of untreated tumor-bearing animals. The  $pH$  of tumor and other tissues is not appreciably changed by the treatment. The glass electrode (cf. C. A. 26, 5034) appears to be suitable for  $pH$  measurements in biol. systems. E. R. Main

Bromide psychoses: diagnosis, treatment and prevention. Max Levin. *Ann. Internal Med.* 7, 709-14 (1933). John T. Myers

The effect of pilocarpine on the volume, free and combined acid, total chlorides and pepsin of gastric secretion, and a comparison with the effects of histamine stimulation. Leo J. Meienberg and Charles L. Brown. *Ann. Internal Med.* 7, 702-8 (1933).—Pilocarpine increases all of these factors. Histamine stimulates the secretion of pepsin. Histamine is not a better gastric stimulant than pilocarpine. John T. Myers

An enquiry into the relative toxicities of benzene and toluene. T. Ferguson, W. F. Harvey and T. D. Hamilton. *J. Hyg.* 33, 547-75 (1933). Toluene is a poison of the same type and action as benzene, but acts less readily because of its physicochem. properties. Under certain circumstances it may have a more lasting effect on account of slower elimination. John T. Myers

The action of atropine in complete heart block. A. Rae Gilchrist. *Quart. J. Med.* [N. S.], 2, 483-98 (1934). John T. Myers

The action of adrenaline in complete heart block. A. Rae Gilchrist. *Quart. J. Med.* [N. S.], 2, 499-519 (1934). John T. Myers

Cancer chemotherapy. XI. The effect of carbon monoxide, hydrocyanic acid and pituitrin upon tumor growth. L. C. Maxwell, Fritz Bischoff and Henry Ullman, Jr. *J. Pharmacol.* 49, 270-82 (1933).—Exposure of animals bearing transplantable tumors to CO and to HCN resulted in a decrease in the rate of tumor growth, whereas sublethal doses of pituitrin did not. There was

no significant change of lipid and cholesterol values of the tumors or of lipid and glycogen values of other tissues accompanying such treatment. T. H. Rider

The pharmacology of acetyl- $\beta$ -methylcholine and the ethyl ether of  $\beta$ -methylcholine. J. H. Comroe, Jr., and Isaac Starr, Jr. *J. Pharmacol.* 49, 283-99(1933); cf. Simonart, C. A. 27, 138.—Acetyl- $\beta$ -methylcholine (I) and the Et ether of  $\beta$ -methylcholine (II) are superior to acetylcholine in convenience of administration, duration of action and absence of side effects. I and II produce slowing of the heart rate, and cardiac contraction similar to the effect of vagus stimulation. They also cause vasodilatation, increased peristalsis and intestinal tone, and constriction of bronchi and uterine strips. In equal doses I usually has a stronger effect than II. T. H. Rider

Irritation and toxicity of sodium iodobismuthite (iodobismutol) prepared with propylene glycol and diethylene glycol. P. J. Hanzlik, H. G. Mehrtens and J. B. Spaulding. *J. Pharmacol.* 49, 300-5(1933).—Iodobismutol (I) prep'd. with propylene glycol is at least as irritating but less toxic than I prep'd. with ethylene glycol. I prep'd. with diethylene glycol is more toxic than the latter. The presence of iodide increases the toxicity of I. T. H. Rider

Myocarditis produced experimentally in rabbits by drugs. Charles M. Gruber, Isaac Y. Olch and Brian Blades. *J. Pharmacol.* 49, 306-18(1933).—Myocarditis is produced in rabbits where a methylxanthine or xanthine drug is injected prior to adrenaline, ephedrine or tyramine. T. H. Rider

The anesthetic action of a series of naphthalene derivatives. Merl E. Fisk and Frank P. Underhill. *J. Pharmacol.* 49, 329-36(1933).—Incomplete pharmacol. data are given on diethylaminoethyl- $\alpha$ -naphthoate, diethylaminopropyl- $\alpha$ -naphthoate, diethylaminoethyl- $\beta$ -naphthoate, diethylaminopropyl- $\beta$ -naphthoate, 2-ethoxy-3-diethylaminopropyl (hvl) naphthoate, 2-hydroxy-3-diethylaminopropyl naphthoate, 2-ethoxy-3-diethylaminopropyl naphthoate and diethylaminopropyl- $\alpha$ -naphthoate all as hydrochlorides. All were active on mucous membranes but unstable and irritating. T. H. Rider

Sodium iodobismuthite (iodobismutol): Muscular absorption of bismuth. P. J. Hanzlik and J. B. Spaulding. *J. Pharmacol.* 49, 257-69(1933).—Muscular absorption of Na iodobismuthite (6% voln. with 12% NaI in ethylene glycol) is reported to be prompt and marked. Absorption is retarded after 1 hr. but approaches completion after 24 hrs. After injection the tissue concn. varies considerably but is higher than that of the blood. T. H. Rider

Responses of the cat uterus, in situ, to adrenaline, quinine, morphine and pituitary extract. N. B. Dreyer and R. A. Moreash. *J. Pharmacol.* 49, 337-44(1933).—Quinine and morphine have no stimulating action on pregnant or involuting cat uterus. Pituitrin produces marked effects in pregnancy and immediately after parturition. Adrenaline produces pure inhibition 48 hrs. after birth, but during pregnancy produces motor responses which are abolished by ergotamine, which does not stimulate the pregnant uterus. T. H. Rider

Coronary circulation. II. The effect of ephedrine. O. O. Stoland and A. M. Ginsberg. *J. Pharmacol.* 49, 345-51(1933); cf. C. A. 25, 3396.—Single doses of ephedrine (I) produced increased coronary flow in the dog. Repeated injections of I had a diminishing effect. T. H. Rider

The influence of ephedrine sulfate on the reflexes of spinal monkeys. C. F. Jacobson and Margaret A. Keimard. *J. Pharmacol.* 49, 362-74(1933).—Ephedrine sulfate injected into monkeys after cord transection causes an increase in the excitability of spinal reflexes, believed to be due to direct action on the central nervous system. T. H. Rider

The secretion of the posterior lobe of the hypophysis after the administration of drugs. Alexander Simon. *J. Pharmacol.* 49, 375-86(1933).—The vasopressin content of cerebrospinal fluid of dogs was negligible after the administration of insulin, urea and novasurol. T. H. R.

The reaction of the oviduct of the skate to autonomic poisons. George B. Roth. *J. Pharmacol.* 49, 387-92(1933).—The oviduct of skates is highly reactive to adrenaline but only moderately sensitive to pilocarpine and atropine. T. H. Rider

Elimination of barbituric acid derivatives in the urine with special reference to isoamylethylbarbituric acid (sodium amytal) and (1-methylbutyl)ethylbarbituric acid (pentobarbital sodium). H. A. Shonle, A. K. Keltch, G. F. Kempf and E. E. Swanson. *J. Pharmacol.* 49, 393-407(1933).—Na amytal (I) and pentobarbital sodium (II) are excreted in the urine of men and dogs in traces only while barbital and phenobarbital are excreted as such. I and II are probably rapidly and completely destroyed in the body. T. H. Rider

The bradycardia caused by sympathomimetic drugs. Lawrence Terry and Howard C. Peters. *J. Pharmacol.* 49, 428-31(1933). T. H. Rider

Chronic morphine poisoning in dogs. V. Recovery of morphine from the tissues of tolerant and nontolerant animals. O. H. Plant and I. H. Pierce. *J. Pharmacol.* 49, 432-49(1933); cf. C. A. 22, 4652.—The following method has given 95-110% recovery of morphine (I) from tissues, which are removed immediately after death of the animal and chopped fine. Grind 20-g. samples to a paste with water and glass, and dil. to 100 cc. Add 100 cc. of 4%  $\text{CCl}_3\text{COOH}$  and heat the soln. in boiling water for 5 min., filter hot and conc. a max. sized aliquot on the water bath to 50 cc. Analyze this residue by the method previously described for urine (cf. C. A. 27, 138). Modifications are described for the treatment of blood and contents of the alimentary canal. Detailed results are given for the recovery of I from various organs after administration to normal and tolerant dogs. The av. total recovery was 12.8% greater in nontolerant dogs after 4 hrs., but was 46.2% greater in tolerant dogs after 24 hrs. The percentage of total dose recovered was distinctly less after 24 hrs. than after 4 hrs. in nontolerant animals while the reverse was true in tolerant animals. Increased ability to destroy I is not a factor in tolerance. T. H. Rider

The absorption of insulin from the intestinal tract. David Campbell and Thomas N. Morgan. *J. Pharmacol.* 49, 450-5(1933).—Insulin (I) once in the portal circulation is as active as when introduced into the systemic circulation. The failure of I to act when given orally is due to lack of absorption since it is not destroyed in the intestines. Shaking a  $\text{H}_2\text{O}$  soln. of I with an  $\text{Et}_2\text{O}$  soln. of lecithin (II) led to the formation of a comp'd. of I and II which was not absorbed from the alimentary canal but which was active on subcutaneous injection. T. H. R.

The hyperglucemic action of certain drugs. David Campbell and Thomas N. Morgan. *J. Pharmacol.* 49, 456-65(1933).—The oral administration of  $\text{Et}_2\text{O}$  or the subcutaneous injection of picrotoxin, apomorphine or large doses of ephedrine produces hyperglucemia, but this reaction is prevented by the prior administration of barbiturates. The hyperglucemia produced by adrenaline or by pituitary ext. is not prevented by the barbiturates. The mechanisms of the actions of the various drugs are discussed. T. H. Rider

The influence of caffeine on the effects of acetanilide. J. A. Higgins and H. A. McGuigan. *J. Pharmacol.* 49, 466-78(1933).—Acetanilide (I) has little effect on the heart. Fatal doses of I paralyze the respiratory mechanism. The effects of I,  $\text{EtOH}$  and citric acid are additive. Caffeine (II) does not increase the toxicity of I, and may slightly decrease it. The depression of sympathetic tone by I and II and most analgesics is suggested as having an important relation to therapeutic effect. T. H. R.

Calcium. IX. Acute thrombophlebitic edema. Arnold L. Lieberman and N. R. Cooperman. *J. Pharmacol.* 49, 479-82(1933); cf. C. A. 28, 211<sup>8</sup>.—Ca therapy seems to decrease edema by increasing absorption, but will neither prevent nor reduce the development of the max. amt. of edema produced by the intravenous block of the femoral vein with fibrogen. T. H. Rider

The treatment of toxemia. II. G. Norman Myers.

*J. Pharmacol.* 49, 503-502(1933); cf. *C. A.* 26, 2023. The shock produced by diphtheria toxin is due to the paralysis of the peripheral vascular mechanism preceding paralysis of the medulla and independent of an absence of adrenaline in the suprarenal gland. The circulation is improved and the blood pressure raised by the administration of large quantities of normal gum saline. T. H. R.

The physiological action of the principles isolated from the secretion of the South African toad (*Bufo regularis*). K. K. Chen and A. Ling Chen. *J. Pharmacol.* 49, 503-13(1933); cf. *C. A.* 28, 214<sup>1,4,7</sup>.—The parotid secretion of *Bufo regularis* yielded cholesterol, *regularo-bufagin* (I), *regularo-bufotoxin* (II), *regularo-bufotenine* (III) and adrenaline. I,  $C_{28}H_{48}O_8$  (?), prisms (from alc.-Et<sub>2</sub>O-petr. ether), m. 234-5° (cor.), has a digitalis-like action, min. emetic dose 0.3 mg. (pigeons) and 0.09 mg. (cats) and fatal dose 0.15 mg. (cats) per kg. II,  $C_{28}H_{48}O_{10}N_2$ , has an indefinite m. p., is also digitalis-like in action; min. emetic doses are 0.35 mg. (pigeons) and 0.275 mg. (cats) and fatal doses 0.48 mg. (cats) per kg. III, an indole deriv. isolated as its flavanate, had slight action on blood pressure and stimulated both isolated rabbit intestines and guinea-pig uteri. I and II both showed pressor action and stimulation of smooth muscle organs. T. H. Rider

The physiological action of the principles isolated from the secretion of the Jamaican toad (*Bufo marinus*). K. K. Chen and A. Ling Chen. *J. Pharmacol.* 49, 514-25(1933); cf. *C. A.* 28, 214<sup>1,4,7</sup>.—The parotid secretion of *Bufo marinus* yielded cholesterol, adrenaline, *marino-bufagin* I, *marino-bufotoxin* II, and *marino-bufotenine* III. I,  $C_{28}H_{48}O_8$  (?), prisms (from alc.), m. 212-3° (cor.) and II,  $C_{28}H_{48}O_{10}N_2$  (?), spheroids, m. 200° (cor.) both have digitalis-like actions, their min. emetic doses being, resp., 0.375 mg. and 0.2 mg. (pigeons), 0.3 mg. and 0.125 mg. (cats) and fatal doses 0.57 mg. and 0.43 mg. (cats) per kg. III, isolated as its flavanate,  $C_{28}H_{48}O_{10}N_2 \cdot C_{12}H_{10}O_2N_2S$ , m. 271-2° (cor.); it gives orange crystals, has no pressor action nor effect on rabbit intestines but stimulates guinea-pig uteri. T. H. Rider

The poisonous secretion of five North American species of toads. K. K. Chen and A. Ling Chen. *J. Pharmacol.* 49, 526-42(1933).—The compds. isolated from the parotid secretion were, from *B. valliceps*, cholesterol (I), *vallicapo-bufagin*,  $C_{28}H_{48}O_8$ , clusters (from alc.), m. 212 3° (cor.), *vallicapo-bufotoxin* and *vallicapo-bufotenine*, as its flavanate,  $C_{28}H_{48}O_{10}N_2 \cdot C_{12}H_{10}O_2N_2S$ , orange-red needles (from H<sub>2</sub>O), m. 261-2° (cor.); from *B. fowleri*, I, *fowlero-bufagin*,  $C_{28}H_{48}O_8$ , m. 153°, *fowlero-bufotoxin*, and *fowlero-bufotenine* as its flavanate,  $C_{28}H_{48}O_{10}N_2 \cdot C_{12}H_{10}O_2N_2S$ , orange crystals, m. 198-9° (cor.); from *B. alvarius*, I, *alvaro-bufotoxin* and *alvaro-bufotenine* as its flavanate,  $C_{28}H_{48}O_{10}N_2 \cdot C_{12}H_{10}O_2N_2S$ , orange needles, m. 224 5° (cor.); from *B. quercicus*, I, *quercico-bufagin*,  $C_{28}H_{48}O_8$ , m. 258-9° (cor.), *quercico-bufotenine* as its flavanate,  $C_{28}H_{48}O_{10}N_2 \cdot C_{12}H_{10}O_2N_2S$ , orange-red needles (from water), m. 204° (cor.); and from *B. americanus*, *americano-bufotenine* as its flavanate,  $C_{28}H_{48}O_{10}N_2 \cdot C_{12}H_{10}O_2N_2S$ , orange needles (from water), m. 197.5-8.5° (cor.). The bufagin and bufotoxin type products had digitalis-like actions. Emetic and fatal doses are given for some. The bufotenine type products stimulated smooth muscle organs. T. H. R.

The parotid secretion of *B. bufo gargarizans* as the source of Ch'an Su. K. K. Chen and A. Ling Chen. *J. Pharmacol.* 49, 543-7(1933).—A comparison of the compns. and pharmacol. actions of the constituents indicates that the Chinese drug Ch'an Su is prep'd. from the parotid secretion of *Bufo bufo gargarizans*. T. H. Rider

The active groupings in the molecules of cino- and marino-bufagins and cino- and vulguro-bufotoxins. K. K. Chen and A. Ling Chen. *J. Pharmacol.* 49, 548-60 (1933).—The generic terms bufagin and bufotoxin include two groups of substances isolated from the parotid secretion of toads which have digitalis-like actions but are not glucosides. Investigations of derivs. were made to ascertain the important chem. groupings responsible for the physiol. action. A lactone ring and double bonds present in the bufagins are essential to their sp. action on the heart, and an acid radical (acetic or formic) at-

tached to a hydroxyl group is of almost equal importance. Covering all free hydroxyl groups decreases but does not destroy activity. The chief activity of the bufotoxins depends upon the bufagin content. Suberic acid present in the bufotoxin mols. appears to enhance the emetic action. T. H. Rider

Similarity and dissimilarity of bufagins, bufotoxins and digitaloid glucosides. K. K. Chen and A. Ling Chen. *J. Pharmacol.* 49, 561-79(1933).—A comparison of 20 digitalis-like principles from phys., chem. and pharmacol. points of view. The bufagins and bufotoxins are generally similar but specifically different. They are more closely related to scillaren A than to g-strophanthin, digitoxin or thevetin. Various methods of digitalis standardization are discussed. T. H. Rider

Nickel carbonyl poisoning. K. Kötzing. *Arch. Gewerbepath. Gewerbeky.* 4, 500-7(1933).—The extremely toxic effect of Ni(CO)<sub>4</sub> is due to the substance itself, not the CO which may form within the body. H. Tauher

Hemoglobin production. IV. Evaluation of therapeutic agents in anemia, due to milk diets, based on a study of the blood and bone marrow of rats from birth to maturity. Thomas Fitz-Hugh, Jr., George M. Robson and David I. Drabkin. *J. Biol. Chem.* 103, 617-28 (1933); cf. *C. A.* 25, 2203, 5693.—Rats made anemic by a diet of whole milk were not cured by addn. of 0.3 mg. Fe daily, but were cured by 0.3 mg. Fe + 0.05 mg. Cu, or by 0.2 mg. Fe + 70 mg. Na glutamate daily. The Cu content of the glutamate was far too low to account for its effect. The increase in hemoglobin and in erythrocytes was preceded by a rapid rise and fall of the reticulocyte count. The fall was more complete with the glutamate than with the Cu therapy. Corresponding changes in the bone marrow were followed. That glutamate is effective in anemia treatment thus confirms the results of Drabkin and Miller (*loc. cit.*), but neither with the nor with Cu was a completely permanent cure accomplished. K. V. Thimann

The influence of *l*- and *d*-lactate on oxygen consumption of rabbits. K. W. Buchwald, Carl F. Corn and Robert E. Fisher. *J. Biol. Chem.* 103, 763-76(1933). Injection of Na *l*(+)-lactate into rabbits caused an increase in O consumption equiv. to about 25% of the lactic acid which disappeared, the disappearance being calculated from detns. of blood lactic acid before and after the exp't. Since a small rise in O consumption followed the injection of NaHCO<sub>3</sub>, the increased O consumption is equiv. only to 20% of the lactic acid which disappeared. However, injection of *d*(-)-lactate gave an increase in O consumption equiv. to the whole of the lactate which disappeared. It is therefore probable that with *l*-lactate, 80% is resynthesized to glycogen at the expense of the oxidation of 20%, while with *d*-lactate, all is directly oxidized. K. V. Thimann

## I—ZOOLOGY

R. A. GORTNER

The composition of silks in relation to the food of silk-worms. Guido Colombo. *Boll. ufficiale stat. sper. seta* 3, 65(1933).—No difference was found in the tyrosine and tryptophan contents of the silks obtained from normally fed and from hungry worms. G. A. Bravo

Amino acid composition of the protein of the chrysalis of the domesticated and Tussah silkworm. Ryūgo Inoue, Teitoku Miwa and Kōichi Kitazawa. *Bull. Sericult. Silk Ind. Japan* 6, No. 2, 1-3(1933).—The aq. ext. of freshly ground pupae was heated and the coagulated protein extd. with  $\text{B}_2\text{O}_3$  and dried. The amino acids in 100 g. dry protein from domesticated and Tussah silkworms were, resp.: glycine, 0.146, 0.87; alanine, 3.79, 2.52; leucine, 6.04, 5.68; aspartic acid, 2.60, 0.47; glutamic acid, 1.70, 5.62; serine, —, trace; phenyl-alanine, 7.83, 9.53; hydroxyproline, 0.77, 1.59; proline, 0.65, 0.01; tyrosine, 4.28, 5.73; arginine, —, 2.11; histidine, —, 2.34; lysine, —, 1.00; choline, —, 2.81; betaine, —, 2.77. Rachel Brown

Influence of hypophyseal extract on regeneration by axolotyls. Raphael Belkin. *Compt. rend. soc. biol.* 115, 111-12(1934).—Axolotyls normally regenerated severed limbs in 61 days. When ext. of the posterior lobe of

the hypophysis was added to the water in which they were kept, the regeneration was completed in 46 days.

L. E. Gilson

Fatty acids from the larva fat of the beetle *Pachymerus dactylis* L. Geoffrey Collin. *Biochem. J.* 27, 1874 (1933).—Insects lay down fats similar in type to those produced by mammals; and, like the latter, they can assimilate fats present in their diet and also synthesize fat from other constituents of the food. Benjamin Harrow

Conditions affecting the response of the avicularia of *Bugula*. Alexander Forbes. *Biol. Bull.* 65, 469-79 (1933).—The avicularia or "bird's heads" on a colony of *Bugula* can be made to close by adding to the sea water NaOH, HCl, albumin or the press juice from mussels or clams. Sugar soln. or inorg. salts are without effect. Conc. and diln. of the sea water, or merely introduction of inert solids in suspension, also caused closing, so that the stimulus may be either chem. or mechanical.

K. V. Thimann

A relation between the free and combined carbon dioxide content of the blood and the mean level of habitat in some brachyrrhynch decapods. Maurice Fontaine. *Bull. inst. océanograph.* No. 639, 4 pp.(1933).—The combined  $\text{CO}_2$  contents of the blood of 3 species of crabs of comparable size and activity, but different habitat, were compared. The figures were: *Grapsus marmoratus* living at high tide level, 19.9; *Carcinus maenas*, at intermediate heights, 11.7; *Portunus puber*, at depths down to 30 m., 8.7 cc.  $\text{CO}_2$  per 100 g. blood. Before the detn., the crabs were placed under identical conditions for 24 hrs. Since the  $\text{pH}$  of the blood of all 3 species was the same, 7.75, the total  $\text{CO}_2$  content must vary in the same direction. The alk. reserve and  $\text{CO}_2$  tension thus decrease with increasing duration of submergence.

K. V. Thimann

## 12—FOODS

F. C. BLANCE AND H. A. LEPPER

Agricultural products and their vitamin contents. G. Stenbohl. *Deut. Essigind.* 37, 283-4(1933).—The principal agricultural foodstuffs used by man are enumerated with respect to their vitamin contents. W. O. E.

Preservation of food. Gulbrand Lund. *Teknisk Tidskrift* 80, 574-6(1933).—A review dealing particularly with the influence of the hermetic preservation process upon the vitamin content of vegetable and animal foods. Expts. show that the destructive effect is far less than is generally believed when the foods are boiled in closed tins in the absence of air. Only vitamin C is appreciably affected, however, it is not affected as much as by cooking in open pots. When particular stress is laid upon the keeping of vitamins canning is the ideal form of preservation. C. A. Robak

Movement of diffusible substances in food products. J. Alexander. *Science* 77, 489-90(1933). G. G.

Coloring of foods in former times. E. Merres and R. Linnan. *Deut. Essigind.* 37, 164(1933).—Reference is made to a recent (No. 50) report of the Reichsgesundheitsblatt, in which mention is made of the use of various deleterious substances as food colors, notably during the late 18th and early 19th centuries. W. O. E.

Medicaments as food products. Herbert Patzsch. *Pharm. Ztg.* 79, 20-2, 32, 43-5(1934).—Certain medicaments enumerated in the D. A.-B. VI and the Supplement V. thereto are discussed, as baking powder,  $\text{AcOH}$ , meat ext., gelatin, mutton tallow, yeast, honey, cacao, potato starch, kefir,  $\text{NaCl}$ , malt ext., arrowroot, lactose, whey, fruit juices, oils, lard, starch, albumin, wine and brandy. W. O. E.

Copper in Chinese food materials. Wm. H. Adolph and Lung-Pi Chou. *Chinese J. Physiol.* 7, 185-8(1933).—Among the common cereals sesame seeds were the richest with 16.8 mg./kg. and white corn was the poorest with 2.3 mg. Among legumes cow peas had the lowest with 6.8 mg./kg. while black soy beans were the richest with 10.8.

In most cases only 1-3 samples were analyzed but the table comparing Chinese and American foods shows parallel values except with soy beans, turnips, radishes, spinach and celery. C. M. McCay

Methods for determination of lead in foods. H. J. Wichmann, C. W. Murray, M. Harris, P. A. Clifford, J. H. Loughrey and F. A. Vorhes, Jr. *J. Assoc. Official Agr. Chem.* 17, 108-35(1934).—Six methods for the detn. of small quantities of Pb, particularly in spray residues on fruit or vegetables, are described; they are presented in the order in which they were developed, and their practicability increases in about the same order. Harris method

The sample is prepd. by the digestion procedure used in the official A. O. A. C. method for As detn.; after preliminary sepn. as sulfate, Pb is converted into  $\text{PbCrO}_4$  and the  $\text{CrO}_4$  ion is detd. iodometrically. The method is applicable to all food samples that may be digested in a quantity sufficient to yield 1 mg. or more of Pb. Alc. ppts. very impure  $\text{PbSO}_4$  in the presence of Fe (over 75 mg.), Ca and alkali sulfates, or  $\text{SiO}_2$ ; under these conditions interfering elements may not be entirely removed in the sulfate sepn., and if they are carried through to the  $\text{PbCrO}_4$  pptn. they cause serious interference and erratic results. Otherwise the method gives satisfactory results in the hands of analysts experienced in the procedure. Recoveries of Pb added to Pb-free apple peelings, together with a liberal dose of such contaminants as might be found on sprayed fruits or vegetables, were 95% or better. The method is time-consuming (about 3 days). *Wichmann-Murray method.*—After detg. As on the sample by the bromate method (modified to substitute hydrazine as the reducing agent), the residue is used for the estn. of Pb by Fairhall's method (C. A. 16, 2160), modified by controlling the  $\text{pH}$  of the sulfide and chromate isolations to (1) avoid co-ppts. of elements that commonly interfere, (2) eliminate the necessity for more than 1 sulfide pptn., and (3) reduce the difficulty of obtaining a satisfactory

**PbCrO<sub>4</sub> ppt.** Two alternative methods are given for prepn. of the sample. *A*—suitable for dry pectin, dried apples, tea and probably for similar substances and biol. materials: ash, taking care that the temp. does not exceed 550° to avoid volatilization of Pb. *B*—suitable for Na and Ca phosphates: dissolve 50 g. of sample in the smallest practicable vol. of soln. by warming and alternately adding small quantities of H<sub>2</sub>O and HCl, filter, rinse the beaker and wash the filter successively with 20 cc. hot HCl-citric acid reagent (200 g. citric acid per l. of 1 + 4 HCl), hot water and 20 cc. of 40% NH<sub>4</sub>OAc. *Loughrey's method.*—This method utilizes the remarkable affinity of diphenylthiocarbazone ("dithizone") in CHCl<sub>3</sub> soln. for Pb in sepg. the Pb from common interferences according to Fischer (*C. A.* 27, 3418); the org. Pb compd. is decompd., the Pb is pptd. as PbCrO<sub>4</sub> and detd. indirectly by iodometric titration of the chromate ion. Presence of BaSO<sub>4</sub> or of a large quantity of CaSO<sub>4</sub> causes low results because of occlusion of Pb in these substances and consequent interference in the dithizone extn.; Sn and Bi are extd. by dithizone along with the Pb and interfere in the PbCrO<sub>4</sub> pptn.; other elements that commonly interfere in the chromatng are eliminated by the dithizone extn. Electrolytic sepn. of PbO<sub>2</sub> after partial destruction of the dithizone compd. with HNO<sub>3</sub> may be practiced to advantage, especially in cases where there is less than 1 mg. Pb. The method (with PbCrO<sub>4</sub> pptn.) has been successfully applied to samples that could be digested in sufficient amts. to give a quantity of Pb greater than 1 mg., and that did not introduce interferences of Sn, Ba and CaSO<sub>4</sub>. *Colorimetric sulfide method (Wickmann-Vorhes).*—The method is primarily designed for rapid approx. detn. of Pb on fresh apples and pears. It is essentially as follows: spray residue is removed from the fruit by means of solvents (an alk. immersion is combined with an acid rinse and a detergent is introduced in the alkali; this results in a 95% or better extn. of the Pb or As on the fruit); the soln. is freed from org. coloring matter and common interferences (the most important of which is Fe); and Pb is estd. colorimetrically as the sulfide. The method was applied to control on an extended scale during the 1933 season. Its accuracy was checked by adding known quantities of Pb (unknown to the analyst) to the "strip" solns. of Pb-free apples, and the difference between theoretical and detd. amts. varied from -0.001 to +0.002 grain per lb. (with amts. varying from 0.008 to 0.028 grain per lb.). *Electrolytic method (Wickmann-Clifford).*—This method is based on electrolytic anodic deposition of Pb as PbO<sub>2</sub> from a dil. HNO<sub>3</sub> soln., reaction of the PbO<sub>2</sub> with acidified KI soln., and titration of the liberated I. Interferences noted by Hillebrand and Lundell (*Applied Inorg. Analysis*, *C. A.* 24, 316) are Bi, Sb, Sn, Mn, halogens, As, Se, Te and P. Moderate quantities of elements of the latter series expected in spray residues do not prevent complete deposition of Pb by the procedure described; Bi, Sb and Sn are not found at present in com. spray residues; Mn is found and provision is made to remove it before electrolysis by dithizone extn. From 0.05 to 10 mg., or more, of Pb may be very satisfactorily sepd. on the anode and titrated with 0.001 or 0.005 *N* Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub>. A so-called "mush" method of prepn. of the sample is described, which permits use of a very large sample and reduces sampling error to a very low figure. It consists essentially in weighing 40-50 apples (or pears, etc.), peeling (being careful to remove completely the stem and calyx ends), weighing peelings (including stem and calyx ends), running 3 times through a food grinder that shears rather than presses, dilg. 200 g. of the homogeneous mushlike mass to about 300 cc., adding 40 cc. concd. HNO<sub>3</sub>, bringing to a boil and stewing slowly while stirring until initial foaming ceases and a comparatively smooth mixt. is obtained (about 10 min.), making to 500 cc., and carrying out the Pb detn. on a 250-cc. aliquot after a dithizone extn. *Colorimetric dithizone method (Vorhes-Clifford).*—The method was originally devised for rapid approx. detns. on fresh apples and pears, and especially to avoid some of the interferences that were troublesome in previous methods. As described it should be very satisfactory for routine work, giving

results accurate to 0.001 grain per lb. within the range of 0-0.025 grain per lb.; and with certain refinements it can be made very exact even for exceedingly minute quantities of Pb. It is based on the following principle: when a CCl<sub>4</sub> or CHCl<sub>3</sub> soln. of dithizone is shaken with progressively larger amts. of Pb in ammoniacal KCN soln. its normal green color changes, through a series of blues, purples and crimsons, to a cherry red, this gradual change in color is caused by the formation of a red CHCl<sub>3</sub>-sol. org. Pb compd.; the combination in varying proportions (depending on the relative amt. of Pb present) of this red color with the blue-green of the excess dithizone produces the intermediate colors. The colors produced are matched against standards by a process similar to colorimetric *p<sub>H</sub>* detns. This system of color colorimetry has 2 regions of great sensitivity, (1) where dithizone is in great excess and (2) where it is almost satd. with Pb. The use of ammoniacal KCN-citric acid soln. (10 g. KCN, 10 g. citric acid, 500 cc. concd. NH<sub>4</sub>OH per l.) prevents interference from all metals that are liable to be encountered in spray residues. The *p<sub>H</sub>* of the sample and standards must be practically the same; the optimum *p<sub>H</sub>* under varying conditions has not yet been detd., but it is believed to be secondary to the equality factor of the *p<sub>H</sub>*. A. Papineau-Couture

**Distribution of the phosphorus in wheats and flours** A. Feyte. *Compt. rend. acad. agr. France* 19, 925 (1933).—The total P in 53 French wheats varied from 0.80 to 1.41%, in 7 Syrian wheats from 0.50 to 0.69%, and from 0.185 to 0.32% in 7 samples of flour. The P content depends especially on the climate and ripening or scalding and very little on the variety. The P is concentrated in the peripheral parts of the grain. There is no general relation between the P content of a wheat or flour and the extensimeter readings. Except in scalded wheats where it is higher, mineral P reaches a max. of only 0.115% of the dried material. Phytin P composes, on the av., about 73% of the total P. Flours contain very little P in the form of phytin. J. R. Adams

**The most common adulterants in wheat flours** Giovanni Issoglio. *Industria chimica* 8, 1359 (1931). Wheat flour, adulterated with other grain flours, or with flour from grains affected by blight or rust, often shows reduced plasticity, rendering them unfit for bread flour. The loss in plasticity can be detd. by the ergometer (*C. A.* 26, 4106). A. W. Condon

**Shortening requirements for baked products** C. B. Morison. *Oil and Soap* 11, 234 (1934). E. Scherubel

**The nutritive properties of milk in relation to pasteurization.** J. D. Stirling and J. H. Blackwood. *Illness Dairy Research Inst., Bull.* 5, 80 pp. (1933). A review with 188 references. K. D. Jacob

**Factors influencing the rennase coagulation of milk by the action of calf rennase.** Pericle Parisi. *Giorn. chim. ind. applicata* 15, 545-52 (1933).—The enzymic coagulation of milk by rennase is accelerated by increase in concn. of H or Ca ions. Addn. of alkalies; org. acid, H<sub>2</sub>PO<sub>4</sub> and HCl influences the reaction only to the extent that they affect the concn. of H and Ca ions. The temp. coeff. of the reaction changes with different milk, varying from 1.35 to 2.09 within the temps. 30-50°. Outside these temp. limits the variation is much greater. A. W. Condon

**Methods for manufacturing acid-precipitated casein from skim milk.** Charles S. Trimble and R. M. Hill. U. S. Dept. Agr., *Circ.* 279, 1-36 (1933).—Mfg. methods are described for the production of the different types of acid-pptd. casein. By use of these methods a high-grade product may be obtained having a low-ash and free-acid content. Methods are also described for detg. the properties of com. casein such as moisture, ash and fat content, adhesive strength, *p<sub>H</sub>* and free acid value, solv and viscosity. W. H. Ross

**Coloring matter of butter.** A. Loewy and G. Cronheim. *Z. Untersuch. Lebensm.* 63, 450-1 (1933).—After 1st extg. with EtOH to prove that no artificial coloring matter is present, the intensity of natural coloring matter in butter

is detd. by extn. with  $\text{Et}_2\text{O}$  or light petroleum and comparison with fresh soln. of saffron (0.5%). B. C. A.

Relative economies of various types of cheese as determined by analysis. Ruth B. McCammon and W. J. Caulfield. *Trans. Kansas Acad. Sci.* 36, 159-61 (1933); et. C. A. 27, 8535.—By comparing the nutritive value of 100 cal. portions of Neufchatel, cream, rennet and acid types of cottage cheese, and cheddar, it was found that at prevailing prices cheddar was most economical, the 2 types of cottage cheese were next, and Neufchatel and cream least. Cheddar was also found to be higher in Ca and P contents. W. A. Moore

Chemistry of cheddar cheese-making. F. H. McDowall and R. M. Dolby. *Nature* 133, 101 (1934).—During the cheese-making process the concn. of lactate in the whey rises steadily, the titratable acidity remaining const. or even decreasing. The addn. of salt to the curd causes a sharp fall in the lactose content of the whey, at whatever stage of the process it is added; this is ascribed to the liberation of bound water by the salt. From the fact that in the whey, after the curd is cut, lactose may be more concd. than in the original milk, it is calcd. that about 2% of the water in milk is bound, the curd thus containing bound water equal to 80% of its casein content. On the other hand, if 0.1% of sulfate is added to the milk at the start, then the addn. of salt to the curd increases the sulfate in the whey by 50%. No explanation available for this contradiction. K. V. Thimann

Digestibility of cheese. A. Mørn. *Tids. Norske Landbruk* 40, 3-5 (1933).—A fresh half-fat Gauda cheese contained 14.8% water-sol. and 92.0% digestible (HCl and pepsin) N; the ripe (6 months) cheese contained 52.0 and 99.3%, resp. B. C. A.

The quantities of water frozen out in the freezing of foodstuffs. R. Heiss. *Biochem. Z.* 267, 438-51 (1933); et. C. A. 27, 5829.—As detd. by 2 different procedures, the amts. of water frozen out when fresh beef meat was frozen were functions of the temp. No difference was observed in the amt. of cooling required for slow or rapid freezing to the equil. condition. S. Morgulis

Detection of paprika pigment in sausages. W. Pfahl and A. Rotsch. *Z. Untersuch. Lebensm.* 65, 452-4 (1933).—The fat must be extd. and saponified, and the pigment taken up with 95% EtOH before the usual test for paprika pigment can be applied. B. C. A.

Attack of metal containers by so-called canned fish in white wine. Daniel Florentin. *Ann. fals.* 26, 594-7 (1933).—Investigation of complaints relative to digestive disturbances alleged to have been caused by so-called fish in white wine (which are really fish in vinegar) showed that Sn-plated cans were considerably attacked by the high acidity (even when they were not swollen or blown), most of the dissolved Sn being fixed by the fish instead of remaining in soln. in the liquid. With well-varnished containers the amt. of Sn dissolved was negligible. A. Papineau-Couture

The effect of ethyl alcohol on the ripening of tomatoes. S. A. Soldatenkov and M. G. Kubli. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1, 85-7 (in English 88-90) (1934).—One cc. of 96% alc. per hundred g. of fruit stops growth and causes full ripeness in 11-17 days. Twelve % alc. does not stop growth and ripening requires 20 days. Untreated fruits require over 25 days. Forty-eight % alc. gave a max. acceleration of ripening. Alc. vapors in a concn. of 1 cc. per 10 l. with an exposure of 24 hrs. gave optimum acceleration of ripening. F. H. Rathmann

Studies on a physiological spotting of apples. R. F. Sutt. *Quebec Soc. Protection Plants, 23rd & 24th Ann. Rept. 1930-1932*, 119-28 (1932).—The disease, which seems to be distinct from bitter pit, occurs as depressed spots which are slightly darker in color than normal and are surrounded by cork layers. The diseased apples keep well in storage and the diseased areas do not spread within the fruit tissues. A study of the physiology of the diseased and normal Fameuse apples showed that the diseased fruits were less acid, more highly colored and had a higher catalase, oxidase, peroxidase and a lower org. peroxide content than the normal fruits. In con-

trast to the normal apple tissue surrounding the spots, the dead cells in the diseased spots contained an abundance of starch. K. D. Jacob

The keeping quality of frozen orange juice. M. A. Joslyn and G. L. Marsh. *Ind. Eng. Chem.* 26, 2305-9 (1934).—A study has been made of factors that influence the keeping quality of frozen orange juice stored over 2 years at 0°F. A change in flavor was detectable after a storage for 2 months and was quite marked after 6 months. Deaerated juices retained their flavor more completely than untreated juices. Deaerated juice treated with O-free N more nearly retained its original flavor than when  $\text{CO}_2$ , H, etc., were used. 0.005% of orange oil gave a juice that had fairly fresh orange flavor even after storage for 13 months. Among the other phases of this subject that were studied were the effects of amt. and kind of suspended matter, the addn. of acids and sugars, flash pasteurization, precooling the fruit prior to extn. and storage of fruit. F. L. Dunlap

Time and methods for harvesting Royal Ann cherries for barreling. E. H. Wiegand. *Oregon State Hort. Soc., Rept. 47th Ann. Meeting 1932*, 24 7.—Maturity studies indicated that the fruit should be picked when it contains 16-18% of sol. solids and approx. 0.5% acid (calcd. as malic acid) in the juice. Maturity influences to a great extent increased color formation in the fruit; the increased color is partially responsible for the differences in the shade of cherries bleached in  $\text{SO}_2$  solns. K. D. Jacob

Nitrogenous compounds of the white gourd melon and the muskmelon. Kiyohisa Yoshimura and Takeshi Iwata. *J. Agr. Chem. Soc. Japan* 9, 1235-8 (1933).—The analysis of the white gourd melon is:  $\text{H}_2\text{O}$  97.098, crude protein 0.57, protein 0.193, crude fat 0.086, crude fiber 0.513, crude ash 0.375, total N 0.092, protein N 0.031, ammonia N 0.002, N in the ppt. by phosphotungstic acid 0.020 and N in other form 0.039%. Adenine (HCl salt) 0.1, trigonelline (HCl salt) 0.2 g. and histidine trace were isolated from 30 kg. of the fresh white gourd melon. Adenine (HCl salt) 0.1 g. and trigonelline (HCl salt) 0.3 g. were also isolated from 15 kg. of the fresh unripe melon. Y. Kihara

Alkali scorch of Bermuda onions. J. J. Taubenhaus and Walter N. Ezekiel. *Am. J. Botany* 21, 69-71 (1934).—

A shipment of white Bermuda onions turned brown and withered where they came in contact with the jute bags. The bags were found to be impregnated with an alk. salt which caused the damage. L. E. Gilson

Soy bean (*Glycine hispida* Maxim.). M. Wynne Sayer. *Agr. Live-Stock India* 3, 470-4 (1933).—The compns. of 3 varieties of soy-bean seeds grown in the Punjab were:

	Yellow variety	Chocolate variety	Black variety
Moisture	10.50	10.50	10.47
$\text{Et}_2\text{O}$ ext.	16.43	17.38	14.36
Crude protein	38.31	37.31	41.38
Sol. carbohydrates	24.18	24.39	23.42
Woody fiber	6.20	6.14	5.66
Sol. mineral matter	4.35	4.25	4.67
Sand and $\text{SiO}_2$	0.03	0.03	0.04
Total N	6.13	5.97	6.62
Albuminoid N	5.80	5.77	6.23
Albuminoids	36.81	36.06	38.94
Albuminoid ratio	1.68	1.79	1.45

K. D. Jacob

Analytical constants of peanut butter. Helen L. Wikoff, Maribodine Busey and A. M. Kaplan. *Ind. Eng. Chem.* 26, 291-2 (1934).—The exptl. procedure is described. Analytical data are given, based on examn. of 10 samples purchased on the market. The moisture varied from 0.87 to 3.7%, with an av. of 1.74. Ash varied from 1.91 to 3.18%, av. 2.37 (dry basis); chlorides from 1.08 to 3.45%, av. 1.60 (dry meal basis); oil from 39.45 to 52.34%, av. 46.70 (dry basis);  $\alpha$  from 1.4540 to 1.4749, av. 1.4676; crude fiber from 2.67 to 4.31%, av. 3.34 (meals); protein from 54.64 to 62.45%, av. 58.65 (dry meals), which is equiv. to 30.66% on the basis of the whole butter; reducing sugars are absent before

hydrolysis. Starch, cellulose and pentosans were the polysaccharides found in the fat-free meal. F. L. D.

Report of the biochemist for 1932. D. I. Evans. Tea Research Inst. Ceylon, *Bull.* 10, 48-60 (1933).—Slow withering of tea improves the color and strength of the aq. infusions but decreases the pungency, quality and flavor. In general characteristics, teas withered in 4.5 hrs. compare favorably with those withered in 15 hrs., whereas withering in 40 hrs. is detrimental. The degree of wither, as measured by the moisture content of the leaves, has little effect on the pungency of the made teas; harder wither gives more color, strength, quality and flavor. K. D. Jacob

Fermentation of hay for dairy farms. Tiemann and Rehm. *Deut. Landw. Presse* 60, 319 (1933).—Freshly cut hay was covered with 30 cm. of soil and allowed to ferment at 55-65°. Samples of the top layer, a layer 25-30 cm. deep and the bottom layer, were analyzed for AcOH, butyric acid, acetates, butyrates, lactic acid,  $p_n$ ,  $NH_3$ , dry wt., ash, org. matter and crude protein. After 4 months, the top layer had rotted and was unfit for cows. The top and bottom layers had the highest content of butyric acid, 0.27 and 0.30%, while the middle layer had the highest content of lactic acid, 0.60%. Similar results were obtained after 6 and 14 months. The total wt. of the fermented material was about 46% of the original wt. K. C. Beeson

Effect of maturity on the nutritive value of Markton oat hay. J. Sotola. Wash. Agr. Expt. Sta., *42nd Annual Rept.* (*Bull.* 275) 22 (1932).—On a 10% moisture basis the protein percentages of 9.3, 9.2 and 9.18 were obtained for the milk, dough and ripe stages, resp. Similarly the fiber percentages were 28.32, 24.41 and 24.12. The decrease is attributed to the increasing amts. of carbohydrates accumulating in the heads. Ca:P ratios of 1.13:1, 1.48:1 and 1.72:1 were detd. for the milk, medium dough and ripe stages, resp. In the milk stage Markton oat hay contained 5.88% digestible protein and 50.15% total digestible nutrients. At the dough stage the hay contained 5.8% digestible protein and 47.69% total digestible nutrients. The hay from the ripe plants exceeded all others with a content of 6.4% protein and 54.56% total digestible nutrients. C. R. Fellers

Cattle poisoning by the feeding of rape cake. C. Kučera. *Intern. landw. Rundsch.* 37, 915 (1931).—In samples of rape cake having toxic action on cattle the mustard-oil content was low, but probably there was a deficiency of myrosin. Data are given showing the amts. of mustard oil developed by rations contg. rape cake and various myrosin-contg. feeds. B. C. A.

Removing Bordeaux spray from oranges (Benton, Powell) 15. Elec. water heater for use with refractometer [for tests on butter] (Lorenzola) 1. Allergic reactions to foods and their avoidance (Gutmann) 11G. Influence of the nutrition of the plants on the sensitiveness of potato tubers to storage parasites (Fehmi) 15. Occurrence of cyanogenetic glucosides in Nelson pasture plants (Rigg, et al.) 11D. Resorption of  $CaSO_4$  in the digestive tract [fodder preservation] (Virtanen, Tikka) 11F. Liver exts. (Brit. pat. 400,979) 17.

Herzberg, Gustav: Der Nahrungsmittelchemiker und seine Tätigkeit. 5th ed. Stuttgart: Dieck-Verlag Franckh. 76 pp. M. 1.60; cloth, M. 2.25.

Valde, Albert van de: Vade mecum voor chemisch en bacteriologisch Onderzoek van Lebensmiddelen. Antwerp: De Nederlandsche Boekhandel. 168 pp. F. 30.

Use of relatively water-resistant cellulose derivatives in foods. Camille Dreyfus. U. S. 1,943,374, Jan. 16. In forming foods intended to promote peristaltic action, cellulose derivs. such as cellulose acetate, etc., are incorporated with foods such as oatmeal, farina or other cereal foods.

1 Drying the gluten mass obtained by the washing of flour. K. Möller and B. Fischer. Swed. 77,355, May 23, 1933. An addn. to Swed. 76,070 (C. A. 27, 5442)

Bread. Georg Purucker. Ger. 590,345, Dec. 29, 1933 (Cl. 2c. 2.02). Comps. to be added to dough comprise liquid malt ext., sol. starch, sugar sirup and malt meal. Specific comps. are described. The comps. can be marketed in cast pieces.

2 Granular calcium phosphate. Wm. H. Knox, Jr. (to Victor Chemical Works). U. S. 1,943,919, Jan. 16. A product which is suitable for use in baking powder comprises mono-Ca phosphate together with less than 0.1% Fe phosphate, less than 0.2% MgO and 1-2% alkali metal oxide, and may be prep. by use of  $H_3PO_4$  obtained by the volatilization process.

Apparatus for determining the fat content of milk (products). Aktiebolaget Separator. Brit. 400,170, Oct. 9, 1933.

3 Milk concentrate. Pomosin-Werke G. m. b. H. Ger. 590,476, Jan. 2, 1934 (Cl. 53c. 5). Addn. to 555,275 (C. A. 26, 5155). Skim milk is treated with a liquid pectin ext. and the mixt. is allowed to stand.

Milk and cream. Bengt A. Clemmedson and Helge V. Abrahamson. Fr. 756,135, Dec. 5, 1933. Milk and cream are improved by heating them slowly from 10° or lower to 40-42° during 20-30 min., and cooling slowly to 2-3°, repeating the process and then maintaining at 2-3° for some time.

Increasing the viscosity of cream. Ture V. Bergman and Hilding A. Svedberg. U. S. 1,944,541, Jan. 23. Cream of relatively high fat content such as that used for making whipped cream is subjected to repeated cooling (suitably to about 5°) and alternate heating to above room temp. but without again fluidizing the fat solidified by the cooling.

5 Preserving fish, etc. Frank Heywood and Imperial Chemical Industries Ltd. Brit. 400,658, Oct. 30, 1933. Fish, etc., are preserved in a mixed atm. of air and  $CO_2$  in a heat-insulated chamber cooled by the evapn. of solid  $CO_2$ . App. is described.

Preserving meat, etc. Jack Brooks, Thomas Moran, Edgar C. Smith and Ronald G. Tomkins. Brit. 400,197, Oct. 19, 1933. Meat (products) and other animal materials are preserved in an atm. contg. a proportion of O to N as great as or greater than that of air and a proportion of  $CO_2$ , generally within 4-40% and never greater than the O present. App. is described.

6 Preservative for roots and fruit. I. E. O. Larsson and E. A. Grönlund. (C. G. Pettersson, inventor). Swed. 76,298, Jan. 17, 1933. An addn. to Swed. 70,515. To a mixt. of 75-90% of slaked lime and 10-25% of carbon is added sublimed S, suitably in an amt. of 1-2.5% of the total mixt.

7 Transporting perishable products. Imperial Chemical Industries Ltd. Fr. 756,085, Dec. 4, 1933. The gas liberated by evapn. from solid  $CO_2$  is led into the refrigerating chamber (contg. fish, fruit, etc.) by an injector which thus causes a simultaneous entry of air. The proportion of  $CO_2$  to air is regulated by a valve to the mixt. best calculated to preserve the products.

8 Apparatus for quick freezing of foods such as fruits, vegetables and meats. Harold V. Atwell (to Standard Oil Co. of Ind.). U. S. 1,944,857, Jan. 23. Various structural and operative details are described suitable for use with refrigerant such as propane under such pressure that it boils at -20° to -35°.

9 Wax emulsion suitable for coating food products such as fruits and vegetables. Walter A. Bridgeman and John A. Schade (to Wilbur White Chemical Co.). U. S. 1,943,468, Jan. 16. A lustrous waxy coating is formed by passing a natural food product through an emulsified compn. consisting essentially of carnauba wax 5-15%, an emulsifying agent such as triethanolamine soap 1-4%, resinous material such as Pontianak gum or rosin 2-6% and water (constituting the remainder of the compn.), the bath, at a temp. of 20° having a surface tension of from about 45 dynes to about 38 dynes per cm., the coated material being then drained and dried.

- Coffee and tea. Theodor Grethe. Ger. 588,844, Nov. 21, 1932 (Cl. 53d. 5). See Brit. 366,805 (C. A. 27, 1904).  
 Food product from pineapple waste. Bruno Pilorz (to Calif. Packing Corp.). U. S. 1,944,265, Jan. 23. A shredded waste from the cores and outer cuttings of pineapples is mixed with an impure sugar soln. while the moisture content of the pineapple waste is above 60%, and the mixt. is then dried to a moisture content of 5-15%. The product is suitable for use as a stock or chicken feed.  
 Fodder. Ulrich Luebkens. Ger. 590,087, Dec. 22, 1933 (Cl. 53g. 4.04). Animal organs including essentially organs communicating with the liver or the gall bladder, or secretions or excretions of such organs, are dried, preferably *in vacuo* at atm. temp., and added to fodder for milk-yielding animals. Appropriate substances may be added to improve the taste.  
 Preserving green fodder. I. G. Farbenind. A.-G. (Friedrich A. Henglein and Friedrich W. Stauff, inventors). Ger. 588,992, Nov. 30, 1933 (Cl. 53g. 5.01). Green fodder is preserved without the aid of O by the employment of solid substances giving off CO<sub>2</sub>, e. g., CaCO<sub>3</sub>.

## 13—GENERAL INDUSTRIAL CHEMISTRY

EARLAN S. MINER

- Upturn in 1933 foreign trade in chemicals. Otto Wilson. *Ind. Eng. Chem.* 26, 351-6 (1934). G. G.  
 Accurate methods of determining the number and size frequency of particles in dusts. H. L. Green. *J. Ind. Hyg.* 16, 29-39 (1934).—Constructional details of a sedimentation cell are given for sampling dust-laden air. The dust is allowed to settle on microscope slides from which the particle counts are made. The no. count, which is most suitable for concns. not less than 1000 particles/cc., was checked by an ultramicroscope. Size frequencies are estd. by means of a special ocular graticule, covering the range down to 0.2  $\mu$  diam. Errors and limitations of the methods are discussed and typical data from an actual dust analysis are cited. L. W. Elder  
 The employment of commercial filtration and decantation methods. H. Tiedemann. *Chem. Fabrik* 1934, 114.—A general discussion of vacuum and pressure filtration, percolation and decantation. J. H. Moore  
 Rectification of liquid air. C. Boe. *Teknisk Ukeblad* 80, 284-8 (1933).—A review, chiefly theoretical, with graphs, equations and 1 illustration. C. A. Robak  
 The fractional degassing of hot and cold waters in the Claude-Boucherot process. P. Chambadal. *Compt. rend.* 197, 825-7 (1933); cf. C. A. 26, 4111.—It is suggested that the gas be extd. in several fractions.  
 J. B. Austin  
 The temperature distribution of a gas flowing through a furnace. K. F. Herzfeld. *Physics* 4, 362-5 (1933).—The temp. coeff. of a chem. reaction in a gas flowing through a tubular furnace at low pressure is studied theoretically. If the flow is stream-line, and the pressure drop through the tube is less than 0.008 mm. of Hg per cm. length, temp. equil. is reached throughout the gas. If the pressure drop is about 10 times as great, only a thin layer close to the wall reaches temp. equil. Even under these conditions the measured temp. coeff. of reaction velocity is not affected by the thickness of this hot layer.  
 Channing Wilson  
 Iodized carbon as protector against mercury-vapor poisoning. Alfred Stock. *Angew. Chem.* 47, 64 (1934).—Iodized C is an activated C impregnated with I. The most favorable amt. of I is about 5%. The C either can be used in gas masks or can be sprinkled directly upon open areas or in cracks contaminated with Hg. Expts. are reported which demonstrate the great effectiveness of this prepn. Karl Kammermeyer  
 Carbon tetrachloride poisoning in connection with dry shampooing and dry cleaning, with a survey of the use and action of the substance. Knud O. Møller. *J. Ind. Hyg.* 15, 418-32 (1933); cf. C. A. 27, 2740.—Six cases are described, and 43 references are reviewed. W. D. L.  
 Health aspects of radium dial painting. I. Scope and findings. Louis Schwartz, Fred L. Knowles, Rollo H. Britten and Lewis R. Thompson. *J. Ind. Hyg.* 15, 362-7 (1933).—The study was conducted in 7 factories and included the examn. of 14 men and 228 women. The dust in the general air of the workroom was radioactive (an av. of  $9.8 \times 10^{-10}$  g. per 10 cu. m. of air), while in the vicinity of dial painters the radioactive content of the aerial dust was 2-3 times greater and near dusters it was many times as high. Workers were exposed to  $\gamma$ - and  $\beta$ -radiations. The av.  $\gamma$ -ray exposure was equiv. to that produced by about 1 mg. of Ra 50 cm. from the worker. There was no evidence of harmful effects such as skin necrosis from radiations from sources outside the body. Ra accumulation in the body was assocd. with the length of Ra exposure, the greatest amt. found being 11.3  $\gamma$ . X-rays of the alveolar regions showed bone changes in some workers, notably focal atrophy (osteoporosis or bone rarefaction). The relation of these bone changes to increasing deposits of Ra in the body is unmistakable. With the abolition of the practice of pointing the brush in the mouth, prevention of Ra poisoning depends primarily on extreme cleanliness in the factory, thorough cleanliness of the workers and adequate ventilation, both general and local. Twenty-eight specific suggestions are included for minimizing the hazard of Ra dial painting. II. Occupational environment. J. J. Bloomfield and Fred L. Knowles. *Ibid.* 369-82.—The occupational environment of Ra dial painters is discussed under the headings: history of Ra painting processes, occupational analysis, sanitary survey, the detn. of the amt. of atm. and settled radioactive dust in the air of workrooms, the degree of exposure to  $\gamma$ - and  $\beta$ -rays at the working places, together with the amt. of Rn in the air of these places. Fifty-six air samples (60-200 cu. ft. in vol.) were collected with the paper thimble (C. A. 17, 1331) as the collecting medium, at positions which made them representative of the air breathed by the workers or of the general workroom conditions. The thimbles were ignited and the resulting ash analyzed by fusion with KHSO<sub>4</sub> (C. A. 12, 1942). The av. exposure for Ra dial and hand painters was  $26.1 \times 10^{-10}$  g. of Ra per 10 cu. m. of air. The general air of the rooms contained  $9.8 \times 10^{-10}$  g. For Ra dusting 5 samples gave an av. of  $169.3 \times 10^{-10}$  g. per 10 cu. m. of air, the lowest being  $45.3 \times 10^{-10}$  g. The av. exposure for Ra transfer press operators was  $34.9 \times 10^{-10}$  g. In general the lower levels of Ra dust concn. were assocd. with better ventilation, less crowding, stricter supervision, the use of small amts. of paint and the avoidance of handling of dry paint. Electroscopic detn. of the amt. of  $\gamma$ - and  $\beta$ -radiations and of Rn at the working places showed the av. for all  $\gamma$ -ray readings in the dial painting rooms was equiv. to the discharge produced by about 1200  $\gamma$  of Ra 50 cm. from the instrument. For  $\beta$ -ray readings the av. was equiv. to about 2100  $\gamma$  of Ra. The Rn readings gave an av. of 51 curies  $\times 10^{-8}$  per 10 cu. m. of air, about 2000 times the content of normal outdoor air. E. G. Meiter  
 Health aspects of radium dial painting. III. Measurements of radioactivity in workers. James E. Ives, Fred L. Knowles and Rollo H. Britten. *J. Ind. Hyg.* 15, 433-46 (1933); cf. preceding abstr.—To measure  $\gamma$ -rays, the rate of discharge of a Wulf bifilar electroscope was measured, the probable error being 0.3  $\gamma$ . For Rn and Tn, expired air in a Douglas bag was placed near an electroscope, and the movements were measured. Standardization curves were made, the half-life period of thoron being 54.5 sec. Results of detns. made upon Ra workers are given. W. D. Langley  
 The behavior of gases and smokes in buildings several stories high. D. Dassel. *Gasmask* 6, 10-12 (1934).—

In consequence of chronic gas poisoning which occurred in a 4-story lab. building in rooms far distant from the source of the gas an investigation was made of the distribution of gases in this building. Currents were followed by means of P smoke produced by burning white P. Results showed unexpectedly wide distribution. For example, when 2 ventilating shafts serving different sections of the building emptied into a single discharge shaft with an exhaust fan at its exit end and when the rooms served by one of the ventilating shafts were closed, smoke discharging from the other shaft backed down into the closed rooms. The temp. gradient in a room greatly affected the distribution of smoke in it. The article is of interest in connection with the designing of buildings in which toxic gases will be used.

A. L. Kibler

A new filter and ventilator for closed gas-protected rooms. E. Smolczyk. *Gasmaskes* 6, 16-17(1934).—The ventilator is hand-operated and is intended to protect small, closed rooms from poison gases, primarily chemical warfare gases.

A. L. Kibler

Carbon monoxide and gas protection. Fritz Bangert. *Draeger-Hefte* No. 169, 2415-18(1933).—The reasons that CO is not suitable as a war gas are stated. The question of protection against CO is also discussed and the proper Dräger gas mask is indicated.

A. L. K.

The gas mask in the service of the worker. (The gas mask in industry.) Erich Neitzel. *Gasmaskes* 6, 19(1934).—Accidents are described which occurred in industrial plants in Germany during the year 1932 and which could have been prevented by the use of gas masks. There were only 60 fatalities as compared to 249 for the year 1931 (cf. C. A. 28, 1118\*). Among the causes of the accidents described were Ph, P, Hg, As, Mn, aromatic compounds, CS<sub>2</sub>, H<sub>2</sub>S, CO, dusts, nitrous gases, halogens, chlorinated hydrocarbons, chromic acid, NH<sub>3</sub>.

A. L. Kibler

Comparative life, fire and explosion hazards of common refrigerants. A. H. Nuckolls, et al. Underwriter's Labs., *Miscellaneous Hazards* No. 2375, 118 pp.(1933). Materials investigated were NH<sub>3</sub>, C<sub>2</sub>H<sub>6</sub>, C<sub>2</sub>H<sub>4</sub>, C<sub>2</sub>H<sub>2</sub>, C<sub>2</sub>H<sub>10</sub>, MeCl, MeBr, C<sub>2</sub>H<sub>5</sub>O<sub>2</sub>, EtCl, EtBr, CHCl<sub>3</sub>, CCl<sub>4</sub>, C<sub>2</sub>H<sub>5</sub>Cl<sub>2</sub>, COCl<sub>2</sub>, CCl<sub>2</sub>F<sub>2</sub>, CCl<sub>2</sub>F<sub>3</sub>, C<sub>2</sub>Cl<sub>2</sub>F<sub>4</sub> and, for comparison, gasoline and illuminating gas. Toxicity was detd. with concns. of 0.5-1.0% and 2-2.5% by vol. (with higher concns. in some cases), by exposing guinea pigs for periods of 5 min. to 2 hrs. Addnl. toxicity tests were made to det. the effect of decompn. of the gas mixts. by heat from gas and oil flames and elec. heating units, and analyses were made of the products of decompn. Investigation of fire and explosion hazards included detns. of ignition temp., limits of flammability or explosibility, explosion pressure-time tests, and speed of flame propagation tests. CCl<sub>2</sub>F<sub>2</sub> and C<sub>2</sub>Cl<sub>2</sub>F<sub>4</sub> are practically nontoxic but yield toxic and irritating decompn. products in the presence of flame or very hot surfaces. Both of these compds. are noncombustible and nonexplosive. The app. used and results of tests are described in detail and the data obtained are tabulated.

C. G. Storm

The effect of oil pressure on insulation strength. John A. Scott. *Elec. Eng.* 53, 308-9(1934).—At power frequencies and under long-time application of voltage there is a considerable increase in endurance strength of oil-treated insulation at pressures of several atms. Under impulse stresses, however, practically no benefit results from increased pressures. The effect of pressure on dielec. strength is greater the longer the time of voltage application, being negligible for the impulse voltage tests of only a few microseconds' duration and a max. for the long-time endurance test.

W. H. Boynton

The life of impregnated paper. J. B. Whitehead. *Elec. Eng.* 53, 244-51(1934); cf. C. A. 27, 1577.—A series of accelerated life tests on 14 different oils as used for the impregnation of one grade of cable insulating paper is described. Complete absence of gaseous ionization was definite relationship shown between the under stress and the capillary rise of a definite type the life of the power, while with oils

of different types differences may be evident in the relation of penetrative power to life. The influence of dielec. loss on life is negligible and the values of power factor during life tests appear to have no relation to life. Numerous curves are shown.

W. H. Boynton

Some mechanical and thermal properties of electrical insulators. Rubberoid, fiber and chemically prepared insulators. Ulrich Retzow. *Z. tech. Physik* 14, 551-5(1933).—Existing values for the sp. gr., tensile strength, bending strength, impact strength, hardness, thermal expansion, sp. heat and thermal cond. of a no. of insulators are collected and reviewed.

Separating gases or vapors. Edoardo Mazza. *Fr* 750, 239, Dec. 6, 1933. An app. is described for sep'g gas or vapors by the concomitant actions of centrifugal force and gravity and expansion force.

Acid gases from gaseous mixtures. Julius A. Brachfeld and Albert Smola. *Fr* 751,541, Sept. 5, 1933. See Austrian 135,047 (C. A. 28, 841<sup>3</sup>).

Wet purification of gases. J. Debricr. Belg. 391,501, April 29, 1933. Mech. features.

Gas scrubbing. Harvey R. Pife (to Carbide and Carbon Chemicals Corp.). U. S., 1,944,122, Jan. 16. Aq. solns. used in treating gas such as those contg. an amine and which tend to foam, are brought into contact with activated C, to remove foam-forming substances.

Controlling the hydrogen-ion concentration of flowing solutions. Harold S. Martin and Thomas A. Jauncey. U. S. 1,943,684, Jan. 16. There is continually introduced and mixed with the soln. a pH-controlling agent, and a portion of the soln. is subsequently removed and continuously mixed with an indicating agent giving by color an

indication of the  $pH$ . A photoelectric cell and elec. circuit serve to control the addn. of the  $pH$ -controlling agent in accord with the color of the test portion treated with the indicator.

**Treating gases with liquids, etc.** Industrikemiska Aktiebolaget. Brit. 400,592, Oct. 16, 1933. In processes of evapn., satn., gas-washing, etc., in which a gas is forced through a perforated plate immersed in a liquid to form a layer of foam on the liquid, the conditions are such that the foam layer is composed of uniform-sized bubbles of polyhedral form uniformly distributed throughout the layer. Such layer is formed by adjusting the velocity,  $v$ , of the gas through the plate, the smallest dimension,  $D$ , of the plate apertures and the kinematic viscosity,  $\nu$ , of the gas so that  $vD/\nu < 3500$ .

**Treating solids with gases.** F. M. Wiberg. Swed. 76,093, Feb. 28, 1933. The gases are conducted through a number of vessels contg. the material, which are connected in series and preferably mounted upon a string of cars, 2 on each car. The containers of each couple are connected beneath with each other and at the top with the containers of the neighboring couples, the gas passing through the material in downward direction in one container and upward direction in the next one.

**Drying granular materials.** Aktiebolaget Svenska Läkfabriken. (H. Edholm, inventor). Swed. 77,841, July 18, 1933. Granular materials, particularly grain, are treated with drying air during the passage downward through a silo, the passage being divided into a number of drying and resting stages. Mech. features.

**Separating solids from solutions by vacuum cooling in stages.** Karl Ebner (to American Lurgi Corp.). U. S. 1,911,548, Jan. 23. Various details are described of an evaporator and condenser system, suitable for treating solids such as those of mixed salts.

**Increasing the efficiency of centrifugal separation.** Aktiebolaget Separator (E. A. Forsberg, inventor). Swed. 76,944, April 19, 1933. By heat treatment and (or) by addn. of suitable substances the particles in suspension are made to agglomerate into coarser particles and (or) to join with small particles of a sp. gr. differing from that of the liquid in the same direction as the suspension.

**Crystallization.** Louis Prime. Fr. 756,006, Dec. 4, 1933. Larger crystals, e. g., of  $(NH_4)_2SO_4$ , are obtained in saturators by taking up the crystals from the lower part of the app. and causing them to redescend with a gyratory movement imparted to the liquid.

**Aqueous emulsions.** Th. Goldschmidt A.-G. Ger. 590,165, Dec. 27, 1933 (Cl. 23c. 2). Addn. to 551,403 (C. A. 26, 4392), and 582,106 (C. A. 27, 5124). The esters used as emulsifying agents in the processes of Ger. 551,403 and 582,106 are replaced by corresponding esters of hydroxy or unsatd. higher aliphatic acids or their substitution products, mixed with 5-12%, calcd. on the ester, of a saponaceous substance. Examples are given.

**Atmospheric mercury vapor.** Deutsche Gasglühlicht-Auer-G. m. b. H. Ger. 588,531, Nov. 20, 1933 (Cl. 30r. 501). A mass for removing Hg vapor in the atm. of com. laboratories, etc., to prevent poisoning the attendants, consists of active C,  $SiO_2$  or metal gels, impregnated with halogen.

**Apparatus and method of operation for producing compressed gas such as oxygen, nitrogen or methane from liquefied gas.** Christian W. P. Heylandt (to Fluga A.-G.) U. S. reissue 19,054, Jan. 16. A reissue of original pat. No. 1,812,954 (C. A. 25, 5058).

**Absorption refrigerating apparatus.** Platen-Munters Refrigerating System A.-B. (A. H. Fredholm, inventor). Swed. 77,509, June 13, 1933. The cooling medium is  $NH_3$  and the absorption medium is water-free  $LiNO_3$ .

**Apparatus for liquefaction and use of solid carbon dioxide.** Justus C. Goosmann (to American Dryice Corp.). U. S. 1,943,820, Jan. 16. Structural and operative details.

**Dielectric material.** Frank M. Clark (to General Elec. Co.). U. S. 1,944,730, Jan. 23. A material suitable for use alone or with paper, cloth, etc., comprises mainly chlorinated benzene, has a solidification temp. at least as low as  $5^\circ$ , a sp. gr. of about 1.43-1.48 and contains sufficient Cl to yield only substantially non-inflammable gas when electrically or thermally decompd. Cf. C. A. 28, 521.

**Insulating material.** Theo Uranschek. Fr. 756,220, Dec. 6, 1933. A porous insulating construction and refractory material is made by mixing org. fibrous material 3, asbestos flour,  $Al_2O_3$ , etc., 5-7.5, and  $Na_2SiO_3$  of 36-8° Baumé 5-7.5 parts, pressing and drying.

**Electric insulating material.** Linwood T. Richardson (to Cutler-Hammer Inc.). U. S. 1,944,404, Jan. 23. Various details are described of prepg. a cold-moldable insulating material by mixing a fibrous material such as asbestos with an org. binder such as a pitch or synthetic resin mixt., extruding the mixt. as a continuous strip, dividing the strip into blanks and cold-molding the latter. App. is described.

**Testing electrical insulating material.** Ellery B. Paine, Joseph Tykocinski-Tykociner and Hugh A. Brown (to Board of Trustees, Univ. of Ill.). U. S. 1,943,391, Jan. 16. There is impressed on the insulation a potential below the breakdown potential of the insulation but sufficient to cause insulation inhomogeneities to set up disturbance currents, and such currents are measured. U. S. 1,943,392 relates to various elec. details of testing cable insulation or the like.

**Electrical insulation.** Abraham Kronstein (to Electra-Lackwerke G. m. b. H. System Kronstein). U. S. 1,944,562, Jan. 23. Thin, fiberless, unsaponifiable sheets of viscose-like solid regenerated cellulose are provided with a coating of solidified linseed oil oxidation products.

**Coloring and coating insulated wire.** Neil C. Lamont (to National Electric Products Corp.). U. S. 1,944,823, Jan. 23. Various details of app. and operation are described for applying coloring matter and waxlike material to insulated wire.

**Coating cables with materials such as mica and stearin pitch.** Wm. W. Church and Wm. C. Robinson (to National Elec. Products Corp.). U. S. 1,944,822, Jan. 23. Various details of app. and operation are described.

**Apparatus and method for impregnating electric cables, etc., with resin, etc.** N. V. Machinerieën-en Apparaten Fabrieken. Brit. 400,446, Oct. 26, 1933.

**Cables.** Johnson & Phillips Ltd., Albert P. Pyne and Tom B. Parker. Brit. 400,235, Oct. 17, 1933. A cable is protected against fire and vermin by a layer of fibrous material impregnated with a non-inflammable chlorinated, preferably a polychlorinated,  $C_{10}H_8$ , which on application of heat generates a combustion-resisting gas.

**Preventing corrosion of lead sheathing on electric cables.** Henri Benit (to Compagnie générale d'électricité). U. S. 1,944,778, Jan. 23. S is incorporated in a protective covering such as pitch or tar which is applied over the Pb sheathing to form a protective film of Pb sulfide. Cf. C. A. 28, 736.

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Progress in American water supply and purification practices during 1933. H. E. Jordan. *Water Works and Sewerage* 81, 1-6(1934).

Biological examination of water in Leipzig. Conrad Rich. *Pharm. Zentralhalle* 75, 15-16(1934).—An il-

lustrated paper on the occurrence of *Spongilla lacustris* L. and *Hematoecoccus pluvialis* Flotow in the water system of Leipzig. W. O. E.

Hydrobiologic and hydrographic investigations of two pond waters. Weimann Reinhold. *Botan. Centr. Beihefte*

51, 397-476(1938).—A small part of this investigation discusses the periodic analysis of the water samples for nitrates,  $\text{NH}_3$ , phosphates and Fe. R. C. Burrell

Examination of a spring water and applications of thermodynamic theories to real solutions. Giuseppe Bragagnolo and B. Maria Fregiani. *Ann. chim. applicata* 23, 546-56(1933).—The spring water in the Vigarano Mainarda region has been analyzed and its properties have been compared with values calcd. according to thermodynamic theory. The water contains Na, K, Ca, Mg,  $\text{NH}_3$ , Fe, HCl,  $\text{CO}_2$ ,  $\text{SiO}_2$ , org. matter. The f. p. of this water was calcd. as  $-0.162^\circ$  (measured  $-0.16^\circ$ ). A. W. Contieri

Simple water analysis. H. G. Smith. *Can. Mining J.* 55, 14 17(1934).—Simple routine water tests are described that are sufficiently accurate to ensure correct softening of water for all purposes. W. H. Boynton

Nephelometry. I. Analysis of potable waters. Luigi Belladen, Ugo Scazzola and Renato Scazzola. *Ann. chim. applicata* 23, 509-16(1933).—Nephelometric methods have been applied to the detn. of sulfate, Cl, Ca and Mg in potable waters. Cl is readily detd. to 1 part/10 million with proper illumination. Addn. of glycerol does not help any in sulfate detn., the low limit being about 7 parts/million. Ca is detd. according to Rona and Kleiman (C. A. 17, 3351) by using Na sulfocinate as precipitant. The Ca and Mg are then detd. according to Feigl and Pavelka (C. A. 19, 797) with  $\text{K}_4\text{Fe}(\text{CN})_6$  and  $\text{NH}_4\text{Cl}$ , the soln. for comparison contg. the same amt. of Ca as found above. The Mg is then detd. by difference. A. W. Contieri

Flow diagrams for the chemical treatment and filtration of water. John R. Baylis. *Water Works and Sewerage* 81, 65-8(1934).—A general discussion of the theory and practice of chem. treatment of water. Several typical flow diagrams showing points of application of the various chemicals in standard use are included. G. H. Young

Wayside water treatment on the Lehigh Valley Railroad. J. V. Cardillo. *Water Works and Sewerage* 81, 11-14(1934).—The treatment of railroad water supplies by automatic proportioning pumps feeding Na aluminate has resulted in decreased boiler maintenance and operating costs. G. H. Young

Methods and value of water treatment with respect to estimating and summarizing possible savings effected. R. B. Coughlan, et al. *Am. Ry. Eng. Assoc.* 35, Bull. 362, 624-5(1933).—Material reduction has been made in boiler repairs, and periods between boiler washings have been extended. R. C. Bardwell

Records show value of water treatment. E. L. E. Zahm. *Ry. Age* 95, 760(1933).—The Missouri, Kansas and Texas Railroad has 72 water-treating plants, all of continuous type using lime, soda ash and Na aluminate. Water treatment has greatly increased locomotive mileage between shoppings and has practically eliminated engine failures due to water conditions. R. C. Bardwell

Large water-treating plant embodies new features. R. E. Coughlan. *Ry. Eng. Maintenance* 29, 418-20(1933).—The Chicago and Northwestern Railroad recently placed a 2.5 million gal. per day water-treating plant in service at Clinton, Ia. Mississippi River water is used. Incrusting solids vary from 7.14 to 11.99 gr. per gal. and suspended solids from 19.68 to 624.27. Water is treated at a rate of 100,000 gal. per hr. with lime, soda ash and Na aluminate. Compressed air is used for mixing and sludge is recirculated. Operation is automatic. Softened water has a hardness of less than 1.0 gr. per gal. and  $\text{pH}$  of 9.8-10.2. R. C. B.

Chemical precipitation at Freeport, Long Island. Lawrence L. Luther. *Public Works* 65, No. 1, 20-2(1934).—Chem. treatment of sewage results in (1) improved quality of effluent, (2) accelerated speed of settling in sedimentation tanks, and (3) improved condition of tanks. Specifically,  $\text{FeCl}_3$  was found effective as a coagulant, the best results being obtained in conjunction with Cl.  $\text{FeCl}_3$  accelerated de-watering of either fresh or digested sludge. Pre-chlorination required no more Cl than post-chlorination. The re-use of previously coagulated solids appeared to have some merit. G. H. Y.

1 Reducing the cost of chlorinating. C. H. Vivian. *Water Works and Sewerage* 81, 25-6(1934).—By recirculating a portion of the chlorinated effluent through the sewage chlorinators, appreciable saving in tap water normally used for carrying Cl into the sewage may be realized. G. H. Young

Tastes, chlorine and chloramines in water purification. I. Charles H. Capen, Jr. *Water Works and Sewerage* 80, 447-50(1933).—A relation between water temp. and Cl dosage is presented and correlated with seasonal variations in Cl demand. II. *Ibid.* 81, 31-8(1934).—The use of  $\text{NH}_3$  in combination with Cl has proved effective in the control and prevention of many tastes and taste-producing organisms, particularly those resulting from direct chlorination alone. G. H. Young

Ammonia in water treatment. L. H. Enslow. *Water Works and Sewerage* 80, 379(1933).—Combination of  $\text{NH}_3$  with Cl in water treatment results in the following advantages: (1) inhibition of tastes produced by reaction of Cl with foreign substances, (2) reduction of Cl requirements, (3) prevention of free Cl taste and odor, (4) maintenance of long-sustained disinfectant action, and (5) control of slime and algal growth in reservoirs and distributing systems. G. H. Young

Results from the use of activated alum at Batavia, N. Y. Herbert M. Cook. *Water Works and Sewerage* 81, 47-8(1934).—A 20% reduction in alum consumption was obtained by using activated C compounded alum. Improved coagulation and more satisfactory taste and odor control resulted. In addn., less wash water is required for back-washing filters, and the filter beds are in better condition since the change to activated alum. G. H. Y.

Well filters. F. Burghardt. *Gas- u. Wasserfach* 77, 5-7(1934).—Well filters are a necessity in the northern part of Germany. Screened filters have the disadvantages that the pipe must be removed and filters replaced periodically because of action of Fe and Mn compds., or stoppage with fine sand. Various types of ring filters and the so called "pocket" filters, generally surrounded with graded filtering material, give longer service. R. W. Ryan

Experience with anthracite coal as a filter medium for water softening. C. P. Hoover. *Water Works and Sewerage* 80, 394(1933).—Anthracite coal of uniformity coeff. 1.6 and approx. 1 mm. effective size is giving satisfactory operation at the Columbus, O., water-softening and purification plant. After operation for 13 months, examn. showed no lumping or cementing together of the anthracite, though appreciable incrustation was observed. A top sample taken after the 13 months' operating period had an effective size of 0.95 mm. and 1.2 uniformity coeff. G. H. Young

Comparison of the reactions which take place in the softening of water by means of trisodium phosphate and sodium carbonate, respectively. J. Leick. *Warme* 56, 250-3(1933); *Chimie & industrie* 30, 1071; cf. C. A. 27 2084. —A general discussion, chiefly bringing out the advantages of  $\text{Na}_3\text{PO}_4$  over  $\text{Na}_2\text{CO}_3$ . A. P.-C.

Modern purification methods for boiler feed water. R. Klein. *Gluckauf* 69, 1077-85(1933).—An automatic method for control of alk. is illustrated. J. D. Davis

The uses of phosphates in boilers and their practical possibilities. Y. Markovitch. *Publ. assoc. ing. (cole mines Mons)* 1933, 259-450; *Chimie & industrie* 30, 1069. A. Papineau-Couture

Phenomena which take place when liquids come into contact in the feeding of boilers and in the treatment of water. Marcand and Bock. *Warme* 56, 302-6(1933). *Chimie & industrie* 30, 1323-4. A. Papineau-Couture

Cause and extent of pitting and corrosion of locomotive boiler tubes and sheets. J. H. Davidson, et al. *Am. Ry. Eng. Assoc.* 35, Bull. 362, 623-4(1933).—Experience indicates that the most practical method for reducing pitting and corrosion is to provide a caustic alk. in the boiler water equal to 10-15% of the  $\text{Na}_2\text{SO}_4$  and NaCl present. R. C. Bardwell

Corrosion inhibition by lime treatment—effect on industrial water-consumption costs. Sheppard T. Powell. *Ind. Eng. Chem.* 26, 254-6(1934). W. A. Moore

**Internal attack of water mains.** K. Adloff. *Wärme* 56, 265-8(1933); *Chimie & Industrie* 30, 1070-1.—Corrosion of water mains is due chiefly to the thin film of water which adheres strongly to the pipe, and depends on its O content and acidity and on the velocity of the water in the pipe. When the speed is very high, as is the case in main pipes as compared with small branch pipes, corrosion is slight or nil because the adherent film is carried away by the current. Two methods are used to prevent corrosion by dissolved  $\text{CO}_2$ : (1) the water is allowed to flow over marble; this process is not effective for waters having a certain hardness; (2) satd. lime water is added in amts. depending on the total hardness. After this treatment has been applied for a certain time the inside of the mains becomes covered with a protective coating which prevents corrosion and permits of decreasing the amt. of  $\text{CaO}$  added. A. Papineau-Couture.

The disturbing influence of nitrite compounds on the potassium permanganate consumption of water and sewage effluents and their removal. H. Jung and W. Otto. *Gas u. Wasserfach* 77, 56-8(1933).—Some sewage effluents contain excessive amts. of nitrite, which tend to give an excessive permanganate consumption. This may be avoided by destroying the nitrite with Na azide or urea. A large excess of urea may be added without interfering with the titration, and 5 cc. of 10% urea soln is recommended for adding to 100 cc. water or effluent to be tested. R. W. Ryan.

**Sewage-treatment plant, Boulder City, Nevada.** Earl M. Kelly. *Proc. 6th and 7th Ann. Conventions Am. Water Works Assoc., Montana Section* 1932, 35-6; cf. *A. 26*, 5361.—The plant designed by the U. S. Bureau of Reclamation uses the sep. sludge-digestion feature. It was designed to handle an av. sewage flow of 0.6 m. g. d. Dorr equipment is used, the digester having special mechanism to promote digestion. Gas from digestion is collected and used to fire a hot-water boiler to furnish heat to maintain sludge in the digestion tank at 90° F. Lime sludge from a water-softening plant is being discharged into the sewers and its effect upon the sewage-plant operation will be studied. G. L. Kelso.

**An economical sewage-treatment plant.** John Strowbridge. *Water Works and Sewerage* 80, 375-7(1933).—At the Dundee, N. Y., disposal plant the entire flow of chlorinated crude sewage is given sedimentation in one unit during a period of 2-3 months, the second settling tank being shut off. At the end of this period the first tank is shut off and the sewage passes through the second unit for the ensuing 2-3 months. Thus each unit is used alternately for sedimentation and digestion, digestion taking place in the 2-3 months each tank is out of service, and no special chem. treatment or aeration is required. Pre-chlorination eliminates surface scum and seems to aid sludge digestion. G. H. Young.

**Chemical treatment of sewage for Birmingham, Ala.** H. H. Herndon. *Water Works and Sewerage* 80, 427-30(1933). G. H. Young.

**British practice in sewage disposal.** H. C. Whitehead and F. R. O'Shaughnessy. *Trans. Inst. Chem. Engrs.* (London) Adv. copy, Jan. 25, 1933, 21 pp. E. J. C.

**Chlorine for small sewers.** G. S. Robins. *Public Works* 65, No. 1, 38-9(1934).— $\text{NaClO}$  was used successfully for combating odor nuisances in Webster Groves, Mo. The hypochlorite was fed directly into the sewer lines from 5-gal. carboys, 5 p. p. m.  $\text{Cl}_2$  being the av. dose. G. H. Young.

**Methods for the aeration of sewage.** Harold E. Babbitt. *Water Works and Sewerage* 81, 27-30(1934).—The relative advantages and disadvantages are given of mech. agitation and air diffusion for aerating sewage in the activated-sludge process. G. H. Young.

**The Pössneck sewage clarification plant with relation to city gas supply.** Otto Waldmann. *Gas u. Wasserfach* 77, 49-56(1934).—The large proportion of factory sewage in Pössneck causes wide variations in the amt. to be treated. Pössneck has 13,000 inhabitants and the sewage averages 620 l. per capita per day. The sludge is fermented in 100 cu. m. concrete digesters, each stirred by 3 stirrers

and provided with 3 gas domes. The normal compn. of the gas is 73-75%  $\text{CH}_4$ , 21-24%  $\text{CO}_2$ , a small percentage each of H and N and 1.0-1.5%  $\text{H}_2\text{S}$ . The heating value is normally 6600-6700 Cal. and the sp. gr. 0.70 to 0.80, av. 0.75. This gas is mixed with vertical chamber oven and blue gas to give a gas about 0.62 sp. gr. and a heating value of 4530 B. t. u. per cu. m., the proportion of sewage gas being about 20%. A slightly higher distribution pressure than normal is used to compensate for the higher sp. gr. and the mixed gas is entirely satisfactory. The gas works and sewage works are near each other. Operating costs for 1931-32 are given, which show that gas recovery made a substantial contribution toward operating costs. R. W. Ryan.

**Study of coagulation as applied to sewage treatment.** I. E. F. Eldridge and F. R. Theroux. *Mich. Eng. Expt. Bull.* 55, 3-22(1934); cf. *C. A.* 28, 1435<sup>a</sup>, 1436<sup>a</sup>.—There is a definite  $p_H$  zone in which  $\text{FeCl}_3$  coagulation of sewage is most effective. For E. Lansing sewage this zone is at  $p_H$  6.5-8.0. There is a higher optimal range and a lower one, where good removal of turbidity and suspended solids in sewage are obtained. The zone of low removal may be due to a coagulation of sewage colloids at their isoelec. point without the aid of  $\text{FeCl}_3$ . Ions extend the range of coagulation. Neg. ions extend the range toward the lower  $p_H$  values and pos. ions toward the higher. Ions of higher valences have a greater effect on extension of the range.  $\text{KMnO}_4$ , in small amts., allows the flocculation of a water at normal  $p_H$  of 7.8, when otherwise flocculation would occur at  $p_H$  4.5-5.5. Greater amts. of solids may be removed from sewage by the use of  $\text{FeCl}_3$  than by plain sedimentation, and the amts. increase with the dosage up to 1.25 grains per gal. For this dose the removal is about 90%. The biol. O demand was greatly decreased, an indication of the removal of org. colloids as well as suspended solids. Odors in the settled sewage were decreased by the use of  $\text{FeCl}_3$ . Fifteen references. C. R. Fellers.

**Some aspects of chemical precipitation in sewage treatment.** Alexander Potter. *Water Works and Sewerage* 80, 367-8(1933).—Advantages claimed include (1) freedom from odor nuisances, (2) ability to handle industrial waste, (3) lower construction costs, (4) space saving and (5) favorable comparison with other types of secondary treatment with regard to fixed charges, maintenance costs and quality of final effluent. G. H. Young.

**Improving settling-tank efficiencies and lowering operating costs at Aurora, Ill.** Walter A. Sperry. *Water Works and Sewerage* 80, 440 2(1933).—Vertical baffles at right angles to the inlet channel in the settling tanks resulted in increased efficiency of removal of suspended solids. G. H. Young.

**The practice of wasting excess activated sludge.** T. R. Haseltine. *Water Works and Sewerage* 80, 411-14(1933).—Results of operating and lab. expts. conducted at the Salinas, Calif., disposal plant show that wasting the activated sludge by return to the crude sewage (1) increases the suspended and settleable matter and biochem. O demand of the clarifier effluent, (2) results in higher percentage decrease of suspended solids and biochem. O demand, but (3) increases the actual suspended solids and biochem. O demand, the increase varying from 30 to 50% in biochem. O demand values and from 10 to 110% in suspended matter, and (4) increases the load on aerators, with accompanying increased operating cost. G. H. Young.

**Reducing the cost of activated-sludge treatment.** Edmund B. Besselièvre. *Water Works and Sewerage* 80, 364 6(1933).—By combining mech. agitation with diffused air aeration, 4 American cities lower power consumption and procure more flexible operation. G. H. Y.

**Utilization of sewage-sludge gas for refrigeration.** Guy E. Griffin. *Water Works and Sewerage* 80, 426(1933).—At Greenwich, Conn., sludge-digester gas from a sewage-treatment plant is used satisfactorily for operation of an Electrolux refrigerating unit in the plant lab. G. H. Y.

**The hygienic value of the disinfecting of swimming water by means of chlorine, chloramine and copper**

chloride. J. Idzerda and J. H. Wildervanck. *Nederl. Tijdschr. Geneeskunde* 77, IV, 5091-5101 (1933).—Ordinary chlorination is preferable in the continuous system of purification, provided that the passage of the pool water through the filter does not exceed 8 hrs., that the no. of visitors does not exceed the allowed limit and that the water is suitable for this kind of disinfection. The chloramine method is to be used for the "periodical" system. The combined Cu and Cl method is unreliable and requires too much supervision.

R. Beutner  
**Essentials of mosquito control.** H. W. Van Hovenberg. *Am. Ry. Eng. Assoc.* 35, *Bull.* 362, 637-9 (1933).—Methods used include proper drainage, oiling, filling, use of fish which eat mosquito larvae, screening and prophylaxis.

R. C. Bardwell  
**Handling sugar-beet wastes in a municipal water plant.** W. D. Loreaux. *Water Works and Sewerage* 81, 61-3 (1934).—Operating expts. carried out at the Dundee, Mich., municipal water works prove that powd. activated C applied in the first and second mixing chambers is superior to a fixed filter bed of granulated C for the removal of tastes and odors resulting from sugar-beet wastes. The most satisfactory results were obtained by using the powd. C in conjunction with pre-ammoniation and pre-chlorination, the ratio of Cl to  $\text{NH}_3$  being maintained at 7:1.

**Sterilizing water.** John C. Baker and Franz C. Schmelkes (to Wallace & Tiernan Products, Inc.). U. S. 1,943,650, Jan. 16. A soln. contg. 0.02-0.3% dichloramine is used for treating the water.

**Purifying water.** Fritz Hahn. Fr. 756,266, Dec. 7, 1933. Water is softened and purified by the action of alkalis (caustic or carbonate) and a small amt. of a salt of Cu, Cr or Ni (preferably  $\text{CuSO}_4$ ).

**Purifying water.** Otto Kammann. Ger. 590,170, Dec. 27, 1933 (Cl. 85b. 1.01). Drinking water is freed from Fe, Mn and free  $\text{CO}_2$  in one operation by passing it slowly through a tank in which it is treated simultaneously with finely divided compressed air introduced tangentially and with a heavy metal hydroxide or peroxide capable of adsorbing the sepd. Fe and Mn compds. For the latter purpose, a sludge contg. coarse  $\text{Fe}(\text{OH})_3$ ,  $\text{MnO}_2$ , and a little  $\text{Cu}(\text{OH})_2$  or  $\text{Ni}(\text{OH})_2$  is suitable.

**Purifying aqueous liquids by treatment with chlorine.** Georg Ornstein. U. S. 1,944,804, Jan. 23. An excess of Cl is added to a flowing stream of liquid such as water or sewage to be treated, and a stream of the liquid contg. the Cl is brought into contact with one electrode of a galvanic element; another stream of the liquid contg. the Cl is

dechlorinated and then brought into contact with the other electrode of a galvanic element, and the further addn. of Cl is regulated according to the difference of potential produced across the electrodes. App. and various details of operation are described.

**Heating and deaerating water.** George H. Gibson and Victor A. Rohlin (to Cochrane Corp.). U. S. 1,943,800, Jan. 16. Various details of app. and operation are described.

**Analysis of water.** Louis Friderich. Fr. 755,916, Dec. 1, 1933. Water which has been purified by oxidizing agents is tested for excess of oxidizing agent by the variation produced in the e. m. f. of a couple immersed in the water. The couple may comprise a pos. electrode of Zn and a neg. of Cu.

**Base-exchange substances.** "Mutosel" (Soc. anon. holding luxembourgeoise). Fr. 755,681, Nov. 28, 1933.

**Ground blast-furnace slag is used as starting material and is given an acid or alk. treatment, e. g., with an aq. soln. of  $\text{NaHSO}_4$ , or with  $\text{NaOH}$  at 400-500°, followed by a thorough washing and drying.**

**Zeolites.** General Zeolite Co. Ger. 588,740, Nov. 25, 1933 (Cl. 12i. 38.01). Jelly-like zeolites are obtained by mixing fine streams of concd. solns. of silicate and Al compds. and allowing the mixed stream to flow into a collecting vessel, where the product eventually appears.

**Treating feed water.** H. A. G. Gunnellus. Swed. 77,617, June 20, 1933. Ammonia is used at least for the final regulation of the alk. of the water.

**Several-way valve for regenerative water-filtering apparatus.** Aktiebolaget Filtrum (K. A. R. Johanson, inventor). Swed. 78,347, Sept. 12, 1933.

**Control system (operated by differences in electrical potential) for indicating and regulating the concentration of water- or sewage-purifying reagents such as chlorine** Georg Ornstein. U. S. 1,944,803, Jan. 23. Various details of app. and operation are described.

**Sterilizing liquids such as water or sewage by successive treatment with ammonia and chlorine.** Edward D. Ruth (to Howard J. Pardee). U. S. 1,943,487, Jan. 16. Liquid (which may be flowing through a pipe) is treated with  $\text{NH}_3$  (supplied in gaseous form) and after a predtd elapsed time is then treated with Cl. App. is described.

**Sewage water clarifying plant.** Rudolf Gessner. Ger. 588,757, Nov. 27, 1933 (Cl. 85c. 6.01).

**Septic tank apparatus for treating sewage.** Georg H. mann. Ger. 590,156, Dec. 27, 1933 (Cl. 85c. 6.05). Means for accelerating the digestion of the sludge is described.

**Apparatus for aerating liquids.** Activated Sludge Ltd., Ernest R. Jones, Arthur B. Denton and James A. Coombs. Brit. 400,940, Oct. 23, 1933. Divided on 397,841 (C. A. 28, 11269).

**Purifying air.** Deutsche Gasglühlicht-Auer-Ges. m. b. H. Ger. 590,072, Dec. 22, 1933 (Cl. 30i. 5.02). Air contaminated with  $\text{NH}_3$  or other volatile base is passed through a filter impregnated with an aliphatic hydroxy monocarboxylic acid, e. g., glycolic or lactic acid.

**Sterilizing air.** J. Doms. Belg. 396,748, July 31, 1933. The air is passed through a filter, the mass of which contains metals such as Ag or  $\text{AgCl}$ , and is brought into a storage tank where it is in contact with the same metals in a form having as large a surface as possible.

## 15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND K. D. JACOB

**Report of the agricultural chemist for 1932.** T. Eden. Tea Research Inst. Ceylon, *Bull.* 10, 42-7 (1933).—**Soils** that supported little or no growth of tea had  $p_H$  values of 7.06-7.31; within 7-10 months after application of 1000 lb. flowers of S per acre the  $p_H$  values were reduced to 5.00-6.61 and better growths of tea were obtained. **Fertilizer expts.**—Significant increases in the yields of tea were obtained by the application of N fertilizers at the rate of 20-40 lb. N/acre; the best results were obtained

with blood meal and  $(\text{NH}_4)_2\text{SO}_4$  and the poorest with com.  $\text{CaCN}_2$ ; K fertilizers had little or no effect. K. D. J.

**Gezira chemical section, G. A. R. S. Final report on experimental work in 1931-32.** H. Greene. Sudan Gov., Gezira Agr. Research Service., *Ann. Rept.* 1932, 75-92 (1933).—**Soil improvers.**—Significant increases in the yield of cotton were obtained by the application of  $\text{K}_2\text{SO}_4$  (2 tons/acre), gypsum (2 tons/acre) or  $\text{FeSO}_4$  ( $3\frac{1}{4}$  tons/acre), with and without  $(\text{NH}_4)_2\text{SO}_4$ ; S had little or no

effect. The treatments increased the penetration of water in the soil and also the incidence of leaf curl in the plants. *Phys. properties of soils.*—As compared with fallow soils, air-dry soils from cotton plots contained more moisture when exposed to the same atm. conditions, had greater sediment vols. after treatment with  $\text{Na}_2\text{CO}_3$  soln., were less alk. and gave higher values for Na uptake; no significant differences were found in capillary rise of paraffin, in salt content or in production of nitrate in the moist soils. Data are given on the seasonal variations in the nitrate content of soils in fallow and under cotton.

K. D. Jacob

Results of twenty years' complete soil fertility tests, Brookings, South Dakota. Joseph G. Hutton. S. Dak. Agr. Expt. Sta., *Bull.* 280, 3-19(1933).—Over 20 years' field expts. show that the application of P alone has increased the yield of crops by 32.08%, or 1979 lb. per acre per year over the yield from untreated soil. The P alone, added as superphosphate at the rate of 200 lb. per acre per year, has produced an increase of 74% in the total wt. of the red clover crop, including hay, straw and seed. P must be applied to S. Dak. soils if the fertility is to be maintained. The application of N and K, either singly or in combination, proved not to be economical. The expt. is being continued. Detailed data are presented.

C. R. Fellers

Organic matter and humus. F. Trawinski. *Ergras* 49, 15-17(1934).—A short history is given of the discovery of natural humus, followed by a description of some of the recent work on artificial humus, its prepn. and properties. An attempt is made to differentiate between the terms org. matter and humus by stating that humus is a colloidal dehydration product of certain org. matter. *Ibid.* 49-50.—A rather detailed discussion of the phys. and chem. properties of humus and the application of these properties to its use as a fertilizer. Enumeration of its advantages shows its great utility.

J. R. Adams

Functions of humus in orchard soils. R. E. Stephenson. Oregon State Hort. Soc., *Rept.* 47th Ann. Meeting 1932, 33-42.

K. D. Jacob

The exchangeable cations in the soil and the plant. K. K. Gedroiz. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 113, 3-13(1933).—A chernozem soil was satd. with the following cations: Li,  $\text{NH}_4$ , Na, K, Mg, Ca and H. The chlorides of the resp. cations were used until the soil was completely satd. with cations. The excess of chlorides was washed out with alc. The variously satd. soils were dispersed in a l. of water, decanted, and again dispersed in another l. of water. In the solns. detns. were made for humus, total dry matter, loss on ignition,  $\text{SiO}_2$  and  $\text{R}_2\text{O}_3$ . It was found that sol. humus and  $\text{R}_2\text{O}_3$  are the highest in the soils satd. with Li, Na, K,  $\text{NH}_4$ , Mg, Ca and H, in the order given. As to the  $\text{SiO}_2$ , the order remained the same except for the K soil, which gave a lower  $\text{SiO}_2$  content than with any of the other univalent cations. Addns. of  $\text{CaCO}_3$  to the suspensions decreased the yield of humus and other constituents; especially was this noted with the  $\text{NH}_4$  soil. Soils satd. with Cd and Ni did not produce a crop of flax or oats. Expts. with  $\text{NH}_4$ -satd. soils show that in this particular soil adsorbed  $\text{NH}_4$  may serve as a splendid source of N for oats.

J. S. Joffe

Effect of cover crops on the soil solution at different depths under orchard conditions. E. L. Proebsting. *Hilgardia* 7, 553-84(1933); cf. C. A. 24, 5094.—Analyses of soil solns. displaced from 0-2, 2-4, 4-6 and 6-8 ft. samples in peach, apricot, pear and prune orchards given differential cover crop treatment confirm previously reported results as regards the 0-2 and 2-4 ft. samples. The nitrate concn. of the 4-6 and 6-8 ft. depths under peaches and apricots is higher than that under pears and prunes, in contrast to the opposite situation in the surface 4 ft. The nitrate concn. in the 4-6 and 6-8 ft. samples is greatly reduced under alfalfa and winter cover crops as compared with clean cultivated check plots. Plowing under alfalfa increased the nitrate concn. markedly in the surface 4 ft. but had little effect below that depth. Reseeding caused a reduction of nitrate to about the former level. The sulfate concn. under peaches and apricots is

higher in the 4-6 and 6-8 ft. samples than that under pears and prunes. The max. sulfate concn. is normally in the 4-6 ft. layer. In spite of addns. of sulfate by irrigation water the sulfate concn. of the soil soln. remained practically unchanged during a 5-7 yr. period. The bicarbonate concn. is higher in the 4-6 and 6-8 ft. levels than in the surface samples; it is also higher under alfalfa and winter cover crops than in uncropped controls. Max. Cl concn. is at the 6-8 ft. level, and is higher under peaches and apricots than under pears and prunes. Cl is also lower under alfalfa than under clean cultivation. The phosphate concn. is higher in surface than in deeper samples, with a min. at 4-6 ft. Ca concn. varies in a manner analogous to nitrate. The Mg concn. parallels that of Ca except that it is lower in the 0-2 ft. level, and higher in the 6-8 ft. level. The K concn. decreases with depth.

C. R. Fellers

Effects of soil reaction. F. Munter. *Landw. Wochschr.* 89, 552-4(1931).—The influence of various fertilizers on soils of varying  $\text{pH}$  is recorded. The Ca present in certain N fertilizers and in basic slag and Khenania phosphate is insufficient to have any appreciable effect on soil reaction. In soils of different type but similar  $\text{pH}$  plant injury due to acidity varied considerably in extent. On acid soils cultivated plants were frequently unable to form nutrient-assimilating roots. The starch content of potatoes on acid soils was increased by applications of  $\text{CaO}$ .

B. C. A.

Oxides of manganese and the quinhydrone error in measurements of soil reaction. E. M. Crowther and S. G. Heintze. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930* 2, 1-6(1933)(in English).—Further studies on the causes of errors in measurement of soil  $\text{pH}$  by the quinhydrone method (cf. C. A. 24, 4571) indicate that reduction of higher oxides of Mn to  $\text{MnO}$  and the activity of the latter as a base are the principal sources of error. The simultaneous change in the ratio quinone:hydroquinone is a partially compensatory error of much less importance, except with alk. soils, in which case autooxidation of hydroquinone to quinone and probably other products is catalyzed by Mn. C. J. Schollnberger

Comparative investigations on various methods for measuring soil  $\text{pH}$ . B. P. Nikolskii. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930* 2, 7-16(1933)(in German).—Tabulated data with a very brief discussion of results obtained on 8 soils varying in humus content and texture, by means of (I) the Haber glass electrode, (II) the same with streaming  $\text{H}_2$ , (III) the Hildebrand  $\text{H}_2$  electrode, (IV) the quinhydrone electrode with quinhydrone specially synthesized, the first potential reading, (V) the same, with further addn. of quinhydrone until potential was const., (VI) Merck's quinhydrone, the first reading, (VII) the same, with further addn. of quinhydrone to const. potential, (VIII) Sb electrode prepd. by electrodeposition from  $\text{Me}_2\text{CO}$  upon amalgamated Pt wire, and the following colorimetric methods: (IX) Universal indicator "Selkhosgiz," (X) technic of Michaelis and (XI) Clark. The measurements were on both  $\text{H}_2\text{O}$  and N KCl exts. of soil, ratio 1:2.5, prepd. by shaking for 2 hrs., letting stand overnight, again shaking and letting stand  $\frac{1}{2}$  hr. Most of the partly settled suspension was then poured off. A part was tested as "suspension" (a), and another portion centrifuged (b) for application of colorimetric as well as electrometric methods. The remainder of the original suspension was tested as "mud" (c). I furnished closely reproducible indications on suspensions a and c, and is believed to be the most accurate method. With centrifugate b, agreement was better with KCl than with aq. exts., the former being more acid and better buffered. II indicated higher  $\text{pH}$  values except with an acid peat and a chestnut brown soil contg.  $\text{CaCO}_3$ , in consequence of removal of  $\text{CO}_2$  by streaming  $\text{H}_2$ . III was satisfactory in only a few cases, no doubt for the reason mentioned. IV, V, VI and VII furnished good indications with some soils, but were subject to grave errors with others. With the last, the observations of Heintze and Crowther (cf. C. A. 24, 4571 and preceding abstr.) as to the effects of

MnO<sub>2</sub> were confirmed. The data do not indicate much advantage in using specially prepd. rather than com. quinihydrone. With soils permitting good measurements of  $p_H$  by the quinihydrone method, the apparent equilibrium potential is the more accurate. In general, quinihydrone indications with the lighter suspension were better than those with the heavier c, and the use of centrifugate b was best with "bad" soils. With "good" soils, b was inferior because inadequately buffered. Indications of VIII were quite satisfactory, although it appears to be subject to errors from suspended solids and salts, not adequately investigated. With centrifugates from peat soils, it was more satisfactory than methods in which quinihydrone was used. Of the colorimetric methods, IX is insensitive, although in practice almost as good as X and XI. In general, these were unsatisfactory, for the reason that they can be applied only to clear exts., insufficiently buffered to resist change in  $p_H$  from acids of indicators. With any method for detg.  $p_H$  of soil, it is advantageous to operate with as narrow a soil:soln. ratio as possible, to secure max. buffering. Clear exts. are very poorly buffered as compared with soil suspensions.

C. J. Schollenberger

$p_H$  or reaction of soils. F. Trawinski. *Engrais* 48, 753-5(1933).—A detailed description of the chemistry of the  $p_H$  of soils from the practical viewpoint, its terminology and its use in detg. the soils best fitted for various crops. A table is given which lists 16 different plants and the  $p_H$  range of the soil in which they give the best yields.

J. R. Adams

The estimation of  $p_H$  values with the antimony electrode. J. Di Gleria. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930* 2, 17-19(1933)(in German).—The prepn. of an Sb electrode by electrodeposition from a soln. of tartar emetic and Na<sub>2</sub>S upon a base of Sn-plated Cu is described, and the potentials of the same in buffers,  $p_H$  3.0-10.2 by steps of 0.4, are tabulated. The e. m. f.- $p_H$  relation is not strictly linear nor in exact agreement with the Nernst equation, but indications with 20 soils checked well and agreed with those of the quinihydrone electrode up to  $p_H$  8.5, above which the latter is known to be unreliable. The Sb electrode is recommended for soil  $p_H$  work, especially for alk. soils.

C. J. Schollenberger

Some notes on Kappen's method. D. J. Hissink. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930* 2, 20-4(1933)(in German).—Kappen's method for unsatn. (cf. C. A. 24, 1093) was modified by substituting leaching with Ca(OAc)<sub>2</sub> soln. for shaking and filtration without improvement. Results from a procedure in which soil and soln. were in contact overnight and the size of the soil sample was so regulated that as nearly as possible 10 ml. 0.1 N NaOH was required in titrating 50 ml. of the filtrate, which conditions were found to correspond to a CaO absorption resulting in a  $p_H$  of about 6.5 in the residual soil, were higher and bore a more const. relation (factor 1.5 ± 0.1) to the CaO absorption necessary to take the soil to  $p_H$  7.0 in an electrometric titration with Ca(OH)<sub>2</sub>. These higher figures are believed to approximate the quantity of CaO necessary for amelioration of phys. condition as well as neutralization of heavy clay soils.

C. J. Schollenberger

Influence of rain on soil reaction. A. Salminen. *Acta Chem. Fennica* 6B, 60(1933).—Rainfall under warm summer conditions increased the  $p_H$  of soil at all depths to 25 cm. Later in the season on well-fertilized soil the effect was reversed.

B. C. A.

The use of indicators for the qualitative determination of soil reaction. Horace J. Harper. *Soil Sci.* 36, 451-63(1933).—Filtrates of indicators passing through different soils do not show the same  $p_H$  values as electrometric measurements of the same soil samples. A variation in the concn. of the indicators also affects the results. A decrease in  $p_H$  value occurs when the concn. of an indicator is increased and vice versa. When soils are mixed with indicator solns. and filtered the  $p_H$  values are more acid than when suspensions are used except in very acid soils. Bromothymol blue and bromocresol green are absorbed to a greater extent by soil than bromocresol purple,

1 chlorophenol red or cresol red. A qual. indicator method for soil reaction is proposed in which 0.04% bromocresol purple soln. is used in 16% alc. The soln. is added to soil on Al foil. From the color of a drop passing through the soil,  $p_H$  values are arranged in 5 groups ranging from 5.4 to 7.5.

M. S. Anderson

Effect of soil reaction on the growth of the potato. O. Smith. *Am. Potato J.* 10, 115-21(1933); cf. C. A. 27, 5881.—Potatoes were grown on soils in which the  $p_H$  values were varied from 4.68 to 7.45 by addn. of H<sub>2</sub>SO<sub>4</sub> or hydrated lime. The total yields were reduced on soil of  $p_H$  4.68-4.90 but there were no significant differences in yields on soils of  $p_H$  6.08-7.45. The best yields of U. S. grade No. 1 tubers were obtained on the most alk. soil. The largest no. of scabby potatoes occurred on soils of  $p_H$  6.08-6.51, the no. decreasing at higher and lower  $p_H$  values. Marketable tubers grown at  $p_H$  5.64-6.05 contained more dry matter than did those grown at higher or lower soil reactions. Preliminary tests indicated that immature tubers and tubers grown at  $p_H$  7.16-7.45 showed sloughing off of the outer layers during boiling than do mature tubers or those grown at  $p_H$  5.64-6.05.

K. D. Jacob

Influence of the reaction of peat and mineral soils on the development of potatoes. B. Swietochowski. *Polish Agr. Forestal Ann.* 27, 385-412(411 12 in German) (1932).—Pot expts. gave the following results: Any change of the soil acidity has only a small effect on the juice of potato leaves, but the vegetation period of the plants is lengthened with rising  $p_H$  of the soil, this effect being more pronounced on peat soils. Max. crops of tubers and dry substance are obtained on mineral soil in the neutral region, on peat in slightly acidic soils (to  $p_H$  4.6). In mineral soil an acidity of  $p_H$  3.6 is already prohibitive, while in peat soils the plants develop normally at  $p_H$  3.6, yielding a lower crop. On the alk. side no limiting  $p_H$  is observed. The acidity of the soil also influences the quality of potatoes. The no. of tubers as well as the amt of starch and dry substance increase with rising  $p_H$  of the soil.

J. Wiertelak

A modification of the barium hydroxide method for determining exchangeable hydrogen. H. Grenc. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930* 2, 23-7(1933)(in English).—In "Sigmund's and Di Gleria's" conductometric titration of soil with Ba(OH)<sub>2</sub>, based on the original method of Hissink (cf. C. A. 19, 3337) for detg. unsatn., many addns. of reagent and readings are necessary for plotting the curve. G. points out that increase in cond. of the soil mixt. is almost entirely due to unabsorbed Ba(OH)<sub>2</sub>, and over most of their courses the curves are the same as those of a Ba(OH)<sub>2</sub> soln. increasing in concn. If a plot is prepd with g. Ba(OH)<sub>2</sub> in soln with corresponding conductivities at const. vol. on the x axis, and g. Ba(OH)<sub>2</sub> added on the y axis, and sufficient Ba(OH)<sub>2</sub> added to bring the cond. into the region where the slope of the curve is 1, a single reading will furnish a fairly accurate indication for H in the sample. A line with slope 1 is drawn through the point and a value for Ba(OH)<sub>2</sub> in soln. read at the intercept with the x axis. The difference between this value and Ba(OH)<sub>2</sub> added represents the H equiv. For several Gezira soils, satisfactory results were obtained with 5 g. soil and 10 ml. 2.5% Ba(OH)<sub>2</sub>, but the method is not applicable to all soils.

C. J. S.

The acetic acid method for the determination of exchangeable bases in carbonate-free soils. Rice Williams. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930* 2, 28-33(1933)(in English).—Advantages of the HOAc extn. procedure for detn. of all exchangeable bases, as well as for Ca previously noted (cf. C. A. 23, 2234), are reviewed. The method of extn. consists in stirring 25 g. soil with 200 ml. 0.5 N HOAc occasionally for 2 hrs., then filtering and washing with the same to a total vol. of 1 l. Ca and Mg are detd. in 500 ml. by the usual methods. The remainder is evapd. to dryness and ignited to convert acetates to carbonates, redissolved in 20 ml. 0.5 N HCl and titrated for total exchangeable bases (S-2224); this figure does not include H<sub>2</sub>O-sol. salts, sometimes of significance in

humid soils and necessitating laborious corrections with other methods of detn. K and Na may be detd. also (cf. C. A. 24, 5912). Data on exchangeable bases detd. by this H<sub>2</sub>OAc method and N NaCl and NH<sub>4</sub>Cl extn. were in good agreement.

C. J. Schoellenberger  
Base saturation in soils as measured by the soil-calcium carbonate-air equilibrium. Richard Bradfield and W. H. Allison. Ohio Agr. Expt. Sta., 50th Ann. Rept. Bull. 497, 47-8(1932).—As evidence that a true equilibrium has been reached, the amt. of Ca fixed by a soil is the same whether the Ca is added as CaCO<sub>3</sub> or Ca(OH)<sub>2</sub>, or whether the equil. is approached from the acid side by passing an excess of CO<sub>2</sub> and then removing the excess with air, or from the alk. side by the gradual conversion of the excess Ca(OH)<sub>2</sub> into CaCO<sub>3</sub> by the CO<sub>2</sub> of the air. That true satn. is obtained is shown by the fact that the amt. of Ca fixed by the soil is independent of the amt. of the excess added. The p<sub>H</sub> values of soils brought into equil. with an excess of CaCO<sub>3</sub> and air are fairly const., varying from 8.2 to 8.4. The sp. cond. of a series of acid soils increased from 5 to 10 times as a result of the carbonate treatment. The carbonated soils in a 1:5 suspension had sp. cond. ranging from 2.3 to 5.1 × 10<sup>-4</sup> mho at 25°. An increased Ca concn. brings the colloidal particles to the crit. potential with resultant flocculation.

C. R. Fellers  
The relation of the nitrifying capacity of soils to the availability of ammonia and nitrates. G. S. Fraps and A. J. Sterges. Soil Sci. 36, 465-70(1933); cf. C. A. 27, 1646.—Nitrate N was on an av. 5.4% more available than ammonia N in soils of high nitrifying capacity and 1% more available than ammonia N in soils of low nitrifying capacity. There is no evidence of a regular relation between availability of nitric N or of ammonia N and the nitrifying capacity of soils. The availability of N in cottonseed meal is lower than that of either NaNO<sub>3</sub> or (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>. There is no relation between the availability of N in cottonseed and the nitrifying capacity of soils. The nitrifying capacity of soils is somewhat increased by cropping and the addn. of fertilizers.

M. S. A.  
Lysimeter investigations. III. Mineral and water relations and final nitrogen balance in legume and non-legume crop rotations for a period of 16 years. R. C. Collison, H. G. Beattie and J. D. Harlan. N. Y. Agr. Expt. Sta., Tech. Bull. 212, 5-81(1933); cf. C. A. 26, 6047.—A final report of these well-known expts. is given. A detailed discussion is given of the influence of the various crops upon subsequent crops, the effect of the addn. of various fertilizers and the removal of elements in the drainage water. Large quantities of N were lost in drainage water, only a small amt. of K and practically no P. The ratio of Ca removal in drainage to that in crops was nearly 1:1 for alfalfa-grain rotations, but as wide as 8:1 for timothy-grain rotations. The presence of sol. N in the soil increased loss of Ca through drainage. Applications of 2200 lb. of CaCO<sub>3</sub> to the Ca-deficient hill soil every 4 years was ample to maintain the soil Ca. In the hill soils the Ca concn. in the drainage water averaged 47 p. p. m., and in the Ontario loam, 91 p. p. m. The quantity of Mg in the drainage was 1/5-1/3 that of Ca. P removed from the soils was lost entirely through crop removal. Applications of 560 lb. of 16% superphosphate per acre in the odd years for 16 years resulted in just balancing P removal from soils in alfalfa-grain rotations, and increasing P somewhat in soils in timothy-grain rotations. The depth of the soil column has little to do with P removal. From the hill soil the largest amt. of bases lost consisted of sulfates, followed by chlorides and bicarbonates. However, from the Ontario loam, greatest base loss occurred as bicarbonates, followed by sulfates and chlorides. Tanks which maintained a high N level or to which N was applied lost much less S, indications that the bases combined with the nitrate ion and conserved the sulfate ion. Enough S was added as pptn. to make up for the S lost in drainage. The same is largely true of chlorides. In the 8-ft. tanks, it appears that some of the N, K and Ca which was already present in the soil below 2 ft., or which was leached to lower levels, becomes available to shallow-rooted plants, probably through capillary

forces. Such interchange is considered relatively unimportant.

C. R. Fellers  
Effects of acidifying amendments on impermeable soils. C. W. Botkin. New Mex. Agr. Expt. Sta., Tech. Bull. 210, 2-18(1933).—Poor soils of the Gila clay loam type were treated with CaSO<sub>4</sub>, FeSO<sub>4</sub>, Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>, S, (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, NaNO<sub>3</sub>, manure and superphosphate annually for 3 years. In the 4th year, the soils were deeply subsoiled and planted to cotton with 16 in. of irrigation water. The soils remained dry under the 20 in. horizon. No increases in yield of cotton were found in any case. Most of the amendments decreased the percentage of sol. alkali salts in the soil in the 0-8-in. horizon, and decidedly improved the soil permeability in this horizon. There was no effect at lower horizons. CaSO<sub>4</sub>, as gypsum, was the cheapest amendment, and was most effective in replacing Na in soil. The low permeability of these soils is caused by the high content of replaceable Na in the upper horizon and by a hardpan formed largely by cementing Ca compds. in the lower levels.

C. R. Fellers  
Influence of method of irrigation on the nutrient status of soil and yield of cotton. F. Celtzer. Arb. allruss Forschingsinst. Baumwollbau (Taschkent) 43, 34 (1931); cf. Pedology (U. S. S. R.) 27, 91-102(1932).—Infiltration methods are preferable to surface flooding, since soil structure is less impaired, permeability of soil is greater, and the enrichment with CO<sub>2</sub> of air immediately above the soil surface is considerable. Poorer nitrate accumulation after flooding is ascribed to the lowered activity of the organisms and to denitrification.

B. C. A.  
The effects of thallium sulfate upon soils. A. S. Crafts. Science 79, 62(1934).—In equimol. concns. Tl<sub>2</sub>SO<sub>4</sub> was many times as toxic as As<sub>2</sub>O<sub>3</sub> and NaClO<sub>3</sub>. It was strongly fixed in all soils and its toxicity remained unchanged through 3 successive croppings. Tl-treated grain, used in rodent control, showed very little effect on adjacent plants. The loss of agriculturally valuable land through sterilization by the Tl compds. used in the proper amt. for rodent control seems remote.

J. R. Adams  
Fatigue of soils planted in alfalfa. A. Demolon and A. Duncz. J. agr. prat. 98, 29-30(1934); cf. C. A. 28, 1444.

J. R. Adams  
Relationship between soil and associated plants in the Czerwone Wierchy and Bielskie Tatry districts (Tatra Mountains). J. Wlodek, K. Strzemiencki and E. Ralski. Bull. intern. acad. polonaise, Classe sci. math. nat. 1931B, 1, 103-22.—*Versicoloretum Tatricum* and *Trifidistichetum* grow in a soil richer in humus than that required by *Disticho-Versicoloretum*; the first-named requires a soil richer in Ca than the 2 last. All the plants examd. grow in soils which have a reaction varying from strongly acid to mildly alk. (p<sub>H</sub> 3.7-7.1). *Festuca versicolor* and *Sesleria bielsii* require a soil with relatively high Ca content, in contrast to *Juncus trifidus* and *Sesleria disticha*.

B. C. A.  
The distillation method for determining the combined water and organic matter in soils. G. J. Bouyoucos. Soil Sci. 36, 471-84(1933); cf. C. A. 27, 547.—Further work is presented on the distn. method for the detn. of combined water and org. matter in soils. The original app. is modified and improved. Water added to soil is accurately recovered by this process. The distn. is carried out at 900°. At this temp. soils lose all of their H<sub>2</sub>O in 30 min. The vol. of H<sub>2</sub>O coming off is measured directly and the org. matter calcd. by deducting the wt. of H<sub>2</sub>O from the ignition loss. Detns. are made on a large no. of soils of widely varying character. A comparison is made of org. matter content by this method and by the combustion method (multiplying the CO<sub>2</sub> evolved by the factor 0.471). There is fair agreement between the 2 methods. Muck and peat show high combined H<sub>2</sub>O contents. Clay soils contain more combined H<sub>2</sub>O than do soils of coarser texture. There is no close consistent relationship between clay content and combined H<sub>2</sub>O in the various soils. It is thought that the H<sub>2</sub>O of org. matter can be regarded as combined H<sub>2</sub>O, just as in the inorg. soil material.

M. S. Anderson

Nitrate nitrogen present in two soil types under various treatments. A. O. Allen, B. G. Sitton Rulon, D. Lewis and J. L. Pelham. Nat. Pecan Assoc., *Rept. Proc. 31st Ann. Convention* 1932, 46-9.—After the application of 1500 lb./acre of a 6-8-6 fertilizer, contg.  $\text{NaNO}_3$ ,  $(\text{NH}_4)_2\text{SO}_4$ , and cottonseed meal, to an alluvial Yahola soil in February, the nitrate N in the 1st 3 in. of soil increased to a max. in approx. 2 months. One month after application of the fertilizer the 18-24 in. horizon contained 3.33 p. p. m. of nitrate N, as compared with 1.5 p. p. m. in the same horizon of the unfertilized soil; after 2 months this horizon contained only traces of nitrate. Similar results were obtained on an Orangeburg fine sandy loam, except that in the unfertilized soil nitrate was present in more than traces only in the top 3-in. layer. Clean cultivation increased the nitrate content of both fertilized and unfertilized soils, whereas green-manure crops caused a temporary reduction in soil nitrates but were highly beneficial after they were turned under and allowed to decompose.

K. D. Jacob  
Polar adsorption or adsorption by interchange in soil. II. O. Bottini. *Ann. chim. applicata* 23, 474-83 (1933); cf. C. A. 27, 4866.—A soil having 1 exchangeable cation (Na) was placed in contact with solns. contg. 2 salts having the same anion ( $\text{Cl}$ ). The cation couples studied were K,  $\text{NH}_4$ , Mg, Ca in all their combinations. The total adsorption of cations, except Ca-Mg, was about the same for all the cations, and the values were very close to the values for the adsorption of a soln. of similar concn. having a single cation. The ratio of the 2 cations adsorbed depends on their nature and concn.

A. W. Conti  
Grades of peat and muck for soil improvement. A. P. Dachnowski-Stokes. U. S. Dept. Agr., *Circ.* 290, 1-30 (1933); cf. C. A. 27, 4616.—The characteristic phys. properties and chem. compn. of the main classes of peat are described and the possibilities of several different kinds of peat for improving sp. conditions of a mineral soil are outlined. A light-colored poorly decompd. fibrous moss, reed or sedge peat is most effective in improving unfavorable structural properties of a soil, in increasing its water-holding capacity and in releasing sol. salts and nutrients during decompn. Peat and muck that have been dried artificially or chaired are relatively less suitable grades of org. material because of their greatly reduced capacity to retain water.

W. H. Ross  
Subterranean clover, with special reference to its value on soils of relatively low fertility. J. N. Whittet. *Agr. Gas. N. S. Wales* 44, 717-23 (1933).—Good growth of subterranean clover (*Trifolium subterraneum*) was obtained on soils of  $\text{pH}$  4.3-7.6 and contg. 0.061-0.174% and 0.0013-0.0051%, resp., of CaO and  $\text{P}_2\text{O}_5$  sol. in 1% citric acid.

K. D. Jacob  
Investigations on lime requirement of soils by laboratory methods and fertilizer trials. O. Lemmermann, et al. *Z. Pflanzenernahr. Dungung Bodenk.*, Beiheft 2, 463 pp. (1933).—Soils not responsive to liming had exchange acidity (Daikuhara, KCl) of 0.1-1.4 ml. and hydrolytic acidity (Kappen,  $\text{Ca}(\text{OAc})_2$ ) of 0.5-12.1 ml. With light to medium soils poor in humus, the methods of Daikuhara, Goy ( $\text{pH}$  5.5), Tacke-Arnd and Gehring (degree of satn. = 40%) are in substantial agreement, and liming according to their indications is sufficient for non-acid-sensitive crops. Similarly, the methods which det. hydrolytic acidity, Goy ( $\text{pH}$  7.7) and Gehring (degree of satn. = 70%), give concordant indications and are best adapted to use with heavy soils, and liming accordingly is required for acid-sensitive crops. None of the methods tested is very reliable for highly acid humus sand and peat soils, although the Tacke-Arnd method is satisfactory for humus loam soils. Detn. of degree of satn. by the Kappen and Gehring procedures is generally unsatisfactory, as shown by frequent lack of concordance and the indications of vegetation tests. Indications for lime requirement obtained in pot expts. are likely to be lower than opt. field applications, because distribution of the latter is inferior. Chem. methods in general do not take into account improvement in phys. condition of heavy soils resulting from adequate liming. Finely ground limestone

and equiv. burned lime had practically equal effects, although in some instances the latter was more effective the first season. Some of the collaborators comment upon variation in apparent opt.  $\text{pH}$  for a particular crop on different soils, while others consider  $\text{pH}$  an unsafe guide for need of liming.

C. J. Schollenberger  
The potassium-lime problem in soils. Hans Jenny and E. R. Shade. *J. Am. Soc. Agron.* 26, 162-70 (1934)  
A study of the K-clay- $\text{CaCO}_3$  interchange with purified soil colloids, permutites and natural and artificial soils, reveals that in all systems investigated  $\text{CaO}$  liberates adsorbed K in large quantities. Pronounced exchange takes place in the presence of such anions as  $\text{Cl}$ ,  $\text{SO}_4$ ,  $\text{CO}_3$ ,  $\text{HCO}_3$ ,  $\text{OH}$  and  $\text{PO}_4$ .  $\text{H}_2\text{CO}_3$  liberates considerable amt. of absorbed K because of the large no. of Ca ions resulting from the formation of  $\text{Ca}(\text{HCO}_3)_2$ . In the presence of absorbed H ions the replacement of K by  $\text{CaCO}_3$  is intensified, provided the resulting partial  $\text{CO}_2$  pressure approaches that of soil air. Microorganisms reduce the leaching of K as compared with sterile systems and this reduction is most pronounced in the presence of  $\text{CaCO}_3$ . Under certain conditions of K level and microbiol. conditions the addn. of  $\text{CaCO}_3$  may actually cause a reduction of the K content of the soil soln. below the value of the unlimed soil. This is attributed to biol. reabsorption of K and ionic exchange impedance.

J. R. Adams  
Influence of the absolute reaction of the soil solution upon the growth and activity of *Azotobacter*. P. L. Gainey. *Kan. Agr. Expt. Sta., 6th Biennial Rept.* 1932, 28-9; cf. C. A. 27, 2749.—A 10. Director Dec., 1932, conditions in wheat fields is summarized. The soil of these spots is supplying much more available N than the surrounding soil, for even though the growing plants remove 4.7 times as much N from the soil from the spot, this soil still contains 3.8 times as much nitrate N. Nitrate N was accumulated 3.6 times as fast in the soil of spots. The soil of spots showed an av. 230 lb. per acre more N than surrounding soils. The spots were produced by adding sol. N fertilizers to wheat soils. These spots are identical with the naturally occurring spots. The role of *Azotobacter* in the formation of these spots is not conclusive. There were no differences in the nitrifying bacteria of spots and of the surrounding soils.

C. R. Fellers  
Chemical composition of pasture grasses in Vermont. J. A. Newlander, C. H. Jones and H. B. Ellenberger. *Vt. Agr. Expt. Sta., Bull.* 362, 2-18 (1933); cf. C. A. 27, 1059.—Eighty-six samples of grass gathered from representative Vt. pastures showed Ca contents of 0.282-1.7 averaging 0.825; P contents 0.155-0.573, averaging 0.36%; and Ca:P ratios which averaged 2.72:1. Oth. av. results were crude protein 18.34, crude fiber 20.5 N-free ext. 45.99 and  $\text{Et}_2\text{O}$  ext. 2.62. The av. digestil. crude protein (calcd.) and total digestible nutrients were resp., 14 and 67.5%, the nutritive ratio being 1:3. Vt. grasses are abundantly supplied with minerals. More frequent the cuttings of pasture grasses, the higher were the percentages of Ca and P which they contain. Frequent cutting or reasonably close grazing is recommended.

C. R. Feller  
The meadow and pasture soils of the Rhine Palatinate relative to their contents of nutrient substances, particularly phosphoric acid. M. Kling and O. Enj. *Phosphorsäure* 4, 43-51 (1934).—In 91 samples of soil the root-sol.  $\text{P}_2\text{O}_5$  (Neubauer method) ranged 1.05 to 10.7 mg. per 100 g. dry soil; 47% of the soil contained less than 4.0 mg.; the content of root-sol. ranged from 14.9 to over 50.0 mg. Approx. 50% of samples were deficient in Ca. In general, the soil was richer in Ca and poorer in root-sol.  $\text{P}_2\text{O}_5$  and than the surface soils.

K. D. Jacob  
Improving clover-grass hays. R. Thun. *Dtsch. L. Presse* 60, 285, 296 (1933).—In hay contg. less than clover, increasing the N in the fertilizer from 0 kg./ha. caused a decrease in the percentage of clover-grass hay from 31.7 to 15.0% and a decrease crude protein from 9.80 to 8.12%. The total yi. dry matter and crude protein was increased. I

contg. more than 50% of clover, the reduction in percentage of clover and crude protein as the N in the fertilizer was increased was greater than in those hays contg. less than 50% of clover, and no increase in yield of dry matter was obtained. For hays contg. less than 50% of clover, an application of 20 kg./ha. of N gave the most economical results. Liming the soil increased the  $pH$  from 4.8 to 5.6 and increased the amt. of clover in the hay from 20 to 48%.

K. C. Beeson

The decomposition of peat under aerobic conditions. I. A. Makrinov. *Zentr. Bakt. Parasitenk.*, 2 Abt., 89, 201-9 (1933).—With a large amt. of moisture and air, peat develops a wide variety of soil bacteria with a high degree of activity. Within 10-15 days at 11-12° there are marked changes in chem. constitution. J. T. M.

Plant physiology section, G. A. R. S. Final report on experimental work 1931-32. F. Crowther. Sudan Gov., Gezira Agr. Research Service, *Ann. Rept.* 1932, 56-74 (1933).—The N content of cotton leaves decreased from 4.8-5.0% at germination to approx. 3.2-3.7% in 90 days after sowing the seed; the decrease was more rapid in leaves from seed sowed early in the season than in those from late-sowed seed. The low N levels of early sowings were assoc. with low growth rates. Optimum date for applying  $(NH_4)_2SO_4$ .—With seed planted in Aug. and Sept. the highest yields of cotton were obtained when the  $(NH_4)_2SO_4$  was applied about 6 weeks after sowing; with July plantings application of the  $(NH_4)_2SO_4$  approx. 15 days before sowing gave the best results. The optimum date for application of  $(NH_4)_2SO_4$  was intimately related to the N supply of the soil. Activity of soil microorganisms.

As measured by the evolution of  $CO_2$ , soils receiving no fertilizers or soil amendments showed the greatest activity of the microorganisms, followed in order by those receiving  $(NH_4)_2SO_4$ , farmyard manure, gypsum, and  $(NH_4)_2SO_4$  and gypsum, resp. The highest concns. of nitrates occurred in soils receiving  $(NH_4)_2SO_4$  and the lowest in those receiving farmyard manure. Denitrifying organisms caused rapid disappearance of nitrates added to Gezira soils; the soils were well supplied with N-fixing bacteria, principally *Azotobacter*. Leguminous crops.—Nodulized dry roots of jack bean, addis and *pis* contained 1.66, 0.77 and 0.62% N, resp.

K. D. Jacob

Phosphorus in soil and the phosphorus content as influenced by phosphorus applications to G. Weidemann. *J. Am. Soc. Agron.* 26, 170-8 (1934).—Various rates of application of  $P_2O_5$  were made in quantities of N and  $K_2O$  on soil which was somewhat readily available  $P_2O_5$ . About 400 lb. of superphosphate per acre was required to produce a 1% increase in the amt. of readily available  $P_2O_5$  in soil. There was no consistent increase in yield of the crops grown as a result of applications of P in N and  $K_2O$ . The increases in  $P_2O_5$  content of any, due to  $P_2O_5$  applications to the soil were usually inconsistent. There were, in some very noticeable but inconsistent increases in  $P_2O_5$  of chaff and straw due to these treatments. It is more advisable to add  $P_2O_5$  directly to the animals, where needed, through the use of bone meal or other carrier rather than to try to increase content of grain through the application of  $P_2O_5$ , since the increases in  $P_2O_5$  obtained in this way are not in the grain but in the portion of the plant normally used as feed.

J. R. Adams

Seasonal variation of lime and phosphoric acid in pastures. A. C. Roy and K. C. Sen. *Ag. India* 3, 437-47 (1933).—A study was made of 10 of the grasses of pastures situated at an av. of 7000 ft. above sea level in the Kurmaun district. With the growth of the plants and in-rainfall, the percentages of Ca and P increased in Sept. or Oct. The amt. of P then decreased with the approach of winter and dry conditions marked decrease in Ca occurred. Drought decreased P content more than the Ca content, but after

the rainy season the mixed herbage contained almost the same amts. of CaO and  $P_2O_5$ .

K. D. Jacob

Further experiments with Nitrophoska. Tobacco Substation Windsor Rept. 1932. T. R. Swaback, O. E. Street and P. J. Anderson. *Conn. Agr. Expt. Sta., Bul.* 350, 478-9 (1933).—The fertilizer contained N 16.3,  $P_2O_5$  16.3 and  $K_2O$  20%. Plots fertilized with Nitrophoska produced tobacco of consistently lower grade than other plots fertilized with standard fertilizer mixes. Approx. 80% of the N for tobacco should be from an org. source. Slightly lower yields were also assoc. with the use of Nitrophoska.

C. R. Fellers

The fixation of phosphates by clay soils. G. D. Scarseth and J. W. Tidmore. *J. Am. Soc. Agron.* 26, 152-62 (1934).—Max. plant response to phosphate fertilization on highly colloidal acid and calcareous soils was not obtained until the applications of the phosphates were equiv. to 1800 and 2000 lb. of superphosphate per 2 million lb. of soil, resp. The efficiency, measured by plant response, of the various phosphates decreased rapidly with the time of contact with the soil. In the acid soil,  $CaH_2(PO_4)_2$  was slightly more available than  $CaH_4(PO_4)_2$ . The relative efficiencies for  $CaH_2(PO_4)_2$ ,  $Ca_4(PO_4)_2$ ,  $NH_4H_2PO_4$ , ferric phosphates, and superphosphate were 100, 57, 110, 25 and 117, resp.  $CaCO_3$  greatly decreased the availability of readily sol. phosphates and the crop yield when applied immediately before planting to the acid clay soil, whereas after equil. was established and  $CaCO_3$  was no longer present in the soil the availability of the phosphates increased, as shown by the yield of sorghum.  $CaCO_3$  decreased the availability of  $Ca_2(PO_4)_2$  as measured by plant growth. In general, the more sol. the phosphate used, the more rapid was the rate of fixation. Relatively insol. phosphates were fixed slowly but were inefficient in supplying available P to the plants.

J. R. Adams

The fixation of phosphates by soil colloids. G. D. Scarseth and J. W. Tidmore. *J. Am. Soc. Agron.* 26, 138-51 (1934).—The amt. of available phosphate in soil colloids varied directly with the  $SiO_2$ -sesquioxide ratio of the colloid. The native phosphate in soil colloids was about as sol. in H-satd. as in Ca-satd. colloids, but it was most sol. in Ca-supersatd. colloids. The phosphate-fixing capacity of soil colloids varied inversely with the  $SiO_2$ -sesquioxide ratio of the colloid. In the least weathered colloid the concn. of  $PO_4$  ions brought into soln. by 0.05 N  $H_2SO_4$  at  $pH$  3.0 was considerably decreased on standing for 16 hrs. The concn. of  $PO_4$  ions was not decreased on standing 16 hrs. in contact with a 0.1 N  $H_2SO_4$  soln. Fixation of the  $PO_4$  from  $H_2PO_4$ ,  $CaH_2PO_4$  and  $Na_2PO_4$  was about equal in the colloids with a high  $SiO_2$ -sesquioxide ratio when the degree of Ca satn. was below 100%.  $CaH_2PO_4$  and  $Na_2PO_4$  were slightly more available than  $H_2PO_4$  in the colloids with low  $SiO_2$ -sesquioxide ratios.  $CaH_2(PO_4)_2$  was fixed slightly more than  $CaHPO_4$  in all the colloids. In the gray colloids  $Ca_2(PO_4)_2$  was about 10% less available and rock phosphate 20% less available than  $CaH_2(PO_4)_2$ , while in the red colloids the  $Ca_2(PO_4)_2$  was about equal to the  $CaH_2(PO_4)_2$  and the rock phosphate was slightly more available. At  $pH$  5.4 about 76% of the phosphate added as  $CaH_2(PO_4)_2$  to the red colloid was insol. in buffered 0.05 N  $H_2SO_4$ ; the phosphate application was equiv. to 1806 lb. of 16% superphosphate per acre to a soil contg. 80% colloids. The lower the  $SiO_2$ -sesquioxide ratio the smaller was the influence of the degree of Ca satn. below 100% on the amt. of phosphate fixed by the colloid. When the colloids contained Ca equiv. to 200% satn. the tendency was for more phosphate to be sol.

J. R. Adams

The decomposition of saw phosphates by the root secretions of lupines. D. Prymishnikov. *Phosphorsäure* 4, 1-23 (1934).—Normal development of lupines in sand cultures was obtained with amorphous phosphoric acid as the sole source of P; good, but somewhat less efficient, growth of peas, white mustard and buckwheat was also obtained under these conditions. Red clover and most cereals utilized the P of raw phosphoric acid only when they were grown on acid soils. As shown by direct  $pH$  measure-

ments, the root secretions of the lupine are acid and increase the acidity of the neighboring soil soln., thereby promoting the soln. of the phosphorite. Because of the solvent action of lupine root secretions on phosphorite, plants, such as oats, which normally cannot utilize this source of P make good growth when planted either with or directly after lupines that have been fertilized with crude phosphate. Twenty-two references. K. D. J.

The behavior of small quantities of phosphate fertilizer in soils of different compositions. L. Meyer and U. von Rennenkampff. *Phosphorsäure* 4, 24-42(1934).—The rates and extents of fixation of small amts. of superphosphate (1-4 mg.  $P_2O_5$  per 100 g. soil) in different types of soil were studied by means of von Wrangell's  $H_2O$ -extn. method (cf. C. A. 21, 2762; 25, 1019). In general, the highest fixation of  $P_2O_5$  occurred in heavy loam soil and the lowest in humus-contg. sandy soil. Numerous data are given. K. D. Jacob

Action of phosphatic fertilizers on the development of the plant and on the distribution of the phosphorus in spring barley. H. Burgevin and G. Guyon. *Compt. rend. acad. agr. France* 19, 929-34(1933).—Pot tests of the action of liberal quantities of  $CaHPO_4$  on spring barley showed a marked action in the first development of the plant and a marked increase in the crop, particularly the grain. This is due to an increased no. of heads.  $P_2O_5$  absorption by the plant is increased by applications of phosphatic fertilizer. The lipid  $P_2O_5$  increases constantly, to about 10% of the total  $P_2O_5$ . The protein  $P_2O_5$  varies similarly but the proportion is much smaller. The mineral  $P_2O_5$  is accumulated by the young plant, reaching a max., in some cases 60% of the total  $P_2O_5$ , at the moment of heading, after which a progressive decrease occurs. The phytin  $P_2O_5$  is low before heading and afterward increases very rapidly. The major portion of the absorbed  $P_2O_5$  is found in the grain (80-85% of the total) and 95% of the phytin  $P_2O_5$  concs. there. The phosphatic fertilizer accentuates and accelerates these phenomena. Similar tests in the field led to the same results with few exceptions but in lessened form. J. R. A.

Fertilizer experiments with phosphates on winter wheat. W. Kärsten. *Phosphorsäure* 3, 624-9(1933).—In general, both superphosphate and Thomas meal had a favorable effect on the yields of grain and straw from plants grown on different types of acid and alk. soils. K. D. Jacob

Valuation of the paper "Fertilizer experiments with phosphates on winter wheat" by W. Kärsten. Floess. *Phosphorsäure* 3, 748-53(1933); cf. preceding abstr.—The data are rearranged and critically discussed. K. D. Jacob

Utilization of phosphate and potash fertilizers on degraded chernozem soils. G. Maslov. *Arb. Landw. Versuchs-Sta. Kiev* No. 64, 81-104(1930).—The beneficial effect of a previous leguminous crop persisted after one growth period. Phosphorite had little action on the immediate crop, but its after-effect on the following sugar-beet crop was considerable. Among artificial P fertilizers, double superphosphate was the most effective on both acid and alk. soils. Its use in conjunction with other alk. fertilizers reduced the efficiency of basic slag. Bone meal gave best results when applied with alk. materials. B. C. A.

Magnesium ammonium phosphate in vegetation tests. Z. G. Ilkoyakaya, M. Z. Podolskaya and K. Z. Dmitriev. *Trans. Sci. Inst. Fertilizers* (Moscow), No. 113, 44-9(1933).—Pot expts. with flax on a podzolic soil and oats on a degraded chernozem show that  $Mg NH_4$  phosphate is a very favorable source of N and P. The Mg apparently improved the quality of the flax.  $MgHPO_4$  proved to be a better fertilizer than ammoniated  $MgHPO_4$ . The flax, as a rule, does not tolerate high quantities of N. The oats responded to the N in the fertilizer.  $Mg NH_4$  phosphate was superior to pptd. phosphate for mustard and peas, but not for buckwheat. It is suggested that for oily plants, such as flax and mustard, the Mg in this new fertilizer is highly effective. J. S. Joffe

Phosphate rock. Bertrand L. Johnson and B. H. Stoddard. *Statistical Appendix to Minerals Yearbook*,

1 *Bur. Mines* 1932-33, 25-30(1933); cf. C. A. 28, 2441.

Alden H. Emery  
Enriching superphosphate with ammonia. K. Zeidenberg. *Trans. Sci. Inst. Fertilizers* (Moscow), No. 113, 74-8(1933).—The use of liquid  $NH_3$  and  $Ca(NO_3)_2$  in soln. gives a higher  $NH_3$  content in the superphosphate than when gaseous  $NH_3$  is used. The higher the N content in the mixt. the better is the phys. condition and the better are the keeping qualities. J. S. Joffe

The ammoniation of double superphosphates. L. E. Berlin and L. Goritskaya. *J. Chem. Ind. (Moscow)* 1933, No. 10, 21-7.—Gaseous  $NH_3$  may be added to double superphosphates in amts. varying from 8.3 to 18%, depending on the source of the superphosphate. If more  $NH_3$  is added, it is lost when the product is allowed to stand. Keeping the substance under pressure decreases its moisture content. The ratio of available to total  $P_2O_5$  does not change when  $NH_3$  is introduced. H. M. L.

The methods of obtaining ammoniated superphosphate. L. E. Berlin. *Trans. Sci. Inst. Fertilizers* (Moscow), No. 113, 64-74(1933).—B. presents data on the production of ammoniated superphosphate by treating rock phosphate with acids and passing gaseous  $NH_3$  into the mixt. He takes up the quant. relationships for the successful operation of this process with a no. of types of rock phosphate. The speed of admitting the  $NH_3$  into the acid-rock phosphate mixts., the temp., the time period and other factors involved are discussed. It is pointed out that such ammoniated superphosphate maintains a good phys. condition, does not take up so much moisture and holds the  $NH_3$ . J. S. Joffe

Experiments on the methods of analyzing fluorine in Khibin apatite and superphosphate. S. N. Rozanov and V. A. Kazarinova. *Trans. Sci. Inst. Fertilizers* (Moscow), No. 113, 96-103(1933).—For the detn. of F in apatite and superphosphate in the presence of Cl and colloidal  $SiO_2$  the Penfield method is suitable providing a trap with 10%  $Ag_2SO_4$  in  $H_2SO_4$  soln. is introduced in the absorption train. For samples contg. also org. matter two traps are introduced: one with  $Ag_2SO_4$ , the other with a satd. soln. of  $Cr_2O_3$  or  $K_2Cr_2O_7$  in  $H_2SO_4$ . In the presence of colloidal  $SiO_2$  the yield of F, according to the Penfield method, is low. For detg. F in superphosphate the sample should be dried in a desiccator over  $CaCl_2$  or  $H_2SO_4$ ; it may also be dried in the oven, but the temp. should not exceed 50°. J. S. Joffe

Total and water-soluble phosphoric acid in Diammophos. V. P. Mikhailov. *Trans. Sci. Inst. Fertilizers* (Moscow), No. 113, 129-31(1933).—M. concludes, after having made a no. of tests, that while very frequently the water-sol.  $P_2O_5$  is identical with the total  $P_2O_5$  in Diammophos, it is not always safe to make only a water-sol.  $P_2O_5$  detn. J. S. Joffe

The preparation of the original extract for the determination of phosphoric acid in phosphate rock and superphosphate with a dilute hydrochloric acid solution. A. I. Senger and N. A. Demidenko. *Trans. Sci. Inst. Fertilizers* (Moscow), No. 113, 125-7(1933).—Tests made with cold 10% HCl exts. show that the method is not adequate for the detn. of  $P_2O_5$  in apatite and superphosphate. Boiling with this dil. acid gives satisfactory results. J. S. Joffe

Verifying the methods of determining the fertilizer requirements of the soil. A. Sokolov. *Trans. Sci. Inst. Fertilizers* (Moscow), No. 113, 57-64(1933).—S. discusses the methods used in detg. the fertilizer requirements of the soil and points out that empirical tests on the various soil zones and on the soil variations within the zone may serve as a reliable guide in obtaining information. J. S. Joffe

The fertilizer requirements of the fundamental soil types in the Soviet Union. A. N. Lebedyantsev and D. N. Borodich. *Trans. Sci. Inst. Fertilizers* (Moscow), No. 113, 107-18(1933).—This is a summary report on the effect of fertilizers on the zonal soil types: podzols, chernozem and their subtypes, chestnut and gray. It covers a series of 1590 expts. conducted by the Inst. for

Fertilizers. The various podzols respond most effectively to a complete fertilizer. These are followed by the degraded chernozem soils. The normal and deep chernozems respond only to high applications, and, what is more striking, these soils respond to large applications of N. The data for barley, hemp, sugar beets, oats, potatoes, flax and spring wheat are presented in tables and graphs.

J. S. Joffe  
The ratio of the fertilizer components in a complete fertilizer. A. Sokolov. *Trans. Sci. Inst. Fertilizers* (Moscow), No. 113, 13-18(1933).—From expts. with potatoes S. attempts to draw conclusions as to the favorable and economical ratios of the N to K to be applied, using  $P_2O_5$  throughout the variations of the N or K. He points out that it is difficult sometimes to establish which of the elements is in the first minimum. The difficulty lies in the fact that the effects of the individual constituents are not an arithmetical sum. Fertilizer ratios have to be adopted for the different soil types, crops, rotation, etc., all of which has to be detd. experimentally. He argues against the prepn. of mixed fertilizers.

J. S. Joffe  
The equivalent physiological acidity or basicity of American fertilizers. Arnon L. Mehring and Avis J. Peterson. *J. Assoc. Official Agr. Chem.* 17, 95-100 (1934).—Calcs. are given showing that from 1880 to 1906 the av. equiv. physiol. effect of mixed fertilizers on soil reaction was basic; from 1907 to 1924 it was slightly acid; and since then the acidity has increased rapidly, until in 1932 it was equiv. to 150 lb.  $CaCO_3$  per ton of fertilizer. At the present time the upward trend appears to have been checked. The present acidity could be more than neutralized, when desirable, by substituting dolomite or limestone for sand in the analysis formula at very little addnl. cost to the consumer.

A. Papineau-Couture  
The equivalent acidity and basicity of fertilizers as determined by a newly proposed method. W. H. Pierre. *J. Assoc. Official Agr. Chem.* 17, 101-7(1934); cf. *C. A.* 27, 4010.—The method was studied collaboratively on 10 samples of fertilizers. The agreement in results obtained by chemists working in 8 different labs. was found to be satisfactory. Limestone added as filler in mixed fertilizers was accurately evaluated, and all labs. which were equipped with furnaces for ignition reported that the method was well adapted to routine work.

A. P.-C.  
Studies on the fertilizing value of Polish kainites. M. Górski. *Polish Agr. Forestal Ann.* 26, 259-96 (295-6 in German)(1931).—Pot expts. with barley and sugar beets show that Polish kainites and a 25%  $K^+$  salt act better than pure K salts, and are at least as good as German coned. (40%) K fertilizers. In field expts. with sugar beets a Polish 25% salt is as effective as the German 40% salt as regards yield of beets.

J. Wiertelak  
Effect of fertilizers on the botanical and chemical composition of the vegetation in permanent pastures. B. A. Brown. *Conn. Agr. Expt. Sta., Bull.* 187, 54 pp.(1933); cf. *C. A.* 27, 364.— $CaCO_3$ , K or carriers of N alone were ineffective in altering the character of the pasture herbage, but where superphosphate was applied, white clover and Ky. blue grass increased greatly, and poverty grass, *Danthonia spicata* L., was almost eliminated. These changes were more marked where  $CaCO_3$  was also added. With superphosphate, N was even more effective than  $CaCO_3$  in increasing blue grass, this species constituting 70% of the herbage on the plots after 8-9 years. White clover was greatly depressed and in some cases almost eliminated by N. Rhode Island bent and sweet vernal grasses were relatively unaffected by fertilizer treatment. Weeds were very prominent on the non-P plots and were least prominent on the plots which received both minerals and N. The percentages of dry matter, fiber and N-free ext. were highest in the herbage from the non-P plots, and lowest where the treatment was superphosphate plus either lime or N. The reverse was true of ash, N, fat and K. The P content of herbage from the non-P-treated plots was only 60% that of the plots receiving P. Ca content was depressed by the addn. of N and by the omission of superphosphate and increased by P, and especially by P plus lime. The K content of the grass was significantly

raised by the addn. of either K or N fertilizers. The Ca:P ratios varied widely but were smallest, 2:1, where complete fertilizer but no lime was applied. Si, Fe, Al, Mg, Ca, Mn, Cl and S were detd. in the several plots. Usually Si was highest in the non-fertilized herbage. Fe and Al showed no changes. Except in the N-fertilized plots, Mg, P, S and Cl varied with Ca, though not as markedly. The herbage from the limed plots contained only about 1/2 as much Mn as that from the unlimed plots. Seasonal variations in chem. compn. of the grasses were great. When moisture was very deficient, dry matter, ash, N-free ext., fiber and Ca increased but N, fat, P and K decreased. The highest percentages of dry matter, N, N-free ext. and fat were found in the first samples of the season, while the max. for fiber occurred in June, and for Ca and P in July or early Aug. The lowest values for ash, fiber and Ca were found at the first sampling date in the spring. The Ca:P ratios were usually highest in July and lowest in early May. Herbage of more uniform N content was obtained by N fertilization, or by N plus minerals. Chem. analyses show, contrary to popular opinion, that the quality of herbage from permanent pastures is poorest during the period of max. growth, e. g., about June 1st in Conn. On the contrary, the moisture content and the relative amt. of herbage is greatest at this time. Thirty-two references.

C. R. Fellers  
Symptoms of fertilizer deficiencies in hops. F. H. Beard. *Ann. Rept. East Malling Res. Sta.* 1932, 156 & (1933); *Rev. Applied Mycol.* 12, 785.—The symptoms of each nutritional deficiency of hop plants were detd. by growing them for 3 seasons in pots contg. pure sand and fed with the following nutrient solns., viz., (1) complete nutrient soln., (2) N omitted, (3) K omitted, (4) P omitted, (5) Ca omitted, (6) Mg omitted and (7) rain water only.

Oden B. Sheppard  
Can the composition of pecan nuts be changed by fertilizer or other cultural treatment? Max B. Hardy and H. I. Crane. *Natl. Pecan Assoc., Rept. Proc. 31st Ann. Convention* 1932, 110-17.—Nuts of the Pabst and Schley varieties contained more oil and less protein than those of the Stuart variety. Two lots of Stuart nuts contained approx. the same percentage of oil, but the protein content of nuts from fairly vigorous trees was 3-6% higher than that of nuts from very weakly growing trees. There was no definite relation between the size and the chem. compn. of otherwise comparable nuts. Regardless of variety, size or cultural treatment, the best-filled nuts were consistently higher in oil and lower in protein than the poorer-filled ones. Pruning and fertilizing the trees had no marked or consistent effect on the chem. compn. of the nuts.

K. D. Jacob  
Chemical reactions in fertilizer mixtures. Wm. H. Ross. *Am. Fertilizer* 80, No. 4, 5, 6, 24, 26(1934).—A review and discussion of various types of reactions that may occur in fertilizer mixts., such as those involved in the ammoniation of superphosphate and double superphosphate, the replacement of water in hydrated salts by urea, the formation of reciprocal salt pairs by double decompn. and the decompn. of liming materials by  $NH_4H_2PO_4$ . A mixt. of equimol. parts of limestone and  $NH_4H_2PO_4$  reacts to set free  $NH_3$  and  $CO_2$ . Dolomite and  $NH_4H_2PO_4$  also react to set free  $CO_2$ , but loss of  $NH_3$  is prevented by the formation of  $MgNH_4PO_4$ . W. H. R.

The quantity of acid used in decomposing fertilizers. V. P. Mikhailov. *Trans. Sci. Inst. Fertilizers* (Moscow), No. 113, 127-9(1933).—Data are given on min. quantities of  $H_2SO_4$  and  $H_2SO_4$ -HNO<sub>3</sub> mixts. that might be used for the extn. of  $P_2O_5$  from phosphates of various kinds. The smallest quantity that could be used for 5 g. of rock phosphate or 10 g. of Thomas slag was 30 cc.  $H_2SO_4$ , sp. gr. 1.84. For pptd. phosphate the use of 30 cc.  $H_2SO_4$  or 10 cc. HNO<sub>3</sub> gives just as good results as higher quantities of acid.

J. S. Joffe  
Treating phosphates with nitric acid. A. N. Loginov. *Trans. Sci. Inst. Fertilizers* (Moscow), No. 113, 132-7 (1933).—L. reviews the various methods used in extg.

crude phosphate with acids and the prepn. of ammoniated phosphate. L. also takes up the methods used in extg. sol. phosphate from low-grade rock. J. S. Joffe

The nomenclature and classification of fertilizers. S. I. Volkovich and N. E. Pestov. *J. Chem. Ind. (Moscow)* 1933, No. 10, 17-21. H. M. Leicester

The technology of organic-mineral fertilizers: humates of ammonia. S. S. Dragunov and E. F. Bakhtina. *Trans. Sci. Inst. Fertilizers (Moscow)*, No. 113, 79-86(1933).—Peat samples varying in moisture content were satd. with  $\text{NH}_4$ , which was introduced at temps. from 125° to 200°. The peat was then treated with HCl and the hydrolyzable  $\text{NH}_4$  detd. as well as the total  $\text{NH}_4$  absorbed. Low-moor peat contained as much as 6-7% N. The peat with a 30-50% moisture content is most efficient for  $\text{NH}_4$  absorption. With an increase in temp. the N absorbed becomes unavailable and it is recommended not to exceed 100°. J. S. Joffe

The role of the mineral nitrogen of manure. I. P. Mamchenkov and I. F. Romashkevich. *Trans. Sci. Inst. Fertilizers (Moscow)*, No. 113, 18-27(1933).—Pot expts. on the utilization of N from manure by crops show that the N utilized does not exceed the content of  $\text{NH}_4$  nitrogen in the manure. In manures made up of straw 75% of the  $\text{NH}_4$  nitrogen and in peat manure 95% of it is utilized. The org. N of the manure is not utilized during the first year. This is especially true for plants with a vegetation period of 3-4 months. Manure contg. a low  $\text{NH}_4$  content sometimes even depresses the yield. This is due to the locking up of the N by the microbes. It is advisable to accumulate some mineral N in manure before applying, if the N is to be utilized immediately upon application. J. S. Joffe

The significance of calcium and magnesium in fertilizing and liming of soils. D. V. Druzhinin and V. G. Shvuidenkov. *Trans. Sci. Inst. Fertilizers (Moscow)*, No. 113, 28-41(1933).—The authors tested the validity of the Luxw theory on the relation of the ratio of Ca to Mg to crop yield. Oats, barley and peas grown in pots give normal yield even when the sol. and mobile Ca is far in excess of Mg as required by Loew. A yield decrease takes place when Mg is in excess of Ca, the point of depressing the yield beginning with a ratio of mobile Ca to Mg 1:2 to 2.9. In neutralizing acidity Mg limestone was found to be superior to Ca limestone without any fertilizer. A complete fertilizer seems to react more efficiently with  $\text{CaCO}_3$ .  $\text{MgO}$  and  $\text{CaO}$  equally stimulate nitrification.  $\text{CaO}$  alone added to an unsatd. soil does not increase the water-sol. Mg. J. S. Joffe

Studies on potassium fertilizers. F. Terlikowski, A. Byczkowski and S. Sozański. *Polish Agr. Forestal Ann.* 28, 45-119(115 19 in German)(1932).—The sorption of K by wheat and barley proceeds in the first period of vegetation (1 month) independently of the form of K salt present ( $\text{KCl}$  or  $\text{K}_2\text{SO}_4$ ). The production of dry substance and the ratio of seeds to straw are equal for both salts, provided the concn. of Cl and  $\text{SO}_4$  ions is not too high. Of K fertilizers contg. K as  $\text{KCl}$ , the best crops and highest yields of seeds of oats, wheat, barley, millet, peas and beans are obtained with kainite of Stebnik (10.25%  $\text{K}_2\text{O}$ ), followed by K salts of Kalusz (25.97%  $\text{K}_2\text{O}$ ) and a German K salt (40%  $\text{K}_2\text{O}$ ). Evidently, the plants use K better from low-percentage kainite in building up to org. substance than from high-percentage salts. Of fertilizers contg. K as  $\text{K}_2\text{SO}_4$ , the best yields are obtained with a K-Mg fertilizer contg. 18.3%  $\text{K}_2\text{O}$ , the so-called half-product, while the finished product (24.77%  $\text{K}_2\text{O}$ ) and a German product (25.25%  $\text{K}_2\text{O}$ ) give lower yields. It follows, therefore, that admixts. of low-percentage fertilizers exert a beneficial effect on the growth of the tested plants. Special expts. performed to det. this effect of admixts. to pure K salts, however, did not give concordant results. In general, addn. of  $\text{NaCl}$ ,  $\text{MgCl}_2$ , and  $\text{MgSO}_4$  to c. r.  $\text{KCl}$  and  $\text{K}_2\text{SO}_4$  did not have a harmful effect, and sometimes even had a beneficial effect; addn. of  $\text{NaCl}$  gave almost always a higher yield, especially with oats. The effect of these salts was

1 disturbed by the simultaneous addn. of Ca ions. Addn. of K fertilizers causes an increased retention of moisture by the soil, especially at a low moisture content (80%) in the order: kainite,  $\text{KCl}$ ,  $\text{K}_2\text{SO}_4$ . Plants with low requirement of moisture (oats, barley) show a better effect from fertilization at a small moisture content of the soil, while plants with large requirements of moisture (peas, beans) exhibit an opposite effect. All expts. were performed in a soil showing  $p_H$  6.7. J. Wiertelak

Effect of different potassium fertilizers in pot experiments. M. Górski and J. Krotowiczówna. *Polish Agr. Forestal Ann.* 28, 121-84(133-4 in German)(1932).—Expts. with barley show that low-percentage K salts (kainites of Stebnik and Kalusz, sylvite) give higher yields of barley seeds and straw than concd. K salts (40% K salt,  $\text{K}_2\text{SO}_4$ , K-Mg salt). With horse beans the K-Mg salt yields as good a crop as low-percentage K fertilizers. J. Wiertelak

Influence of potassium on the development of plants in various stages of growth. M. Korczewski and J. Majewski. *Polish Agr. Forestal Ann.* 28, 1-26(25-6 in German)(1932).—Maize raised in aq. cultures on a nutrient soln. of  $\text{P}_2\text{O}_5$  14.2 mg., N 39.7 mg. and varying amts. of K 2.5-31.8 mg. per liter shows 2 optima of growth, viz., at 4 and 32 mg., and one min. at 12-20 mg. K per l., K being indispensable in all stages. If it is removed at any stage of growth, the development curve shows a rapid fall, except at the min. region, 12-20 mg. K per l., where removal of K in the blooming period causes a rise of the growth rate. Addn. of Na in these conditions increases the growth still more. J. Wiertelak

Action and efficiency of potassium fertilizers. M. Górski, M. Korczewski and F. Terlikowski. *Polish Agr. Forestal Ann.* 28, 263-75(270-5 in English)(1932)

5 Polish crude K salts (of Kalusz, Stebnik and Holy) differ from the analogous German salts. Their content in wt. % of  $\text{KCl}$ ,  $\text{K}_2\text{SO}_4$ ,  $\text{MgCl}_2$ ,  $\text{MgSO}_4$ ,  $\text{NaCl}$ ,  $\text{CaSO}_4$ , insol. residue,  $\text{H}_2\text{O}$  and  $\text{K}_2\text{O}$  are resp.: kainite of Stebnik 9.2-12.9, 2.9-12.0, 0.4-1.3, 18.1-27.0, 31.2-37.7, 2.7-3.8, 11.7-17.4, 7.9-10.3, 8.1-12.3; kainite of Kalusz 8.3-14.8, 3.7-6.9, 2.1-3.4, 17.8-27.7, 28.4-37.0, 2.2-2.7, 5.8-13.7, 10.0-13.1, 8.6-11.8; *Polish 25% K salt*: 39.6, 0.0, —, 1.2, 32.4, 5.8, 19.4, 1.6, 25.0; *Polish K Mg salt(half product)*: 22.7, —, 47.9, 3.4, 5.1, 7.6, 3.5, 17.7; *Polish K Mg salt(finished)*: —, 47.3, —, 36.8, 0.7, 0.3, 0.4, 13.7, 25.6. Conclusions (based on numerous water, sand, soil culture and field expts.): The effects of  $\text{KCl}$  and  $\text{K}_2\text{SO}_4$  on the yield of plants are approx. equal, with a slight tendency in favor of  $\text{K}_2\text{SO}_4$ , especially on soils low in sulfate or showing an excess of Cl ions. Com. fertilizers act better than c. p. salts. The larger their proportion of accompanying salts the better are their fertilizing properties. In most cases best results are obtained on Polish kainite and langbeinite, viz., with sugar and fodder beets, barley, summer wheat and oats. Potatoes and rye, on the other hand, are indifferent to the various types of K fertilizers, giving approx. equal crops. The non-K components of the fertilizers in question consist of (1) chlorides and sulfates of Na, Mg, Ca, etc., abundantly present in crude minerals, (2) loam, (3) compds. of B, Ti, Mn, appearing in insignificant quantities. Na salts enhance the effect of crude K fertilizers. The loam may play some role as a useful component. The presence of B produces a favorable effect on beans, peas, tomatoes, tobacco and potatoes. J. Wiertelak

Report of collaborative work on the determination of potash by the Chemical Control Committee of the National Fertilizer Association. F. B. Carpenter. *Am. Fertilizer* 79, No. 12, 11, 26(1933); cf. C. A. 28, 1130°.—This report gives the results obtained by 10 labs. in the detn. of  $\text{K}_2\text{O}$  in 5 mixed fertilizer samples. The detns. were made (1) by the official method by leaching up to somewhat less than 250 cc.; (2) by the same method by leaching up to 500 cc.; and (3) by boiling in water in a 500 cc. flask, proceeding otherwise by the official method. The 1st procedure gives low results as indicated by the formulas from which the samples were prepd. W. H. Ross

Conditions influencing the action of potash fertilizers on podzols. D. V. Drushinin. *Ergebnisse Vegetationsversuchen Lab.-Arb. Pryanishnikov 13*, 273-340 (1930).—In soils not satd. with bases, application of large quantities of low-grade K salts may cause plant injury. In podzols having no exchange acidity this effect is counteracted by the presence of mobile Ca ion. In the  $pH$  range 5.0-5.5 red clover benefits more by the presence of Ca ion than by the correction of the acidity. Peat effectively regulates the reaction and proportion of mobile Ca in sandy soils.

B. C. A.

Obtaining lime-ammonium nitrate. K. Zeidenberg. *Trans. Sci. Inst. Fertilizers* (Moscow), No. 113, 78-9 (1933).—By adding finely divided lime to fused  $NH_4NO_3$  (at  $135^\circ$ ) the lime-ammonium nitrate is obtained. Z. made such a mixt. by using  $CO_2$  and liquid  $NH_3$  in which  $Ca(NO_3)_2 \cdot 4H_2O$  was dissolved according to the following equation:  $Ca(NO_3)_2 \cdot 4H_2O + CO_2 + 2NH_3 = CaCO_3 + 2NH_4NO_3 + 3H_2O$ . A product is obtained contg. 20% N and 40%  $CaCO_3$ .

J. S. Joffe

Pot tests with quartz meal. Werner Wöhlbier. *Deut. Landw. Presse* 60, 423-4 (1933).—Quartz meal was compared with glass sand in soil mixts. contg. either a humus material deficient in plant food, a peat or a compost. A complete fertilizer, a  $P_2O_5$ -deficient, a  $K_2O$ -deficient or a N-deficient fertilizer was added. No material difference was observed in any case when the complete fertilizer was used. A 30-40% increase in yield was obtained when quartz was used with a K-deficient fertilizer in the peaty soil and the humus material. A 100% increase was obtained with a P-deficient fertilizer in the mixt. of quartz and humus material. Less striking increases were obtained with N-deficient fertilizers. Mixts. of  $1/2$  compost and  $1/2$  quartz gave less satisfactory results than mixts. contg. half of each.

K. C. Beeson

Annual fertilizing of vineyards and the accumulation of the fertilizing effects according to the woody diagnosis of the vine. E. Vinet. *Compt. rend. acad. agr. France* 19, 938-46 (1933).—The use of complete fertilizers over a period of 5 years has caused no increase in the amt. of N in the wood in the sequence of years. It has brought about an increase in the amt. of  $P_2O_5$ , especially when a high- $K_2O$  fertilizer has accompanied the phosphatic fertilizer. This increase of the  $P_2O_5/N$  ratio indicates an increased capacity to bear fruit. There is also a marked increase in the amt. of  $K_2O$  in the wood.  $K_2SO_4$  is superior to KCl in increasing the  $K_2O$  content of the wood and in favoring the production of sugar but inferior in favoring the production of fruit.

J. R. Adams

Fertilization of early potatoes. J. E. Metzger and E. H. Schmidt. Md. Agr. Expt. Sta., *Bull.* 333, 41-62 (1932).—Comparison of various sources of N in 7-6-5 fertilizer on early potatoes showed that no 1 source of inorg. N was entirely satisfactory when used alone. A mixt. of inorg. and org. sources of N was desirable, though the inorg. could predominate. Urea and Leuna saltpeter were acceptable for use in compounding potato fertilizers. When a 7-6-5 fertilizer was used in amts. in excess of 2000 lb. per acre, the results were not profitable. The most favorable method of applying the fertilizer was in the row. No crop injury occurred when fertilizer was used in this way. In a comparison of fertilizer mixts. contg. 5, 8 and 10 units of  $K_2O$ , the best results were obtained with 5 units. KCl was superior to manure salts and  $K_2SO_4$ . Double-strength fertilizer where the sole source of N was urea gave fully as satisfactory results as the usual 7-6-5 formula although applied at only  $1/2$  the rate. C. R. F.

The relative responses of potatoes to different fertilizer elements. T. E. Odland. *Am. Potato J.* 10, 27-31 (1933).—The results of long-time expts. on potatoes in Rhode Island are summarized. Kainite, KCl,  $K_2SO_4$  and sulfate of potash-magnesia were almost equally effective as sources of K. Superphosphate, basic slag and triple superphosphate were about equally effective as sources of P, but bone meal and rock phosphate were less satisfactory. Variations in the amt. of P did not affect the yields as much as did variations in N or K. Mg may become a limiting factor on these soils.

K. D. Jacob

Some significant variations in the chemical composition of the plant associated with a malnutrition trouble of potatoes. R. L. Carolus. *Am. Potato J.* 10, 147-65 (1933).—The malnutrition condition is characterized by (1) a yellowing of the leaves of the plant, the lower leaves and especially the apical leaflets yellowing from the margin toward the midrib, (2) stunted growth of the plant during the earlier stages, (3) new terminal growth consisting of small, half-closed, purplish gray leaves and (4) stems of small cross-section, also purplish gray in color. A detailed study of the chem. compn. of the plants showed that the trouble is caused by a deficiency of available Mg in the soil and that this deficiency is, to a certain extent, correlated with the continued cropping of the soils, the use of large amts. of concd. chem. fertilizers in which the greater portion of the N is present as  $(NH_4)_2SO_4$ , and the depletion of the soil in org. matter. In general, soils that produced healthy plants contained approx. 1.76 times as much org. matter as did soils producing plants suffering from malnutrition. Also, the condition occurs most frequently when the acidity of the soil is lower than about  $pH$  5.0; it is overcome by the use of  $MgSO_4$  on soils that are not excessively acid or by the use of Mg limestone on excessively acid soils. Absorption of Mg by the potato plant is increased by liming the soil. Fifteen references.

Fertilizers for yellow tobacco. A. V. Otruigan'ev. *State Inst. Tobacco Investigations* (Krasnodar), No. 84, 3-29 (English summary 30-32) (1932).—See C. A. 27, 4014.

J. S. Joffe

Fertilizer experiments with tobacco at the Goryache-Klyuchev Station for 1928-31. S. Vladuchenski. *State Inst. Tobacco Investigations* (Krasnodar), No. 100, 3-23 (1933).—Summarizing the results of 3 years of expts. V. draws the following conclusions: The sandy loam soils of the podzolic yellow earths show N in the first minimum,  $P_2O_5$  in the second, and  $K_2O$  in the third. In the first period of its growth tobacco responds most to the  $P_2O_5$  treatment. It also speeds up the following stage, hastens maturity and improves the quality. The addn. of 30 kg. of N per hectare increases the yield without injuring the quality. An increase of N to 80 kg. impairs the quality. Physiologically alk. and neutral fertilizers are better than acid fertilizer. The vegetation period is shortened by fertilizer addns. and acid fertilizers are best in this respect. Physiologically alk. fertilizers do not affect the quality, whereas the acid fertilizers decrease the assortment of the better grades. Addn. of lime may increase the yield, but frequently it gives neg. results. It is most effective with physiologically acid fertilizers. Org. fertilizers seem to be more effective both with regard to the quality and quantity of tobacco. Green manuring has also proved to be beneficial.

J. S. Joffe

Tobacco-plant nutrition. P. Koenig. *Das Superphosphat* 9, 124-5 (1933).—A brief review of the fertilizer requirements of tobacco.

K. D. Jacob

The correlation between cultivated plants, their parasites and distribution. The influence of the nutrition of the plants on the sensitiveness of potato tubers to storage parasites and the alteration of the enzymic metabolism processes during storage. Salahattin Fehmi. *Phytopath. Z.* 6, 543-88 (1933); cf. Volk, *Ibid.* 3, 1 (1932).—Under favorable respiration conditions (low atm. moisture) sound tubers from plants grown under all conditions of nutrition were resistant to attack by *Bacillus phytophthorus* and *B. atrosepticus* during storage. Under unfavorable respiration conditions all tubers were rapidly attacked, but those from plants receiving low-N fertilizers were somewhat more resistant than tubers grown under other conditions of nutrition. The effect of complete fertilizers in increasing the thickness of the skins of potatoes was in the decreasing order: high P, low N, low P, no K, high K, normal N, P and K, and high N. Tubers from plants receiving fertilizers high in N were the most readily attacked by the bacteria, followed in order by those receiving fertilizers high in P, high in K, contg. no K, contg. normal amts. of N, P and K, low in P and low in N, resp. The highest storage losses occurred

in potatoes fertilized with excessive amts. of  $(\text{NH}_4)_2\text{SO}_4$  and the lowest in those receiving fertilizers low in N; likewise, the infection of tubers on the plants with *B. phytophthorus* was highest with high-N and lowest with low-N fertilizers. *Fusarium* rot was highest when K was omitted from the fertilizer and was lowest with complete fertilizers low in N. During storage the greatest total loss of carbohydrates occurred in tubers receiving high-N fertilizers and the smallest in those receiving low-N. The initial enzymic changes during storage were smallest in those tubers receiving an excess of K, particularly in the form of 40% potash salts. There was no definite relation between the yield of potatoes, as affected by the fertilizer treatment, and the enzymic changes during storage.

K. D. Jacob

The value of the sugar-beet crop in relation to its technical processing. V. S. Denisievskii. *Trans. Sci. Inst. Fertilizers* (Moscow), No. 113, 49 55(1933).—D. shows how the fertilizers, the soil and climatic condition have an effect on the sugar content of beets, on the undesirable type of N compds. (non-protein) and on other properties.

J. S. Joffe

Fertilizing experiments with strawberries. M. Górski, J. Szlaskiewiczówna and K. Jezewska. *Polish Agr. Forestal Ann.* 26, 335-56(355-6 in German)(1931).—Since fresh strawberries contain  $\text{K}_2\text{O}$  0.14-0.20,  $\text{P}_2\text{O}_5$  0.03-0.06 and N 0.00-0.12%, it follows that the annual requirement of fertilizers for the crop of 10,000 kg. per ha. and the plants themselves is, contrary to older opinions, very small, viz.,  $\text{K}_2\text{O}$  37,  $\text{P}_2\text{O}_5$  12 and N 32 kg. Field expts. lasting 5 and 2 years verified the above calcns. Artificial fertilization has practically no effect on the yield. Pot expts. show that the plants may be easily damaged by nitrates,  $\text{NH}_4$  and K salts in higher concns. Phosphates, on the other hand, are not detrimental even at high concns.

J. Wiertelak

The boron content of some soils, plants and potassium fertilizers. F. Terlikowski and B. Nowicki. *Polish Agr. Forestal Ann.* 28, 135-44(144 in German)(1932).—Different types of soil contain 0.1-14 mg. B per kg. and 0-6.8% org. C. Similarly cultural plants contain varying amts. of B; the lowest amts. are found in barley, rye and wheat, viz., 0.1-0.3 mg. per kg., and the highest in tomato fruit 1, stalks 14 mg. per kg., tobacco 10, potatoes 14, beans 8, peas 18 mg. per kg. This phenomenon is in agreement with the fact that the growth of the latter group is increased by addn. of minute amts. of B. The fertilizers analyzed contain the following amts. of B: kainite (Stebnik) 0.0032, K salt of Kalusz 0.0035, K-Mg fertilizer (half product) 0.0022, K-Mg fertilizer (Polish) 0.0005, K-Mg fertilizer (German) 0.0066, K salt (German) 0.0012%.

J. Wiertelak

Influence of boron compounds on the development of plants. M. Górski. *Polish Agr. Forestal Ann.* 28, 27-44(44 in German)(1932).—Since crude K salts contain small amts. of B compds., pot expts. were performed to det. the influence of B on the development of certain plants, viz., bean, barley and potatoes. Borax in small amts. (0.05-0.1 g. per 8 kg. sand) has a very beneficial effect on the yield of beans, doubling it. Beans do not develop seeds at all without B. B does not have a beneficial action on barley. Preliminary expts show that B increases the growth of potatoes.

J. Wiertelak

Effect of magnesium addition on the yield and the chemical composition of oats. K. Korczewski and F. Majewski. *Polish Agr. Forestal Ann.* 28, 145-53(1932).—Mg added in excess to pure fertilizers has no inhibiting effect on the yield of oat seed and the total dry substance of the plant up to K/Mg = 1:2.5. The Mg content of the plant increases as that of the soil is raised. The assimilation of K and N is independent of the amts. of Mg added to the soil. The CaO content of the plant is decreased regularly by addn. of Mg to the soil, CaO being replaced by  $\text{MgO}$ . Each gain in  $\text{MgO}$  of 1% corresponds to a loss of 0.87% CaO in the dry substance of the plant. This substitution is harmless to the plant. The expts. prove that the amts. of Mg present in K-Mg

fertilizers are by no means harmful and do not disturb the physiol. equil. of the soil constituents.

J. Wiertelak

Influence of irrigation upon growth, production and quality of small fruits. W. S. Brown. *Oregon State Hort. Soc., Rept. 47th Ann. Meeting 1932*, 103-6.—Irrigation had no significant effect on the total solids and sugars in strawberries, but slightly increased the sugar and acid contents of loganberries.

K. D. Jacob

Report of the entomologist for the year 1932 [control of the nettle grub]. C. B. Redman King. *Tea Research Inst. Ceylon, Bull.* 10, 27-33(1933).— $\text{BaSiF}_6$  and Pb arsenate were ineffective as stomach poisons for the nettle grub. The best control was obtained by spraying the infested plants with a 1:40 aq. soln. of laundry soap.

K. D. Jacob

Relative toxicities of pyrethrins I and II. F. D. Wilson. *Soap (Insecticide and Disinfectant Sect.)* 9, No. 9, 84

(1933).—A statistical study of data presented by Wilcox and Hartzell (*C. A.* 27, 1977) indicates that pyrethrin II has a toxicity of about 7% of that of pyrethrin I.

Henry H. Richardson

The action of pyrethrum on insects. Alfred Weed. *Soap (Insecticide and Disinfectant Sect.)* 9, No. 8, 84 5 (1933).—A review with 10 references.

H. H. R.

Scientific section of the insecticide committee. C. H. Peet. *Soap (Insecticide and Disinfectant Sect.)* 10, No. 1, 85, 87(1934); cf. *C. A.* 27, 4019.—A review of recent publications on *pyrethrum*, *rotenone* and *synthetic insecticides* with 28 references.

Henry H. Richardson

New insecticide, germicide and disinfectant patents R. C. Roark. *Soap (Insecticide and Disinfectant Sect.)* 9, No. 11, 89, 91, 93, 99, 101, 103, 105(1933).—Summaries of recent patents are given.

H. H. R.

Petroleum and products are ideal insecticides: used with success on a large scale. C. K. Francis. *Oil and Gas J.* 32, No. 33, 16, 34(1934).—F. describes various petroleum products which are used as insecticides.

J. R. Strong

Factors in insecticide performance. D. F. Murphy and C. H. Peet. *Soap (Insecticide and Disinfectant Sect.)* 10, No. 1, 95, 97, 99, 101, 103(1934).—The toxicities of several *petroleum distillates* ranging from naphtha to heavy oils in combination with *pyrethrum* or with Lethane 384 varied inversely with their viscosities in tests against house flies. The distillates had little toxicity in themselves.

Henry H. Richardson

Spray materials and the residue problem. O. C. Roberts and A. I. Bourne. *Mass. Fruit Growers' Assoc. Rept. 38th Ann. Meeting 1932*, 154-61.—Addn. of hydrated lime to lime-S and Pb arsenate mixts. checks somewhat but does not entirely prevent foliage burning. Apples sprayed with Pb arsenate within 6 weeks of harvesting are likely to carry arsenical residue in excess of the tolerance in a season of normal rainfall; the use of Ca caseinate in late sprays tends to increase the arsenical residue. Arsenical residue is not increased by the use of S and lime-S dusts following Pb arsenate sprays.

K. D. Jacob

Contact sprays for the Japanese beetle. Walter J. Fleming. *U. S. Dept. Agr., Circ.* 280, 1-4(1933).—A review of methods for the prepn. of contact sprays for the Japanese beetle.

W. H. Ross

Zinc hydroxide, a substitute for calcium hydroxide in arsenical sprays. R. H. Hurt. *Phytopathology* 23, 17 (1933).— $\text{Zn}(\text{OH})_2$  can be used instead of  $\text{Ca}(\text{OH})_2$  to prevent arsenical injury to the foliage of peach trees and snap beans. It may be combined with arsenicals either in the form of dust or liquid sprays. In either case the  $\text{Zn}(\text{OH})_2$  should replace the hydrated lime lb. for lb.

R. C. Burrell

Zinc and copper spray materials for peaches and apples. R. H. Hurt. *Va. State Hort. Soc., Proc. 37th Ann. Meeting, Va. Fruit* 21, No. 1, 55-64(1933).

K. D. Jacob

Some incidental effects of routine scab sprays, with special reference to apple fruit sawfly control. A sidelight on the interpretation of field spraying experiments M. H. Moore. *Ann. Rept. East Malling Research Sta. 1932*,

90-8(1933); *Rev. Applied Mycol.* 12, 766-7; cf. C. A. 27, 1080.—Pink-bud applications of Bordeaux mixt. caused severe cracking and russetting of Cox's Orange Pippin apples, and *Sclerotinia fructigena* (brown rot) penetrated the cracks so that some of the sprayed trees showed more brown rot than the controls. Post-blossom applications of Bordeaux mixt. caused surface russetting but very little cracking, and brown-rot infection was slight. Bordeaux mixt. and lime sulfur with and without Pb arsenate applied against apple scab also gave control of sawfly (*Hoplocampa testudinea*). Oden B. Sheppard

New developments in potato spraying. F. M. Blodgett, E. O. Mader, O. D. Burke and R. B. McCormack. *Am. Potato J.* 10, 79-88(1933).—Yields of potatoes increased to a max. with increase in the total amt. of  $\text{CuSO}_4$  applied to the plants in the form of Bordeaux mixt. sprays. In 1 locality the optimum amt. of  $\text{CuSO}_4$  was 75-80 lb./acre. With a given total application of  $\text{CuSO}_4$ , the yields also increased as the amt. of  $\text{CaO}$  in the Bordeaux mixt. was decreased. A ratio of 5 lb.  $\text{CuSO}_4$  to  $2\frac{1}{2}$  lb. hydrated lime to 50 gal.  $\text{H}_2\text{O}$  is recommended. K. D. Jacob

Total amount of copper applied and ratio of lime to copper in Bordeaux mixture as important factors in potato spraying. F. M. Blodgett, E. O. Mader, O. D. Burke and R. B. McCormack. *Phytopathology* 23, 5(1933).—There is some evidence that the total amt. of Cu applied (as Bordeaux mixt.) is an important factor in increasing the yield of potatoes. In a comparison of Bordeaux mixts. made with different kinds of lime, that made with high-Mg lime gave slightly, but fairly consistently, better results than the mixt. made with high-Ca lime. R. C. Burrell

The use of arsenic compounds in fruit-tree cultivation. J. Blanchard. *Compt. rend. acad. agr. France* 19, 1021-6(1933); cf. C. A. 27, 2624.—The results of this work support the findings of last year that the As found on the fruit is not sufficient to cause poisoning. A broadening of the scope of this work shows that the quantities of As found on legumes cultivated under treated trees cause no trouble in animals consuming them. J. R. Adams

The estimation of the wetting power of the solutions or mixtures used in agriculture. Augustin Boutaric. *Compt. rend. acad. agr. France* 19, 1013-20(1933).—A crit. discussion of 3 methods for detg. the surface tension and its use in comparing the wetting power of solns. and mixts. The surface-tension coeff. can be used to give a rough comparison between the solns. only when they are used to wet similar surfaces. When it is a question of detg. the wetting power on unlike surfaces such as the leaves of spinach and cabbage these coeffs. are of little value. J. R. Adams

Bordeaux mixture. G. E. Sanders. *Phytopathology* 23, 31-2(1933).—The addn. of an excess of lime to Bordeaux mixt. increases its value in the control of early blight of potatoes. Mixing Na arsenite soln. with the  $\text{CuSO}_4$  soln. before the addn. of lime gives a much safer arsenical than can be obtained by adding the Na arsenite to the completed Bordeaux mixt. Also in *Am. Potato J.* 10, 248-50(1933). R. C. Burrell

Some effects of Bordeaux mixture on transpiration. J. D. Wilson and H. A. Runnels. *Ohio Agr. Expt. Sta., Bi-monthly Bull.* 18, 147-51(1933); cf. C. A. 28, 1131<sup>1</sup>.—(a) *Coleus* plants the daily curves of changing stomatal aperture are very similar for sprayed and unsprayed plants, but wide variations occur during a 24-hr. period. The sprayed plants transpired much more during darkness, but fell behind the unsprayed during daylight. Bordeaux mixt. may be a deterrent to stomatal transpiration at all times but it causes a decided acceleration of cuticular transpiration during the night period. The cooling effect of a film of Bordeaux mixt. on the upper side of *Coleus* leaves causes a decrease in transpiration rate equiv. to 5% of that of an untreated plant during the mid-day period. This effect is counterbalanced and even exceeded by a drying action during the rest of the daylight period. Bordeaux mixt. increases transpiration to a greater extent on days of low light intensity and high air humidity than on bright, dry days. C. R. Fellers

Removing Bordeaux spray from oranges. R. J. Benton

and T. N. Powell. *Agr. Gas. N. S. Wales* 44, 683-4(1933).—The deposit on Valencia oranges caused by spraying the trees with Bordeaux mixt.-oil sprays was completely removed by immersing the fruit for 30 sec. in 0.125% HCl or for 7.5 sec. in 2% HCl. Satisfactory removal of the discoloration was obtained also with 1% acetic, lactic, citric and tartaric acids. During storage for 3 weeks, fruit that had been dipped in HCl, rinsed in fresh water and dried showed no sign of injury from the treatment. K. D. Jacob

A homemade colloidal copper spray. W. P. Raleigh. *Phytopathology* 23, 29(1933).—A concentrate was prepd. as follows: 1 lb.  $\text{CuSO}_4$  was dissolved in 2 qt. water, and 1 pint blackstrap molasses was added. The mixt. was stirred well and made slightly alk. by adding 0.4 lb. of lye dissolved in 1 qt. of water. The concentrate was allowed to stand until it turned yellow and was used at the rate equiv. to 4 lb. of  $\text{CuSO}_4$  to 50 gal. of water for the control of late blight of potatoes. R. C. Burrell

The method of action of copper mixtures. Role of the deposits. J. Brauns and J. Dulac. *Compt. rend.* 198, 120-2(1934); cf. C. A. 28, 1131<sup>1</sup>.—To dissolve appreciable amts. of the insol. Cu from the dried deposits of Bordeaux and Burgundy mixts. the  $\text{H}_2\text{O}$  should contain more than 7 mg. of  $\text{NH}_3$  per l. and have a  $\text{pH}$  of 5 or less. Rain water normally averages 1 mg. of  $\text{NH}_3$  per l. and has  $\text{pH}$  values ranging from 5.3 to 7.5. Thus after these mixts. have dried and the sol. Cu has been washed out, the rain water does not have enough solvent action on the insol. Cu to give a toxic soln. J. R. Adams

Fungicidal efficiency of mercuric chloride and potassium iodide. W. P. Raleigh. *Phytopathology* 23, 28(1933).—Preliminary field expts. indicate that the addn. of KI to a soln. of  $\text{HgCl}_2$  greatly increases the fungicidal efficiency of the soln. when used to control *Rhizoctonia* on potatoes. R. C. Burrell

Crown treatments for hop downy mildew control. G. R. Hoerner and Walter Jones. *Phytopath. Z.* 6, 619-26(1933).—Tests were made with numerous dusts and sprays for controlling the hop downy mildew (*Pseudoperonospora humuli*). The best results in controlling the disease and reducing the no. of basal spikes on the plants were obtained with dusts contg.  $\text{CuSO}_4 \cdot \text{H}_2\text{O}$  (1 part) and hydrated lime (6 parts) and applied to the exposed crowns at the rate of approx. 1 oz. per hill after pruning in the spring. The results of dusting in the fall and also before flooding in the spring indicated that some of the material is leached away and the effectiveness of the treatment thereby reduced. K. D. Jacob

Citrus red scale—experiments with liquefied hydrocyanic acid gas fumigation. P. C. Hely. *Agr. Gas. N. S. Wales* 44, 823-6(1933).—Fumigation with liquid HCN was slightly more effective than an equiv. amt. of  $\text{Ca}(\text{HCN})_2$  in controlling red scale (*Chrysomphalus aurantii* Mask.) on Valencia orange trees. Higher kills were obtained under closely-woven light calico tents than under those made of heavy calico. K. D. Jacob

"Purple patch" of wheat and oats, a disease caused by the fungus *Rhizoctonia solani*. H. J. Hynes. *Agr. Gas. N. S. Wales* 44, 879-83(1933).—Treatment of affected soil with  $(\text{NH}_4)_2\text{SO}_4$  (1 cwt./acre) prior to sowing the seed gave good control of "purple patch" in wheat. Applications of lime were inefficient until the 2nd season after treatment, when the control was as good as in the original  $(\text{NH}_4)_2\text{SO}_4$  treatments. K. D. Jacob

The "white ear" disease of oats. W. Sauerlandt. *Ernahr. Pflanze* 30, 21-5(1934); cf. Rademacher, C. A. 27, 1079; *Arch. Pflanzensbau* 8, 436(1932).—"White ear" or "blast" is a term applied to a condition in oats which is characterized by the bleached appearance of the spikes due to the absence of chlorophyll. Pot expts. showed that applications of  $\text{P}_2\text{O}_5$  had no effect on the occurrence of the disease. With pots receiving N and  $\text{K}_2\text{O}$  the occurrence of the disease decreased with increasing applications of  $\text{K}_2\text{O}$ . With a N:K ratio which corresponds to the nutrient requirements of the crop there was little or no trace of the disease. The occurrence of the disease

was also increased by reducing the  $H_2O$  supply of the plants.

John O. Hardesty  
Whiptail disease of cauliflowers can almost be eliminated by liming. C. J. Magee. *Agr. Gas. N. S. Wales* 44, 911-14 (1933).—Excellent control of the disease, which is caused by high soil acidity, was obtained by treating the soil with hydrated lime ( $1\frac{1}{2}$ -2 tons/acre) several weeks before planting the seed.

K. D. Jacob  
Third report of progress of studies on walnut blight and its control in Oregon. Paul W. Miller. *Rept. 18th Ann. Meeting Western Nut Growers Assoc.*; Oregon State Hort. Soc., *Rept. 47th Ann. Meeting* 1932, 140-61.—Spraying walnut trees with Bordeaux mixt. (2:2:50) considerably reduced the losses caused by walnut blight (*Botryosphaeria juglandis*), but in many cases it caused injury to the young leaves. Zn-lime (8:8:50) and Cu-Zn-lime (1:3:6:50) sprays were relatively noninjurious to foliage and seemed to possess germicidal properties. Addn. of skim-milk powder and blood albumin to Bordeaux sprays did not reduce the foliage injury. Bordeaux sprays contg. thrice as much lime as  $CuSO_4$  caused less injury than sprays contg. equal amts. of lime and  $CuSO_4$ .

K. D. Jacob  
Control of the obscure scale [on pecan trees]. Howard Baker. Natl. Pecan Assoc., *Rept. Proc. 31st Ann. Convention* 1932, 53-4.—Dormant spraying with a 5% lubricating-oil emulsion gave satisfactory control of light infestations of *Chrysomphalus obscurus*, but frequently caused injury to trees in poor phys. condition; 4% emulsions should be used on such trees. Six % emulsions gave good control of heavy infestations but frequently caused injury, regardless of the phys. condition of the trees.

K. D. Jacob  
Control of the pecan Phylloxera. Howard Baker. Natl. Pecan Assoc., *Rept. Proc. 31st Ann. Convention* 1932, 49-53.—Almost complete control of *Phylloxera devastatrix* and *P. notabilis* on pecans was obtained by dormant and delayed-dormant spraying of the trees with liquid lime S 12.5 gal. and nicotine sulfate 1 pint per 100 gal. of soln. Also, 3% lubricating-oil emulsion gave good results; when applied at the delayed-dormant period it retarded opening of the buds for 4-5 days but caused no permanent injury.

K. D. Jacob  
Field and laboratory studies on frencching of tobacco. G. M. Shear. Va. Agr. Expt. Sta., *Tech. Bull.* 49, 3-15 (1933).—Frencching occurred in the field regardless of fertilizer treatment. There was the least amt. of frencching on the plots receiving manure and  $(NH_4)_2SO_4$ .  $K_2SO_4$  and superphosphate had no apparent effect. Frencching was assoc. with seasons of heavy rainfall. Under greenhouse conditions, frencching was corrected by the addn. of nitrogenous fertilizers to the soil or by the provision of conditions favorable for soil aeration. The addn. of absorbent cotton to the soil increased the severity of frencching. The disorder could not be corrected by spraying the foliage of diseased plants with nitrate solns. or by supplying nitrate to the roots. In water cultures the disorder could not be produced by a deficiency of nitrate or a lack of aeration, or by a combination of the 2 conditions. Partial sterilization of the soil which produced frencched plants was effective in preventing the disorder where the treatment was severe enough to kill weed seeds. Frencching developed in soil having a range of  $pH$  from 5.8 to 7.9. Development occurred most rapidly at  $pH$  7-7.5, decreasing quickly above this range and more gradually as the acidity increased. Frencching was produced in sand cultures that were watered with the soln. leached from soil that produced frencching. This indicates that the disorder is a toxicity disease as opposed to the usual opinion that it is a deficiency disease. C. R. F.

Potato scab and Rhizoctonia and their control. [Experiments in] New York. C. F. Taylor and L. L. Stirland. *Am. Potato J.* 10, 66-7 (1933).—Addn. of Hg compds. to the soil mixed with the fertilizer markedly increased the percentage of scabbed tubers in the crop.  $HgCl$  at rates up to 20 lb./acre was slightly worse than  $HgO$  at 10 lb./acre. Org. Hg compds. caused more scab than in the checks but were not so stimulative as  $HgCl$  or

$HgO$ .  $Al_2(SO_4)_3$ , while reducing scab, markedly reduced the yields of potatoes. Treatment of the seed pieces with Hg compds. also increased the amt. of scab. The effect of the Hg treatments in increasing the yield of potatoes was approx. in the order of their effectiveness in increasing scab on the crop. Application to the soil of  $(NH_4)_2SO_4$  and various types of S tended to decrease scab in proportion to their effect in increasing soil acidity. Inorg. Hg compds were more effective than org. Hg compds in reducing the percentage of tubers bearing sclerotia of *Rhizoctonia*. [Experiments in] Wisconsin. B. J. Dipensaar and R. E. Vaughan. *Ibid.* 60-73.—Two-yr expts. indicated that application of S at the rate of 300-900 lb./acre will change the soil reaction sufficiently to control scab, the best results being obtained when high soil moisture is maintained. Treatment of the seed pieces with hot formalin soln. gave excellent control of scab and *Rhizoctonia* but greatly reduced germination and crop yields; immersion for 10 min. in the acid Hg dig gave nearly complete control and caused no injury to germination, except where the tubers were sprouted too much at time of treating or were not properly dried after treatment.

K. D. Jacob  
Internal brown fleck of potatoes. J. E. van der Plank. *Farming S. Africa* 8, 383-4 (1933).—The disease, which occurs only in potatoes grown on acid soils, is controlled by liming the soil. Phosphate fertilizers reduce the incidence of the disease, whereas  $(NH_4)_2SO_4$  favors its occurrence; potash fertilizers have no effect. K. D. J.

The potato scab-gnat, *Phyria scabiei* Hop. Harry I. Gul. *Am. Potato J.* 10, 22-7 (1933).—Treating seed potatoes with  $HgCl_2$  or hot formalin soln. was effective in destroying *P. scabiei* which had overwintered on the seed. Attack by the insect was reduced by treating the soil with heavy applications of manure or other forms of org. matter. When the  $pH$  of the soil was varied from 1 to 7.8 by the use of S or ground limestone, a direct correlation existed between scab-gnat attack and the  $pH$  value;  $pH$  values near 5.0 were the most effective but caused a reduction in the crop yield. Also in Ohio Agr. Expt. Sta., *Bull.* 524, 21 pp. (1933).

K. D. Jacob  
Potato flea-beetle control. L. B. Daniels. Colo. Agr. Expt. Sta., *Bull.* 400, 3-34 (1933).—The flea-beetle, *Ephritus cucumeris* Harr., thrives best in moist, heavy soils. Ca arsenate, 1 lb., to 8 lb. of  $Ca(OH)_2$  and Na fluoaluminat (Kalite) dusts applied in 2-3 applications gave very effective control. The first application should take place the 2nd-3rd week in July. The dusts are used at the rate of 20-30 lb. per acre. The most effective spray material used was Zn arsenite, 1 lb. to 50 gal. of water. A pressure of 150 lb. to the sq. in. should be used to obtain good leaf coverage. The beetles feed mainly on the under side of the leaves.

C. R. Fellers  
The destruction of leather jackets by chemical means. P. Kaysing. *Ernähr. Pflanze* 30, 269 (1934).— $CaH_2$  completely destroyed the larvae but proved a failure under field conditions owing to its volatility. Applications of 9.5 cwts. of kainite per acre, when well mixed with the surface soil, completely destroyed the pest within a period of 3 months.

John O. Hardesty  
Ingestion of poison by the boll weevil. H. J. Reinhardt and F. L. Thomas. Tex. Agr. Expt. Sta., *Bull.* 475, 5-33 (1933).—Approx. 65% of the boll weevil mortality on dusted cotton occurred as a result of accumulation of  $Ca_3(AsO_4)_2$  dust on the mouth parts and the accidental ingestion of poison by weevils while crawling on the leaves, stems and fruits of the cotton plant. To be most effective the As dust must uniformly cover all portions of the plant. In general, dusts give better coverage than sprays and are also more readily picked up by weevils. The detd. lethal dose of poison for the weevil approximated the total amt. retained on the surface of a bud as a result of dusting at the usual rate of 5-7 lb. per acre. The presence of dust on cotton retarded the crawling activities of weevils by about 60% and reduced the no. of fruits which were visited by 50%. The presence of dense pubescence on the stems and leaves increases the efficiency of As dusts

by forcing greater contact of the insect with the poison.

**The carpenter worm (*Prionoxystus robiniae* Peck) and its control.** C. E. Petch and J. B. Maltais. Quebec Soc. Protection Plants, 23rd & 24th Ann. Rept. 1930-1932, 131-6(1932).—Excellent control of the insect on shade trees was obtained by forcing a thick mixt. of solid  $\text{Ca}(\text{CN})_2$  and linseed oil into the larvae tunnels in the tree trunks.

**Grasshopper control by sodium fluosilicate.** S. Marcovitch. Tenn. Agr. Expt. Sta., 45th Ann. Rept. 1932, 33(1933).—The most effective field bait consisted of 100 lb. bran, 4 lb. Na fluosilicate, 2 gal. molasses, and 3 oz. Am acetate. The bait is less toxic to higher animals than As baits.

**Effect of some physical factors on onion maggot infestations in light and heavy soils.** Alan G. Dustan. Quebec Soc. Protection Plants, 23rd & 24th Ann. Rept. 1930-1932, 20-7(1932).—When soils varying in  $\text{pH}$  from very alk. to very acid were prepd. and tested, ovipositing females of the onion maggot exhibited a marked preference for the latter. In tests with artificially prepd. soils in which the amt. of humus and sand was varied, ovipositing flies showed a distinct preference for the 50-50 combination and chose pure humus rather than pure sand. The heavy texture of clay soils inhibits the deposition of eggs, although such soils are usually higher in org. matter than the more highly infested sandy soils.

**The gladiolus thrips and its control.** Alan G. Dustan. Quebec Soc. Protection Plants, 23rd & 24th Ann. Rept. 1930-1932, 32 7(1932).—Spraying gladiolus plants with lime S, nicotine sulfate, pyrethrum ext. or derris ext., or dusting with nicotine sulfate, pyrethrum or hydrated lime gave little or no control of the gladiolus thrips (*Taeniothrips gladioli* M. & S.). The best results were obtained by spraying with Paris green. Excellent control of the insect was obtained by fumigating the plants with  $\text{Ca}(\text{CN})_2$  under oilcloth or brown-paper tents.

**The oriental fruit moth.** Philip Garman. Mass. Fruit Growers' Assoc., Rept. 38th Ann. Meeting 1932, 21-9.—In lab. expts., treatment with 0.5, 1.0 and 2.0% con. white-oil emulsions killed 64, 85 and 94%, resp., of the eggs of the oriental fruit moth. There are indications that treatment of fruit-moth eggs with S dusts may adversely affect parasitization of the eggs by *Trichogramma minutum*.

**Control of the green peach aphid on the Murrumbidgee irrigation area.** P. C. Hely. Agr. Gas. N. S. Wales 44, 751-8(1933).—When they were applied to the eggs under controlled lab. conditions, tar distillate washes, at dilns. up to 1:40, gave complete control of the green peach aphid (*Mysus persicae*); similar results were obtained under field conditions. Lime S (winter strength) combined with either nicotine sulfate (1:800) or pyrethrum ext. (1 oz./16 gal.) gave good control of aphids and was effective against the peach leaf curl. When they were used alone, nicotine sulfate and pyrethrum ext. had practically no aphicidal value; lime S seems to activate these materials. Pyrethrum dusts and red- and white-oil sprays were ineffective.

**The pumpkin beetle, *Aulacophora hilaris* Boisd.** W. L. Morgan. Agr. Gas. N. S. Wales 44, 915-22(1933).—Hydrated lime and mixts. of lime and tobacco dust (equal parts) were the best dusts for protecting young plants. On older plants Pb arsenate and Paris green sprays had a slight repellent action but did not give satisfactory kills. Although the beetles do not readily feed on foliage that has been sprayed or dusted with arsenicals, Pb and Ca arsenate dusts may give comparatively high kills because of accidental ingestion of the poison while the insects are cleaning the dust from their bodies. Pyrethrum and its exts. were the most promising of the contact insecticides used. Nicotine dust and arsenical sprays were injurious to young pumpkin plants.

**Investigations on the green vegetable bug (*Nezara viridula* Linn.).** E. H. Zeck. Agr. Gas. N. S. Wales 44, 594, 675-82(1933).—The adult bugs are extremely

difficult to kill with contact insecticides. In lab. expts. under controlled conditions the highest kills (80-71%) were obtained with (1) nicotine sulfate and hard soap, (2) petroleum soap emulsion and (3) resin, soda and fish oil; (2) and (3) caused damage to bean plants and (1) is too expensive for large-scale use. Pyrethrum dust, alone or mixed with an equal amt. of 2.5% nicotine dust, killed 40-50% of the bugs and temporarily acted as a deterrent.

**Notes on the tarnished plant bug in the dry belt of British Columbia.** E. P. Venables. Proc. Entomol. Soc. Brit. Columbia No. 30, 17-20(1933).—The poor results obtained with lime-S sprays (1:8 and 1:20) in controlling the tarnished plant bug (*Lygus pratensis*) on apple trees were improved somewhat by addn. of 3-4% of oil to the sprays. A 5% nicotine dust was ineffective against the adult insects.

**Developments in codling-moth control.** W. S. Hough. Va. State Hort. Soc., Proc. 37th Ann. Meeting; Va. Fruit 21, No. 1, 88-92(1933).—Excellent control of the codling moth on apples was obtained by substituting  $\text{BaSiF}_6$  or  $\text{Na}_2\text{AlF}_6$  for Pb arsenate in the July or later sprays; however, the fruit showed an excessive amt. of arsenical residue at picking time. This indicates that F compds. prevent the normal rate of loss of As from fruit during the interval between the last application of Pb arsenate and the picking time. Summer-oil sprays, following Pb arsenate, had but little effect on arsenical residue and gave poor control of codling moth. Addn. of lime to Pb arsenate sprays decreased both the amt. of As adhering to the fruit and the efficiency of the sprays. Ca arsenate did not give satisfactory control of codling-moth larvae.

**Materials used as canker paints in woolly aphid control.** A. A. Dennys. Proc. Entomol. Soc. Brit. Columbia No. 30, 8-10(1933).—Entrance of woolly aphids into canker and pruning wounds in apple trees was prevented by painting the wounds with a mixt. of 25% Castor machine oil (a heavy grade of mineral oil contg. Al naphthenate) and 2.5% nicotine sulfate, emulsified by boiling in water with 5% of wheat flour. The mixt. caused no injury to the wound margins. There is some evidence that the nicotine sulfate may form an oil-sol. Al nicotine naphthenate compd. with the Castor machine oil, which makes its duration of toxicity considerably greater than that of nicotine sulfate alone.

**Present methods for the control of false blossom [of cranberries].** Charles S. Beckwith. Am. Cranberry Growers' Assoc., Proc. 64th Ann. Convention 1933, 8-9, 12-13.—The disease is caused by leafhoppers and is controlled by spraying the plants with pyrethrum soap mixt. (22.5% soap and 0.2% pyrethrins) dild. 1:160 and used at the rate of 400 gal./acre. Expts. with various dusts indicated that good control is obtained by the use of a mixt. of 10% of finely ground pyrethrum with 90% gypsum or talc applied at the rate of 100 lb./acre.

**Control of the apple leafhoppers in Connecticut.** Philip Garman. Mass. Fruit Growers' Assoc., Rept. 38th Ann. Meeting 1932, 128 32.—Neither lubricating oils nor tar distillate washes nor combinations thereof afforded control of leafhopper eggs. Lime S plus nicotine sulfate, with Fe sulfate added to prevent leaf burn, gave the best kill of mature hoppers in midsummer. Na fish-oil soap plus nicotine sulfate was effective in late summer.

**Insecticide tests against wireworms.** Windsor Tobacco Substation Rept. 1932. Donald S. Lacroix. Conn. Agr. Expt. Sta., Bull. 350, 497-8(1933).—Naphthalene, used at a concn. of 16 teaspoonfuls per gal. of water, repelled the worms but burned the tobacco plants. *p*-Dichlorobenzene broadcast over the field at the rate of 10 lb. per acre had no effect on either wireworms or plants. When drilled in the row or used at the rate of  $\frac{1}{2}$  teaspoonful per plant, it gave partial control without injury.

**Weed eradication with chemical sprays.** W. L. Latschaw, J. F. Zahnley and W. F. Pickett. Kan. Agr. Expt. Sta., Biennial Rept. 42-3(1932).—The use of  $\text{NaClO}_2$

spray on bindweed and Johnson grass effectively controlled these weeds. From 150 to 350 lb. per acre is recommended. The month of Aug. proved the best time to spray the bindweed. Narrow-leaf plantain on lawns was completely destroyed without injury to lawn grass by spraying with  $\text{NaClO}_2$ . The optimum concn. was 0.5 lb. of chemical to 1 gal. of water. This amt. covered 100 sq. ft. of lawn.

C. R. Fellers  
Selective eradication of weeds from cereals with sodium chlorate. Ch. Chabrolin. *Compt. rend. acad. agr. France* 19, 1035-40 (1933).—Preliminary results show the possibility of using  $\text{NaClO}_2$  (12 kg. or 1200 l. of 1% soln. per hectare) for the selective destruction of a no. of weeds in cereal cultivation. The cereal (wheat) is itself affected but only transitorily.

J. R. Adams  
Commercial cattle sprays. Franklin C. Nelson. *Soap* (Insecticide and Disinfectant Sect.) 10, No. 2, 79-81, 97, 99, 101, 103 (1934).—The various cattle pests and the purposes of cattle sprays are discussed. A spray with a volatile petroleum-oil base is irritating to cattle. A medium-viscosity oil was most suitable and it had some repellent (A) and toxic (B) value against cattle insects. The addn. of pyrethrum ext. increased A and B. Methods of testing A are described. Cyclic esters had the greatest A of a series of org. compds. Diethyl phthalate was the most effective of these. Approx. 20 cc. of spray applied both morning and evening was found the most suitable. Larger quantities are liable to cause injury. During the fly season sprayed cattle maintained a higher milk flow of higher butter-fat content than unsprayed cows. The spray is best applied as a fine mist. Twenty-one references.

Henry H. Richardson  
Rotenone in fly sprays—raising the quality of pyrethrum fly sprays by the addition of a constant amount of rotenone. A. Edison Badertscher. *Soap* (Insecticide and Disinfectant Sect.) 9, No. 8, 85, 87 (1933).—The addn. of 0.05 % rotenone dissolved in a kerosene miscible solvent to several samples of common household fly sprays of the pyrethrum type increased the killing efficiency against house flies, especially with the less efficient sprays.

Henry H. Richardson  
The use of liquid insecticides for preventing moth damage. Wallace Thomas. *Soap* (Insecticide and Disinfectant Sect.) 9, No. 8, 89, 91 (1933).—A review.

H. H. R.  
Jetting mixtures for the control of sheep blowfly attack. Experiments carried out during 1932-33. R. N. McCulloch. *Agr. Gaz. N. S. Wales* 44, 706-74 (1933); cf. C. A. 27, 365.—Ca arsenite mixt. (10 lb.  $\text{As}_2\text{O}_3$ , 10 lb. stone lime and 1 lb.  $\text{NaOH}$  per 100 gal.) was more effective than Na arsenite soln., sheep dip or Paris green in protecting sheep against blowfly attack. A Ca arsenite mixt. contg. 25% of its As in the  $\text{H}_2\text{O}$ -sol. condition was unsatisfactory. Ca arsenite renders the wool somewhat harsh and rather difficult to cut with hand shears during the 1st 6-8 weeks after jetting. Injury to the sheep may result if the Ca arsenite mixt. is allowed to strike the animal at pressures exceeding 150 lb./sq. in. K. D. J.

A promising new blowfly dressing. R. N. McCulloch. *Agr. Gaz. N. S. Wales* 44, 711-12 (1933).—A paste prepd. from  $\frac{1}{2}$  oz. Paris green,  $\frac{5}{8}$  oz. kaolin and 18 oz. soft soap soln. (1-2%) and applied directly to the wounds was effective in killing blowfly maggots in sheep. The treatment reduced the no. of fly re-strikes occurring in 6-20 days.

K. D. Jacob  
Experiments in the treatment of stomach worms in sheep. F. H. S. Roberts. Queensland Dept. Agr. & Stock, Div. Entomology & Plant Path., *Pamphlet* 5, 17 pp. (1932); cf. C. A. 27, 1443.— $\text{CCl}_4$ , tetrachloroethylene and  $\text{CuSO}_4$  and mustard, administered orally, had little if any effect on tapeworms, *Moniezia* sp., in lambs. Good control seemed to be obtained by the administration of an aq. soln. of 2.33 grains  $\text{As}_2\text{O}_3$  and 105 grains  $\text{MgSO}_4$ . A mixt. of Na arsenite and  $\text{CuSO}_4$  was only slightly efficient.

K. D. Jacob

et al.) 6. Pptn. of  $\text{H}_2\text{PO}_4$  by chalk (Gurévich) 18. App. for granulating crystd. salts, particularly fertilizers (Fr. pat. 755,743) 1. Vermin-destroying compns. (Ger. pat. 555,115) 18. Sulfonated oleic acids [products used for combating insects] (Brit. pat. 400,587) 25.

Miller, Merritt F.: The Soil and Its Management. Boston: Ginn & Co. 386 pp.

Perrot, Em.: Où en est la question des pyrèthrinés. Principes insecticides et vermicides du chrysanthemum cinerariaefolium (ou pyrèthre de Dalmatie). Paris: Office national des matières premières végétales. 15 pp. F. 5.

Jahrbuch der Moorkunde. Bericht über die Fortschritte auf allen Gebieten der Moorkultur und Torfverwertung. Jg. 19, 1931. Edited by Bruno Tacke and Friedrich Brüne. Hannover: Schaper. 177 pp. M. 14.

Fertilizer. Frederick W. Genz (to Virginia-Carolina Chemical Corp.). U. S. 1,944,788, Jan. 23. Tobacco stems are impregnated with plant nutrient salts which are formed by reaction in the material of successively added reagents such as lime and  $\text{H}_2\text{PO}_4$  with such chem. and inech. action that part of the tobacco stem material is disintegrated into a colloidal state.

Fertilizer. Norsk Hydro-Elektrisk Kvaestofaktieselskab. Norw. 52,920, Aug. 14, 1933. A fertilizer contains chiefly  $\text{NH}_4\text{NO}_3$  and finely ground dolomite or magnesite, the latter being mechanically bound to the  $\text{NH}_4\text{NO}_3$ , so that every single grain of the fertilizer contains a certain amt. of the different constituents.

Fertilizer from crude phosphate. Stockholms Superfosfat Fabriks A.-B. (J. Gelhaar, inventor). Swed. 77,858, July 25, 1933. Crude phosphate is mixed with an acid nitrate such as  $\text{NH}_4\text{NO}_3$ ,  $2\text{HNO}_3$ , or  $\text{KNO}_3 \cdot 2\text{HNO}_3$  in the solid state, and the materials are allowed to act upon each other until the  $\text{P}_2\text{O}_5$  is all or largely converted into a sol. form.

Decomposing crude phosphate with alkali trinitrate. Stockholms Superfosfat Fabriks A.-B. (J. Gelhaar, inventor). Swed. 79,035, Nov. 28, 1933. An addn. to Swed. 77,858 (preceding abstr.). The acid nitrate is added in successive portions to the crude phosphate so that the mixt. remains very nearly neutral until practically all of the  $\text{P}_2\text{O}_5$  has gone into soln. Swed. 79,036, Nov. 28, 1933. A further addn. to Swed. 77,858. Part, preferably not more than half, of the trinitrate required for the decomposition is replaced by  $\text{HNO}_3$  or  $\text{H}_2\text{PO}_4$  or both of these acids.

Nitrogenous fertilizer. Wm. H. Waggaman (to Oberphos Co.). U. S. 1,944,046, Jan. 16. Protein-contg. material of animal origin such as leather scrap is subjected to the action of a gaseous nitrating agent such as lower oxides of N and then to a heat and pressure conversion (suitably at a temp. of about  $110^\circ$ ).

Complete fertilizer containing citrate-soluble phosphoric acid. Norsk Hydro-Elektrisk Kvaestofaktieselskab. Norw. 53,320, Nov. 27, 1933. Crude phosphate is decomposed with acid, preferably  $\text{HNO}_3$ , and  $\text{CaHPO}_4$  is pptd. by means of  $\text{CaCO}_3$ ,  $\text{CaO}$  or other base. The Ca phosphate is mixed with salts of K and  $\text{NH}_4$  and its water of crystn. is then driven off by heating.

Insecticides. Schering-Kahlbaum A.-G. Fr. 756,242, Dec. 6, 1933. The efficacy of vegetable disinfectants is improved by melting these with appropriate org. or inorg. materials which are solid when cold, e. g., naphthol,  $\text{C}_{10}\text{H}_8$ ,  $\text{NaOAc}$  or crystd. borax.

Insecticide and germicide. John D. Mulligan. Can. 335,803, Jan. 23, 1934. A compn. consisting of Pb arsenate 3, bluestone 2, Cu carbonate 2, pitch 1, salt 1, and sugar 1 lb. may be used dry or wet for the destruction

of wireworms and other insects, and for prevention of 1 potato scab and of smut and rust of grain.

**Fungicides for seeds.** I. G. Farbenind. A.-G. (Wilhelm Schepas, Wilhelm Bonrath and Carl Tanbe, inventors). Ger. 590,219, Dec. 28, 1933 (Cl. 45. 4.01). Addn. to 515,075 (C. A. 25, 1626). Use is made of compds. in which Hg is linked to a substituted aryl radical, e. g., *o*-ClC<sub>6</sub>H<sub>4</sub>HgOAc, *p*-FC<sub>6</sub>H<sub>4</sub>HgOAc, *p*-MeOC<sub>6</sub>H<sub>4</sub>HgOAc or *o*-MeOC<sub>6</sub>H<sub>4</sub>HgCl.

**Seed disinfectant.** Morris S. Kharaevch (to E. I. du Pont de Nemours & Co.). U. S. 1,943,540, Jan. 16.

An alkyl mercuric acetate is used with a dry diluting agent such as CaCO<sub>3</sub> or tolanite or clay. Cf. C. A. 28, 1460<sup>7</sup>.

**Plant treatment.** Roger P. M. Viguier and Daniel Ranghiano. Fr. 756,021, Dec. 4, 1933. An adhesive for fixing antiseptics, etc., to plants contains gum arabic, gelatin, K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, Na<sub>2</sub>CO<sub>3</sub> satd. with cresyl and dried and Cr alum.

**Foot-rot remedy.** Arthur Edward Newman. Brit. 401,046, Nov. 9, 1933. Foot-rot in sheep is treated with a mixt. of methylated spirit, oil of vitriol, verdigris, blue vitriol, burnt alum and Stockholm tar.

## 16—THE FERMENTATION INDUSTRIES

C. N. FREY

**Advances in the fermentation industry.** A. J. C. Cosbie. *Fond* 3, 148-4(1934).

**New light on the chemistry of alcoholic fermentation.** A. P.-C. A. Harden. *J. Inst. Brewing* 39, 644-6(1933); cf. C. A. 27, 3553.

**The phosphorylated intermediate products and the last phases of alcoholic fermentation.** O. Meyerhof and W. Kiessling. *Biochem. Z.* 267, 313-48(1934).—Three reactions in the process of alc. fermentation are described, of which the 1st and 3rd are inhibited by CH<sub>3</sub>ICO<sub>2</sub>H but not by F, while the 2nd is inhibited only by F and that only partially, i. e., the carboxylase phase in which AcH is formed is unaffected either by F or by CH<sub>3</sub>ICO<sub>2</sub>II. Results.

3 Tikka. *Acta Chem. Fennica* 7B, 75(1934) (in German).—Considerable amts. of pyruvic acid are formed in the bacterial fermentation of hexoses. Graessl and Le Fèvre (cf. C. A. 20, 218) have postulated a mechanism in which the acid is fermented by carboxylase to give AcH and CO<sub>2</sub>, and finally AcOH. T. shows that this mechanism is incorrect, since the fermentation of pyruvic acid by coli bacteria gives HCO<sub>2</sub>H and AcOH, comparable to the fermentation of glyceric acid (cf. Virtanen and Peltola, C. A. 24, 2157). It is possible that the fermentation process first forms glyceric acid. Only 54% of the HCO<sub>2</sub>H was obtained, since the organism readily decomposes it into CO<sub>2</sub> and H<sub>2</sub>O. The calcd. amts. of H<sub>2</sub> were not obtained, but it was shown that 19% of unfermented

The nature of the triosephosphoric acids formed is not known. The 3rd reaction is catalyzed by hexosediphosphoric acid. The 1st reaction represents the induction phase in alc. fermentation by yeast maceration juice and can be greatly shortened by the addn. of AcH. According to this scheme methylglyoxal as an intermediate product in alc. fermentation is unnecessary. The appearance of methylglyoxal in Neuberg's expts. with very dil. yeast (MS. poor in coenzyme) is attributed to the easy transformation of 3-glyceraldehydephosphoric acid to methylglyoxal because in the absence of coenzyme the normal dismutation of the intermediate triosephosphoric acid is prevented and it undergoes chem. decompn. S. M.

**Oxidation-reduction potentials of bacterial lactic fermentations.** L. Genevois and T. Nicolaleff. *Compt. rend. soc. biol.* 115, 179-80(1934). Respiration expts. with 5 species are reported. L. E. Gilson

**Dehydration of alcohol by means of an absorbent and recovered vapor.** G. Du Bois. *Chimie & industrie* 30, 535-6(1933).—Anhyd. EtOH can be obtained in a single operation by evap. aq. alc. provided its concn. is above the azeotropic point (97.2%); the method is expensive, however, because the H<sub>2</sub>O in the head fraction carries with it a very considerable quantity of alc. The desired result can be obtained economically by returning to the tower part of the high-strength alc. (e. g., 98% or over) so that the vapors therein are above the azeotropic point, suitable devices being used to obtain max. heat recovery. Application of this modification to the absorbent process of dehydrating alc. will permit it to compete advantageously with the azeotropic processes. A. Papineau-Couture

**The fermentation of pyruvic acid by coli bacteria.** J.

pyruvic acid had been reduced by the nascent H to lactic acid. S. A. Karjala

**Industrial solutions of the brewing industry in the future.** G. M. Vanlaer. *Brasserie & malterie* 23, 310-16, 325-32 (1934).—A discussion of the properly coordinated utilization of heat, cold and mech. power. A. P.-C.

**The nature of metals [used in brewing].** R. Seligman. *J. Inst. Brewing* 39, 415-8(1933). Quick Landis

**The physical properties of metals used in brewing.** J. S. Pritchard. *J. Inst. Brewing* 39, 449(1933).

**The action of cooling tanks (in brewing).** P. Petit. *Brasserie & malterie* 23, 274-9(1933).—A brief discussion of the use of open cooling tanks, showing that, in most cases, their advantages far outweigh their drawbacks. A. Papineau-Couture

**Notes on the barleys of the 1933 crop.** Goethals. *Bull. assoc. (lives inst. sup. fermentations Gand* 34, 246-52 (1933).—A brief discussion of the malting qualities of the 1933 barley crop in various districts of France. A. Papineau-Couture

**Notes on the barleys of the 1933 crop.** J. Raux. *Brasserie & malterie* 23, 249-55(1933); cf. C. A. 28, 251<sup>9</sup>.—A discussion of the compn. of barleys from different districts in France, from the standpoint of their malting quality. A. Papineau-Couture

**Barley problem researches. Prediction of extract.** II. The effect of variety on the relation between nitrogen content and extract. L. R. Bishop and F. R. Day. *J. Inst. Brewing* 39, 545(1933); cf. C. A. 24, 4929. —The ext. in brewers' lb. per 330 lb. of dry malt is given by ( $E = A + 10.5N + 0.20G$ ), where  $A$  is a varietal character-

latic,  $N$  the percentage of  $N$  on dry barley, and  $G$  the thousand corn wt.  $A = 108$  and  $101.5$ , resp., for English and Calif. barleys.

**Quick Landis**  
The Institute of Brewing Research Scheme. I. Investigations on barley Report on the ten years of experiments under the Institute of Brewing Research Scheme 1922-31. E. J. Russell and L. R. Bishop. *J. Inst. Brewing* 39, 287-421(1933).

California barleys. II. Analytical methods for appreciation of barley and malt. H. Lloyd Hind. *J. Inst. Brewing* 39, 258-72(1933).

**Quick Landis**  
Kiln drying of barley. II. T. S. Miller. *J. Inst. Brewing* 39, 428-45(1933); cf. *C. A.* 26, 5168.—Barley must be dried at  $110-15^{\circ}$  for accurate moisture detn. There is a definite loss of solids on kiln drying,  $CO_2$  being evolved in storage and the content of matter sol. in cold water changing.

**Quick Landis**  
Approximate calculation of the extract of barleys. P. Petit. *Brasserie & malterie* 23, 258-62(1933).—Russell and Bishop have proposed the formula  $M = K - 1.30P + 0.156G$  (in which  $M$  is the ext. of dry malt,  $P$  protein % of dry barley,  $G$  the wt. of 1000 grains of barley and  $K$  a const.). P. studied the possibility of applying such a formula for calcg. the ext. in barley. From the analyses of a large no. of barleys of the 1932 crops, he calcd. the value of  $K$ , obtaining an av. value of 85.4. The values for the ext. calcd. from the above equation varied from those obtained by analysis by up to more than 8%.

**A. Papineau-Couture**  
Report on the preservative principles of hops. XV. The gravimetric estimation of the antiseptic constituents of hops. T. K. Walker and J. J. H. Hastings. *J. Inst. Brewing* 39, 509-12(1933); cf. *C. A.* 27, 2248.—The modified Ford and Tait method (*C. A.* 26, 5169) gives high results for the preservative value because of the slow pptn. of the Pb salt of a non-antiseptic substance. Ten g. finely minced sample is extd. with 100 cc. pure MeOH and filtered. Fifty cc. of the ext. is diluted with 100 cc. of 1% aq. soln. of NaCl and extd. in a separatory funnel with one 50-cc. and three 40-cc. portions of petr. ether. The ext. is diluted to 200 cc. and the total soft resin is detd. on 50 cc. of the ext. The solvent is evapd. from 100 cc. of the ext., the residue taken up with a little warm MeOH and the  $\alpha$ -resin detd. by the Ford and Tait method. Lead salt  $\times 25.45 =$  percentage of  $\alpha$ -resin. **Quick Landis**

Some factors affecting the solubility of nitrogenous substances in mashing. II. The effect of various salts in the mashing liquor. Hugh E. Kelly and T. S. Bremner. *J. Inst. Brewing* 39, 622-39(1933).—The  $N$  content of wort as a function of  $pH$  is characteristically parabolic for  $CaSO_4$ ,  $NaCl$ ,  $CaCl_2$  and  $K_2SO_4$ . The "toxic salts"  $MgSO_4$ ,  $CuSO_4$ ,  $FeSO_4$  and  $Al_2(SO_4)_3$  show a marked inhibition at  $pH$  4.6. A comparative method for estn. of malt proteinase activity is described. **Q. Landis**

Formation of mannitol in musts dialyzed at low temperature in the presence of chloroform. G. Barbera. *Ann. chim. applicata* 23, 470-3(1933).—When wine must is dialyzed through animal membrane at  $8-10^{\circ}$  (20-30 days is required for 3 l. of must) a fungus vegetation develops, in spite of the presence of  $CHCl_3$  to prevent fermentation, and large quantities of mannitol are formed. If parchment is used instead of animal membrane, no mannitol is formed. It has not been proved whether the reaction is

due to flora present in the animal tissue or to the proteins contained therein. The dialyzed liquid outside the animal membrane will also form mannitol, but only in the absence of  $CHCl_3$ .

**W. O. E.**  
Sterilization of spirit vinegar and wine vinegar by the catadyn process. Heinrich Kreipe. *Deut. Essigind.* 37, 257-9(1933); cf. *C. A.* 27, 2827.—Spirit vinegars activated by 250  $\gamma$  or more per l. are still sterile after 6 months' storage and suffer no new infection. Expts. with double wine vinegar show that bacteria are killed by 850  $\gamma$  in 7 days, by 500  $\gamma$  in 18 days. Vinegar eels, on the other hand, succumb in double wine vinegar only to 850  $\gamma$  and upward in about 14 days. The activation of double wine vinegar must be greater, for production of like effects, than with spirit vinegar. Smell and taste of double wine vinegar are unimpaired by the catadyn process. With higher activation (from 850  $\gamma$  up) an opalescent turbidity develops.

Determination of the residual sugar in red wines. F.

Alexia. *Ann. Jills* 27, 609-10 (1933).—The following simple and accurate method is recommended as suitable for control of wine-cellar operations: to 5 cc. wine add 2.5 cc. NaCl (15 g. NaCl, 100 cc. H<sub>2</sub>O, 20 drops AcOH), place 3 min. in a boiling water bath, cool, neutralize with dil. NaOH in the presence of phenolphthalein powder and make up to 30 cc.; to a 20-cc. aliquot add 1 cc. of 1.5% Na<sub>2</sub>CO<sub>3</sub> and 20 cc. 0.01 N I, let stand 2 hrs., acidify with 5 drops HCl, dil. to 50 cc. and titrate with 0.005 N Na<sub>2</sub>S<sub>2</sub>O<sub>8</sub>, using starch indicator. A. P.-C.

Different methods of determining total solids in wine. N. Roussopoulos. *Ann. Jills* 26, 582-84 (1933).—From a discussion of the various methods it is concluded that for highly accurate work total solids should be detd. by drying in a vacuum for 48 hrs. over P<sub>2</sub>O<sub>5</sub>. For ordinary routine analysis, total solids should be obtained from the d. of the dealcoholized wine ( $d' = d + 1 - dp$ , in which  $d'$  is the d. of wine after distn. and dln. to its original vol. with H<sub>2</sub>O,  $d$  is the d. of the wine and  $dp$  the d. of the distillate made to the original vol. of the wine) according to  $s = 2663 (d' - 1)$ , based on a d. of 1.8 for invert sugar.

A. Papineau-Couture

Influence of the distilling process on the composition and quality of brandies. H. Wüstenfeld and C. Luckow. *Pharm. Zentralhalle* 75, 36 8, 52-5, 67-72 (1934).—Two high-grade Charente wines were distd. into raw and refined brandy. In refining, fractionation was resorted to, the various fractions obtained being placed in storage. Each fraction was subjected to the customary com. analysis and organoleptically appraised. Fractions 1-3 and for the time being an addnl. fraction were mixed in the lab., the resulting mixts. being analyzed. The quality of the resulting distillates is in large measure dependent on the type of distg. process followed, the analytical values, however, not in like measure. If only the 1st fractions are mixed, e. g., in practice an early switch to 2nd runnings, there result, as in the use of dephlegmators, very pure-toned products which are quite wine-like; they completely satisfy the analytical requirements. Far-reaching use of the later fractions leads to the production of "fatter," more abundant, but less fine distillates. W. O. E.

The stability of beers. R. Morlion. *Bull. assoc. élèves inst. sup. fermentations Gand* 34, 277-82 (1933).—An address discussing the factors on which the stability of beer depends.

A. Papineau-Couture

Notes on the attenuation of beer. G. Kauert. *Bull. assoc. élèves inst. sup. fermentations Gand* 34, 283-7 (1933).—A brief discussion of attenuation on the stability of beer.

A. Papineau-Couture

Notes on the retention of "creaminess" of beer. P. Petit. *Brasserie & malterie* 23, 241-8 (1933).—An address discussing more particularly the part played by the nature and quantity of colloids, and indicating that a study of the optical properties of beer would furnish a valuable method of investigation for improving the behavior of beer on storage.

A. Papineau-Couture

Influence of the rate of agitation in mashing on the composition and quality of beer. P. Petit. *Brasserie & malterie* 23, 321-5 (1934).—A discussion of the results of Jalowetz and Pickholz (*Brau- und Malsindustrie; Wochschr. Brau.* 50, 287 (1933)).

A. Papineau-Couture

New reagents for cleaning (beer) bottles. A. Bossart. *Schweiz. Brauerei Rundschau* 1933, No. 3, 53; *Brasserie & malterie* 23, 284-7.—A mixt. of Na<sub>2</sub>PO<sub>4</sub>, Na silicate, Na<sub>2</sub>CO<sub>3</sub> and NaOH, without addn. of an antiseptic, has no bactericidal power when used at atm. temp. and at a concn. of 0.5-1.5%; but, in a good washing machine, its cleansing power permits of having clean bottles. To ensure sterility of the bottles, a disinfectant should be added. The above mixt. gives perfectly clear bottles, even with a hard water, which cannot be obtained with NaOH alone; it does not remove labels as well as NaOH. As the various ingredients are not utilized to the same extent during cleaning, partial addn. of the original mixt. to the used soln. does not regenerate it.

A. Papineau-Couture

The production of pure yeast. Bernard M. Brown. *J. Inst. Brewing* 42, 9-10 (1934).—Mixed cultures are

preferred to single-cell cultures for brewing purposes. The technic of obtaining them is described. Q. L.

The nitrogenous metabolism of yeast. II. General considerations relating to yeast growth and fermentation in synthetic media. III. The ability of certain pure chemical compounds to function as nitrogen sources for yeast. R. S. W. Thorne. *J. Inst. Brewing* 39, 597-621 (1933); cf. *C. A.* 26, 3869.—Effects of temp., aeration, seeding rate, N concn.,  $pH$  and bios are reported. Nitrite formation retards growth. Yeast races vary in their response to N in different amino acids. Quick Landis

Estimation of nitrogen in yeast and brewing materials. J. S. Ford, A. Tait, L. Fletcher, Jus. Spiers and W. J. Mitchell. *J. Inst. Brewing* 39, 472-86 (1933); cf. *C. A.* 26, 3869, and Case and Price, *C. A.* 27, 2249.—Polemical. A review. Exptl. evidence is also given which indicates that the Kjeldahl modifications are satisfactory. W. A. Davis, J. G. Maltby and F. E. Salt. *Ibid.* 577-81.—A crit. discussion. The Kjeldahl-Gunning method and the Christiansen and Fulmer modification are equally reliable. H<sub>2</sub>O<sub>2</sub> is unnecessary and may cause error by its variable N content. The "absolute" Dumas method is often unreliable. Quick Landis

Yeast troubles (in brewing). J. Raux. *Brasserie & malterie* 23, 279 85, 295-301 (1933).—An address discussing their causes and prevention or remedies.

Alcohol. Firma E. Merck (Eloi Ricard, Paul Savarit and Henri M. Guinot, inventors). Ger. 588,869, Nov. 29, 1933 (Cl. 6b. 25). App. for producing abs. alc. by distg. and dehydrating fermented mash is described. Cf. *C. A.* 27, 4342.

Malt beverage of permissible alcohol content. Thomas Whittam. U. S. 1,943,943, Jan. 16. An HOAc soln. is added to a malt ext. soln. contg. yeast and the mixt. is fermented in a closed container.

Apparatus for separating hop resin from beer. Carl Hurner. Ger. 590,097, Dec. 22, 1933 (Cl. 6d. 3).

Tank and agitator construction suitable for treating mashes for beer. Andreas R. Kellner. U. S. 1,944,742, Jan. 23.

Extrusion press, particularly for extruding yeast. Gerrit Dwaars. Brit. 400,799, Nov. 2, 1933.

Yeast. Pfeifer & Langen A.-G. Ger. 588,738, Nov. 25, 1933 (Cl. 6a. 17.02). Addn. to 536,989 (*C. A.* 26, 1062). In prepg. yeast, the method of 536,989 is improved by fermenting in two sep. stages. In the first, only part of the diluted culture medium is mixed with NH<sub>4</sub> salts. This is given an addn. of yeast and allowed to ferment till the greater part of the inorg. N is assimilated. This is then added to the rest of the culture medium and the whole fermented as usual.

Yeast. Norddeutsche Hefeindustrie A.-G. Ger. 590,-

209, Dec. 29, 1933 (Cl. 6a. 17.02). Molasses for use in the manuf. of compressed yeast is clarified by treatment with  $\text{CaSO}_4$  or by pptg.  $\text{CaSO}_4$  therein. Phosphates of  $\text{NH}_4$  are then added, to serve as nutrient material for the yeast.

Apparatus for yeast fermentation. Svenska Jästfabriks A.-B. (N. R. Nilsson, inventor). Swed. 77,912, Aug. 1, 1933. Air is introduced into the fermenting liquid

in one or more sep. zones of the app. in which the liquid is kept in circulation by action of the ascending air bubbles. Nutrient substances are added successively at one or more places in such a way that they are distributed quickly and evenly.

Centrifuge for the separation and washing of yeast. Aktiebolaget Separator (S. A. B. Dahlgren, inventor) Swed. 79,024, Nov. 28, 1933.

## 17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

Disinfectants, fumigants and cleaning materials. W. P. Hale, et al. *Am. Ry. Eng. Assoc. 35, Bull. 362, 640-3* (1933).—The majority of disinfectants sold are usually various mixts. of cresol. Formalin is considered more effective.  $\text{HCN}$ ,  $\text{SO}_2$ , and pyrethrum powder are used widely for fumigation but ethylene dichloride, ethylene oxide and  $\text{CO}_2$  are also being tried. R. C. Bardwell

Application quotient and the pharmacological differentiation of similarly acting drugs. P. Pulewka. *Arch. expil. Path. Pharmacol. 169, 482-97* (1933).—The ratio between the doses of a drug necessary to cause death, anesthesia, mydriasis, etc., when administered to the same animal by 2 different routes is termed the "application quotient." Its use in differentiating similarly acting drugs is illustrated by various mydriatics and local anesthetics. B. C. A.

Preparations of cod-liver oil with iron and with ferrous iodide. G. Nobili. *Boll. chim.-farm. 72, 161-7, 201-7, 241-6, 281-93* (1933).—Conn. products are often unsatisfactory. The usual methods of prepn., which may entail loss of vitamin or yield a product of low Fe content, have been critically examd. Ferruginous cod-liver oil is best prepd. by using pure  $\text{Fe}(\text{OBz})_2$  with oleic acid and sweet almond oil or by a modification of Dieterich's method from a complex Fe benzoate.  $\text{FeI}_2$  is incorporated either by formation from Fe and I in the oil or by direct soln. of the pure compd. Standards for content of Fe or  $\text{FeI}_2$  are suggested. B. C. A.

Glycerophosphates and their analysis. C. Gino. *Boll. chim.-farm. 72, 321-6* (1933).—Methods are given for the analysis of pharmaceutical products. B. C. A.

Direct analysis of tobacco. R. Dubrisay and François. *Mem. manuf. état tabacs 6, 264* (1930).—The importance of detns. of resins, waxes and essential oils in the examn. of tobaccos is discussed. Customary methods of analysis do not always give clear differentiation of types. For this purpose the following detns. are made on a  $\text{CaH}_2$  ext.: dry matter, acidity ( $\text{KOH}$  in  $\text{EtOH}$ ), sapon. value, ester value, I value. Characteristic values for oriental, Kentucky and Virginia tobaccos are recorded. B. C. A.

Determination of moisture in tobacco. C. J. Rzymowska. *Roczniki Chem. 12, 943-51* (1932).—Schlapfer's method of distn. with  $\text{PhMe}$  is preferred. B. C. A.

Odorless disinfection with thiocyanic acid solution. Alumina thiocyanogen. B. Dikomeit. *Z. Hyg. Infektionskrankh. 115, 781-91* (1933).—Solns. of alumina thiocyanogen (0.3 and 0.4%) are effective as disinfectant against *Esch. coli*, *B. paratyphosus B* and *Staph. aureus*. One hundred cc. of a 0.35% soln. can be administered orally without harm. Rachel Brown

Green coloration of solutions of quinine salts. M. Bachstsz and G. Cavallini. *Ann. chim. applicata 23, 490-4* (1933).—The green coloration often appearing in solns. of quinine salts on exposure to air or on standing is due to traces of Cu, as all such green solns. give a test with Feigl's reagent (C. A. 23, 4421). A double salt of Cu and quinine has been isolated by adding a soln. of  $\text{CuCl}_2$  in acetone to an acetone-soln. of quinine-HCl. After 48 hrs. at freezing temp., a ppt. of dark green powder,  $[\text{C}_{20}\text{H}_{24}\text{N}_2\text{O}_2 \cdot \text{HCl} \cdot 2\text{H}_2\text{O}]_2 \cdot \text{CuCl}_2$ , forms. To avoid the green coloration, quinine salts must be recrystd. until entirely free from traces of Cu or else  $\text{O}_2$  must be excluded from the soln. A. W. Contieri

Strychnine phosphomolybdate. A. Tettamanzi. *Atti*

*accad. sci. Torino, Classe sci. fis., mat. nat. 68, 147* (1933).—Strychnine phosphomolybdate, as prepd. by Embden (*Z. physiol. Chem. 113, 138*), and that prepd. by Antoniani (cf. C. A. 22, 4715) are found to be identical, and the phosphomolybdate has the same ratio  $\text{P}_2\text{O}_5/\text{MoO}_3$  1.24, as in common  $\text{NH}_4$  phosphomolybdate.

A. W. Contieri  
Supplements to the D. A.-B. VI. Konrad Schulze. *Apoth. Ztg. 49, 23-5* (1934).—A commentary on certain essential changes and addns., including some 20 references. W. O. E.

Relative values of commercial pancreas preparations. H. Dyckerhoff and H. Miehl. *Apoth. Ztg. 49, 161* (1934).—The amylase, lipase and trypsin values of 10 different dry pancreas preps. are recorded. W. O. E.

Specialty events and investigational results during the year 1933. Konrad Schulze. *Apoth. Ztg. 49, 125* (1934).—A review. W. O. E.

Glucosides of *Digitalis lanata*. C. Mannich. *Arch. Pharm. 272, 5-8* (1934).—The "digitanides" of Skoll and Kreis (C. A. 27, 3777) are identical with M.'s *lanata* glucoside II, which, however, he was unable to sep. from the glucosidal mixt. prior to the sepn. effected by S. and K. W. O. E.

Recent investigations in the field of essential oils, especially during the period between 1930 and 1932. Konrad Bournot. *Arch. Pharm. 272, 23-37* (1934). W. O. E.

Microsublimate of radix ononidis. R. Jaretsky and A. Sievers. *Pharm. Zentralhalle 75, 16-17* (1934).—A commentary on the D. A.-B. VI evaluation procedure. W. O. E.

Preservation and sterilization of drug products. H. Eschenbrenner. *Pharm. Zentralhalle 75, 17-20* (1934). A discussion of past and present methods employed in the preservation and sterilization of drug products, in connection with the tabulated amts. of certain preservatives (nipagin, nipazol) required for such purpose. W. O. E.

Colorimetric control of the gradual decrease in the free phosphorus content of phosphorus-containing pills. D. Koszegi. *Pharm. Zentralhalle 75, 34-6* (1934).—A series of 30 pills each contg. 0.5 mg. P was examd. at intervals of 3 days over a period of 16 days, with the result that at the final examn. the pills contained an av. of only 0.05 mg. P, or about  $1/10$  their original content. W. O. E.

Principles for the production of liquid disinfectants. D. Maun. *Pharm. Zentralhalle 75, 65-7* (1934).—Liquid disinfectants should be: nonirritant to the skin and n- tably insensitive to phenolic action after long use; capable of yielding with  $\text{H}_2\text{O}$  quite stable emulsions; noncorrosive to surgical instruments; able in 1-3% soln. to kill *Es. coli* and *Staph. aureus* in a short time, and in 5% soln. to kill *Mycobact. tuberculosis* with certainty; and of pleasant smell. W. O. F.

Adeps suillus. Horkheimer. *Pharm. Ztg. 79, 60* (1934).—A method is suggested for the production in a small way of lard of low acidity and suited to pharmaceutical requirements. The fresh, carefully cleaned and washed fat is drained, steam-heated and sepd. from the cracklings, the resulting fat transferred to flasks, securely corked, then inverted and maintained for a day in an incubator at  $50^\circ$ . On removal and solidification at room temp. the  $\text{H}_2\text{O}$  is withdrawn from the still inverted containers, and the final traces of moisture are removed with filter paper, and

the flasks again closed with fresh stoppers and stored in a refrigerator. The acidity, at first 1.7%, gradually rises to 2.00 after a lapse of 3 weeks. W. O. E.

**Viscosity measurement in the evaluation of fluidextracts.** Hellmuth Schrader. *Pharm. Ztg.* 79, 88-9 (1934); cf. C. A. 28, 855<sup>5</sup> (and Höppler, C. A. 27, 1550).—An exptl. study showing the results obtained by this method with specially prepd. liquid exts. W. O. E.

**Quick method for the estimation of essential oils in drugs and plants.** A. Kuhn. *Pharm. Ztg.* 79, 99-100 (1934).—A specially constructed extn. app. with reflux is shown, which permits the collection and measurement of the oil in one limb of the extractor. The extn. is complete in  $\frac{3}{4}$  of an hr. The results are recorded in the examn. of several series of crude drugs and plants. W. O. E.

**Evaluation of medicinal chars by the antipyrine method.** C. Rohmann and U. Rohmann. *Pharm. Ztg.* 79, 122-4 (1934).—The results obtained in the examn. of several series of medicinal chars are recorded. W. O. E.

**Theory and practice of emulsions.** Wolfgang Brandrup. *Pharm. Ztg.* 79, 137-9 (1934).—An address. W. O. E.

**Detection of small quantities of carbon monoxide in medicinal carbon dioxide.** Jacob E. Schmidt and John C. Krautz, Jr. *Quart. J. Pharm. Pharmacol.* 6, 625-7 (1933).—A simple test (a modification of Martinek and Marti's modification of Teague's  $I_2O_5$  method which involves passage of the questionable sample over this reagent heated to 150°) has been devised, requiring no gas-free CO for scrubbing purposes. The sensitivity of the test is in the order of 1.50,000. Also in *J. Am. Pharm. Assoc.* 22, 1222-5 (1933). W. O. E.

**New medicaments and pharmaceutical specialties during the fourth quarter of 1933.** F. Zernik. *Sudderl. Apoth. Ztg.* 74, 90-2 (1933). W. O. E.

**Observations and criticisms of analytical methods for certain products in the Belgian Pharmacopoeia IV.** J. G. Breugelmanns. *J. pharm. Belg.* 15, 677-81, 697-700, 717-21, 733-6, 749-53, 765-72 (1933).—A crit. review of the phys. and chem. analytical procedures in the Belg. Pharm. A pertaining to Na citrate, Ca glycerophosphate, cinchophen, synthetic camphor, chloral hydrate, argyrol and colloidal Ag. Modified or new procedures are offered. S. W. Goldstein

**The essential oil industries of foreign lands.** C. A. Browne. *J. Chem. Education* 11, 131-41 (1934). E. H.

**The oxygen number and the determination of the fermenting stage in yellow tobacco.** A. I. Smirnov. *State Inst. Tobacco Investigations* (Krasnodar), No. 95, 3-18 (1933).—S. discusses the various contributions on the absorption of O in the fermentation of tobacco and presents step by step the methods used. He also gives his data for different varieties of tobacco. J. S. Joffe

**Toxic principles of *Cucumis africanus* L. f., *Cucumis myriocarpus* (Naud.) emend., and of a new unnamed *Cucumis* species.** C. Rimington. *S. African J. Sci.* 30, 705-14 (1933).—From the mature fruit of *Cucumis africanus*, *Cucumis* species A and species B, the last probably being *C. myriocarpus*, an amorphous bitter toxic principle has been extd. Yields from  $CHCl_3$  extn. from the juice are 0.01, 0.06-0.09, 0.06-0.09%, resp. The bitter principle, cucumin,  $C_{27}H_{46}O_8$ , contains 3OH groups and has  $[\alpha]_D^{25} = +64.35^\circ$ . It decamps. 111-15° with const. loss of wt. Species B contains a 2nd bitter principle,  $\alpha$ -todermin,  $C_{27}H_{46}O_8$  m. 104°,  $[\alpha]_D^{25} = +64.46^\circ$ . This substance also neutralizes 3 equivs. of alkali. One equiv. of acid is volatile. The action of alkali completely destroys their toxic properties. For rabbits and fish the min. lethal dose for intravenous administration was + 2 mg. per kg. H. E. Messmore

**Toxicology and assay of methylene blue.** David I. Macht and Wilton C. Harden. *Ann. Internal Med.* 7, 738-45 (1933).—Chem. and pharmacol. examn. of many samples of medicinal methylene blue reveals many differences in purity. The intravenous lethal dose of methylenium chloride for cats is about 40 mg. per kg. wt. John T. Myers

**The terpenes of Jamb. oil of citronella.** Jean Tabuteau.

*Bull. inst. pin* 1933, 237-46.—The terpene fraction removed in the com. production of terpeneless oil contained methylheptenone, limonene, citronellal, geraniol and citronellol, a complex mixt. of terpene alcs. and acids, and a mixt. of diterpenes contg. an internal ether as impurity. A. Papineau-Couture

**History and value of germicides.** A. R. L. Dohme. *J. Assoc. Official Agr. Chem.* 17, 19-28 (1934).—An address. A. Papineau-Couture

**The structure and synthesis of new anti-malarial substances. The structure of "atebrin."** G. V. Chelintzev, I. L. Knunyantz and Z. V. Benevolenskaya. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, I, 63-5 (in English 65-7) (1934).—Com. "atebrin" was recrystd. from hot water, m. 248-50°. From this dihydrochloride the free base was isolated, dissolved in 120 cc. of 20%  $H_2SO_4$  and 9 g. of  $KMnO_4$  in satd. soln. added. Alkali was added, and then steam distn. gave the base, 5-diethylamino-2-aminopentane. "Atebrin" was shown by synthesis to be 7-methoxy-2-chloro-5-( $\delta$ -diethylamino- $\alpha$ -methylbutyl)-aminoacridine-di-HCl. F. H. Rathmann

**Disinfectant scientific committee.** Emil Klarmann. *Soap (Insecticide and Disinfectant Sect.)* 10, No. 1, 87, 89, 91 (1934).—A review of recent work on disinfectants with 37 references. Henry H. Richardson

**Committee on standardization of disinfectants.** Wm. Dreyfus. *Soap (Insecticide and Disinfectant Sect.)* 10, No. 1, 91, 93 (1934).—Good agreement was obtained by 2 labs. with the Food and Drug Administration (F. D. A.), the Hygienic Lab. (H. L.) and the American Rideal Walker (R. W.) methods for testing phenol coeffs. on 4 samples of different coal-tar disinfectants. On a pine-oil disinfectant H. L. and R. W. agreed but the results with F. D. A. were not uniform. Henry H. Richardson

**Determining the glowing power of tobacco.** Vitez L. Nagy. *Chem.-Ztg.* 57, 971-2 (1933).—Both inorg. and org. constituents affect the glowing power, also the methods of growing and fermenting. A method is described in which powd. tobacco is burned in a fine stream and the time of burning and the length in mm. of the burnt tobacco is measured. E. R. Rushton

**The synthesis of new vermifuges and their pharmacological use. The relationship between chemical constitution and pharmacological effect of compounds of the santonin group.** Alexander Gluske. *Arch. wiss. prakt. Tierheilkunde* 65, 201-43 (1932).—Synthetic 1-tetralol-2-acetic acid lactone (1,2,3,4-tetrahydro-1-hydroxy-2-naphthaleneacetic acid lactone) (syntonin-a) and 1-tetralol-2-propionic acid lactone (1,2,3,4-tetrahydro-1-hydroxy- $\alpha$ -methyl-2-naphthaleneacetic acid lactone) (syntonin-b) (both prepd. from  $\alpha$ -tetralone) are as effective as the expensive santonin of plant origin. A great no. of derivs. have been prepd. of which the above 2 were most effective and practically non-toxic. Henry Tauber

**Medicaments as food products (Patzsch) 12.** App. for making and spraying disinfectants (Brit. pat. 400,242) 1. Depilatories (Brit. pat. 400,980) 29.

**Urdang, Georg:** Zur Geschichte der Metalle in den amtlichen deutschen Arzneibuchern. Mittenwald: Ne-mayer. 138 pp. M. 5; cloth, M. 7.

**Vandenbussche, L.:** Pro pharmacia. Menin: Vandenbussche. 538 pp.

**Codex Revision Committee.** Report of Pharmaceutical Chemistry Sub-Committee. London: Pharm. Press. 51 pp. 2s. 6d. Reviewed in *J. State Med.* 42, 60 (1934).

**Cours de pharmacie galénique.** Mons: G. Delporte. 296 pp. F. 70.

**Medicinal fats.** Gottfried Erhard and Gerhard Schaefer. Fr. 755,532, Nov. 25, 1933. Rd is combined with assimilable edible fats.

**Ointment.** O. S. Foght. Swed. 77,752, July 11, 1933. A mixt. of about 58% of tallow, 28% of beeswax and 14% of rosin.

**Quintments.** Johann Trimmel and Hugo Weil. Fr.

752,419, Sept. 22, 1933. See Ger. 587,142 (C. A. 28, 856').

**Chelidamic acid derivatives.** Max Dohrn and Paul Diederich (to Schering-Kahlbaum A.-G.). U. S. 1,944,412, Jan. 23. Reaction of the Ag salt of 8,5-diiodochelidamic acid dimethyl ester with MeI in dry xylene at its b. p. and sapon. with alc. KOH forms the methyl ether of 3,5-diiodochelidamic acid. The corresponding ethyl, propyl, butyl, allyl and benzyl ethers may be similarly formed. The products may be used for intravenous injection in making x-ray pictures for diagnosis. Various details of procedure are given. Cf. C. A. 27, 4880.

**Cholesterol esters of chaulmoogric and hydnocarpic acids.** Max Bockmuhl and Robert Knoll (to Winthrop Chemical Co.). U. S. 1,944,542, Jan. 23. These esters may be formed by reaction of cholesterol with the acids or acid chlorides. They m. 68-70° and 63-65°, resp., are sol. in acetic acid ester, "moderately sol." in alc. and fatty oils, insol. in water, and are bactericides which can be used in treating leprosy.

**Compounds of chloral and its homologs with quinine.** Chemisch-pharmazeutische A.-G. Bad Homburg. Ger. 590,312, Dec. 29, 1933 (Cl. 12p. 12). Chloral hydrate (or a homolog thereof) and quinine base are heated together in equimol. proportions in a solvent, e. g., EtOH or CHCl<sub>3</sub>. Examples are given of the prepn. of compds. of chloral and butylchloral with quinine. The products are of therapeutic value.

**Organo arsenic compounds.** I. G. Farbenind. A.-G. Brit. 400,776, Nov. 2, 1933. Addn. to 360,957 (C. A. 27, 1094). See Ger. 565,414 (C. A. 27, 2533); Ger. 578,312 (C. A. 28, 859').

**Quaternary salts of heterocyclic compounds.** I. G. Farbenind. A.-G. (Fritz Schonhofer and Hans Heneka, inventors). Ger. 590,239, Dec. 28, 1933 (Cl. 12p. 1.01). This corresponds to a part of Brit. 390,831 (C. A. 27, 4878-9), but includes the following addnl. examples: (1) (a) 6-aminoquinoline (I) and 2-bromo-4-chlorobenzoyl chloride → 6-(2-bromo-4-chlorobenzamido)-quinoline, m. 246-8°, → quaternary methyl sulfate, m. 245-6°; (b) I and 2-phenoxy-4-chlorobenzoyl chloride → 6-(2-phenoxy-4-chlorobenzamido)quinoline, m. 171° → quaternary methyl sulfate, m. 221°; (c) I and 4-butoxybenzoyl chloride → 6-(4-butoxybenzamido)quinoline, m. 154°, → quaternary methyl sulfate, m. 195°; (2) I and phthalic anhydride → 6-(2-carboxybenzamido)quinoline, m. 227°, and 6-quinolylphthalimide, m. 225°, → quaternary methyl sulfates, m., resp., 268-70° and 243°; (3) 3-amino-4-methoxypyridine and 3-nitro-4-toluy chloride → 3-(3-nitro-4-toluy)amino-4-methoxypyridine, m. 184-5°, → quaternary methyl chloride, m. 167° (decompn.). The products are effective against blood parasites.

**Quaternary salts of choline derivatives.** E. Merck Chem. Fab. Ger. 590,311, Jan. 10, 1934 (Cl. 12p. 17.01). Addn. to 539,329 (C. A. 26, 1713). Quaternary salts of therapeutic value are prepd. by addn. of neutral alkyl or aryl sulfuric or sulfonic acid esters to compds. of the formula X(Y)NC(O)OZ, where X is H, alkyl, or CONH<sub>2</sub>, Y is H or alkyl, and Z is a dialkylaminoalkyl group. Examples are given of the prepn. of NH<sub>2</sub>COOCH<sub>2</sub>CH<sub>2</sub>NMe<sub>2</sub>OSO<sub>3</sub>Me, m. 118-20°, NH<sub>2</sub>COOCH<sub>2</sub>CH<sub>2</sub>NMeEtOSO<sub>3</sub>Me, m. 76-7°, MeNHCOOCH<sub>2</sub>CH<sub>2</sub>NMeEtOSO<sub>3</sub>C<sub>6</sub>H<sub>4</sub>Me-p, and NH<sub>2</sub>CONHCOOCH<sub>2</sub>CH<sub>2</sub>NEt<sub>2</sub>OSO<sub>3</sub>C<sub>6</sub>H<sub>4</sub>Me-p.

**Acridinium derivatives.** I. G. Farbenind. A.-G. Fr. 755,631, Nov. 28, 1933. Acridinium compds. of the general formula C<sub>11</sub>H<sub>9</sub>N[OAsO(OH)R']R, in which the acridine ring may be substituted by aminoalkyl or hydroxyalkyl groups (R is alkyl, hydroxyalkyl or aralkyl and R' an aromatic or aromatic-heterocyclic radical) are prepd. by causing a salt sol. in water of an arylarsonic acid (isocyclic or heterocyclic) to react with an acridinium compd. contg. the anion of a mineral acid or lower carboxylic acid joined to the N, in addn. to R. Examples are given of compds. prepd. by the action of p-glycolylaminophenyl-, 3-acetamido-4-hydroxy-5-chlorophenyl-1-, 2,4-dihydroxyphenyl-1-, benzoxazolone-6-, 3-methylben-

zimidazole-6- and 4-acetamido-2-phenylacetic-1-arsonic acid on 3,6-diamino-10-methylacridinium chloride or acetate, 4-phenylglycineamide-1-arsonic acid on 3,6-dimethoxy-10-methylacridinium chloride and 4-glycolylaminophenyl-1-arsonic acid on 2,7-dimethyl-3,6-diamino-10-methylacridinium chloride. The formulas are given. The products have a strong bactericidal action. Cf. C. A. 28, 1361<sup>1</sup>.

**Solutions of chemical compounds.** I. G. Farbenind. A.-G. Fr. 755,635, Nov. 28, 1933. Salts of acridine compds. with org. arsonic acids, such as those described in Fr. 755,631 (preceding abstr.) which are difficultly sol. in water, are brought into soln. by dissolving them in water in the presence of easily sol. salts of bases of the acridine group. In this way very strongly concd. bactericidal solns. may be prepd. The insol. salts need not be isolated, but may be prepd. in the presence of the sol. salts so as to obtain solns. directly. A list of acridine compds. and arsonic acids which may be allowed to react to form new compds. is given.

**Lactones.** Byk-Guldenwerke Chem. Fab. A.-G. Ger. 590,238, Jan. 4, 1934 (Cl. 12p. 25). Cyclohexanone (I) and diethyl mesoxalate (II) are gently boiled together to form diethyl 2-ketocyclohexyltartronate, b<sub>p</sub> 173°, which loses water when heated with AcCl and yields diethyl 2-ketocyclohexylidenemalonate. The latter is reduced with H in the presence of a catalyst to form diethyl 2-hydroxycyclohexylmalonate, which loses EtOH when distd. *in vacuo* and forms a lactone. If the residual ester group in the lactone is sapond. and the acid heated to 150°, CO<sub>2</sub> is split off. Lactones may be prepd. similarly from other cyclic ketones and other keto carboxylic acids or their esters. Other examples given are (1) o-methyl-I and II → a lactone b<sub>p</sub> 143-5°; (2) α-ketotetrahydronaphthalene and glyoxylic acid → 1-hydroxytetrahydronaphthalene-2-acetic acid lactone; (3) menthone and II → a lactone b<sub>p</sub> 160-5°. The products are of therapeutic value.

**Product having the properties of vitamin C.** Nyegaard & Co., A/S. (Invented by O. Rygh). Norw. 53,145, Oct. 9, 1933. The components of narcotine after decompn. of all or part of the methyl or methoxyl groups are brought to combine with each other. Cf. C. A. 27, 1453.

**Solutions containing sulfur and metal.** Paul Mochall. Ger. 588,903, Nov. 29, 1933 (Cl. 30k. 2). Oil or fat solns. contg. S and metals for medicinal or com. uses are prepd. by heating S with sugar, and meal contg. starch, in fats or oils. The C which is pptd. is sepd. and the residue is heated with metal or metal compds. till a colloidal soln. results. In an example, S, starch meal and sugar are heated with fat to 170°. The C is removed and the residue heated to 200° with Fe filings till a reddish brown colloidal soln. results.

**Preparations giving off carbon dioxide.** Firma C. Brady. Ger. 588,718, Nov. 25, 1933 (Cl. 30k. 2). Therapeutic preps. are prepd. by mixing lecithin evolving CO<sub>2</sub> with fat, etc., and enclosing in digestible capsules.

**Cresol preparations.** Carol A. Cofman-Nicoresti. Ger. 588,612, Nov. 21, 1933 (Cl. 30i. 3). Solid preps. contg. cresol in dispersed water-sol. form are obtained by sapon. cresol with fatty acids such as palmitic or stearic in the warm at 10-20 atm. with an excess of NaOH or NH<sub>4</sub>OH only sufficient to convert a small part of the cresol to its alkali salt. The prepn. is used as a disinfectant.

**Keratin compounds.** Firma Johann A. Wilfing. Ger. 588,710, Nov. 24, 1933 (Cl. 12p. 16). Addn. to 578,828 (C. A. 28, 1472'). The method of 578,828 for producing keratin compds. contg. heavy metals and SH groups by treating Zn-SH-keratin compds. with H<sub>2</sub>S and a heavy metal, is modified by titrating sulfhydrylkeratin acid with AgNO<sub>3</sub> soln., with Na nitroprusside as indicator to find the amt. of heavy metal required, and then adding the equiv. amt. of a Bi, As or Sb compd. The resulting keratin compd. is pptd. by addn. of EtOH or MeOH. Examples are given.

**Liver extracts.** Leslie W. Mapson and Cambio Products Ltd. Brit. 400,979, Oct. 30, 1933. The autanemic principle, the physiologically active substance or

- hormone known as physin and meat exts. for flavoring, etc., are extd. from (aq. soln. or suspensions from) liver, or from liver digested by ferments, by treatment with alc. of concn. increasing progressively up to 90% and treating the ext. that is sol. in 90% alc. with  $\text{Me}_2\text{CO}$ . Thus the liver is digested, e. g., with papain, and the liquid product evapd. to a paste to which alc. is added to give a 60% alc. content. The mixt. is allowed to stand and is filtered. The ppt. is a meat ext.-or base for soups, etc. Alc. sufficient to give a 90% alc. content is added to the filtrate which is then filtered, the residue being redissolved in  $\text{H}_2\text{O}$  and again pptd. with 90% alc. This ppt. contains the anti-anemic principle. The combined filtrate is freed from alc. by distn. and taken up in  $\text{H}_2\text{O}$ . It contains all the physin which may be further concd. by adding  $\text{Me}_2\text{CO}$  to 90%. The filtrates from  $\text{Me}_2\text{CO}$  treatment are evapd. to dryness or small bulk and form the final concentrate of physin. The residue from the  $\text{Me}_2\text{CO}$  treatment is a meat-flavoring ext.
- Hormones.** Elektro-Osmose A.-G. (Graf Schwerin Ges.). Ger. 590,159, Dec. 27, 1933 (Cl. 12p. 17.10). The recovery of pure hormone preps. from urine is facilitated by removing electrolytes from the concd. urine by electrobiosis.
- Sexual hormones.** Soc. pour l'ind. chim. à Bâle. Brit. 400,520, Oct. 26, 1933. Crude products extd. from animal or human urine are treated in presence of  $\text{H}_2\text{O}$ , but in absence of org. solvents, with a hydroxide or monoxide of a metal of the 2nd periodic group until an easily disintegrated powder is obtained, this is filtered off, the filtrate and aq. washings are acidified and extd. with a  $\text{H}_2\text{O}$ -immiscible solvent and the ext. is purified in known manner to obtain female sexual hormones in cryst. condition. Examples are given. Cf. C. A. 27, 1718.
- Bandages.** J. Pfrimmer & Co. Ger. 588,532, Nov. 20, 1933 (Cl. 30i. 8.01). Bandages of cotton or cellulose are impregnated with an aq. or alc. soln. of I and I salts, contg. some partly swelled starch.
- Synthetic perfumes.** Soc. anon. M. Naef & Cie. Ger. 588,647, Nov. 21, 1933 (Cl. 12a. 7.03). See Fr. 744,345 (C. A. 27, 4031).
- Lotion.** E. Stockman. Swed. 79,214, Dec. 19, 1933. The mixt. specified consists of 100 parts of formic acid, 10-15 parts of fir-leaf oil (from red fir, *Pinus sylvestris*), eucalyptus oil, bornyl acetate and 4 parts of concd.  $\text{NH}_3$ , diluted with an equal amt. of distd. water.
- Antiseptic mouth wash.** S. A. G. Hasselskog. Swed. 78,459, Sept. 26, 1933. Iodine compds. and I-liberating substances, such as  $p\text{-MeC}_6\text{H}_4\text{SO}_3\text{NHCl}$  or its salts or homologs or derivs., are mixed in the solid state, and dissolved in water.
- Dentifrice.** Roy Cross (to Silica Products Co.). U. S. 1,943,856, Jan. 16. Bentonite 50,  $\text{MgO}$  50,  $\text{NaF}$  1, camphor 1, and tincture of benzoin 5 parts are used together. Soap 5, Na phosphate 5, oil of eucalyptus 1 part and water to form a paste also may be used.
- Antiseptic dentifrice.** Rudolph S. Bley. U. S. 1,943,467, Jan. 16. A dentifrice is prepd. contg. the final reaction products of org. acids with hydroxybenzenes, such as hexylresorcinol or the like and also contg. an enzyme such as diastase in an active state.
- Disinfectant.** I. G. Farbenind. A.-G. (Georg Wesenberg and Friedrich Muth, inventors). Ger. 583,875, Sept. 11, 1933. Addn. to 563,643 (C. A. 27, 1027). The method of 563,643 for producing a disinfecting and conserving agent is modified by using bis(hydroxyaryl) polysulfides contg. no acid residues. Examples mention bis(o-hydroxyphenyl)disulfide, trisulfide and bis(o-hydroxy-5-chlorophenyl)trisulfide. The salts of these sulfides may also be used. Cf. C. A. 28, 860<sup>4</sup>.
- Tobacco.** Neuburg'sche Verwaltungsgesellschaft m. b. H. Ger. 588,958, Nov. 30, 1933 (Cl. 79c. 1). Injurious substances are removed from tobacco to improve its taste and smell by submitting it to an air circulation at temps. not exceeding 65° and with a moisture content not exceeding 10%; the injurious substances are absorbed by active C or  $\text{SiO}_2$ .

## 18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

- Acid making at the Ipswich superphosphate works.** Anon. Ind. Chemist 10, 49-54(1934). E. H.
- Production of phosphoric acid. II. The Dorr process.** A. A. Sokolovskii. J. Chem. Ind. (Moscow) 1933, No. 10, 48-53; cf. C. A. 27, 2535. H. M. Leicester
- Precipitation of phosphoric acid by means of chalk.** L. M. Gurévich. Mineral. Udobr. 1, 38-40(1932); *Chimie & industrie* 30, 800.—Natural White Russian chalk, when treated with water, forms a rather fine suspension, which reacts easily with  $\text{H}_3\text{PO}_4$ . It is impossible to obtain a complete reaction with chalk alone, a certain amt. of milk of lime being also required. The process is carried out in 2 stages: (1) addn. of  $\text{CaCO}_3$ , (2) addn. of milk of lime. The end point of the reaction is detd. in the same way as in pptn. with  $\text{Ca(OH)}_2$  alone, in the presence of methyl red, the only difference being that the sample must be filtered and the indicator added to the filtrate. By this process the  $\text{CaO}$  consumption can be reduced to 6%, and the finished product contains about 36% citric-sol.  $\text{P}_2\text{O}_5$  on the dry basis. The excess of  $\text{CaO}$  is in the form of  $\text{CaCO}_3$  and does not affect the ratio of citric-sol. to total  $\text{P}_2\text{O}_5$ . The time required for pptn. is about 60 min., as compared with 25 min. for  $\text{CaO}$  alone. Combined use of  $\text{CaCO}_3$  and  $\text{CaO}$  improves and facilitates filtration of the ppt. Use of  $\text{CaCO}_3$  does not affect the decrease in the sol.  $\text{P}_2\text{O}_5$  content on drying. A. Papineau-Couture
- Colloid problems of the nitrogen and sulfuric acid industries.** Bruno Waeser. Kolloid-Z. 66, 123-7(1934); cf. C. A. 28, 1473<sup>7</sup>.—Leuna lime and caustic mud properties are reviewed. Patents relating to the recovery of  $\text{H}_2\text{SO}_4$  fog from waste gases are reviewed. A. F.
- The lead chamber process. VI. The relation between pressure and sulfuric acid formation, with nitric oxide as oxygen carrier.** E. Berl and F. W. Althoff. Z. anorg. allgem. Chem. 215, 225-41(1933); cf. C. A. 27, 4351.—In an exptl. chamber process, pressures of 1, 6.6 and 13.3 atm. gave outputs of approx. 150, 600 and 2900, resp. Since the reaction  $2\text{NO} + \text{O}_2 = 2\text{NO}_2$  is the slowest, it defines the overall reaction velocity. Since it is trimol., its velocity should increase as the cube of the pressure. The tests showed that the output of the system increased as the 4th power of the operating pressure in the reaction vessel, so that the above equation is not the only reaction defining velocity. Also, dependence upon the 4th power shows that, in addn. to diffusion velocity or absorption velocity, the limiting surfaces of gas-liquid define the reaction velocity. That oxidation of NO in the gaseous phase does not alone det. velocity is evident from the fact that the outputs of all recent  $\text{H}_2\text{SO}_4$  systems have been increased by incorporating sprays to increase the liquid-gas phase limiting surfaces. E. M. Symmes
- Alkali-containing Hungarian ores from a technological point of view.** József Györki. Vegyi Ipar 32, No. 23-4, 2(1933); *Földtani Közlöny* 63, 189-92(in German).—Phonolites and trachodolerites contain 6.66-2.30%  $\text{Na}_2\text{O}$  and 5.38-0.98%  $\text{K}_2\text{O}$ . No increase of alkali content was obtained by electromagnetic sepn. For the time being such ores cannot be used by the trade. S. S. de Finály
- The production of calcium nitrate.** A. M. Dubovitskii and N. I. Kryuchkov. J. Chem. Ind. (Moscow) 1933, No. 10, 27-32.—Descriptive. H. M. Leicester
- Volatilization of fluorine in manufacture of phosphorus and phosphoric acid by furnace processes.** D. S. Raynolds and K. D. Jacob. Ind. Eng. Chem. 25, 1321-3(1933).—Recovery of the F volatilized does not seem to be worth while. Albert L. Henne

**Isolation of helium and the complete utilization of Larderello gases.** Piero Ginori-Conti. *Giorn. chim. ind. applicata* 15, 500-5(1933).—Summary of recent progress in sepn. and utilization of the gases liberated in the soffioni of the borax-bearing hot springs at Larderello.

A. W. Contieri

**Sulfur in Peru—some deposits of the Andes.** Robert D. Ferron. *Eng. Mining J.* 135, 64-5(1934).—A brief description of some of the comparatively unknown deposits of S in Peru.

W. H. Boynton

**The reactivity of charcoals.** C. Collina and I. Gior-dano. *2me Congr. intern. carbons carburant* (Milan, Oct. 1932), 131-40; *Chimie & industrie* 30, 1117.—Under fixed exptl. conditions (900° and approx. atm. pressure) the reaction const. of  $\text{CO}_2 + \text{C} \rightleftharpoons 2\text{CO}$  may be considered as the abs. numerical value of the reactivity. A method and app. are described for carrying out the detn. by passing a measured vol. of  $\text{CO}_2$  over charcoal heated to 900°, analyzing the gases, and calcg. the reactivity of the charcoal from suitable tables or graphs. A. Papineau-Couture

**Mica.** F. W. Horton and B. H. Stoddard. Statistical Appendix to Minerals Yearbook, 1932-33, *Bur. Mines* 7-12(1933).

Alden H. Emery

**Waste gases from the preparation of kieselsguhr (diatomaceous earth).** W. Liesegang. *Angew. Chem.* 47, 48-9(1934).—Kieselsguhr is usually calcined in open sheds, and it was found in lab. expts. that the gases of combustion contained mainly  $\text{SO}_2$  with small amts. of  $\text{H}_2\text{S}$ ,  $\text{NH}_3$ , aldehydes, pyridine and thio acids. However, the quantity of  $\text{SO}_2$  liberated was not sufficient to cause damage to the surrounding vegetation.

Karl Kammermeyer

**Preparation of bleach liquors from liquid chlorine and [quick]lime.** O. Wurz. *Papier-Fabr.* 31, 49-53, 62-5(1933).—Tech. details are given. The quicklime should contain  $>0.2\%$   $\text{Fe}_2\text{O}_3$ ; if Mn is present the liquor is red, but this is harmless. During chlorination a rise of temp. to 42° does not increase the loss of Cl as  $\text{Ca}(\text{ClO})_2$  or  $\text{CaCl}_2$  if the liquor is alk. (as is always necessary). For an escape of Cl<sub>2</sub> the best spray is aq.  $\text{Na}_2\text{CO}_3$ . B. C. A.

**"Italian" powder for polishing marble.** A. G. Eliseev and N. A. Khmelevskaya. *Mineral. Suir'e* 8, No. 10, 37-40(1933).— $\text{Al}_2\text{O}_3$  was used as a substitute for putty powder with good results. The product was prepd. by complete pptn. of a satd. soln. of alum with  $\text{NH}_3$ , d. 0.91, the mixt. was allowed to stand 18 hrs., the ppt. was filtered off, dried, heated, comminuted and sifted to a diam. of 2.3-4.7  $\mu$ . Chas. Blanc

**Liquids for cooling automobile radiators in winter.** E. Hoeg. *Ingenioren (Automobillechnik)* 42, No. 8, 17-19 (Feb. 25, 1933); *Chimie & industrie* 30, 571.—A considerable no. of such liquids at present on the market are highly corrosive. Tests on one of them showed that corrosion is slow at first but proceeds at increasing rate. Even when corrosion is slow, it interferes with cooling, because the sludge formed hinders proper circulation.

A. Papineau-Couture

**Liquids for automobile radiators.** J. Eilersten. *Ingenioren* 42, 73-5(1933); *Chimie & industrie* 30, 571.—The evapn. loss of 30% alc. is equiv. to approx. 0.4 l. of 93% alc. per 1000 km.; alc. of this strength does not attack varnish, while 93% alc. does. Corrosion tests were carried out with aq. 26% glycol, 30% glycerol and 30% EtOH. All 3 attack Pb considerably during the 1st month, after which the rate of attack falls considerably; Sn, Zn and Cu are much less attacked. In every case (except Cu) the metal was least attacked by the EtOH. Fe is attacked more by pure  $\text{H}_2\text{O}$  than by any of the 3 above liquids. A. Papineau-Couture

**Oxidation of NO to  $\text{N}_2\text{O}_5$  by means of  $\text{O}_3$**  (Kobozev, et al.) 4.

**Bachala, A.:** La chaux, facteur de production. Auch: Th. Bouquet. 15 pp.

**Bernard, Edouard:** Le problème de l'azote en France. Paris: J. B. Baillière & fils. 220 pp. F. 25.

**Annuario delle materie plastiche.** Milan: P. A. Pollini. 432 pp. L. 20.

**British Plastics Year Book, 1934.** London: Plastics Press, Ltd. 568 pp. 7s. 6d.

**Boric acid.** Emil Franke (to Chemische Fabrik Grünau Landshoff & Meyer A.-G.). U. S. 1,944,598, Jan. 23. In the manuf. of boric acid from minerals such as kernite and rasorite contg. Mg as an impurity, the material is heated with hot  $\text{H}_2\text{SO}_4$  in the presence of Na borate, so that a soln. of  $\text{H}_2\text{BO}_3$ ,  $\text{MgSO}_4$  and  $\text{Na}_2\text{SO}_4$  is produced, this soln. is cooled to sep. a portion of the  $\text{H}_2\text{BO}_3$ , the resulting liquor is concd. to the point where it is satd. with  $\text{Na}_2\text{SO}_4$  to sep. Na Mg sulfate, and the hot liquor is cooled to crystallize further quantities of  $\text{H}_2\text{BO}_3$  free from sulfate.

**Boric acid.** Andrew Kelly. Ger. 584,702, Sept. 22, 1933 (Cl. 12i. 40). See Brit. 351,810 (C. A. 26, 3337).

**Phosphoric acid from crude phosphates.** George F. Walker, Albert E. Marshall and Holbert E. Dunn (to Southern Mineral Products Corp.). U. S. 1,944,048, Jan. 16. Crude phosphate contg. Fe and Al compds. is leached with a dil. soln. contg. 5-15%  $\text{H}_3\text{PO}_4$  to dissolve Fe and Al compds.; the purified material is then treated with  $\text{H}_2\text{SO}_4$  to produce  $\text{H}_3\text{PO}_4$ ; Fe and Al compds. are pptd. from the leaching soln. and the resulting purified leaching soln. is utilized in the sulfuric acid treatment.

**Phosphoric acid from crude phosphates.** Norsk Hydro-Elektrisk Kvaestofaktieselskab. Norw. 52,397, April 10, 1933.  $\text{H}_3\text{PO}_4$  or a mixt. of acids contg.  $\text{H}_3\text{PO}_4$  is produced by decompn. of crude phosphate with  $\text{HNO}_3$  and pptn. of the lime in the form of  $\text{CaSO}_4$  by passing  $\text{SO}_2$  through the acid soln. under suitable conditions.

**Sulfuric acid.** Metallgesellschaft A.-G. Brit. 400,143, Oct. 19, 1933. In the contact process the removal of solid components from the burner gases and the absorption of the  $\text{SO}_3$  are both performed without any circulation of acid. App. is described.

**Sulfuric acid.** R. A. I. Lundgren. Swed. 76,798, March 28, 1933.  $\text{H}_2\text{SO}_4$  is produced by intimately mixing  $\text{SO}_2$  and nitrous gases with  $\text{H}_2\text{SO}_4$  in an excess of  $\text{H}_2\text{O}$ . The gas mixt. is forced by pressure or suction through a large number of vertical pipes, the lower ends of which dip below the level of liquid in a closed chamber in such a way that the liquid is carried along by means of the gas pressure and is mixed with the gas and introduced into an upper chamber from which the gases are taken out, while the liquid flows back in sep. conduits to the lower chamber and is thus kept in circulation.

**Sulfuric acid concentration.** Wm. C. Mast (to Chemical Construction Corp.). U. S. reissue 19,064, Jan. 23. A reissue of original pat. No. 1,790,507 (C. A. 25, 1340).

**Heat-exchange apparatus suitable for use as an acid cooler in sulfuric acid manufacture.** Bernard M. Carter (to General Chemical Co.). U. S. 1,943,855, Jan. 16. Various structural details are described.

**Vapor-phase catalytic reactions such as ammonia synthesis.** Mortimer J. Brown (to E. I. du Pont de Nemours & Co.). U. S. 1,943,580, Jan. 16. Reactant gases are passed in contact with the inner side of pressure-sustaining walls of a pressure-resisting bomb, and then are passed in heat-exchange relation within the bomb with outgoing gases; the partially heated gases are passed over a preheater and then enter a single catalyst mass at a plurality of adjacent places along the main line of flow. Various structural and operative details are described.

**Apparatus for producing a mixture of water gas and generator gas suitable for the synthesis of ammonia.** The Power Gas Corp. Ltd. and Niels E. Rambush. Ger. 588,715, Nov. 24, 1933 (Cl. 24e. 1.01).

**Alkali cyanates.** Herbert Wittek. Ger. 590,232, Jan. 5, 1934 (Cl. 12k. 9). An alkali carbonate or hydroxide is treated with a mixt. of  $\text{NH}_3$  and  $\text{CO}_2$  at 600-800° in the presence or absence of a catalyst, e. g., Cu or Mg or their alloys or oxides. A little N may be added to the gas mixt. to repress the disson. of the  $\text{NH}_3$ .

**Alkali cyanides.** N. V. Stikstofbindingsindustrie "Nederland." Ger. 588,823, Nov. 27, 1933 (Cl. 12k. 11). Alkali thiocyanates are heated to 400-800° in the presence of oxides of alk. earth or heavy metals and CO or gases

contg. CO. Thus, NaCNS is heated with ZnO and CO to give NaCN, ZnS and CO<sub>2</sub>. Yields of 98–8% cyanide are given.

**Cyanides and cyanamides.** Herbert Wittek. Ger. 588,761, Nov. 25, 1933 (Cl. 12k. 9). A furnace for forming cyanides or cyanamides from NH<sub>3</sub> and uni- or bivalent metals is described. Cf. C. A. 27, 3585.

**Alkaline earth cyanides.** Nikodem Caro and Albert R. Frank (H. Heinrich Franck, inventor). Ger. 588,943, Nov. 30, 1933 (Cl. 12k. 9). Alk. earth carbide is treated with N and the fused or plastic reaction product is rapidly cooled to 400–500° to prevent formation of cyanamides. Thus, CaC<sub>2</sub> is heated and treated with N to give Ca-

**Alkaline earth nitrates.** Harry Pauling. Ger. 588,874, Nov. 29, 1933 (Cl. 12i. 26). The gases obtained by burning NH<sub>3</sub> are absorbed partly in water and partly in dry alk. earth oxides, hydroxides or carbonates. The HNO<sub>3</sub> resulting from the first-mentioned absorption is added to the alk. earth compds. to convert further oxide, etc., to nitrate. The nitrates are sepd. by usual methods.

**Trialkali phosphates.** Chemische Fabrik Budenheim A.-G. (Hans H. Saenger, inventor). Ger. 588,942, Nov. 30, 1933 (Cl. 12i. 31). Aq. concd. solns. of dialkali phosphates are treated with the requisite amt. of alkali carbonate and NH<sub>3</sub>. The soln. is cooled if necessary. In an example, Na<sub>2</sub>HPO<sub>4</sub> is treated with Na<sub>2</sub>CO<sub>3</sub> and NH<sub>3</sub> to give Na<sub>3</sub>PO<sub>4</sub> and (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub>. A 60% yield of Na<sub>3</sub>PO<sub>4</sub> is obtained.

**Alkali polysulfides.** I. G. Farbenind. A.-G. (Erik Reissmann and Hermann Wolff, inventors). Ger. 590,278, Dec. 28, 1933 (Cl. 12i. 18). See Fr. 739,294 (C. A. 27, 1997).

**Molybdates.** I. G. Farbenind. A.-G. (Ernst Pokorny, inventor). Ger. 588,564, Nov. 23, 1933 (Cl. 12n. 10). Molybdates of alk. earth metals or Mg are prepd. by treating roasted molybdenite with boiling alk. solns. or ppts. of these metals. Examples are given.

**Phosphates.** Phosphate Recovery Corp. Fr. 756,037, Dec. 4, 1933. Materials contg. phosphates are concd. by agitation and treatment with air to produce a foam relatively rich in phosphate and sepn. of the foam. The phosphate material is made into a pulp and aerated in the presence of materials contg. naphthenic acid, e. g., those obtained during the refining of petroleum.

**Peroxides.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Fr. 755,562, Nov. 27, 1933. Solns. of peroxides, particularly of H<sub>2</sub>O<sub>2</sub>, are stabilized by the addn. of Sn compds. sol. therein, e. g., Na stannate. To prevent pptn. of Sn a pyrophosphate may be added and the *pH* value of the soln. is kept between 2 and 6.

**Aluminum compounds from material such as bauxite, clay or alunite.** Stephen Hunyady. U. S. 1,944,327, Jan. 23. A salt such as Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>, which may be produced by treating bauxite with (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, is converted into Al hydroxy carbonate (as by the action of (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub>), and the latter, with accompanying insol. substances, is treated with SO<sub>2</sub> to form Al sulfite. The last may be calcined to form Al<sub>2</sub>O<sub>3</sub>.

**Manganese compounds.** Joseph Hetterich and Chemisch-technologische Ges. für Metallforschung m. b. H. Ger. 588,787, Nov. 27, 1933 (Cl. 40a. 46.10). Compds. of Mg free from SiO<sub>2</sub> and contg. very little CaO are prepd. by treating an aq. slurry of Mg ores rich in SiO<sub>2</sub> and CaO with SO<sub>2</sub> and O<sub>2</sub> or ozonized air at high temp. and pressure, the Mg compd. being removed from the residue contg. SiO<sub>2</sub> and CaSO<sub>4</sub> by usual methods. An example is given.

**Thiocyanogen compounds.** Emil Hene. Ger. 588,944, Nov. 30, 1933 (Cl. 12k. 11). CaCN<sub>2</sub> is heated with aq. solns. of alkali or alk. earth hydrosulfides with addn. of S to 150° and the temp. increased to 250°. Thus, CaCN<sub>2</sub> is heated with an aq. soln. of KSH and S to give Ca(CNS)<sub>2</sub>. Cf. C. A. 27, 4354.

**Finely divided metal compounds.** Chem. Werke Schuster & Wilhelmy, Patentverwertungs-Ges. m. b. H. (Paul Beyeradorfer, inventor). Ger. 590,481, Jan. 2, 1934 (Cl. 12g. 5.01). Finely divided metal oxides and

other metal compds. are obtained by subjecting to a chem. reaction a mixt. of a fused or fusible metal or metal compd. with a finely divided inert solid, e. g., sand, glass or porcelain. The inert solid may be sepd. from the product if desired. Thus, finely divided Sb<sub>2</sub>O<sub>3</sub> may be prepd. by treating a mixt. of Sb<sub>2</sub>S<sub>3</sub> and sand with air at a temp. above the m. p. of Sb<sub>2</sub>S<sub>3</sub>, e. g., 650°, the product being freed from sand by mech. means. Other examples are given.

**Metal carbonyls.** Leo Schlecht and Max Naumann (to I. G. Farbenind. A.-G.). U. S. 1,944,849, Jan. 23. In forming a carbonyl by the action of CO on a material such as that used for making an Fe or Ni carbonyl in a closed reaction chamber, spent material is continuously withdrawn from and fresh material continuously fed to the reaction chamber in suitably proportioned rate to keep the reaction chamber substantially completely filled with the material. App. is described. Cf. C. A. 28, 1478°.

**Separating aluminum hydroxide from alkali metal aluminate solution.** Alfred H. Cowles (to Elec. Smelting & Aluminum Co.). U. S. 1,943,786, Jan. 16. See Brit. 382,366 (C. A. 27, 4355).

**Aluminum silicosulfides.** Metallgesellschaft A.-G., Oskar Schober and August Schmitzspahn. Brit. 401,038, Nov. 9, 1933. See U. S. 1,921,705 (C. A. 27, 5156–7).

**Ammonium nitrate.** "Montecatini" soc. generale per l'industria mincraia ed agricola. Ger. 590,409, Jan. 8, 1934 (Cl. 12k. 6). See Brit. 367,060 (C. A. 27, 571°).

**Bleaching powder.** Adolf Remele (to I. G. Farbenind. A.-G.). U. S. 1,944,301, Jan. 23. In producing bleaching powder in mech. bleaching chambers, a mixt. consisting substantially of Ca(OH)<sub>2</sub> with an easily volatilizable and inert liquid such as CCl<sub>4</sub> (in such limited quantity as to permit the material to remain in pulverulent condition) is subjected to chlorination. Cf. C. A. 28, 592°.

**Finely divided hydrated calcium sulfate.** Foord von Bichowsky. U. S. 1,943,497, Jan. 16. For producing finely divided hydrated CaSO<sub>4</sub>, acicular hydrated CaSO<sub>4</sub> material is heated with a soln. of H<sub>2</sub>SO<sub>4</sub>-contg. material in which the free H<sub>2</sub>SO<sub>4</sub> does not exceed that of a soln. of 1.3 sp. gr., and the heating with the acid soln. is continued (suitably gradually up to a temp. of about 100° and for a time of about 24 hrs.) until the acicular material disintegrates without being dehydrated.

**Copper sulfate.** Daniel W. Marsh and Benjamin H. Marsh. U. S. 1,944,444, Jan. 23. Metallic Cu (which may be in the form of sheets, wire, etc.) is suspended in dil. H<sub>2</sub>SO<sub>4</sub> and the reaction mixt. is treated with an O-contg. gas such as air while the material is maintained under superatm. pressure and at an elevated temp. App. is described. Cf. C. A. 28, 1134°.

**Magnesium sulfate.** Kali-Forschungs-Anstalt G. m. b. H. (O. F. Kaselitz, Jean d'Ans and Hans Friedrich, inventors). Ger. 590,482, Jan. 2, 1934 (Cl. 12m. 3). MgSO<sub>4</sub>·H<sub>2</sub>O is prepd. by treating a soln. of MgSO<sub>4</sub> or solid MgSO<sub>4</sub>·7H<sub>2</sub>O, with a hot concd. soln. or melt of Mg-Cl<sub>2</sub>. Details are given.

**Potassium carbonate from potassium sulfate.** Chem. Fab. Buckau (Erich Windbrauck, inventor). Ger. 590,158, Dec. 27, 1933 (Cl. 12i. 13). A soln. of K<sub>2</sub>SO<sub>4</sub> is treated with Ca(OH)<sub>2</sub> and CO at about 200° and 15 atm. to produce a soln. of HCOOK, which is filtered, evapd., and finally calcined under oxidizing conditions to convert it into K<sub>2</sub>CO<sub>3</sub>. Calcination may be effected in the presence of KOH, which may be obtained by converting a part of the HCOOK in known manner into (COOK)<sub>2</sub>, and treating the latter with Ca(OH)<sub>2</sub>.

**Potassium cyanide.** Alfred Mentzel. Ger. 590,231, Dec. 29, 1933 (Cl. 12k. 9). A mixt. of coke and KHCO<sub>3</sub> is briquetted, heated to 300–400° in the absence of air, and then treated with N at about 830°.

**Potassium nitrate.** Kali-Forschungs-Anstalt G. m. b. H. (O. F. Kaselitz and Paul Höfer, inventors). Ger. 552,007, Dec. 19, 1933 (Cl. 12i. 6). A mixt. of Al(NO<sub>3</sub>)<sub>3</sub> and KCl is heated to about 200° until gaseous compds. of N or Cl are no longer evolved. The residue is extd. with water or dil. HNO<sub>3</sub> at an elevated temp., and the ext. is cooled to crystallize KNO<sub>3</sub>. The extrn. residue (Al<sub>2</sub>O<sub>3</sub>) is

reconverted into  $\text{Al}(\text{NO}_3)_3$  in known manner. Cf. C. A. 27, 5905.

**Potassium nitrate.** Preussische Bergwerks- und Hütten-A.-G. Zweigniederlassung Salz- und Braunkohlenwerke Abteilung Kaliwerk Bleicherode (Karl Haase and Hellmut Werth, inventors). Ger. 590,051, Dec. 22, 1933 (Cl. 12i. 8). See Fr. 743,239 (C. A. 27, 8786).

**Potassium sulfate.** H. Lawarrée. Belg. 896,870, July 31, 1933.  $\text{KCl}$  (3 parts) is added to  $\text{MgSO}_4$  (1 part); after filtration of the K salts the mother liquor is crystd.; the crystd. salts are removed and treated with alc., and the undissolved salts are sepd. from the alc. soln.

**Sodium aluminate.** Erik I. Rinnan. Brit. 400,984, Nov. 6, 1933. Cf. Fr. 740,621 (C. A. 27, 2766). Only the requisite amt. of oxides or hydroxides need be added and no  $\text{Na}_2\text{CO}_3$  is used.

**Sodium calcium and sodium cyanides.** Edward J. Pranke. Brit. 400,949, Oct. 30, 1933. See Fr. 730,426 (C. A. 27, 878) and U. S. 1,905,304 (C. A. 27, 3587).

**Purifying caustic soda solution.** Harry Bender (to Pennsylvania Salt Mfg. Co.). U. S. 1,944,630, Jan. 23. A salt of the compn.  $\text{NaOH} \cdot \text{NaCl} \cdot \text{Na}_2\text{SO}_4$  is crystd. from a soln. contg.  $\text{NaOH}$  and  $\text{NaCl}$  by adding  $\text{Na}_2\text{SO}_4$ . Cf. C. A. 27, 1460.

**Sodium nitrate.** Norak Hydro-Elektrisk Kvaestofaktieselskab. Norw. 53,363, Dec. 11, 1933. Solns. of  $\text{Ca}(\text{NO}_3)_2$  and  $\text{NaCl}$  are passed alternately through a suitable app. contg. base-exchanging substances, for instance permutite. Between the solns. suitable portions of pure water are added to prevent a contamination of the nitrate with  $\text{NaCl}$ . **Potassium nitrate.** Norak Hydro-Elektrisk Kvaestofaktieselskab. Norw. 53,372, Dec. 18, 1933. The process is carried out by means of base-exchanging substances in the manner described above.

**Desensitizing thorium dioxide.** Chemische Fabrik von Heyden A.-G. (Rudolf Zellmann, inventor). Ger. 588,563, Nov. 20, 1933 (Cl. 12m. 9). See Fr. 740,229 (C. A. 27, 2252).

**Basic zinc carbonate.** Martin J. Engberg. U. S. 1,944,415, Jan. 23. A suspension of  $\text{ZnO}$  or  $\text{Zn}(\text{OH})_2$  in a soln. of a Zn salt of a water-sol. org. acid such as the formate, acetate, lactate or citrate is treated with  $\text{CO}_2$ .

**Zinc oxide.** Richard W. French (to Superior Zinc Corp.). U. S. 1,944,158, Jan. 23. By-product Zn residues contg. an alkali metal salt and  $\text{ZnCO}_3$  are boiled with water to render the alkali metal salt content sol., washed to dissolve and remove such alkali salt material, and the residue is calcined.

**Zinc sulfide.** Thomas G. Stephens. U. S. 1,944,281, Jan. 23. An aq. soln. of Ba sulfide at a temp. of  $60^\circ$  or higher is mixed with an aq. slurry of  $\text{ZnO}$  at  $60^\circ$  or a higher temp., forming a ppt. of  $\text{ZnS}$  contg.  $\text{Ba}(\text{OH})_2$ ; the ppt. is sepd. from the soln., formed into an aq. slurry and treated with aq.  $\text{HCl}$  to convert the  $\text{Ba}(\text{OH})_2$  into  $\text{BaCl}_2$  and the latter is washed out.

**Hydrogen peroxide.** Kali-Chemie A.-G. (Friedrich Rusberg, Paul Schmid and Ludwig Pellens, inventors). Ger. 588,822, Nov. 27, 1933 (Cl. 12i. 16). Addn. to 587,888 (C. A. 28, 1821<sup>1</sup>). Mixts. of the vapors of  $\text{H}_2\text{O}_2$  and  $\text{H}_2\text{O}$  obtained from any source are freed from mist- or drop-forming constituents by a device for removing mist, prior to condensation.

**Removal of hydrogen sulfide from air.** E. Auger. Belg. 395,348, April 29, 1933. Air contg.  $\text{H}_2\text{S}$  is mixed with  $\text{SO}_2$  and circulated in an enclosure where it is subjected to the action of water sprays.

**Sulfur dioxide.** Daniel Tyrer and Imperial Chemical Industries Ltd. Brit. 400,998, Nov. 6, 1933. Gases contg.  $\text{SO}_2$  in low concn. are treated with an aq. soln. contg. 1 or more salts of stable non-volatile acids having disocn. consts. between  $10^{-3}$  and  $10^{-4}$ , and the  $\text{SO}_2$  is subsequently expelled by heating and (or) reduction of pressure. Suitable acids are lactic, glycolic, citric or  $\text{H}_3\text{PO}_4$ , and the basic radical may be an alkali or alk. earth metal,  $\text{NH}_4$  or other base that does not lead to undesirable pptn.

**Continuous removal of arsenic from sulfuric acid.** Soc. carbochimique (Spec. anon.). Belg. 394,718, April 29,

1933.  $\text{H}_2\text{S}$  is passed through the  $\text{H}_2\text{SO}_4$ . An app. is specified.

**Bromine from sea water.** John J. Grebe and Ray H. Boundy (to Dow Chemical Co.). U. S. 1,944,738, Jan. 23. Sea water is acidified and the Br is liberated by  $\text{Cl}_2$ , the addn. of  $\text{Cl}_2$  being controlled by an electromotive force varying with the Br concn. in the acidified soln. Cf. C. A. 27, 4636.

**Iodine from brines.** Charles W. Girvin (to General Salt Co.). U. S. 1,944,423, Jan. 23. A brine contg. combined I is treated (as by use of  $\text{H}_2\text{SO}_4$  and  $\text{NaNO}_2$ ) to liberate the I in elemental form, the free I is adsorbed on charcoal, the charcoal and adsorbed I are sepd. from the slightly acid soln. by sedimentation and the I may be recovered from the charcoal by use of an acid to form  $\text{HI}$ .

**Catalytic production of hydrogen from hydrocarbon vapor and steam.** Wm. V. Hanks and George H. Freyer-muth (to Standard Oil Development Co.). U. S. 1,943,821, Jan. 16. A catalyst for the reaction is prepd. by first forming a paste contg. heat-decomposable compds. of a metal or metals of the Fe group, admixed with activators, and then heating this paste to remove uncombined water, and further heating the dried paste to about  $870\text{--}1040^\circ$  while continuously passing over it a flushing gas free from catalyst poisons, the catalytic material being maintained at such temp. for some time (suitably about 12 hrs. to 3 days).

**Molybdenum recovery.** Johann Giesen and Ernst Peukert (to I. G. Farbenind. A.-G.). U. S. 1,944,420, Jan. 23. A mixt. contg. Mo and another metal, such a material used as a destructive hydrogenation catalyst in treated brown-coal tar, is roasted with a gas comprising  $\text{O}$  at  $400\text{--}600^\circ$  and then treated with a soln. of  $(\text{NH}_4)_2\text{CO}_3$  to dissolve the Mo.

**Fixation of nitrogen as oxides of nitrogen or as hydrocyanic acid.** Émile Briner and Charles H. Wakker. Brit. 400,431, Oct. 26, 1933. See Fr. 745,840 (C. A. 27, 4181).

**Catalytic purification of oxygen-containing hydrogenation products of carbon oxides.** I. G. Farbenind. A.-G. Brit. 400,262, Oct. 23, 1933. O-contg. products obtained by the catalytic hydrogenation of oxides of C, particularly the fraction boiling above  $110^\circ$  and consisting largely of higher alcs., are purified by catalytic hydrogenation at  $100\text{--}300^\circ$  and pressures above 50 atm. in presence of sulfides or non-reducible oxides of metals of groups 1, 2, 4, 5, 6 or 8, metals of group 6 being especially suitable. The catalysts may be oxides, hydroxides, carbonates and other salts from which the acid radical can be expelled by heat and complex salts of  $\text{H}_2\text{SiO}_4$  or  $\text{H}_3\text{PO}_4$  with  $\text{H}_2\text{MoO}_4$  or  $\text{H}_2\text{WO}_4$ , e. g.,  $\text{NH}_4$  phosphomolybdate. Among examples an initial fraction boiling at  $120\text{--}180^\circ$  is (1) trickled over a catalyst filling, consisting of pieces of Ni and W sulfides made by treating Ni tungstate with  $\text{H}_2\text{S}$ , at  $200^\circ$  and 200 atm. of H and (2) vaporized in H and passed over Cu chromite at  $180^\circ$  and 200 atm.

**Rock salt.** R. Englert & F. Becker, Chemische Fabrik, Prag-VII and Kurt Seidl. Fr. 756,232, Dec. 6, 1933. Uniformly colored blocks, tablets or grains are made from molten rock salt by adding a finely divided ore contg. Fe, particularly silicates or oxides, alone or with Fe oxide or pure Fe salts, and stirring the mass until it begins to thicken if blocks or tablets are desired, or till it completely solidifies if grains are desired. Bauxite and Fe oxide (2%) may be added to the molten salt.

**Leaching crude phosphate rock.** Markus Larsson (to Kunstdünger-Patent-Verwertungs A.-G.). U. S. reissue 19,045, Jan. 16. A reissue of original pat. No. 1,836,672 (C. A. 26, 1078).

**Treating crude phosphate.** Norsk Hydro-Elektrisk Kvaestofaktieselskab. Norw. 53,328, Nov. 27, 1933. Crude phosphate is decompd. by means of  $\text{HNO}_3$  and the  $\text{CaO}$  is pptd. by means of  $\text{NH}_4$  phosphate, in the form of a double salt of  $\text{Ca}(\text{NO}_3)_2$  and  $\text{NH}_4\text{NO}_3$ .

**Treating crude phosphate.** Stockholms Superfosfat Fabriks A.-B. (B. Colbjörnson, inventor). Swed. 78,893, Nov. 14, 1933. Phosphate-contg. materials are decompd.

with  $\text{H}_2\text{SO}_4$  or  $\text{H}_3\text{PO}_4$  or mixts. of these acids. During or after the decompn. is added one or more alkali sulfates to ppt. Ca and form acid alkali phosphates together with alkali salt of the acid used for the decompn. The pptd.  $\text{CaSO}_4$  is sepd. and the soln. treated with  $\text{NH}_3$  to form tri-alkali phosphates together with alkali salts of the acid or acids used for the decompn. The  $\text{CaSO}_4$  is treated in known ways with  $\text{NH}_3$  and  $\text{CO}_2$  or  $(\text{NH}_4)_2\text{CO}_3$  for the production of  $\text{CaCO}_3$  and  $(\text{NH}_4)_2\text{SO}_4$ , the latter being all or in part returned to the process.

**Dissolving titaniferous materials in acids.** Titan Co., A/S. Norw. 52,774, July 10, 1933. The solution is carried out in the presence of sulfurous reducing agents that can be added before or during the reaction. Cf. C. A. 27, 4761.

**Sulfur from pyrite.** A. R. Lindblad. Swed. 76,748, March 21, 1933. Pyrite is roasted in a rotary furnace in the presence of a reducing agent with an adjusted supply of air so that part of the S is driven off unoxidized and is collected as such while Fe and, if desired, part of the S are oxidized.

**Carbon black.** George C. Lewis (to Columbian Carbon Co.). U. S. 1,944,715, Jan. 23. A hydrocarbon flame is impinged upon a metallic depository carrying a layer of insulating material such as fireclay, a ceramic cement or asbestos on some of its unimpinged portions in order to maintain a desirable high temp. Cf. C. A. 27, 574.

**Activated charcoal.** V. Weerts. Belg. 396,962, July 31, 1933. Crude material, such as peat, is carbonized in a closed vessel and is then mixed with a dehydrating agent such as  $\text{ZnCl}_2$ .

**Lampblack.** Electroblacks Inc. Fr. 756,124, Dec. 5, 1933. See Can. 337,132 (C. A. 28, 1822\*).

**Catalyst for the reduction of sulfur dioxide.** Maitland C. Boswell. Can. 338,000, Jan. 16, 1934. Oxides, hydrated oxides, sulfides, hydrated sulfides or oxysulfides of a metal of the Fe group are treated with  $\text{H}_2\text{S}$  at 200–300°. Cf. C. A. 27, 573.

**Condensation products.** Pfenning-Schumacher-Werke (s. m. b. H. Ger. 588,879, Nov. 29, 1933 (Cl. 12o. 17.05). Addn. to 587,643 (C. A. 28, 1822\*). The method of 587,643 for forming hard albumin-like products by condensing urea and  $\text{CH}_2\text{O}$  by the aid of sulfides is modified by using  $(\text{NH}_4)_2\text{S}$  with 1 mol. of urea, thiourea or their derivs., and 2 mols. of  $\text{CH}_2\text{O}$ . The sirupy product is rendered sol. in water by addn. of  $\text{NH}_4\text{CNS}$  and is cleared by addn. of org. acid anhydrides.

**Artificial masses.** Holzhydrolyse A.-G. (Friedrich Koch and Eduard Farber, inventors). Ger. 588,910, Nov. 29, 1933 (Cl. 39b. 26). Masses with lignin as a filling material are prepd. by swelling lignin obtained as a residue by the acid hydrolysis of vegetable materials, in alk. soln. and mixing the product with synthetic resins or casein as binding agent.

**Casein derivatives.** I. G. Farbenind. A.-G. Fr. 755,876, Nov. 28, 1933. See Ges. 574,841 (C. A. 28, 1485\*).

**Laminated products containing phenol-aldehyde resins.** Howard L. Bender (to Bakelite Corp.). U. S. 1,944,143, Jan. 16. Laminated products comprising sheets of material such as paper have a surface sheet impregnated with a resinoid of the phenol-aldehyde type substantially devoid of free phenol and including residual aldehyde largely in the form of a non-phenolic resin, other sheets being treated with a different resin compn.

**Molding powders.** Paul F. Schlingman and Roy H. Kienle (to The British Thomson-Houston Co. Ltd.). Brit. 400,698, Nov. 2, 1933. A molding powder is prepd. by mixing an aromatic amine-aldehyde condensation product (I) with an alk. soln. of a phenol-aldehyde resin (II) in a  $\text{H}_2\text{O}$ -miscible solvent, neutralizing, washing and drying the ppt. I is prepd. by condensing the amine, e. g.,  $\text{PhNH}_2$ , with aq.  $\text{CH}_2\text{O}$  in the presence of  $\text{H}_2\text{O}$  at room temp. II is used while still in the "A" or sol. phase, having a cure of 30–120 sec. on a 160° hot-plate.

**Adhesive.** Hugo Wilken. Ger. 588,866, Nov. 29, 1933 (Cl. 22a. 2). An adhesive for making ply wood is made by treating casein with KOH and glycerol.

**Adhesives.** Firms Adolf Thöl. Ger. 590,257, Dec. 29, 1933 (Cl. 22a. 2). A vegetable phosphatide, or soy-bean sludge contg. phosphatides, is added to known adhesives comprising blood albumin and  $\text{Ca}(\text{OH})_2$ , dissolved in water, whereby premature setting of the adhesive is prevented.

**Gelatinized corn-starch adhesive.** Fred O. Giesecke (to International Patents Development Co.). U. S. 1,943,382, Jan. 16. By a described treatment of the tailings in corn-starch manuf., there is obtained a product which may be used as a binder in briquets and which comprises starch 78–91, protein 7–9, sol. substances 7–9, dextrin 6–8, oil 0.7–0.9, cellulosic material 1–2%, and which has a water-absorption capacity of about 10. Cf. C. A. 28, 1564\*.

**Adhesive tape or plaster.** Frank I. Bennett, Jr. (to Johnson & Johnson). U. S. 1,944,834, Jan. 23. Structural details of a product with a facing sheet of perforated material such as paper. Cf. C. A. 27, 5908.

**Apparatus for making slag wool.** Soc. des hauts-fourneaux de Saulnes, Jean Raty & Co. Fr. 756,092, Dec. 4, 1933.

**Coating composition.** Percy M. Clark (to The Canadian Industries Ltd.). Can. 338,769, Jan. 23, 1934. A coating compn. comprises nitrocellulose 10, tritoyl phosphate 5–15, a nonvolatile mineral oil 0.2–1.0 parts by wt. The compn. is used for coating flexible elec. cables and similar products.

**Compositions for coating metals.** Vereinigte Stahlwerke A.-G. (Heinrich Klas and Gustav Tichy, inventors). Ger. 590,217, Dec. 28, 1933 (Cl. 22g. 7.02). Compos. for coating iron pipes and other metal articles comprise rubber and a hardenable synthetic resin dissolved together in a tar oil with the addn. of a finely divided filler. S and a vulcanization accelerator may also be included. A specific compn. is described.

**Sulfate furnaces.** Alphonse Zieren. Fr. 756,106, Dec. 5, 1933. Construction of scrapers, exchangeable from the exterior, is described.

**Asbestos substitute.** A. Bako. Swed. 76,425, Feb. 7, 1933. An impregnating and coating compn. for the production of substitutes for asbestos consists of a mixt. of  $(\text{NH}_4)_2\text{SO}_4$ , chalk, glycerol, glue and  $\text{H}_2\text{O}$  in suitable proportions.

**Composition for facilitating the running off of water or other liquids from glass and similar surfaces.** E. B. Stenfors. Swed. 77,873, July 25, 1933. A combination of mucin, as a chem. product or in the form of the slime secreted from the skin of fishes and some other marine animals, in either case in alk. soln., and a colloid insol. in water but sol. in the alk. soln., for instance gum tragacanth or horn substance.

**Pastel receiving surface.** Herman E. Braeg (to St. Mary's College). U. S. reissue 19,060, Jan. 23. A reissue of original pat. No. 1,780,113 (C. A. 25, 178).

**Fluid for use in pressure apparatus such as brake systems.** Charles W. Copeland (to Bendix Aviation Corp.). U. S. 1,943,813, Jan. 16. About an equal amount of ethyl lactate is used with an oil such as castor oil and a small proportion of an org. base such as triethanolamine.

**Washable protecting composition for oil tanks.** T. B. Unger Fabrikker A/S. Norw. 52,517, May 8, 1933. A mixt. of  $\text{BaSO}_4$  and water glass with or without addn. of other substances.

**Antifreeze liquid.** Norsk Sprængstofindustri A/S. Norw. 52,559, May 22, 1933. Aq. mixts. contg. glycerol or glycol together with fat or oil with an admixt. of suitable amts. of soap or similar emulsifying substances.

**Luminous compositions.** I. G. Farbenind. A.-G. Ger. 590,256, Jan. 5, 1934 (Cl. 22f. 15). Weatherproof luminous products are prepd. by sintering or fusing  $\text{Al}_2\text{O}_3$  with an oxide such as  $\text{CaO}$ ,  $\text{BeO}$  or  $\text{MgO}$  after addn. of a small proportion of a metal such as Mn, Ni, Rb or Bi or a zincate, titanate or other nonvolatile compd. of such metal. The reagents must be as pure as possible. Examples are given.

**Printing.** Fritz Tutzschke. Ger. 590,437, Jan. 2, 1934 (Cl. 15f. 7.05). A concd. sugar soln. contg. salts

such as  $\text{Ca}(\text{NO}_3)_2$  and  $\text{KH}_2\text{PO}_4$  is used, instead of gum arabic, for coating lithographic stones or metallic printing plates during pauses in the printing process.

**Printing surfaces.** Hermann G. Zimmermann. Brit. 401,063, Nov. 9, 1933. A printing plate having mercurial nonprinting areas is prepd. by coating a metal amalgamable with Hg, e. g., Cu, brass, with a non-amalgamable metal, e. g., Ni, applying the design in a resist to the coating, etching the unprotected parts to expose the lower metal, amalgamating the exposed parts, treating the amalgamated surfaces with a suitable liquid, e. g., a soln. of  $\text{AgNO}_3$  and  $\text{HNO}_3$ , to produce a layer of Ag amalgam having a mat surface and again amalgamating the treated surfaces with Hg. The resist may be of dichromated fish glue.

**Metal printing blocks.** Kodak-Pathé. Fr. 755,540, Nov. 25, 1933. An image in relief is developed by heat on a colloid for the production of a metal block by exposing to light behind a transparent image a sensitized colloidal layer and pouring on to the printed surface a molten alloy of low m. p. so that the heat of the metal causes development of the relief. The metal is allowed to solidify in contact with the relief and is afterward sepd. Cf. C. A. 28, 1292<sup>o</sup>.

**Engraving printing blocks.** Bekk & Kaulen Chemische Fabrik G. m. b. H. Fr. 755,914, Dec. 1, 1933. Printing blocks, covered with a developed layer of colloidal chromate, are engraved with acid which is mixed with solns., of high concn. and a high degree of viscosity, of hygroscopic salts, e. g.,  $\text{ZnCl}_2$ ,  $\text{CaCl}_2$ ,  $\text{AlCl}_3$  or  $\text{Ca}(\text{NO}_3)_2$ .

**Planographic printing bases.** Ulrich Ostwald (to Kalle & Co. A.-G.). U. S. 1,943,486, Jan. 16. There are used as printing bases sheets of cellulose ester compn. such as those comprising cellulose acetate which are capable of being saponified, the desired printing design being resistant to a saponifying agent used to act upon the places of the printing base which are free from the design.

**Coated metal foil suitable for wrapping chocolate bars, etc.** Karl Kilchling. U. S. 1,944,323, Jan. 23. Metal foil of a thickness of 0.009–0.02 mm. and lacking in substantial strength is coated on one or both sides, without use of an adhesive, with a strengthening layer of material such as a cellulose deriv.

**Shoe polish.** Robert Wood. Brit. 400,286, Oct. 26, 1933. A hard polish for boots, etc., is made by mixing 2 parts beeswax or other wax and 1 part turpentine (substitute), palm or other oil and dye being added.

**Esters of sulfonated aromatic carboxylic acids (wetting, cleansing and emulsifying agents).** Friedrich Felix and Otto Albrecht (to Soc. pour l'ind. chim. à Bâle). U. S.

1,935,264, Nov. 14. Numerous examples are given of the esterification or reaction of a sulfonic acid or a sulfonate of an aromatic dicarboxylic acid of the benzene and naphthalene series or a substitution product thereof, an anhydride or halide thereof, with a compd. such as mono- and polyhydric satd. or unsatd. aliphatic alcs. with normal carbon chains or branched chains and contg. hydroxyl groups, linked to primary, secondary or tertiary C atoms, or derivs. of these. There also may be used natural or synthetic higher fatty alcs. or alcs. derived from waxes; also oxidation products of aliphatic hydrocarbons or alcohol-like compds. or mixts. of such compds. obtainable by catalytic hydrogenation; further, diacetone alcohol, hydrogenated final distillates of acetone or alcs. which are obtained by hydration of the unsatd. hydrocarbons formed by the cracking of acid resin or the residual pitch from the distn. of aliphatic raw materials. The products, in the form of their dried alkali salts, are colorless to light-colored powders which easily dissolve in water, and which, when heated with saponifying agents, are split up into an aromatic sulfo dicarboxylic acid and org. compds. contg. hydroxyl groups. They have a pronounced tendency to assist wetting, cleansing and emulsification. Cf. C. A. 27, 6207–8.

**Product for the cleaning and upkeep of metallic electric contact surfaces.** J. de Pouhon and A. Achkienazi. Belg. 395,206, April 29, 1933. The product consists of a mixt. of  $\text{EtOAc}$ , neat's-foot oil or bone oil and liquid paraffin.

**Silicate detergent material.** Alfred W. Scheidt (to Elec. Smelting & Aluminum Co.). U. S. 1,944,848, Jan. 23. Detergent material in fused condition such as that formed from Al and Na silicates is fed between rolls in such proximity to each other that a thin sheet of the material is formed, which on cooling is readily frangible and highly sol. in water. App. is described.

**Cleaning and disinfecting agent.** Mme. Van Wanzelle, née E. E. Pletain. Belg. 395,849, May 31, 1933. Garlic infusion,  $\text{Et}_2\text{O}$  and  $\text{NH}_3$  are added to white spirit.

**Vermin-destroying compositions.** Ernst Dieckmann. Ger. 555,116, Dec. 22, 1933 (Cl. 45/ 3.01). Use is made of solns. of tribromo- $\beta$ -naphthol in  $\text{CCl}_4$ .

**Insecticide.** N. V. de Bataafsche Petroleum Maatschappij. Fr. 755,822, Nov. 30, 1933. A compn. for keeping flies, etc., from animals comprises a mineral oil and a product repelling insects, boiling between the same temp. limits. Thus a mineral oil, 90% of which distils below 400° and which has a viscosity of 40–75 secs. in the Saybolt scale at 38°, may be used with a pine oil distg. not below 340°.

## 19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

**Old English glass; amateur engravings.** Francis Buckley. Glass 11, 66–7(1934). H. S. Willson

**The use of town gas in the British glass industry.** O. W. Roskill. Ind. Chemist 10, 55–9(1934); cf. C. A. 27, 2269.

**Recent studies of the fundamental processes underlying glass melting.** W. E. S. Turner. J. Am. Ceram. Soc. 17, 21–5(1934).—In normal glass melting not one of the alkali carbonates is decompd. by heat alone, but at 800° their reaction with  $\text{SiO}_2$  proceeds rapidly.  $\text{CaCO}_3$  decomposes completely at 610°; hence it is almost entirely thermal and does not rise by interaction with  $\text{SiO}_2$ . There is evidence that in mixts. of  $\text{Na}_2\text{CO}_3$ ,  $\text{CaCO}_3$  and  $\text{SiO}_2$  the shrinking and sintering of the mass at 600° and 750° are due entirely to reaction of the  $\text{Na}_2\text{O}$  and  $\text{SiO}_2$ , the  $\text{CaO}$  acting as it does in the simple  $\text{CaCO}_3$  and  $\text{SiO}_2$  mixts.

C. H. Kerr

**X-ray diffraction and the structure of glasses.** J. T. Randall and H. P. Rooksby. J. Soc. Glass Tech. 17, 287–95(1933).—The examn. included some common glasses and  $\text{Bi}_2\text{O}_3$ ,  $\text{Sb}_2\text{O}_3$ ,  $\text{Cd}_3\text{P}_2\text{O}_7$ ,  $\text{Li}_2\text{B}_2\text{O}_4$ , Se and  $\text{PbSiO}_3$ . The diffraction bands are explained on the basis of minute

crystals or groups of atoms regularly arranged over small vols. It is suggested that the probability of the formation of a glass is high for those substances whose normal cryst forms have forces binding the atoms together in either a strongly directional or in a localized manner. H. P. K

**Methods of determining the constitution of glasses.** Eric Preston and W. E. S. Turner. J. Am. Ceram. Soc. 17, 26–33(1934).—The equil. diagram method involves the destruction of the glassy condition but indicates the compds. that may be formed. The meaning of the change in state at about 40° below the softening point is still obscure. Light-absorption studies indicate solvation. Data on sp. vol., thermal expansion and  $\alpha$  are not decisive. Elec. resistance data indicate the presence of  $\text{Na}_2\text{O} \cdot 2\text{SiO}_2$ . Volatilization data indicate the presence of  $\text{Na}_2\text{O} \cdot 2\text{SiO}_2$  and  $\text{K}_2\text{O} \cdot 4\text{SiO}_2$ . C. H. Kerr

**Strength of glass.** J. B. Murgatroyd. J. Soc. Glass Tech. 17, 260–72T(1933).—The strength of glass with reference to surface condition is discussed. Methods of reducing the effect of surface flaws by fusing substances on glass surfaces and the conditions for making "strong" glass are mentioned. The strength of glass is regarded as

dependent on the chance that a surface flaw is correctly oriented to the principle stress, and the theory is applied to the thermal endurance of glass rods. It is deduced that fatigue under repeated alternating stresses should not be shown by glass, and that strong glasses should have weakly defined transition points.

H. F. Kriege

Behavior of glass when slowly heated with special reference to the thermal expansion. Eric Seddon and W. E. S. Turner. *J. Soc. Glass Tech.* 17, 324-47 (1933).—Measurements of the thermal expansion from room temps. to the softening pt. were made on 7 glasses differing widely in compn., viscosity and other properties. The specimens were heated throughout the range at the rates of  $1^\circ$  and  $1/8^\circ$  per min., after a special annealing schedule involving cooling from the softening temp. at  $1^\circ$  and  $1/8^\circ$  per min., resp. In general, the difference in linear thermal expansion coeff. of the glasses heated at the 2 rates did not exceed 4%. Of the 7 glasses, with 5 the transformation pt. was reduced by the slower heating by  $8^\circ$  or less. Transition pts. at temps. below  $500^\circ$  were even more noticeable with the slower heating. Several glasses show heat absorption just below the transformation pt. Four successive heatings of a pure soda-lime-silica glass produced thermal expansion results differing by not more than 4% over the range  $0-400^\circ$ . For practical purposes it is not necessary to heat specimens of 5 mm. thickness slower than  $1^\circ$  per min.

H. F. Kriege

The thermal endurance of glass. Kozō Tabata and Tarō Moriya. *J. Am. Ceram. Soc.* 17, 34-8 (1934); cf. *C. A.* 28, 595<sup>4</sup>.—Perfectly annealed rods of borosilicate glass of 5 different diams. were studied. A new expression was developed:  $\theta_0(R^m - nR) = C$ , in which  $\theta_0$  = min. temp. difference to cause fracture of the rod;  $R$  = radius of the rod; and  $m$ ,  $n$  and  $C$  are consts. Exptl. data agreed well with calcd. data.

C. H. Kerr

Glass. VIII. The coefficient of thermal expansion of boron trioxide. Monroe E. Spaght and Geo. S. Parks. *J. Phys. Chem.* 38, 103-10 (1934); cf. *C. A.* 25, 4757.—By use of a small dilatometer with Hg as the dilatometric fluid, the coeffs. of thermal expansion of 2 samples of  $B_2O_3$  have been measured between  $100^\circ$  and  $325^\circ$  with a probable exptl. error of less than 5%. The coeff. for the viscous liquid was found to be more than 10 times that for the glassy state. The character of the expansion coeff. temp. curves below  $260^\circ$  depends greatly upon the extent of the annealing during the initial formation of the glass. Tables are given.

John M. Ladino

Principles of the testing of hydrolysis of glass at the surface. H. Jebsen-Rothhausen. *Vorre et silic. ind.* 5, 45-7 (1934); *Sprechsaal* 67, 2-3.

H. S. Willson

Results from reconstructing a tank furnace supplying Fourcault machines. S. Berman. *Glass* 11, 52-8 (1934).—The replacement of a Gobbe type furnace by one of a new construction increased the plant efficiency, lowered the fuel consumption, lowered the net cost of the glass and caused a noticeable improvement in glass quality.

Herbert S. Willson

Scientific principles of fuel economy in the glass industry. Combined low-temperature carbonization and total gasification at the Hazel Atlas Glass Works. David Brownlie. *Glass* 11, 14-18 (1934); cf. *C. A.* 28, 1157<sup>9</sup>.

Herbert S. Willson

Application of statistical methods to the quality control of manufactured products. B. P. Dudding and I. M. Baker. *J. Soc. Glass Tech.* 17, 239-59T (1933).—Some of the simpler statistical methods of analysis are illustrated by using the data obtained in different labs. from thermal endurance tests on glass rods of various diams. The adaptability of control charts and the methods of testing the significance of two estimates of a correlation coeff. are discussed.

H. F. Kriege

Proposals for the desirable stability requirements of different kinds of glass. F. Späte and R. Schmidt. *Fachausschussber. Deut. Glastechn. Ges.* No. 26, 55-62 (1933).—Two test methods, recommended in a report of a previous sub-comm., the extn. test of Mylius and the standard grit-test, were selected to classify the stability and resistance of the various glasses. Discussion of the

requirements for service and recommended standards of min. stability are given for window-glass, mirror-glass, crystal or art glass, chem. glassware of the usual type and of the better grades, app. glassware, glass tubing, illumination glass for incandescent lamps, protecting globes, lantern jackets and optical glass. Eighty-four references.

C. B. Jenni

Study of the stresses in flashed glasses. W. M. Hampton. *J. Soc. Glass Tech.* 17, 273-86 (1933).—The stress distribution present in a system consisting of 2 or more glasses fused together is investigated mathematically. The curves drawn are in good agreement with the actual photographs taken by means of a Babinet compensator.

H. F. Kriege

Dilatometric study of some ternary soda-silica-beryllia glasses. Edouard Rencker. *Compt. rend.* 197, 840-3 (1933).—The replacement of  $SiO_2$  or  $Na_2O$  by  $BeO$  raises the transformation temp. Replacing  $Na_2O$  by  $BeO$  lowers the expansion coeff., but replacing  $SiO_2$  by  $BeO$  causes no apparent change.

J. B. Austin

Chilled plate glass. II. Tsuruo Araki, Sōnosuke Takahashi and Shūichi Mori. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 33 (1934); cf. *C. A.* 28, 1491<sup>4</sup>.—Chilled plate glass when broken forms small pieces without sharp edges. The specially treated glasses cannot be cut by a diamond cutter or by the molten lead method.

Thermal endurance tests on ground specimens are reported.

Karl Kammermeyer

Optical glass about one-half hundred years after Joseph Fraunhofer's death (1836-78). Moritz V. Rohr. *Z. Instrumentenk.* 53, 413-23, 456-65, 494-502 (1933).

Ann Nicholson Hird

Safety glass. A review of the present stage of development. J. Wilson. *J. Soc. Glass Tech.* 17, 296-304 (1933).—The industrial development of satisfactory laminated glass and the legislation requiring its use in vehicles are discussed, along with toughened and other forms of "safety" glass.

H. F. Kriege

Clay. R. W. Metcalf. Statistical Appendix to Minerals Yearbook, 1932-33, *Bur. Mines* 1-5 (1933).

Alden H. Emery

Conditioning of clays in the plastic state. F. H. Clews. *Trans. Ceram. Soc.* 33, 1-12 (1934).—Chem. conditioning by changing the  $pH$  of the clay with suitable acids, alkalis or salts is discussed along with the phys. conditioning by evacuating the plastic mass. A bibliography is included.

H. F. Kriege

A study of the mineralogical and physical characteristics of two lithia-zirconia bodies. Helen Blair Barlett and R. R. Thomas, Jr. *J. Am. Ceram. Soc.* 17, 17-20 (1934).—Differences in thermal expansion coeff. and in other phys. properties are attributed to the presence of a  $Li_2O-Al_2O_3-SiO_2$  mineral in one body and its absence from the other. The fact that the lower  $Li_2O$  body gives lower  $T_e$  value (not dielec. strength) demonstrates the difference in behavior of the alkali when present in the glass phase as opposed to cryst. phase.

C. H. Kerr

Development in automatic stoking for brick kilns. M. Steenbrugge. *Trans. Ceram. Soc.* 33, 15-20 (1934).

H. F. Kriege

Cadmium yellow and cadmium red as ceramic pigments. Ludwig Stuckert. *Farben-Ztg.* 39, 9-10, 36-8, 61-3 (1934).—The literature of CdS and CdSe is briefly reviewed. CdS, prepd. by pptn. of sol. Cd salts with  $H_2S$ , while suitable as such in ceramics is unsuitable for the prepn. of CdSe. For this purpose, CdS is best prepd. by reaction of suspended  $CdCO_3$  with  $Na_2S$  or  $NaSH$ . The completeness of this reaction and the effect of conditions upon the particle size of the product were studied. CdS, prepd. by the direct dry method, consists of mixed crystals of  $\alpha$ - and  $\beta$ -CdS in various ratios. Cadmium red can be prepd. by reaction of a suspension of  $CdCO_3$  with a soln. of Se in  $Na_2S$  or  $(NH_4)_2S$ . A thioarsenide is formed, which when heated loses S and rearranges to form a bright red pigment. In the direct prepn. of Cadmium red by heating  $CdCO_3$ , S and Se, a brown mixt. of sulfides and selenides is formed at about  $300^\circ$ . This mixt. decomposes endothermally at  $450-650^\circ$  into a light red pigment. G. G. Sward

The softening temperature and the ordinary silica-alumina refractory products. M. Lepingle. *Verss et silicates ind.* 5, 21-6 (1934).—Examples show that chem. compn. is not the only criterion of the properties of a clay. *Ibid.* 42-3.—L. discusses briefly d., strength and softening of clays and gives tables showing these properties for several European clays. Herbert S. Willson

Permeability of refractory materials to gases. III. Experiments at temperatures up to 850°. F. H. Clews and A. T. Green. *Trans. Ceram. Soc.* 33, 21-32 (1934); cf. *C. A.* 26, 3348.—Thirteen representative refractory materials were examd. for permeability to N at 500-850°. It was found that the permeability decreases with rise in temp. almost independently of the nature of the material. At 850° and 500° the permeabilities are approx. 0.4 and 0.5, resp., of the value at 10°. The increase in viscosity of the gas with temp. rise accounts almost quantitatively for the decrease in permeability noted. H. F. Kriege

Effect of temperature treatment on abrasives and abrasive products. Ross C. Purdy. *J. Am. Ceram. Soc.* 17, 39-42 (1934). C. H. Kerr

Iron oxide as coloring agent in bodies and glazes. E. Berdel. *Keram. Rundschau* 39, 403-4, 423-4 (1931); *Ceram. Abstracts* (in *J. Am. Ceram. Soc.*) 12, 3-4.—Directions are given for obtaining fiery red colors with Fe oxide. Some of these are: (1) For bodies, the  $Fe_2O_3$  content must be high (near 15%), the body lean with high sand content, the fire oxidizing, and the firing temp. low. (2) For glazes, the glaze must be of an aventuring type contg. little else besides alkalis,  $PbO$ ,  $B_2O_3$  and  $SiO_2$ , and the glaze must be of low temp. and oxidizing. J. D. S.

Body and glaze coloration by iron-bearing calcite. E. Berdel. *Keram. Rundschau* 40, 41-2 (1932); *Ceram. Abstracts* (in *J. Am. Ceram. Soc.*) 12, 4.—Small amts. of Fe in calcite, chalk, marble, etc., do not color the raw material perceptibly and are not observable on firing test pieces. Mixing with finely ground  $SiO_2$  and firing in bisque fire in oxidizing atm. brings out the color well, because of the combination of  $CaO$  with  $SiO_2$  freeing  $Fe_2O_3$ . H. G.

Fish scales L. Vielhaber. *Emailwaren-Ind.* 10, 394-5 (1933).—The assumption that fish scale is due to H is discussed on the basis of its diffusion in Fe. As long as H migrates in the form of atoms in Fe, it can be easily removed by heating. However, when it strikes inclusions of slag, etc., it transforms into mol. H and can no longer permeate Fe. It gathers and develops high pressure. This mol. H is changed again into at., probably during calcining of the ware; the included forge scale acts as catalyzer. Because H diffuses inside slowly, it escapes slowly also, partly after enameling, and gathers under the enamel layer diffusing through it and forming fish scale. M. V. Kondoidy

Tin oxide as a white opacifier. H. Gernscheid. *Emailwaren-Ind.* 10, 413-17 (1933).— $SnO_2$  is made by several methods: (1) oxidation of Sn in tank furnaces by hot air; (2) atomizing Sn metal and oxidation of the tin dust; (3) evapn. of Sn and oxidation of the metal vapors.  $SnO_2$  produced by different methods has practically the same opacifying effect. M. V. Kondoidy

Where the enamel industry belongs. L. Vielhaber. *Emailwaren-Ind.* 10, 401-3 (1933).—The relation between the iron, glass, ceramic and enamel industries is discussed. M. V. Kondoidy

Acid-stable enamels. L. Vielhaber. *Emailwaren-Ind.* 10, 311-12 (1933).—The more complete the chem. reactions the more acid-stable the enamel is.  $B_2O_3$  is always detrimental to acid stability. M. V. Kondoidy

Barium nitrate as enamel raw material. L. Vielhaber. *Emailwaren-Ind.* 10, 277 (1933).—Replacing saltpeper by  $Ba(NO_3)_2$  is not advantageous. M. V. Kondoidy

Phenolite as enamel raw material. Krosta and Pfeiffer. *Glashütte* 63, 606 (1933).—Expts. to replace feldspar by phenolite in brown enamels for cooking utensils gave enamels of high quality. M. V. Kondoidy

Adherence of ground enamel free from adhering oxides. K. Meures and A. Dietzel. *Emailwaren-Ind.* 10, 349-55,

390-3 (1933).—(1) During firing, a ground enamel free from adhering oxides passes through 3 stages: (A) immediately after melting, the green enamel covers the bright iron but does not adhere (it can be adjusted to the iron best by cooling); (B) the enamel appears black and shows clearly a black intermediate layer and adheres, (C) with continued firing, the enamel "burns." (2) It is impossible to transform an enamel (free from adhering oxides) into the firing stage (B) without burning it at the edges and in other sensitive places. (3) The term "adherence" should be used only to mean a combining of enamel and iron by means of the known black intermediate layer (adhering layer); when referring to an enamel being fitted to the iron because of favorable phys. properties or suitable cooling (equalization of tensions), the expression should be "adapted" or "adjusted." M. V. Kondoidy

Action of adhesive oxides in ground-coat enamels. K. Beyerlein. *Keram. Rundschau* 40, 205-8, 221-2 (1932); *Ceram. Abstracts* (in *J. Am. Ceram. Soc.*) 12, 8.—B. concludes from expts. with the application of oxides of Ni, Co, As, Sb and P to sheet iron that (1) it is possible under certain conditions to reduce small amts. of the oxides to the metals on sheet iron but that such metallic particles are not the real cause of the adhesiveness of the enamel, and (2) the adhesive oxide acts in part as a protection against resolution of the ground coat and in part as a contact substance to take up O after the "planing" of the enamel. H. G.

Majolica enameling. L. Vielhaber. *Emailwaren-Ind.* 10, 113-14 (1933).—Dry and wet methods and the lowering of the Pb content are discussed. M. V. Kondoidy

Effect of cold weather on enameling. L. Vielhaber. *Emailwaren-Ind.* 10, 407-9 (1933).—The pickling baths, enamel, raw ware, etc. must have a normal temp. to avoid various defects. M. V. Kondoidy

Significance of analysis with regard to the capability of enameling of cast iron. A. Krautle. *Emailwaren-Ind.* 10, 109-13 (1933).—Among the more or less undesirable elements of cast iron (C, Si, Mn, P and S), C may be considered as a const. quantity. The C content is usually 3.2-3.5%. The other components should be considered variable. The P content may vary, 0.6-1.3%; it promotes a good cast iron. The normal Si content is 2.2-2.6%; it promotes the sepn. of graphite in contrast to Mn and S and favors the destruction of Fe and other carbides. From 0.4 to 0.6% Mn is sufficient to combine with S. S is quantitatively combined with Mn and should not exceed 0.8-0.11%. The relation between analysis and coeff. of expansion is almost unexplainable because a series of factors, such as overheating, thickness of walls, casting temp. and rate of cooling, complicate it. Pretreatment of the Fe by calcining and repeated enameling (ground, intermediate and covering enamel) lowers the coeff. of expansion. A white hardened cast iron has a higher coeff. of expansion than a gray hardened one. The nature of the surface to be enameled is most important. The formation of graphite is of less importance with respect to the formation of bubbles. The surface of the Fe consists of a fine layer of carbide Fe which accounts for the formation of bubbles and needle tapings in many cases. A pearlitic structure is difficult to enamel. The same is true of cast iron contg. 1-2% FeO. The Fe is reduced by the free C and the CO or  $CO_2$  formed promotes bubbles. M. V. Kondoidy

Waste in sheet-iron enamel. H. Ebright. *Email* 1, 9-14; *Emailwaren-Ind.* 10, 399 (1933). M. V. Kondoidy

Furnace [for melting glass] regenerator operation (U. S. pat. 1,944,074) 1. Furnace for the melting of glass (Swed. 78,914) 4.

Comblés, Erich: Feuerfester Mörtel zum Flecken von Silica-Koksöfen. Düsseldorf: Verlag Stahlisen. 5 pp. Schwandt, Erich: Keramische Baustoffe für die Hochfrequenztechnik. Leipzig: Hachmeister & Thal. 78 pp.

**Industrielle Keramik.** Edited by O. Krause. Bd. I. Rohstoffbetriebe der keramischen Industrie. By Alfred Laubenheimer. Dresden: Th. Steinkopff. About 150 pp. About M. 9; bound, about M. 10.

**Glass.** Harold A. Wadman (to Hartford-Empire Co.). U. S. 1,944,855, Jan. 23. Glass-making materials are supplied to a bath of molten glass at a rate substantially equal to the rate of withdrawal of finished glass from the bath; heat of combustion is applied to the glass bath surface, and a further heating to a higher temp. is effected by a c. supplied to submerged electrodes with a c. d. sufficiently low as positively to prevent arcing. App. is described. Cf. C. A. 27, 389.

**Glass.** I. G. Farberingd. A.-G. Brit. 400,742, Nov. 2, 1933. In making glasses of the kind described in Brit. 378,012 (C. A. 27, 3307), which comprise an oxidic component and a vitreifying agent which consists wholly or partly of  $Al_2O_3$  and  $P_2O_5$  in equimol. proportions, more  $Al_2O_3$  is used, the amt. being greater than corresponds to the ratio  $Al_2O_3:P_2O_5$  but not greater than 4 parts by wt. for each part by wt. of  $P_2O_5$ . The Al phosphate is used alone or with other vitreifying compds., e. g.,  $SiO_2$ ,  $B_2O_3$ . In 400,743, Nov. 2, 1933 more  $P_2O_5$  is used, the amt. being greater than corresponds to the ratio  $P_2O_5:Al_2O_3$  but less than corresponds to the ratio  $3P_2O_5:2Al_2O_3$ . Examples are given in both patents.

**Glass.** Corning Glass Works. Ger. 588,643, Nov. 21, 1933 (Cl. 32b. 1). A heat-resisting glass is made from  $SiO_2$ ,  $Al_2O_3$ ,  $B_2O_3$  and alkali, the starting materials being mixed in proportions resulting in the presence of  $SiO_2$  76-90,  $Al_2O_3$  up to 5, and  $B_2O_3$  and alkali 6-14%, in the finished glass. The preferred glass contains  $SiO_2$  about 80,  $Na_2O$  4,  $B_2O_3$  13 and  $Al_2O_3$  2%.

**Lead silicates.** Th. Goldschmidt A.-G. Ger. 590,119, Dec. 23, 1933 (Cl. 12i. 38). Lead silicates and lead alkali silicates for use in the manuf. of glass or glasses are manufd. in a hearth furnace from which gases are withdrawn by a mech. suction device, whereby reduction to Pb is avoided. Preferably, the fuel and (or) the air for combustion are supplied under pressure and are thoroughly mixed.

**Furnace suitable for melting glass, etc.** Ray S. Godard U. S. 1,943,957, Jan. 16.

**Electric glass-melting furnace.** Aktieselskapet Ræders Elektroglasovn. Norw. 53,287, Nov. 13, 1933. An electrode furnace is described in which the fusion proper serves as the elec. conductor. The raw material is charged in a heap between the electrodes; the distance between the active electrode surfaces is less on top of the charge than below, in order to concentrate the heat in the unmelted charge. Structural features.

**Glass-feeder of the kind in which a bell is partly submerged in the molten glass above a discharge outlet and suction or compression applied alternately to the interior of the bell to control the discharge of glass at the outlet.** Peter Kucera. Brit. 400,818, Nov. 2, 1933.

**Apparatus and method for pouring molten glass from a pot onto a rolling apparatus.** Forges & Ateliers de constructions électriques de Jeumont. Brit. 401,071, Nov. 9, 1933.

**Apparatus for the feeding of liquid glass mass to molding machines.** Aktieselskapet Moss Glasvaerk. Norw. 53,021, Sept. 4, 1933.

**Apparatus for forming hollow blown glassware such as bottles.** Karl B. Peiler and Algy J. Smith (to Hartford-Empire Co.). U. S. 1,944,844, Jan. 23. Mech. features. Machine for making glass vessels from tubing. Jakob Dichter. Brit. 400,426, Oct. 26, 1933.

**Electrically heated apparatus for making drawn or rolled vitreous products such as rods, tubes or sheets.** Soc. anon. des manufactures des glaces et produits chimiques de St. Gobain, Chauny & Cirey. Brit. 400,472, Oct. 26, 1933.

**Apparatus for handling sheet glass as it emerges from a vertical drawing apparatus.** N. V. Hollandsche Maatschappij voor de Vervaardiging van Glas. Brit. 400,110, Oct. 19, 1933.

**Apparatus for tempering glass sheets.** Charles Ziegler

(to American Securit Co.). U. S. 1,944,625, Jan. 23. A heating chamber through which the sheet passes has at its exit end a cooling chamber with conveying rollers and chilling surfaces adjacent the path of the glass on the rollers. Cf. C. A. 27, 4646.

**Apparatus for tempering sheets of glass, steel, etc., by jets of air, steam or gas.** Leonardo Mosmieri and Gino Dal Pino. Brit. 401,066, Nov. 9, 1933.

**Continuous polishing apparatus for plate glass, etc.** Forges & Ateliers de constructions électriques de Jeumont. Brit. 400,812, Nov. 2, 1933.

**Decorating glass.** Soc. industrielle de faconnages sur glaces. Fr. 756,045, Dec. 4, 1933. A layer of bakelite varnish is spread on silvered or painted glass, and covered with a soln. of ordinary bitumen not sensitized to light and then, after drying, with a layer of diobromated bitumen. The whole is exposed to light under a negative, the unexposed bitumen is afterward removed by washing with water, then the bitumen and bakelite are removed by appropriate solvents. The Ag thus exposed is converted to chlorite and removed, or the paint is removed by a solvent, leaving a design on the glass.

**Producing silver mirrors on glass.** Max Ermes. Ger. 590,169, Dec. 27, 1933 (Cl. 32b. 10). The known processes, in which a soln. of Ag salt is treated with a reducing agent in the cold, are improved by addn. of a small proportion of cyanides to the Ag salt soln. A mixt. of Hg(CN)<sub>2</sub> and KCN is preferred. Cf. C. A. 27, 387.

**Producing silver mirrors on glass.** Firma Max Ermes. Ger. 587,358, Jan. 5, 1934 (Cl. 32b. 10). Weather-resistant products are made by coating the Ag mirror with an alloy of Ag and a base metal. The alloy may be deposited on the mirror by reducing in the cold a soln. contg. Ag, Cu, Cr, Ni and preferably Zn.

**Apparatus for making wired glass.** Pilkington Brothers Ltd. Ger. 590,134, Dec. 23, 1933 (Cl. 32a. 22). This corresponds to Brit. 381,228 (C. A. 27, 5920).

**Cementing glass sheets.** C. G. Bostrom and G. C. H. Ehrensward. Swed. 78,591, Oct. 10, 1933. The surfaces to be joined are matted and a layer of a suitable cement is applied which fills the depressions of the matted surface and thus restores the transparency. Finally the glass surfaces are pressed together.

**Apparatus for laminated glass manufacture.** Alfred C. Schoepfer. U. S. 1,944,277, Jan. 23. Structural and mech. features.

**Safety glass.** Duplate Corp. Fr. 755,652, Nov. 28, 1933. Means is described for applying a luting agent to the edges.

**Porous materials from clay.** E. I. Lindman. Swed. 78,881, Nov. 7, 1933. Highly porous materials are produced by burning clay, argillaceous materials or rocks in a tunnel furnace with moving bottom at such high temps. that expansion takes place as a result of gas development in the interior of the materials. The raw material is charged in a thin layer on the moving furnace bottom formed by a close succession of cars and heated from above.

**Light-weight porous ceramic material.** Floyd B. Hobart (to Battelle Memorial Institute). U. S. 1,944,007, Jan. 16. A product suitable for use as heat- and sound-insulation is obtained by mixing clay or the like with a sol. silicate soln., foaming the mixt. (as by use of saponin) and introducing a chemical such as  $CO_2$  to cause gelation. U. S. 1,944,008 relates to the production of a heat-insulating material by producing a foam from a sol. silicate soln. (as by use of saponin) and mixing a filler such as slag wool with the foam.

**Apparatus for manufacture of ceramic articles such as tubes.** Willy Langersdorff and Max Langersdorff. U. S. 1,944,790, Jan. 23. Structural and mech. details.

**Molding ceramic articles.** Champion Spark Plug Co. Brit. 400,243, Oct. 16, 1933. Spark-plug cores, etc., are made by prepg. a ceramic material by spraying liquids contg. materials in suspension or soln. from a moving surface, drying or cooling the sprayed drops before they settle so as to form non-adherent pellets which make a

pourable mass, filling the pellets into molds and causing them to adhere to form a self-sustaining article. A spray evaporator and other app. are described. In 400,280, Oct. 16, 1933, divided on 400,243, powd. or granular material is molded by charging the mold through a connection with a storage vessel the material in which is subjected to gas under pressure to cause said material to be permeated therewith so that it flows without clogging and then subjecting the material in the charged mold to high pressure. In 400,281, Oct. 16, 1933, divided on 400,243, an elastic mold is used which is subsequently compressed by pressure applied to the exterior.

**Apparatus for molding tiles with undercut recesses.** Ernest F. Millward and Woods Tileries (Hanley) Ltd. Brit. 400,107, Oct. 19, 1933.

**Electric insulating material.** Gaston Brou. Fr. 755,794, Nov. 30, 1933. The vitrification of a ceramic product having a basis of Mg silicate is obtained by the addn. of a non-alk. borate, the combination of the constituents being regulated automatically and following the law of proportions defined by Proust by the volatilization of the excess of flux which does not enter into reaction. This method of working allows the firing to be carried out at an industrially economic temp., avoiding, in particular, over-firing. Boracite or Mn borate is preferred.

**Refractory masses.** Arthur Sprenger. Ger. 588,860, Nov. 29, 1933 (Cl. 80b. 8.17). Addn. to 587,827 (C. A. 28, 1832\*). The method of 587,827 for producing fireproof masses from  $MgO$ ,  $Cr_2O_3$ , and  $Al_2O_3$  is modified by replacing about  $1/4$  of the  $MgO$  by lime-free  $SiO_2$ .

**Refractory material.** Klinker- und Steinzeugwerke Mertendorf G. m. b. H. Ger. 590,295, Dec. 28, 1933 (Cl. 80b. 8.06). A mixt. of quartz sand with about 10% of metallic Fe is heated in a reducing atm. to 1300-1500°. The mixt. may be heated as such or in the form of balls prepd. with the aid of a binder. The product contains  $SiO_2$  in a modification of low d., and does not increase in vol. when reheated. It may be molded with the aid of a binder and fired at 1280° or above, or it may be added, to the extent of 20% or more, to compns. for making refractory bricks.

**Refractory material resistant to acid and alkali.** Aktiebolaget Amphibolit O. Y. (H. Frauenfelder and H. Avellan, inventors). Swed. 77,783, July 11, 1933. Finely ground amphibole-asbestos rock or waste products obtained by the extn. of asbestos from such rock after moistening with water is pressed and without predrying is burned in known ways until it is through sintering.

**Refractory ceramic products resistant to molten glass.** Paul G. Willetts (to Hartford-Empire Co.). U. S. 1,944,856, Jan. 23. A batch suitable for the manuf. of tank blocks comprises about 65 parts of homogeneous granules of grog of generally similar character to the refractory product to be produced, such as is formed from a mixt. of Georgia Klondike kaolin and Georgia G. clay 92.5% and Bedford feldspar 7.5%, fired to a temp. of about 1560°, and about 35 parts of a binder of the same initial materials in like proportions. Cf. C. A. 27, 2008.

**Refractory articles.** Heinrich Koppers A.-G. Ger. 590,115, Dec. 23, 1933 (Cl. 80b. 8.15). A tube or other hollow article made from sintered finely granular refractory material is coated with relatively coarse refractory material and then fired. Articles impervious to gases and insensitive to temp. variations are obtained.

**Refractory articles cast from highly aluminous materials.** Vladimir Skola (to Corning Glass Works). U. S. 1,944,616, Jan. 23. A melt such as one of bauxite contg. 2%  $Fe_2O_3$  is maintained in a liquid state while the metallic impurities settle to the bottom and imperfectly melted particles rise to the top, and articles such as those for contact with molten glass are then cast from the intermediate layer of the melt.

**Refractory bodies such as blocks or bricks.** Konrad Friederich (to Stollwerk A.-G. vorm. Wilisch & Co.). U. S. 1,944,709, Jan. 23. Various details are described for the manuf. of blocks, bricks or the like from a base material such as chamotte in graded particles of at least

three sizes and pieces of chamotte or other material of larger size.

**Refractory bricks.** Didier-Werke A.-G. Ger. 590,207, Dec. 28, 1933 (Cl. 80b. 12.04). Addn. to 487,110 (C. A. 24, 2264). Binding clay in the form of a slip is mixed with less plastic clay or with clay or bauxite which has been partly dehydrated by heating at a temp. up to 600°. The mixt. is then molded and fired.

**Refractory bricks.** Walter Schroeder. Ger. 590,227, Dec. 28, 1933 (Cl. 80b. 12.04). Binding clay in the form of a slip is mixed with sand, nonplastic clay or other refractory substance to produce a viscous compn. contg. 10-25% of the binder. The mixt. is forced into molds by mech. means and fired.

**Refractory substances.** Siemens & Halske A.-G. Brit. 401,030, Nov. 9, 1933. A support for a heating resistance, e. g., of Ni-Cr, consists of pure  $Al_2O_3$ , free from  $SiO_2$  and binding media, which has been sintered at over 1600° and below the m. p.

**Refractory lining for crucibles such as those used for aluminothermic reactions.** Hermann Schultz. U. S. 1,944,278, Jan. 23. Structural details.

**Production or improvement of calcined magnesite and refractories containing it.** A. G. Alterra. Belg. 395,717, May 31, 1933. Black or blackish brown, strongly ferromagnetic Mg ferrites or Ca ferrites which cause the formation of Mg ferrites are added to magnesite.

**Abrasives.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Fr. 756,117, Dec. 5, 1933. The abrasive grains or powder are fixed to a cloth or paper support by rubber or like gum, having a spongy or porous structure. The rubber is made porous after admixt. with the abrasive and then fixed to the support by heating, vulcanization, etc.

**Abrasive sheet material.** H. I. du Pont de Nemours & Co. Brit. 400,650, Oct. 30, 1933.  $H_2O$ -proof sand paper, emery cloth, etc., consists of a paper, etc., base to which is applied a backsizing impregnation of an emulsion of long oil varnish and asphalt color, a presize of waterproof varnish, a binder coating of an oil-modified polyhydric alc.-polybasic acid resin in which the modifying component is (derived from) a mixt. of drying oils, abrasive material and a sandsize coating of material similar to the binder coating, the paper then being dried at about 160°F. for  $1/2$  hr. The resin may be made from phthalic anhydride, a mixt. of drying oils, e. g., linseed, chinawood, or from the equiv. acids of the oils, and glycerol by heating in a varnish kettle until the desired viscosity is acquired, the hardness and flexibility of the resin depending on the proportion of glyceryl triphthalate to the oil therein. A thinner of naphtha and a drier of Mn linoleate soln. are added to the resin and oxidation-retarding substances, e. g., guaiaccol, hydroquinone, eugenol, may be added.

**Apparatus for making sandpaper and like abrasive materials.** Behr-Manning Corp. Ger. 590,450, Jan. 3, 1934 (Cl. 67c. 3). This corresponds to Brit. 390,385 (C. A. 28, 602\*).

**Polishing or abrading materials.** Fritz Simon. Ger. 580,206, Dec. 18, 1933 (Cl. 39b. 21). A mixt. of emery or like material and powd. resin is applied to a paper or fabric support which has been coated with a drying oil or varnish. Alternatively or in addn., powd. resin is dusted on to the support directly after the emery has been applied. The support is then warmed.

**Polishing, grinding and sharpening material.** Siemens & Halske A.-G. Fr. 755,790, Nov. 30, 1933. See Ger. 589,374 (C. A. 28, 1495\*).

**Grinding wheels, etc.** Theodor Pohl and Josef Schneider. U. S. 1,944,807, Jan. 23. Products comprising a grinding material such as  $SiC$  or emery and matrix material such as a clay or resin are disintegrated to obtain smaller shaped parts, each contg. a plurality of grinding grains and a grinding body such as a wheel is built up from these shaped parts.

**Apparatus for sifting enamel, slip, glaze, etc.** Wm. E. Cotton & Sons (Brassfounders) Ltd. and Wm. E. Cotton. Brit. 401,051, Nov. 9, 1933.

**Enamels.** Philipp Byer. Brit. 401,021, Nov. 9, 1933. Enamelled Fe articles are made by fusing directly onto the Fe base a light-colored glaze, white opacifying agents being used which contain Sb oxide together with ZnO and (or) ZrO<sub>2</sub>. The ZnO or ZrO<sub>2</sub> may be replaced partly or wholly by oxides of the alk. earth or earth metals. The mixt. of Sb oxide and other oxides is calcined and

1 compds. of Al and (or) Ba, together with oxidizing agents, may be added to the mixt. About 1-10 parts of the opacifying agent are added to 100 of the basis glaze, either before fusion or during grinding in the mill. Compns. of suitable basis glazes are given.

Muffle furnace for enamel firing. August Bartelmus. Ger. 588,725, Nov. 25, 1933 (Cl. 48c. 7).

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

**New Italian cement standards.** Hans R. Dewidels. *Zement* 22, 717-18(1933).

**Chrome cements.** Maurice Barrett. *Ceram. Age* 23, 58-9(1934).—A review.

**Rapid tests of lime and cements.** Edmond Marcotte. *Genie civil* 103, 430-2(1933).—Tests *in situ* are given for fineness, setting time, expansion, adherence and density.

**Water absorption by cement.** P. Hansel, R. Steinherz and C. L. Wager. *Zement* 20, 1048-52, 1064-9(1931).—The quantity of H<sub>2</sub>O retained by the cement when a mixt. of cement and H<sub>2</sub>O is centrifuged 5 min. after mixing increases with the quantity of H<sub>2</sub>O used to a limiting value which depends on the fineness, but not on the chem. nature of the cement. The centrifuged mass can be stirred and re-centrifuged with sepn. of H<sub>2</sub>O until a min. quantity is retained. The system portland cement-H<sub>2</sub>O behaves exactly like cement-petrolatum, fine sand-H<sub>2</sub>O or fine sand-petrolatum. If the mixed cement is left for 1-3 hrs. before centrifuging, little change takes place in the H<sub>2</sub>O uptake, but in longer periods more, up to 100%, is retained. The solns. obtained are alk. alkali sulfate solns.

**Water absorption by cement.** II. Paul Hansel, Rudolf Steinherz and Carl L. Wagner. *Zement* 22, 625-30, 639-43(1933); cf. preceding abstr.—Examn. of the liquid fractions centrifuged from water-cement pastes after various short periods indicated these steps in the setting process: (a) the soln. of the readily sol. Ca and alk. compds., (b) their interaction to produce less sol. cryst. and colloidal compds., (c) the delayed reaction of the soln. on the remaining cement particles dependent on the thickness of the gel coating them.

**Slag cement for dam construction.** O. Rolfen. *Teknisk Ukeblad* 80, 18-21, 32-6, 288-91(1933).—Cement was produced by grinding a mixt. of 30-40% of portland cement clinker and 60-70% of chilled blast-furnace slag. A good, impermeable concrete was obtained. Leaching tests showed that the slag cement had 3 times more resistivity toward soln. by water than portland cement. As for the heat developed by hardening, the slag cement was tested according to the latest American specifications in comparison with a normal Norw. portland cement, showing 40-50 and 90-100 cal. per g. of cement, resp.

**External protection of metal pipes by cement mixtures.** "Dalmine" covering. A. Rocca. *Mém. compt. rend. soc. ing. civils France* 86, 890-921(1933).—The advantages of cement for external protection of metal pipes against corrosion are brought out, and also the difficulties of its application in practice. The latter are claimed to have been practically overcome by the use of "Dalmine," a coating consisting of asbestos and cement, the proportions and grade of the materials varying according to the conditions of use. The manuf. of the coating and its application to piping are described.

**Corrosion of steel and physicochemical tests carried out on "Dalmine" covering.** O. Scarpa. *Mém. compt. rend. soc. ing. civils France* 86, 922-65(1933); cf. preceding abstr.—The mechanism of the corrosion of iron and steel piping in the ground and factors affecting it are discussed, and various physicochem. tests carried out on "Dalmine," to det. its value as a protection for piping, are described. The tests include electrolytic estn. of the porosity, macro- and micrographic examn. of the structure, detn. of sp. elec.

resistance (as applied to the pipe and after subjection to an appropriate voltage for periods of up to 12 months or more), ability to induce or maintain apparent or real passivity of the iron, resistance to the action of H<sub>2</sub>O and of aq. salt solns., free CaO content, amt. of CaO that can be removed by H<sub>2</sub>O or aq. salt solns. Results of these tests and of the examn. of Dalmine-protected pipe that had been exposed to very severe corrosive conditions showed the product to be highly satisfactory.

**Portland cement pipe coatings.** F. N. Speller. *Water Works and Sewerage* 80, 380(1933).—The use of hydraulic cement pipe coatings inhibits corrosion of metal pipe by (1) preventing water from penetrating to the metal surface or (2) by maintaining a layer of alk. water at the metal surface.

**"Free lime" in portland cement.** C. R. Platzmann. *Zement* 22, 643-4(1933).—Attention is called to the need of distinguishing between the CaO and the Ca(OH)<sub>2</sub> present in cements.

**Determination of the granular composition of portland cement by using a sedimentation apparatus.** Experimental part. I. Effect of the granular composition upon the strength of portland cement. Katsuzo Koyanagi. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 21-3(1934); cf. C. A. 27, 4648.—Two clinkers were ground to various degrees of fineness and the fineness was detd. by sedimentation tests. Samples of concrete and wet mortars of 1:3 mixts. were prepd. with cements of different fineness and tested. The concrete and wet mortar increased in strength with increasing quantities of finest flour in the cement, while dry mortar, in addn. to the finest flour, required a certain amt. of medium-size grains to attain the highest strength. On the basis of these findings K. criticizes the use of 1:3 dry mortar samples as unreliable for specification purposes. II. Concrete of better strength by longer time of mixing. *Ibid.* 24-5.—Expts. showed that prolonged mixing of the cement and aggregate together resulted in addn. grinding of the cement by the pebbles in the aggregate, which produced concrete and mortar of increased strength. III. Comparison of granular composition of two series of cements ground by two different methods. *Ibid.* 25.—Cements ground by short mills with air separator were compared with cements from long compound mills without separator and it was found that the standard sieve test showed both cements to be of nearly the same fineness, while sedimentation exposed a much greater content of finest flour in the cement from the mill without air separator.

**Evaluation of tests on cement kilns.** J. Koch. *Zement* 22, 609-15(1933).—A graphic method is shown of presenting the factors in the heat balance of cement kilns.

**Calculation of the heat balance of cement rotary kilns.** Wilhelm Gumz. *Zement* 22, 677-82, 691-4(1933).

**Preheating the air in rotary kiln operations.** E. Schirm. *Zement* 22, 651-5, 663-6(1933).

**The action of water on concrete.** B. Kellam. *Proc. Am. Soc. Testing Materials* 33, Pt. I, 289-96(1933).—The literature is reviewed and a summary of the present knowledge is presented. The action of water on concrete is fundamentally a solvent action upon the lime set free by the hydrolysis of cement. The degree of solvent action is dependent primarily upon the CO<sub>2</sub> contents of the water and to a lesser extent upon sol. sulfates and other dissolved

substances. A complete chem. analysis of a water is necessary before any significance can be attached to the  $pH$  value. Exptl. data on the variation of lime content with the  $pH$  value of river waters are presented. Seven references.

Karl Kammermeyer

A study of the analysis of fresh concrete with the Dungan buoyancy apparatus. H. R. Nettles and J. M. Holme. *Proc. Am. Soc. Testing Materials* 33, Pt. I, 297-307 (1933).—The sp. gr. detns. of cement and of fine and of coarse aggregates were affected by the length of time of immersion. The analysis of concrete showed variations in the detd.  $H_2O$  content of 1.0 and 1.1 gal. per sack of cement under field and lab. conditions, resp. When the errors in both fineness and sampling had been eliminated the variation in  $H_2O$  content was as great as 0.35 gal. per sack of cement. A study of significant figures showed that alldule computations were sufficiently accurate for the analysis of the mix. Exptl. data are presented.

Karl Kammermeyer

Permeability of concrete under high water pressure. Cornelius C. Vermeule. *Civil Eng.* 3, 611-14 (1933).—A mixt. of 1:2:4 is necessary to secure water tightness in walls 2 ft. thick even under light pressures, but this mixt. is also sufficient up to 200 lb. pressure. Hydrated lime up to 10% gave a tighter more compact mass. Tables are given showing absorption and leakage from 50 to 200 lb.

Ann Nicholson Hird

Deterioration by aging of the concrete in gravity dams. Axel Ekwall. *Water and Water Eng., Suppl.*, Jan., 1934, 17-22.—A review of the reports of 6 authors. E. concludes that the water-tight layer should be composed of concrete contg. 350 kg. cement per cu. m. and where a wide variation in climatic conditions exists this layer should be protected by a special water-tight coating.

W. A. Moore

Destructive occurrences due to freezing (of concrete). A. Steopoe. *Zement* 22, 667-9 (1933).—Addns. of NaCl and  $CaCl_2$  resulted in higher vol. changes of concrete cured at normal temps., while low-temp. curing showed the specimens contg.  $CaCl_2$  had the least and those contg. NaCl the most vol. change with the untreated specimens intermediate. An example of disrupted concrete was explained on this basis.

H. F. Kriege

The story of gypsum in Manitoba. J. P. de Wet. *Can. Mining J.* 55, 20-4 (1934).

W. H. Boynton

Gypsum. C. Galiher and R. W. Metcalf. *Statistical Appendix to Minerals Yearbook, 1932-33, Bur. Mines* 17-23 (1933). Lime (Detailed statistics). A. T. Coons. *Ibid.* 67-75.

Alden H. Emery

Paint and varnish as wood preservatives. L. A. Jordan. *J. Brit. Wood Preserving Assoc.* 3, 46-55 (1933).—A general discussion of paint as a protective coating for wood, particularly as related to wood characteristics and water movement.

Alfred L. Kammerer

The preservation of railway sleepers. J. Bryan. *J. Brit. Wood Preserving Assoc.* 3, 62-71 (1933).—The standard practice of tie treatment on the British railways is described.

Alfred L. Kammerer

Preservative treatment of Douglas fir sleepers in the Sudan. J. Thomson. *J. Brit. Wood Preserving Assoc.* 3, 89-93 (1933).—Douglas fir sleepers are treated with a mixt. of 60% creosote and 40% petroleum by the full-cell process with an av. net retention of 7.7 lb. per cu. ft. All sleepers are adzed, bored and incised before treatment. Because of the extremely low prevailing humidity checking and splitting of the sleepers is the most serious problem. Termites are also active.

Alfred L. Kammerer

Some experiments in the control of dry-rot in floors. Alex. H. Dewar. *J. Brit. Wood Preserving Assoc.* 3, 22-35 (1933).—Hollow wood floors, ventilated and unventilated, treated and untreated, also solid floors treated and untreated were tested for decay resistance to *Merulius lacrymans* and *Coniophora cerebella*. Hollow, ventilated floors made of seasoned wood treated with creosote or preferably with a water-sol. salt of a nitro deriv. of chlorhydroxytoluene gave the best results. A. L. Kammerer

Decomposition of timber under industrial conditions. III. Pitchpine. Ernest A. Rudge. *J. Soc. Chem. Ind.*

53, 22-24T (1934); cf. C. A. 28, 11634.—Three specimens of pitchpine (*P. palustris*) from: (1) pile in alluvial clay subject to sea-water infiltration, (2) gate-post incased in concrete 2 ft. below ground-line, (3) creosoted waling incased in concrete in trestle above ground, pieces in service 35, 2 and 45 yrs., resp. Specimens 1 and 3 were sound; 2 was disintegrated by "wet" rot. Strength detns. and analyses of ash and cellulose-lignin content were made. Symptoms of decay do not seem to be assocd. with salts of strong acids as sulfates or chlorides but with the presence of Ca in the cellulose and  $CaCO_3$  in the surrounding matrix.

Alfred L. Kammerer

Consolidation and waterproofing, by means of water glass, of fissured or disintegrated rocks. M. Stamatiu. *Ann. mines Roumanie* 15, 277-80, 323-6 (1932); 16, 301-4 (1933); *Chimie & industrie* 30, 1337.—Only alkali silicates and silica are suitable for the chem. consolidation and waterproofing of porous, fissured or disintegrated rocks to stop infiltrations of  $H_2O$  or of saline solns. The crushing strength of chemically consolidated rocks depends on the size of grain of the rocks (decreasing with increase in grain size), the sp. gr., petrographic nature, time of air-drying of the solns. (the strength increasing with the time of drying), their nature and concn. Alkali silicate solns. give best results when used at max. concn., but in practice this is limited to 36-38°Bé., above which the viscosity decreases their penetrative power. A. Papineau-Couture

Rubber compds. [for making flooring] (Fr. pat. 755,913) 30. Furnace for melting cement (Swed. 78,914) 4. Enamel paint for stone materials, particularly asbestos-cement articles (Belg. 397,802) 26.

Cement. Paul Paget. Ger. 588,808, Dec. 14, 1933 (Cl. 22f. 1). An acidproof cement is made from water glass, quartz meal, etc., and a small amt. of  $NH_4$  salts or salts of org.  $NH_4$  bases. Thus, the cement may contain water glass, quartz meal, heavy spar and  $NH_4CNS$ ,  $(NH_4)_2SiO_3$ ,  $CH_3NH_2HCl$  or  $NH_4F$ .

Cement. F. L. Smidth & Co. A/S. Ger. 590,226, Jan. 3, 1934 (Cl. 80b. 3.14). See Fr. 787,833 (C. A. 27, 1733).

Cement. A. O. Purdon. Belg. 395,866, May 31, 1933. Cement is obtained by adding NaOH or KOH and Na silicate or  $CaF_2$  to crushed slag.

**Cement.** D. R. E. Werner, S. Giertz-Hedström and O. Stålhane. Swed. 77,505, June 6, 1933. A cement chiefly consists of  $\text{CaSiO}_3$  and  $\text{As}_2\text{O}_3$ .

**Cements.** Riverside Cement Co. Brit. 400,813, Nov. 2, 1933. A portland cement of low heat of hardening comprises ground clinker contg. less than 12%  $3\text{CaO} \cdot \text{Al}_2\text{O}_3$ , less than 3%  $3\text{CaO} \cdot \text{Fe}_2\text{O}_3$ , at least 10%  $3\text{CaO} \cdot \text{SiO}_2$ , and having a value less than 45% for the function,  $\frac{3\text{CaO} \cdot \text{SiO}_2 + 2 \times \% 3\text{CaO} \cdot \text{Al}_2\text{O}_3}{100}$ . Cf. C. A. 28, 1835<sup>b</sup>.

**White portland cement.** P. Gërimont. Belg. 396,667, July 31, 1933. The clinker is coated with glass as it emerges from the burning zone of the kiln, and is then allowed to cool. No. 396,668. A reducing agent (either liquid or gaseous) is passed over the clinker in the zone extending from the point where burning is complete to the point where the clinker is cooled sufficiently not to be oxidized by air. No. 396,669. The clinker is mixed with F compds., which are thrown upon it during and after burning. No. 396,777.  $\text{CaCl}_2$  is thrown on the clinker after burning is completed but while it is still incandescent.

**Hydraulic cements.** Julius M. Curschellas. Fr. 755,900, Dec. 1, 1933. The properties of hydraulic cements are improved by the addn. of an org. acid contg. O, e. g.,  $\text{AcOH}$ , citric or saccharic acid, and their salts. The addn. may be made to the caking water. A supplementary addn. of sol. phosphates, compds. of sesquioxides with F or oxalic acids may also be made.

**Cement composition.** Aldo Beghelli. U. S. 1,944,820, Jan. 23. A compn. adapted to be mixed with unkneced portland cement to avoid the aging of molded cement materials or articles after their impregnation with molten S comprises "sol. silica" 80,  $\text{Al}_2\text{O}_3$  10,  $\text{Fe}_2\text{O}_3$  25 and titanic acid 5%.

**Grinding portland cement.** Harold J. Dunton (to Calaveras Cement Co.). U. S. 1,943,817, Jan. 16. Various details of grinding are described, suitable for producing a product which will pass a 400-mesh sieve.

**Mill supplied with air currents, suitable for grinding cement materials, coal, etc.** Niels Nielsen (to F. L. Smidth & Co.). U. S. 1,944,755, Jan. 23. Structural and operative details.

**Machine for making cement tiles.** Svend Flamand. Brit. 400,429, Oct. 26, 1933.

**Apparatus for feeding rotary kilns with cement slurry or like materials.** Gustave Coymans. Ger. 590,094, Dec. 22, 1933 (Cl. 80c. 16.10).

**Firing cement.** D. R. E. Werner and S. Giertz-Hedström. Swed. 76,855, March 28, 1933. The smoke gases are passed through a rotary drum where they are brought into intimate contact with water or raw mix slurry, which by means of a pump is kept in const. circulation through a filtering app. The solid materials recovered are returned to the rotary kiln.

**Firing cement.** S. Giertz-Hedström and D. R. E. Werner. Swed. 78,827, Oct. 31, 1933. The plastic raw mix is charged by being pressed through perforations in the conical top of the firing chamber.

**Utilizing waste heat from cement calcining kilns for drying slurry.** Eric J. Ochs. U. S. 1,944,452, Jan. 23. Various details of app. and operation are described.

**Retarding the reaction in the presence of water between arsenic trioxide and cement or lime.** O. Stålhane, D. R. E. Werner and S. Giertz-Hedström. Swed. 78,492, Sept. 26, 1933. Before the addn. of water the materials all or in part are heated and then cooled before, during, or after mixing. Cf. C. A. 27, 176.

**Light concrete.** Carl Dybberg. Norw. 52,770, July 3, 1933. A light concrete with up to 90% of sawdust, cork waste, peat or loose wood pulp or mixt. of these materials contains 10% or more of a light and fine-grained shelly sand, so-called marl sand.

**Composition for decreasing the permeability of concrete.** C. F. Erikson. Swed. 76,932, April 11, 1933. The mass consists of rubber, fat and wood tar, with rubber as the main substance.

**Coating and sealing the surfaces of cellular particles such as cellular aggregate for concrete.** Arthur S. Dwight (to Dwight & Lloyd Sintering Co.). U. S. 1,943,858, Jan.

16. Particles such as those of artificial light aggregate are coated with a material of lower m. p. than that of the particles, and hot gases are passed through a layer of the coated particles on a pervious support in a furnace chamber to fuse the coating material on the particles and provide them with a thin superficial coating without filling their pores. App. is described.

**Wet production of binders.** V. Trief. Belg. 396,627, June 30, 1933. In the manuf. of mortars, concretes, etc., the binder is prepd. *in situ* by crushing the raw materials under water and adding the other materials in a suitable mixer.

**Glazing stone.** Carl Menz and Gustav Boecker. Ger. 588,934, Nov. 30, 1933 (Cl. 80b. 23.04). Concrete, artificial or natural stone is glazed by spreading a mixt. of glaze and flux over the stone and fusing it by a welding burner.

**Road-surfacing material.** A. B. C. Dahlberg. Swed. 76,684, March 7, 1933. An aggregate such as gravel, sand or slag is coated with a porous material such as kieselguhr or chalk in which is absorbed a material that acts as a flux for the bituminous binder used with the aggregate. This flux may be tar,  $\text{CS}_2$  or  $\text{CCl}_4$ , benzine, etc. Under pressure, for instance, in road-rolling, the flux is liberated by crushing of the grains of the porous material.

**Road-surfacing, building and electric insulating material.** H. V. Grönroos. Swed. 77,564, June 13, 1933. In a modification of the process described in Swed. 72,892 (C. A. 27, 3055), the fused or sintered product obtained by the first heating after cooling and grinding is placed in refractory molds or upon refractory plates and heated to sintering or beginning fusion.

**White "Essen-asphalt."** Norsk Esenasfalt Co. A/S. Norw. 53,219, Oct. 23, 1933. As the basic material white marble, limestone or feldspar is employed and as the binder a mixt. of rosin, a mineral oil such as "P-965" and linseed oil.

**Bituminous emulsions.** Robert J. Lacau. Brit. 400,045, Oct. 19, 1933. Road-surfacing material consists of bitumen, e. g., natural bitumen or petroleum-distn. residues, approx. 50, tars obtained in the manuf. of lighting gas in continuous charging ovens, e. g., of the Glover-West or Woodall-Duckham type, approx. 50 and either Swedish residuary oil 3 or middle phenolic oil 2-5%, the mixt. being emulsified with  $\text{H}_2\text{O}$ , contg. soap, casein or other suitable emulsifying agent. The tars, obtained by the distn. of coal, are evolved at 400-450° and do not contact with surfaces heated above 600° for any appreciable time. Cf. C. A. 28, 1165<sup>1</sup>.

**Synthetic inorganic gel.** Charles S. Howe (to Los Angeles Testing Laboratory). U. S. 1,943,532, Jan. 16. A product capable of forming a viscous gel with water and suitable for use in asphalt or oil emulsions or in suspending mineral matter is prepd. by adding a fusible alkali salt such as Na silicate to an ordinary compn. for making portland cement by calcination, and then subjecting the aggregate mixt. to calcination.

**Blast-furnace slags.** Arthur Killing. Ger. 590,155, Dec. 27, 1933 (Cl. 80b. 22.01). See Fr. 754,439 (C. A. 28, 1500<sup>4</sup>).

**Artificial stone.** Maschinenfabrik Komnick G. m. b. H. Brit. 400,477, Oct. 26, 1933. Road paving, etc., blocks are made by molding granular material contg. lime and  $\text{SiO}_2$ , producing a thin hard skin of Ca hydrosilicate on the blocks by applying steam pressure, drying and impregnating *in vacuo* with bitumen with or without pressure.

**Artificial stone.** Robert H. King, Allen O. Crocker, Bernardino B. van Domselaar, Louis N. Thomas, Kenneth Henderson, Wm. S. Adams and Wm. A. Westley (trading as Constructora de Caminos "Kingite," Crocker, King & Co.). Brit. 400,633, Oct. 23, 1933. Divided on 398,872 (C. A. 28, 1836<sup>3</sup>). An artificial lava for use as an aggregate in bituminous concrete or asphalt is produced by causing earth or waste materials to travel substantially horizontally up to a region of fusion and to pass through this region at a greater speed than that of their approach, the fused material being discharged immediately after their passage through said region.

**Constructional material.** Soc. anon. ciments portland artificiels Belges d'Harmignies. Belg. 397,070, July 31, 1933. A material that is a poor conductor of heat and sound is manufd. from cement, asbestos and porous mineral matter, more particularly slag wool or kieselsguhr.

**Faced building blocks.** Springbank Quarry Co. Ltd., Hugh K. Symington and Wm. W. Gault. Brit. 400,774, Nov. 2, 1933. Faced building blocks are formed face downward in collapsible bottomless molds, the contact surfaces of which are oiled. A moist mixt. of pebbles, Dorset peas, etc., and cement, with or without sand, is spread and pressed down on a pallet in the mold, a filling of concrete, *e. g.*, whinstone chips 4, whinstone sand 3 and portland cement 3 parts by vol., is put in, the whole is allowed partly to set, the surface of the facing material is exposed and cleaned by brushing or washing, the mold is disassembled and the block is removed and cured. The facing material may comprise pit sand 17, Dorset pebbles 42 and portland cement 7 parts by vol. In 400,861, Nov. 2, 1933, divided on 400,774, collapsible molds are described.

**Light-weight, heat-insulating blocks.** Erik Hüttemann. Fr. 755,994, Dec. 2, 1933. See U. S. 1,932,971 (C. A. 28, 548<sup>9</sup>).

**Light bricks with a high sound-insulating power.** Johs. Rykken and Hans Sundbye. Norw. 52,994, Aug. 21, 1933. One part (by vol.) of coke slag, 1 part of grout and 1 part of cork are mixed and added to a mixt. contg. 0.1 part of kieselsguhr and 0.1 part of dry plaster of Paris stirred out in a suitable amt. of thin grout, after which all is mixed intimately, molded, dried and burned. The resulting bricks or blocks have an apparent sp. gr. of 0.75-1.4 kg. per l.

**Porous plaster.** Imperial Chemical Industries Ltd. Fr. 755,813, Nov. 30, 1933. A plaster setting with a cellular structure contains finely divided anhydrite, a small amt. of one or more accelerators ( $K_2SO_4$ ,  $ZnSO_4$  or  $Al_2(SO_4)_3$ ), a small amt. of gas-producing ingredients and a small amt. of portland cement. Cf. C. A. 27, 2012.

**Securing linoleum and other coverings to metal floor surfaces, etc.** Robert M. Allard (to Armstrong Cork Co.). Brit. 400,744, Nov. 2, 1933. The metal is treated with a corrosion-inhibiting asphalt paint which is allowed

to dry and the covering is secured to the painted surface by a Manila gum cement.

**Coloring roofing granules.** Ernest H. Nichols. U. S. 1,944,800, Jan. 23. Granules of raw shales are heated and the hot granules are simultaneously treated with aq. solns. of  $FeSO_4$  and borax to cause evapn. of at least part of the water and are then reheated.

**Colored granules for roofing.** Poole Maynard. U. S. 1,944,294, Jan. 23. Burned clay granules are impregnated with a soln. of an inorg. color intermediate such as Pb acetate and the impregnated granules are treated with a soln. of a color precipitant such as  $Na_2Cr_2O_7$ . Various examples are given.

**Colored mineral granules for roofing.** Henry R. Gundlach (to Central Commercial Co.). U. S. 1,943,525, Jan. 16. Color pigments are attached to the granules with a waterproof cement formed from  $H_3PO_4$ , a filler such as china clay and ZnO.

**Artificial board suitable for use in automobile tops, etc.** Clarence J. Strobel (to St. Clair Rubber Co.). U. S. 1,944,533, Jan. 23. A fibrous material such as "Celotex" or the like is assembled with a paper facing and the fibers of both the underlying material and the facing are impregnated with a rubber compn. which fills the surfate voids in the body material and penetrates part way through the paper, and the rubber is vulcanized.

**Tile board.** Richard Ericson (to U. S. Gypsum Co.). U. S. 1,943,663, Jan. 16. Various details of manuf. are described.

**Artificial wood.** Claude M. J. R. Jeantet. Brit. 400,439, Oct. 26, 1933. Fine dry wood powder, *e. g.*, sawdust, without added agglutinants, is heated to below the decompn. point of the natural binding ingredients contained therein and subjected to heavy pressure, the gums, resins, etc., liberated by the heat being spread thereby evenly through the mass and consolidating the whole.

**Compound paper and fabric.** Julio H. Hughes and Julio R. Hughes. Brit. 400,584, Oct. 23, 1933. Sheets of paper, *e. g.*, newspapers, magazine sheets or fabric or asbestos are coated with glue, starch, dextrin, etc., to make them (partly) nonabsorbent, dried, adhesively coated, *e. g.*, with size or glue, superposed and compressed to form a wood substitute.

## 21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER AND ALDEN H. EMERY

**Laboratory fractionation of motor fuels.** Horst Brückner. *Gas. u. Wasserfach* 77, 58-60 (1934).—A simple all-glass lab. fractionating column is described which permits quite accurate cuts to be made by the use of a 1-m. air-cooled column. Results are given for a series of motor fuels, and a typical curve is given for a mixt. of hexane with benzene and toluene.

**The use of alcohol in motor fuel in foreign countries.** C. Y. Hopkins. *Can. Chem. Met.* 18, 2-5 (1934).—Economic. Eleven countries are marketing motor fuel contg. EtOH.

**The preparation of synthetic liquid fuel in Siberia (Russia).** N. M. Karavaev and I. Ya. Felberbaum. "Sapromyxites from Barzass," *Goskhimindal-Petrograd* 1933, 4-18.—A general discussion of the deposits, economics and geology of sapromyxites. The following av. yields of low-temp. products are obtained: tar 20-40%, gas 100 cu. m. per ton, semicoke 38-55%, liquid substances and water, including losses in distn., 14-25% and gasoline absorbed from gas 0.5-1.0%. The primary tar on hydrogenation in the presence of catalysts and at 150-200 atm. pressure produced (per ton of sapromyxite): gasoline 6, kerosene 4.5 and oily residue 3%, while the total yield from the sapromyxite was low-temp. carbonization coke 250 kg., gasoline 103, kerosene 45, paraffinic and oily residues 30 kg. and acidic substances 9 kg. Without hydrogenation the corresponding yields were as follows: 250, 30, 30, fuel oil 114, pitch and acidic prod-

ucts 9%. The gas obtained had a high heating value, while the semicoke had to be consumed on the spot because of brittleness.

**Motor fuel from coal and oil shales.** A. A. Boehlingk and J. C. Morrell. *J. Soc. Chem. Ind.* 52: 228-30T (1933).—The results of a study on the cracking of high- and low-temp. tar and shale oil show that high-temp. coal tar and the tar acids obtained therefrom are very refractory toward cracking while the low-temp. coal tar and the tar acids derived therefrom are highly suitable as cracking stocks and for the production of motor fuels. Shale oils are also shown to be desirable sources of motor fuels by cracking. Numerous data are given to substantiate these results.

**Iodometric method for determination of sulfur in fuel.** E. S. Gavrilenko and O. B. Rabinovich. *Nauk. Zapiski Tsukrovoi Prom.* 10, No. 32, 25-36 (1933); cf. C. A. 27, 5171.—The sample is obtained from a residue of fuel after ignition in a calorimetric bomb. Before ignition 12-15 cc. of 10% NaOH or KOH is introduced into the bomb to absorb  $SO_2$ . After ignition the contents of the bomb is washed into a beaker and 7-8 cc. of 3%  $H_2O_2$  is added and boiled for 10 min. The soln. is acidified with HCl to a strong acid reaction; Fe, Al and  $P_2O_5$  are pptd. by  $NH_4OH$ . The filtrate is acidified with HCl (10-12 cc. excess is added). From 8 to 10 cc. of  $BaCrO_4$  mixt. (19.44 g. of  $K_2CrO_4$  and 24.44 g. of  $BaCl_2 \cdot 2H_2O$ ) is added to the soln. which is boiled for 5 min. The soln. is neutralized with  $NH_4OH$ .

The flask is then cooled and made up to the mark with distd.  $H_2O$ . The contents of the flask are thoroughly mixed and filtered through a double filter paper into a beaker. One hundred cc. of the filtrate is transferred into an Erlenmeyer flask with 3-4 g. of KI dissolved in 5-10 cc. of water and 15 cc. of  $HCl$ . After 15 min. the free  $I$  is titrated with 0.05  $N$   $Na_2S_2O_3 \cdot 5H_2O$  with starch as indicator. The end point is the change from blue to green color. One cc. of 0.05  $N$   $Na_2S_2O_3 \cdot 5H_2O$  = 0.000535 g. of  $S$ .

V. E. Baikow

**Carbonization in semi-intermittent vertical retorts.** E. L. Wallis. *Gas World* 100, 139-41 (1934).—Two exptl. West vertical retorts have been operated at Dudley. Each is 90 × 9 in. at the top and 96 × 14 in. at the bottom, of the shape of Glover-West continuous vertical retorts, and is constructed entirely of silica. The retort is superimposed over a cooling chamber divided into 2 compartments, the lower for coke discharging and the upper for continuous steaming. On a 9-hr. coking period the throughput is 91.6% of that from two 40 in. continuous verticals. The coke is less friable than that from continuous vertical retorts, and the bulk  $d$  is greater. Both cokes were burned in a coke boiler with a complete circulating system, and it was found that the semi-intermittent coke is slower in igniting but gives a hotter fire.

P. J. Wilson, Jr.

**The carbonization process at the Jena Municipal Gas Works.** Gülich. *Gas u. Wasserfach* 77, 1-5 (1934).—A layer of coke, 50-60 cm. deep is used at the top of the coal charge in the vertical chamber ovens to absorb and crack the tar. The use of this coke layer gives a higher and more uniform gas yield throughout the carbonizing period. Each of the newer chamber ovens has an adjacent coke chamber in the same setting for water-gas manuf. Expts. in cracking the tar in these coke chambers instead of at the top of the chamber oven gave much poorer results.

R. W. Ryan

**Present technic of semi-carbonization.** Ch. Berthelot. *Genie civil* 103, 513-18, 543-5 (1933).—A comparison of French and English practice in low-temp. carbonization with photographs, drawings and production data.

Ann Nicholson Hird

**The chemical investigation of low-temperature carbonization products obtained from Barzass sapromyxites.** N. M. Karavaev, I. B. Rapoport and A. N. Bashkirov. "Sapromyxites from Barzass," *Goskhimizdat-Petrograd* 1933, 91-130.—The low-temp. tar was sepd. into fractions boiling at (1) 28-100°, (2) 92-107°, (3) 115-30°, (4) 130-45°, (5) 145-60°, (6) 160-85°, (7) 185-200°, (8) 200-50°, (9) 250-300°. The following acids were obtained: (1) oleic, valeric and capronic acids, as well as some  $HCO_2H$  and  $AcOH$ ; (2) oleic, valeric and caprylic acids, with traces of  $HCO_2H$  and  $AcOH$ ; (3) oleic, valeric, caproic and enanthic acids, with traces of  $HCO_2H$  and  $AcOH$ ; (4) caproic and enanthic acids and traces of  $AcOH$ ; (5) valeric, caproic, enanthic and capric acid and traces of  $AcOH$ ; (6) enanthic and capric acids; (7) capric and traces of  $HCO_2H$ ; (8) could not be properly oxidized and the main treated portion had a b. p. of 98-125°; (9) yielded a product b. 120-52°. The following unsatd. hydrocarbons were found:  $C_6H_{12}$ ,  $C_7H_{14}$ ,  $C_8H_{16}$ ,  $C_9H_{18}$ ,  $C_{10}H_{20}$ ,  $C_{11}H_{22}$ ,  $C_{12}H_{24}$ ,  $C_{13}H_{26}$ ,  $C_{14}H_{28}$ ,  $C_{17}H_{34}$  and  $C_{18}H_{38}$ . The double bond was at the 2nd, 3rd or 4th C atom. A small amt. of diolefins was also traced. The aromatic compds. were investigated in the fractions: (1) 30-100°, (2) 100-15°, (3) 115-45°, (4) 150-6°, (5) 156-61°, (6) 161-7°, (7) 167-75°, (8) 175-85° and (9) 185-200°. Fraction (1) (b. 65-85°) contained  $C_6H_6$ ; (2) toluene; (3) *o*- and *p*-xylene; (4) mesitylene and pseudocymene; (5) mesitylene, pseudocymene and small amts. of *p*-ethyltoluene; (6) mesitylene and pseudocymene, (7) pseudocymene and hemimellitene; (8) hemimellitene; and (9) isodurene and prehnitene. The following naphthenes were found: fraction b. below 60° cyclohexene, 95-105° methylcyclohexane, 132-145° 1,4-dimethylcyclohexane. The following paraffins were found in the fraction b. 35-125.5°:  $C_6H_{14}$ ,  $C_8H_{18}$ ,  $C_7H_{16}$  and  $C_9H_{20}$ . The following acids were isolated from 5

fractions b. 48-162°: caproic, enanthic, caprylic, pelargonic, capric, undecylic, lauric, tridecoic and myristic. The 280-350° fraction on being cracked yielded up to 32% of gasoline and 52-4% kerosene at an operating pressure of about 60 atm. and a temp. of 450°. Hydrogenation in the presence of  $Al_2O_3$  at 70-200 atm. for 4 hrs. at 415-25° yielded 22.4% of a fraction b. below 170°, 11% 170-230°, 9.65% 230-80° and 8.57% at 280-350°, and was accompanied by coke formation. Hydrogenation expts. carried out in the presence of  $Al_2O_3$  +  $CuO$  and  $Al_2O_3$  + ( $Al_2O_3$  +  $CuO$ ) at 440-55° and 405-30° are also reported. Heavy bottoms b. above 350° were hydrogenated in the presence and absence of the above catalysts. The gasoline and kerosene fractions obtained are compared with those from petroleum products. In the hydrogenation of the sapromyxite in the presence of  $Co$  oxide and  $NH_4$  molybdate at 430-450° in a rotating Bergius autoclave the yield after about 1 hr. and 40 min. of oily products reached 40-3.5% and that of the solid residue 38-43.2%, while the gaseous part was composed mainly of  $C_2H_4$ ,  $C_3H_6$ , hydrocarbons. A great variety of berginization expts. are reported. Conclusion: The sapromyxite tars are high in unsatd. hydrocarbons (chiefly iso forms), and they also contain aromatic compds. and naphthenes and 40-60% satd. compds.

A. A. Bochtlingk

**Semiproduction investigation of low-temperature carbonization of Barzass sapromyxites.** N. M. Karavaev and D. D. Zuikov. "Sapromyxites from Barzass," *Goskhimizdat-Petrograd* 1933, 71-91.—Barzass sapromyxites were distd. at 500° in rotating retorts (described in detail), the plants having a daily capacity of 5 tons; and semicoke 56.0-75.0, tar 6-13.78 and gas, water and losses 11.83-35.50% were obtained. The semicoke contained  $H_2O$  0.01-5.98,  $S$  0.47-0.90,  $C$  87.34-88.90,  $H$  3.85-5.22 and  $N + O$  2.25-2.40%. The tar had  $d_{15}$  0.9102-0.9535,  $H_2O$  0.6-1.54%,  $E_{20}$  1.26-1.73,  $S$  0.37%, Brenken flash 23-41°, pour point 6°, acidic compds. 4.49-5.70%, acids trace, bases 0.40%, heating value 10,013-10,346 cal. and paraffin 0.55%. The gas was composed of:  $CO_2$  25.2-28.13,  $C_2H_4$  8.91-12.94,  $O$  1.63-3.89,  $CO$  6.02-6.68,  $H + CH_4 + C_2H_6$  43.25-47.25 and  $N$  3.37-12.83%. The steam-distd. tar yielded 19.7% of a fraction boiling below 200° (sp. gr. 0.7870) and 14.3% boiling at 200-273° (sp. gr. 0.8570). The kerosene fraction (steam-distd.) boiling at 185-310° contained 7.5% acidic products and traces of bases. The residue or the fuel oil has  $d$  1.0423,  $H_2O$  1.07%, Brenken flash 179°, mech. admixts. 0.98%, pour point +22°, ash 0.863% and coke 21.1%.

A. A. Bochtlingk

**Results of the technical-chemical investigation of Barzass sapromyxites.** N. M. Karavaev and I. B. Rapoport. "Sapromyxites from Barzass," *Goskhimizdat-Petrograd* 1933, 44-70.—Analysis of a few samples of sapromyxites gave: total water 1.20-3.56, total  $S$  (sulfate  $S$  and org.  $S$  on the dry substance) 0.64-1.01,  $C$  76.04-79.61,  $H$  7.34-9.48,  $O$  9.42-13.67,  $N$  0.28-0.72, volatile matter 60.53-86.17% and heating value 5417-9100 cal. The coke has a low m. p. and is easily broken up into powder. Fractions obtained by extrn. with various solvents were investigated. Low-temp. carbonization yielded a coke having  $H_2O$  0.83-1.85, total  $S$  0.73-1.18,  $O + N$  2.36-4.34,  $C$  84.84-89.96,  $H$  3.60-3.77%, and a calorific value of 3269-8288 cal. The high-temp. carbonization tar has  $d_{15}^4$  0.8910-0.9008,  $C$  84.85-86.01,  $H$  11.60-11.61,  $O + N$  2.05-3.58,  $S$  0.33-0.47% and a heating value of 9641-10,354 cal. The tar was treated with 5%  $H_2SO_4$  for the extrn. of bases, 10%  $Na_2CO_3$  for the removal of acids and 10%  $NaOH$  for the extrn. of phenols (the results are tabulated). It is characterized by a low content of phenols, a considerable amt. of carboxylic acids and a low content of bases. It contained up to 21.9% of a fraction boiling to 200°, having a sp. gr. of 0.7539-0.7545, about 35% aromatics and unsatd. compds. (about 1:2) and it had an I no. of 141.0. The kerosene and heavier cuts were also investigated. The distillates on treatment with  $H_2SO_4$  and fuller's earth and  $NaOH$  yielded bright and stable products (gasoline and kerosene). Thirty-three references.

Modern American coal preparation practice. R. A. Mott. *Colliery Eng.* 10, 378-81, 385(1933). A. N. H.

Physical and chemical investigation of gases contained in coal beds. K. Peters and A. Warnecke. *Glückauf* 69, 1181-90, 1210-12(1933).—One hundred g. samples (particles > 11 mm.) of 18 different coals were ground to  $\mu$  size in a closed mill in a high vacuum. The gases evolved were collected, measured and analyzed. Fossil N, CO<sub>2</sub>, H and C<sub>n</sub>H<sub>2n+2</sub> up to C<sub>7</sub>H<sub>16</sub> were found in varying amts. Helium was also detd. The amt. of gas increased with increasing rank of the coal and, with Silesian coals, it always contained CO<sub>2</sub> and hydrocarbons. In general, the older the coal the more firmly the gas was held. Coal loses its gas rapidly on being taken from the bed, particularly if it is crushed much in removal. From data on different sizes charged in their mill, the authors were able to plot curves from which, by extrapolation, the gas content of the coal in the bed could be estd. The manner in which the gas is held in the coal differs from true adsorption or solid soln. since it is freed by destroying the coal structure (crushing). The amt. of gas recovered varied from 10.5 ml. per 100 g. in the cannel coal to 890 in the anthracite. The gas from the cannel was 100% CO<sub>2</sub>, while the gases from all other samples were mixts.

Tests in Germany on the distillation of coals by the Verté process. L. Verté. *Industria chimica* 8, 446-50 (1933).—Good results were obtained by Otto and Co., Bochum, on application of Verté's process (C. A. 27, 2561) to anthracite, coking coal and mazout, all of German origin.

B. C. A.

A laboratory method for selection of coal charge and determination of its coking properties. L. M. Sapozhnikov and N. A. Bakun. *Coke and Chem.* (U. S. S. R.) 1932, No. 11, 73-8.—The nature of the coking process of Donetz basin coals was studied, and a lab. method for the detn. of coking properties of com. coal mixts. was developed. A simple app. was designed for this purpose, the essential features of which are: a steel cylinder for the coal sample, a perforated plunger connected with hydraulic compensator and a manometer. The coal sample inside the steel cylinder is heated from the outside by an elec. coil (temp. rising 30° per min.); the pressure of the gases generated is transmitted through the plunger and hydraulic compensator to the manometer. The gases liberated inside the coal sample can only escape through the perforations in the plunger and in order to do so have to overcome the resistance of the plastic layer formed around the sample. The speed of the evolution of gas and the degree of the permeability of the plastic layer are the factors detg. the pressure registered by the manometer. The pressures recorded by this app. for different coals were found to correspond very closely to the drum tests for detn. of mech. properties of coke of these coals, especially when single-grade coals were tested. This method is recommended also as means for proper selection and proportioning of the coal mixts. with the desired coking properties.

James Sorrel

The value of plant and semi-plant tests for determination of coking properties of a coal charge. A. S. Bruk. *Coke and Chem.* (U. S. S. R.) 1932, No. 10, 34-8.—To check the reliability of results obtained by semi-plant tests for detn. of mech. properties of coke from different coals parallel runs were made with the same coal. Semi-plant tests were found unreliable for all purposes.

James Sorrel

The behavior of the petrographic constituents of Upper Silesian bituminous coals on carbonization at high and low temperatures and on extraction. B. Neumann and L. Kremser. *Glückauf* 69, 813-20(1933).—Three coals were assayed at high and low temps. and extd. by the method of Cockram and Wheeler. Fusain, durain and vitrain were sepd. in practically pure state. Fusain gave the largest yields of coke and lowest yields of gas and tar. The gas from this coal was rich in CO<sub>2</sub>, particularly with the hard variety which contained calcite.

The yields of gas and tar from the durain and vitrain were practically the same, although the gas from the latter was the richer. Durain showed little coking power. Extn. results showed that the vitrain contained the largest percentage of coking constituents. It appeared that the oily bitumens were responsible for the caking and the solid bitumens for the swelling of the coals during coking.

J. D. Davis

Solution of coal by pressure extraction and hydrogenation of the extracts. H. Pott, H. Broche and W. Scherer. *Glückauf* 69, 903-12(1933).—Yields of approx. 80% ext. from bituminous coals (pea size) are obtained by stage extn. in a shaking autoclave. The method involves keeping the extn. temp. just under the decompn. temp. of the material which rises (400-410° max.) as extn. proceeds. For each succeeding extn. the temp. is therefore raised. Tetralin (C<sub>10</sub>H<sub>12</sub>), C<sub>10</sub>H<sub>12</sub> + PhOH and C<sub>10</sub>H<sub>12</sub> + PhOH + C<sub>10</sub>H<sub>8</sub> are the solvents used, the last 2 being most effective. If the extn. temp. is raised above the decompn. temp. of the material, the yield of ext. falls off. The exts. are easily hydrogenated, yielding a large percentage of C<sub>6</sub>H<sub>6</sub>-sol. oils.

J. D. Davis

Production of activated carbon from coal. A. E. Williams. *Colliery Eng.* 10, 347-8(1933).—The best results are obtained from anthracite. Carbohydrate matter added as a binder often enhances the activity but must be later removed by oxidation. The degree of activation is affected by homogeneity. The process of carbonization and activation is given.

Oil from coal. W. R. Ormandy and J. Burns. *Trans. Inst. Marine Engrs.* 45, 239-64(1933); cf. C. A. 28, 6204.—A review of hydrogenation, straight distn. and distn. followed by converting coke into water gas and this into oil. The Cunard process of using finely divided coal suspended in oil is discussed, also conflicting economic trends.

Ann Nicholson Hird

Relation of hydrogen and methane to carbon monoxide in exhaust gases from internal-combustion engines. Harold C. Gerrish and Arthur M. Tessmann. *Natl. Advisory Comm. Aeronaut. Rept. No. 476*, 11 pp.(1933).—The results of more than 100 exhaust-gas analyses from engines using hydrocarbon fuels showed that the H and CO were present in definite proportions, the ratio depending on the ratio of H to C in the fuel. The relation found for standard-grade and fighting-grade aviation gasoline, auto Diesel fuel, and lab. Diesel fuel was H = 0.51CO; for hydrogenated safety fuel H = 0.33CO. A small amt. of CH<sub>4</sub> was always present, but was independent of the air-fuel ratio and the H-C ratio of the fuel. O was also found even when the fuel was in excess of that required for complete combustion. The detn. of any 2 components (CO<sub>2</sub>, CO, O, air-fuel ratio), employment of the H-CO relationship, and the use of the Ostwald continuous combustion diagram provide a rapid means for obtaining the quantities of the products of combustion in such exhaust gases. The air-fuel ratio may be detd. from the exhaust gas analysis with a precision of  $\pm 2\%$  without measuring the air taken in by the engine.

Deviations from Boyle's law as affecting the measurement of high-pressure gas. Walter Dayhuff. *Petroleum World* 30, No. 11, 40-44(1933). Emma E. Crandal. The purification of gases. E. Ott. *Schweiz. Ver. Gas-*

**Wasserfack. Monats-Bull.** 13, 285-98(1933).—A review on various treatments of gas: cooling and dehydration (also intensive cooling), S ( $H_2S$  and  $CS_2$ ) removal, active-C benzene removal with simultaneous purification, dehydration and naphthalene removal by compression. Tower purifiers are preferred for dry  $H_2S$  removal;  $CS_2$  can be eliminated catalytically but the process is rather expensive. Intensive cooling dehydrates and removes naphthalene effectively but dehydration with  $CaCl_2$  is simpler. The active-C (A. Kohle) process is effective for  $C_6H_6$ ,  $CS_2$  and  $C_8H_{10}$  removal. Compression processes are expensive and do not remove S compds. The latest Petit liquid purification process and the Fischer-Brandt one have not as yet proved their value.

B. J. C. van der Hoeven  
**New gas sulfur purification process.** A. Thau. *Gas-u. Wasserfack* 77, 33-5(1934).—Tower purifiers are filled with porous balls of Fe hydroxide. These have a diam. of 15-20 mm. and a porosity of about 60%. Advantages claimed are much higher gas throughput per cu. m. of purifying material than with dry box purifiers, need of only a small amt. of ground space and easy extn. of the S with solvent so that the material can be reused. A gas velocity of 100 mm. per sec. can be used instead of the 5-7 mm. max. with boxes. The removal of  $H_2S$  from 100,000 cu. m. gas per 24 hrs. requires 2 tower purifiers each 6 m. high and 3.85 m. in diam., having a cross section of only 25 sq. m. as compared with 200 sq. m. for boxes. The tower size is selected so that the purifying material in the lower part of the tower, contg. approx. 45% S, can be removed every 3 days and fresh material added at the top of the tower. This insures good purification. Costs are given. Also in *Colliery Guardian* 148, 151-3 (1934).

R. W. Ryan  
**The theory of small gas governors.** W. E. Benton. *Gas J.* 205, 314-20(1934); *Gas World* 100, 131-6.—Both the const.-pressure and the const.-vol. type are discussed. In contrast to the former, which can be made to offer a negligible resistance at low applied pressures, the const.-vol. type always opposes a considerable resistance to flow.

P. J. Wilson, Jr.  
**Improved hookup method in vent lines permits accurate gas measurement with Pitot tube.** C. M. Rader and R. A. Feemster. *Oil and Gas J.* 32, No. 31, 15-16(1933).—R. and F. describe the type of Pitot tube which gives the most accurate result. Formulas and diagrams are given which are used in the calcs. of the gas flow.

**A charcoal-gas plant.** H. H. Andrews. *Agr. Gas. N. S. Wales* 44, 869-74(1933).—An app. suitable for the manuf. of fuel for tractors is described.

K. D. Jacob  
**Production of vapor-phase gum for pilot tests by continuous addition of nitrous oxide to city gas.** J. A. Perry. *Am. Gas. Assoc. Monthly* 16, 64-6, 70(1934).—An accelerated test for comparing new gas controls or pilots with regular Rutz lighters is secured by the addn. of a small but controlled quantity of NO to the gas stream and the aging of the mixt. for 2 hrs. before it reaches the devices under test. With Philadelphia city gas a concn. of approx. 10 g. NO per million cu. ft. appears sufficient to cause ordinary Rutz lighters to become inoperative in 20-4 hrs. In order to facilitate control of the NO it is dild. with O-free N to a concn. of 1%.

P. J. Wilson, Jr.  
**The washing of gas.** H. Hollings and L. Silver. *Gas J.* 205, 307-11(1934); *Trans. Inst. Chem. Engrs.* (London) Advance copy Jan. 31, 1934, 3-17.—The theory of gas washing in those cases to which Henry's law applies is reviewed. The difficulty in obtaining satisfactory distribution of the liquid limits the effective use of tower scrubbers as countercurrent washers to those operations in which a large quantity of liquid is used in relation to the vol. of gas washed.

P. J. W., Jr.  
**Multi-stage washers.** L. Silver. *Gas J.* 205, 372-9(1934); *Trans. Inst. Chem. Engrs.* (London) Advance

copy Jan. 31, 1934, 18-35.—Equations are developed for the design of the washers. The importance of the different factors is indicated by graphs and tests. Design of washers for  $NH_3$ ,  $C_2H_6$  and  $C_4H_{10}$  recovery is discussed.

P. J. Wilson, Jr.

**The position of gas-works by-products in Australia.** R. S. Andrews. *Gas J.* 205, 206-7, 260-61(1934); *Gas World* 100, 142-5.—The markets and uses for coke and its by-products are discussed. *Tar has been cracked to gas in an exptl. installation of 4 retorts with a throughput of 50 gal. per day. The tar is distd. to coke in the 2 top retorts, and the vapors mixed with steam go on to the lower but hotter ones where cracking to gas and a tar similar to that obtained by cracking tar in a water-gas generator occurs. Per gal. of tar 55 cu. ft. of 1400 B. t. u. gas, 1.6 lb. of pitch coke, 0.1 gal. of crude benzene and 0.26 gal. residual tar are produced. Two methods for distinguishing between good and bad road tars, both complying with specifications, are suggested: (1) A 1-mm. layer of tar is exposed at 150° in a humid atm. to ultra-violet light from a soft C arc at a distance of 12 in. for 20 hrs. A sheet of "Vita" glass is interposed between the sample and the arc. After this treatment the penetration of a standard needle, 100 g. at 5 sec., shall not be less than 50 at the temp. at which the penetration of the original sample was 100. (2) An ultramicroscopic examn. of the no. and state of the C particles per unit vol. is made. The more C particles, the better suited is the tar for road-binding purposes.*

P. J. Wilson, Jr.  
**Condensation of coke-oven gas by cooling to -185° under various pressures.** P. K. Sakmin. *Coke and Chem.* (U. S. S. R.) 1932, No. 10, 48-55.—Linde's process is compared with Claude's process to det. which is more suitable for producing  $N_2-H_2$  gas mixt. from coke-oven gas for  $NH_3$  synthesis. Lab. expts. were performed to det. the purity and yields of  $N_2-H_2$  gas mixt. The coke-oven gas (percentage compn.:  $CO = 0.9$ ; olefins = 1.6;  $O_2 = 0.5$ ;  $CO_2 = 4.8$ ;  $H_2 = 53$ ;  $CH_4 = 21$ ;  $N_2 = 18.2$ ) was cooled to -185° and data were taken for pressures varying from 0-100 atms. The results are given in the form of tables and curves. At a pressure of 28 atms. (condition similar to Claude's process = 25 atms.) the soly. of the  $N_2-H_2$  gas mixt. in the condensate is so great that the yield of the mixt. is only 45%; the product contains 0.9% impurities. Condensation under 10 atms. (pressure used by Linde's process) gives 50%  $N_2-H_2$  contg. 2.4% impurities; by washing the mixt. in liquid  $N_2$  impurities are reduced to 0.4% with a very small loss in  $H_2$  of the mixt. It is concluded that Linde's process has advantages over that of Claude. Besides higher yields in  $N_2-H_2$  gas mixt. free from contact poisons the former does not require expensive high-pressure app. necessary for synthesis of  $N_2-H_2$  produced by the latter.

James Sorrel

**Determination of hydrogen and methane in coke-oven gas from heating value and density.** R. Mulsow. *Glückauf* 69, 1092-4(1933).—Density and heating value vary widely with H and  $CH_4$  content. By assuming 0.97 for the d. of CO, N and O and correcting for  $CO_2$ , equations are derived on the basis of which charts are drawn giving direct readings for H and  $CH_4$ . The probable error for H is 0.7%, that for  $CH_4$  1.2%.

J. D. Davis

**Determination of benzene in crude and purified gas with active carbon.** R. Kattwinkel. *Glückauf* 69, 853-4(1933).—Crude gas is desulfurized by treatment with  $Fe_2O_3$  before adsorption of light oil on active C. For accurate results it is not necessary to remove  $C_6H_6$ . The benzene remaining in industrially purified gas, unlike that in crude gas, contains olefins, which should be removed by washing with  $H_2SO_4$  (sp. gr. 1.84) before adsorption of benzene on active C. The yield so obtained can be applied directly as a correction to that industrially obtained. The purification and absorption train contains units in the following order: tar filter  $\rightarrow H_2S$  remover  $\rightarrow H_2SO_4 \rightarrow H_2O \rightarrow 1:3 KOH \rightarrow H_2O \rightarrow$  active C  $\rightarrow$  gas meter. The gas sample is taken at the rate of 150 l. per hr.

J. D. Davis

**The new benzene plant at Warrington.** A. Cook. *Gas*

*World 100*, 137-8(1934); *Gas J.* 205, 306.—The plant recovers 2-3 gal. of 80% benzene per ton of coal carbonized in Woodall-Duckham vertical retorts (16,870 cu. ft. of 470 B. t. u. gas per ton). Detns. of the heating value of the gas before and after passage through the benzene plant show a loss of 16 B. t. u. P. J. Wilson, Jr.

**Carbonic acid removal—is it worth while?** William Wilson. *Gas World 100*, 105(1934).—By removal of 5% CO<sub>2</sub> from coal gas the heating value is increased approx. 10% and the capacity of the mains 25%. The CO<sub>2</sub> is completely removed by washing the gas with a soln. of (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub> to form NH<sub>4</sub>HCO<sub>3</sub>. The soln. is regenerated by heating to between 57° and 98° before returning to the absorber. P. J. Wilson, Jr.

**A simple laboratory method for the assessment of the combustible nature of coke.** H. E. Blayden, W. Noble and H. L. Riley. *Gas World 100*, 106-10(1934).—See C. A. 28, 1841'. P. J. Wilson, Jr.

**Determination of the extent of outgassing of cokes.** Ladislaus Sümegi. *Gas u. Wasserfach 76*, 921-2(1933); cf. Ludewig, C. A. 28, 609'.—The gas evolved in the L. test for degree of outgassing of cokes is similar in compn. to a water gas of low heating value, regardless of the coke origin, whereas it would be expected to resemble gas evolved during the latter part of the carbonization period, which is much higher in H. S. attributes the evolution of these gases to the effect of water from coke quenching and to adsorption, and states that this method is not well adapted for detg. the degree of carbonization of coke. Reply. Walter Ludewig. *Ibid.* 922-3.—The purpose of the investigation was not to find out the compn. of the gas given off by coke but to develop a reproducible volumetric method for detg. the degree of carbonization. Any such method will be affected somewhat by the adsorption of gases, but this does not affect its value. The resemblance of the test gases to poor water gas is accidental. The cokes that would adsorb the most gases are the porous, poorly carbonized cokes, which would also give off large vols. of gas, so that the values for various cokes are still relative. R. W. Ryan

**The Mueller under-burner compound coke oven.** W. Mueller. *Gas u. Wasserfach 77*, 7-10(1934).—The various Mueller patents relating to coke-oven construction are reviewed. Advantages of the oven designs claimed in these patents are regenerative heating of the air and gas in parallel currents, mixing in short connecting nozzles discharging directly into the heating flues, convenient and exact regulation of fuel gas and air throughout the whole length of the oven wall, min. use of fuel gas, short coking time, better coke due to uniform heating, highest oven temp. permissible for a given coal, absence of burner stoppages, easy access to and control of flues and regenerators and highest thermal efficiency. **Dust-preventing compositions for solid carbonaceous fuels.** Standard Oil Development Co. Brit. 400,009, Oct. 19, 1933. See Fr. 756,567 (C. A. 27, 4654).

**Vertical-retort for continuous carbonization of fuels.** Heinrich Koppers G. m. b. H. (Josef Daniels, inventor). Ger. 590,348, Jan. 3, 1934 (Cl. 10a. 36.01).

**Destructive hydrogenation of fuels.** I. G. Farbenind. A.-G. (Ernst Hochschwender, inventor). Ger. 590,098, Dec. 22, 1933 (Cl. 12a. 1.05). Solid fuels of high water content are mixed with a heavy oil and treated at a raised temp., e. g., 300-360°, with an inert gas or vapor, e. g., N or steam, until all or most of the water has been removed. The mixt. is then passed directly to the hydrogenation app.

**Destructive hydrogenation.** The Gas Light and Coke Co., Roland H. Griffith, Robert N. B. D. Bruce and Samuel G. Hill. Brit. 400,628, Oct. 27, 1933. The destructive hydrogenation of carbonaceous materials is conducted in the presence of basic oxygenated salts of Ti as catalysts, e. g., basic Ti vanadate, molybdate, chromate or tungstate. Cf. C. A. 27, 3805.

**Distillation of bituminous materials.** S. V. Bergh. Swed. 70,822, March 28, 1933. Bituminous slate, coal and similar materials are heated in vertical retorts under successively increased temp. with introduction of steam or inert gases or both in the lower part of the retort. The distn. residues are taken out from the open bottom end of the retort and passed down into a combustion chamber, the heat developed being used for heating the retorts and for production and heating of the steam, or heating of the inert gases to be introduced into the retorts. Cf. C. A. 27, 3069.

**Washing coal.** Wm. R. Chapman. Brit. 400,644, Oct. 23, 1933. Before treatment to remove adventitious matter and reduce the ash content the coal is given a preliminary washing with H<sub>2</sub>O to remove only the very finely divided argillaceous and like particles, the H<sub>2</sub>O and particles being preferably drained from the coal through a very fine-meshed screen. The coal may first be crushed and screened and then subjected to an air blast to remove some of the clay, etc.

**Apparatus for washing coal, ores, etc.** The Clean Coal Co. Ltd. Ger. 590,429, Jan. 4, 1934 (Cl. 1c. 1.01). See Brit. 341,863 (C. A. 25, 4691) and 361,906 (C. A. 27, 590).

**Flotation separation of fusain, etc., from coal.** Wilhelm Schäfer and Willy Mertens (to Erz- und Kohle-Flotation G. m. b. H.). U. S. 1,944,529, Jan. 23. A froth producing reagent such as a flotation oil is used together with a polyhexose such as starch or dextrin which has been pretreated with HCl and serves to depress the durain, vitrain and clarain but not the fusain.

**Gravity separation apparatus for use in removing fine material from the circulating liquid in the sand-flotation process for cleaning coal, etc.** Thomas Chance. Brit. 400,346, Oct. 26, 1933.

**Apparatus (with a rotatable interiorly-heated hollow drum) for carbonizing coal, etc.** Henry O. Loebell (to Henry L. Doherty). U. S. 1,944,749, Jan. 23. A flexible conveying belt which may be formed of woven wire carries material to be carbonized into contact with the exterior of the drum. Various structural, mech. and operative details are described.

**Low-temperature distillation of coal.** Arthur V. Abbott. U. S. 1,943,291, Jan. 16. Bituminous coal is passed through a distn. chamber in one retort at a comparatively low temp.; the coal is then passed through a distn. chamber of a 2nd retort subjected to a higher temp., thence through the distn. chamber to a 3rd retort at a still higher temp. The liquid and vapors produced from each retort are separately collected from its discharging end, and the hot coke produced is quenched by water within the discharge end of the 3rd retort. The gases produced, commingled with vapors from the quenching operation, are passed to a container, and coke and liquid by-products are separately collected. App. is described.

**Apparatus for low-temperature distillation of coal.** Compagnie internationale de carbonisation. Belg. 397,011, July 31, 1933.

**Tubular apparatus for distilling fine coal.** Kohlenveredlung und Schwelwerke A.-G. Ger. 590,050, Dec. 21, 1933 (Cl. 10a. 33.01).

**Furnace for distilling coal.** Soc. Seedorff-Barfred-George. Fr. 755,521, Nov. 25, 1933.

**Chamber oven for coal distillation.** Carl Still. U. S. 1,943,562, Jan. 16.

**Coal feeding and distillation apparatus for producing coke and gas.** Wm. A. Riddell (to Frederick Iron & Steel Co.). U. S. 1,944,192, Jan. 23. Structural, mech. and operative details.

**By-product recovery from coal-distillation plants.** Stuart P. Miller (to Barrett Co.). U. S. 1,944,130, Jan. 16. Hot fresh coal-carbonization gases are cooled in successive steps, one step being regulated to sep. a heavy tar; the cooler is flushed with tar or pitch during the sepn. of the heavy tar, while there is retained in the gases a substantial quantity of pitch constituents; in a subsequent step a tarry oil contg. such pitch constituents is sepd., this tarry oil is distd. to pitch, and the pitch is blended with the heavy tar. App. is described.

**Treating gases such as those from coal distillation.** Stuart P. Miller (to Barrett Co.). U. S. 1,944,523, Jan. 23. The hot gases are brought into intimate contact with tar or pitch to be distd. and then subjected to elec. pptn. to sep. suspended pitch particles; the surfaces of the app. on which the pitch particles are deposited are flushed with tar or pitch. App. is described.

**Apparatus for cooling and after-drying dried brown coal.** Kurt J. Menning. Ger. 590,467, Jan. 4, 1934 (Cl. 10b. 9.04).

**Apparatus for wet carbonization of peat.** D. W. Berlin. Swed. 78,054, Aug. 15, 1933. An aq. pulp of raw peat is pumped in succession through a heat-exchanging preheater and a wet-carbonization furnace; from this the hot pulp is returned to the heat-exchange app. to preheat the raw peat. Cf. C. A. 24, 2276.

**Improving combustion.** G. Vaudevelde. Belg. 392,158, April 29, 1933. The following products are prepd.: (1) a mixt. of  $\text{KClO}_3$ ,  $\text{NaCl}$ ,  $\text{Fe}$  carbonate,  $\text{Na}_2\text{CO}_3$  and  $\text{NaNO}_3$ ; (2) a mixt. of  $\text{KMnO}_4$ ,  $\text{NH}_4\text{NO}_3$  and  $\text{HC}_2\text{O}_4\text{K}$ ; (3) vegetable charcoal; the 3 products are mixed and sprinkled over the previously moistened fuel.

**Furnace, boiler and steam superheater.** Ralph M. Hardgrove (to Babcock & Wilcox Co.). U. S. 1,944,234, Jan. 23.

**Shell and tube heat-exchange apparatus suitable for use with steam as a superheater.** John A. Potter (to Westinghouse Elec. & Mfg. Co.). U. S. 1,943,456, Jan. 16. Structural features.

**Fuel gas.** Bamag-Mequin A.-G. Ger. 590,378, Dec. 30, 1933 (Cl. 24e. 2.01). Addn. to 479,028 (C. A. 23, 4804). The cooling gas used according to Ger. 479,028 is replaced by a vaporizable liquid introduced with the aid of a compressed gas.

**Gas-purifying compositions.** I. G. Farbenind. A.-G. Brit. 400,387, Oct. 26, 1933. Desulfurization masses comprise a mixt. of hydrated  $\text{Fe}$  oxide with a binding agent in the presence of an alkali metal bicarbonate and  $\text{H}_2\text{O}$ , the mixt. being heated before use. The binding agent may comprise magnesia cement,  $\text{CaO}$  or gypsum, 25 parts binder being mixed with 75  $\text{Fe}$  oxide and 0.5 part  $\text{NH}_4\text{HCO}_3$  added.

**Desulfurizing fuel-distillation gases, etc.** C. Otto & Co. G. m. b. H. Ger. 590,287, Jan. 10, 1934 (Cl. 26d. 9.04). Gases contg. a relatively high proportion of  $\text{H}_2\text{S}$  and relatively little  $\text{NH}_3$  are washed first with a liquid which dissolves a part of the  $\text{H}_2\text{S}$ , and then in known manner with a polythionate soln. contg.  $\text{SO}_3$ , whereby  $\text{NH}_3$  and residual  $\text{H}_2\text{S}$  are removed. The  $\text{SO}_3$  taken up by the gas is then removed by washing the gas with the  $\text{H}_2\text{S}$  soln. obtained in the first washing. App. is described. Cf. C. A. 27, 1144.

**Continuous-diffusion apparatus for testing fine gases, etc.** Aktiebolaget Carba. Ger. 577,485, Dec. 27, 1933 (Cl. 42l. 4.12).

**Apparatus for vaporizing paraffin oil, benzene, etc., for diffusion in gas mains.** Francis C. White. Brit. 400,359, Oct. 26, 1933.

**Gas producers.** Whitfield Gas Producer Patents Ltd. and John N. Williams. Fr. 755,766, Nov. 30, 1933.

**Gas-producer plant.** Babcock & Wilcox Ltd. Brit. 400,881, Nov. 2, 1933.

**Water-gas producer.** C. Otto & Co. G. m. b. H. Fr. 755,677, Nov. 28, 1933.

**Water-gas plant.** The Power-Gas Corp. Ltd., Niels E. Rambush and James MacK. Ballingall. Brit. 400,857, Nov. 2, 1933.

**Apparatus for making carbureted water gas.** Main-Gaswerke A.-G. and Ernst Schumacher. Ger. 590,419, Jan. 3, 1934 (Cl. 24e. 2.07). Addn. to 479,029 (C. A. 23, 4804).

**Means for cooling tuyères and other hot parts of gas producers, etc.** Compagnie générale des Gazogènes Imbert. Ger. 590,068, Dec. 22, 1933 (Cl. 24e. 10.01).

**Apparatus for making gas from liquid fuel and air.** John Whitehart. U. S. 1,944,818, Jan. 23. Various structural and operative details.

**Apparatus for producing compressed gas from liquefied gas.** Alphonse Vergé. Ger. 590,029, Dec. 21, 1933 (Cl. 17g. 5.02).

**Apparatus for producing gas from vegetable waste matter, trash, etc.** Charles R. Hemenway. U. S. 1,943,311, Jan. 16. Structural details.

**Gas generator suitable for producing gas from gasoline, etc.** Wm. H. Cheney. U. S. 1,944,544, Jan. 23. Structural and operative details.

**Gas generators with a fuel-supply shaft and a converter shaft superposed on a grate chamber or producer.** F. C. White. Brit. 400,727, Nov. 2, 1933.

**Gas holders.** Harry H. Hollis. Brit. 401,060, Nov. 9, 1933.

**Piston-type gas holders.** Ashmore, Benson, Pease & Co. Ltd., and Harold E. Bloor. Brit. 400,543, Oct. 26, 1933.

**Piston-type gas holders.** Bamag-Mequin A.-G. Brit. 400,864, Nov. 2, 1933.

**Removing acetylene from gases.** Herbert P. A. Groll and James H. Burgin (to N. V. de Bataafsche Petroleum Maatschappij). Brit. 400,054, Oct. 19, 1933.  $\text{C}_2\text{H}_2$  is removed from gaseous mixts. by absorption in 1 or more polyglycols, their ethers, esters and mixed ether-esters. The  $\text{C}_2\text{H}_2$  may be recovered by heating, and (or) reducing the pressure over the soln.

**Storing acetylene and like explosive substances.** Alfred Burgeni and Reginald O. Herzog. Ger. 590,497, Jan. 4, 1934 (Cl. 26b. 44.20). Porous fillers for vessels for storing  $\text{C}_2\text{H}_2$ , etc., are prepd. by coagulating and granulating a foam produced from a mixt. of a cellulose soln. and a pulverulent or fibrous material, e. g., kieselsoln. or peat.

**Removing phenols from gas liquor.** C. Otto & Co. G. m. b. H. Ger. 590,476, Jan. 2, 1934 (Cl. 85c. 1).

Addn. to 431,244. Phenols are extd. from gas liquor by means of benzene or its homologs, or mixts. thereof with  $\text{C}_2\text{HCl}_3$ , during or directly after the distn. of free  $\text{NH}_3$  from the liquor but before the distn. of fixed  $\text{NH}_3$ . App. is described.

**Removing phenols from ammonia liquors.** Herbert B. Cobb (to Smet-Solvay Co.). U. S. 1,943,653, Jan. 16. In a process in which the liquor is brought into contact with a phenol-extg. medium such as a light oil, a body of the latter is maintained in the extn. vessel (of a described app.) and fresh extg. medium is introduced into the lower portion of the vessel and phenolated medium is withdrawn from the upper portion, the liquor treated being introduced into the vessel above the surface of the extg. medium so that it is distributed over the surface and caused to pass downwardly through the extg. medium. Cf. C. A. 27, 5948.

**Saturator for making ammonium sulfate from coal gas.** Heinrich Koppers A.-G. Ger. 590,028, Dec. 30, 1933 (Cl. 12k. 2).

**Ammonium thiocyanate from fuel-distillation gases.** Ges. für Kohlentchnik m. b. H. (Walter Klempt, inventor). Ger. 590,310, Jan. 2, 1934 (Cl. 12k. 11). Addn. to 565,408 (C. A. 27, 1105). Complex Ni-CN compds. formed in the process of Ger. 565,408 are decompd. by periodic addn. of  $(\text{NH}_4)_2\text{S}$  to the washing liquor. The  $(\text{NH}_4)_2\text{S}$  may be formed *in situ* by periodically reducing the temp. of the liquor. S may be added instead of  $(\text{NH}_4)_2\text{S}$ , and may be produced by withdrawing and aerating a portion of the liquor. Details are given.

**By-product recovery from hot coke-oven gases.** Stuart P. Miller (to Barrett Co.). U. S. 1,944,129, Jan. 16. The gases from a plurality of ovens are collected in a gas collector main while still hot and subjected in this main to regulated cooling to produce a tar with a m. p. between  $32^\circ$  and  $46^\circ$ ; the gases leaving the collector main are cooled to sep. a tarry oil from them, and this tarry oil is distd. App. is described.

**Tar acids from coal-tar distillates.** Wm. C. Cooper (to

Barrett Co.). U. S. 1,944,681, Jan. 23. For obtaining tar acids, the distillates are treated with alkali to convert the tar acids to alkali phenolates, the latter are sep'd. and the tar acids are liberated from them by use of  $\text{CO}_2$ , the liberated tar acids are washed with water to remove phenolates, carbonates and other water-sol. impurities, and the resulting wash water is sep'd. and used in a preceding stage of the process.

**Tar acids.** Stuart P. Miller (to Barrett Co.). U. S. 1,944,131, Jan. 16. See Can. 332,445 (C. A. 27, 4061).

**Agglomerated semicoke and similar products.** Soc. générale de fours à coke système Lecocq. Belg. 396,722, July 31, 1933. The hearth of the oven is heated to a higher temp. than the vertical walls, so as to form, in the immediate neighborhood of the hearth, a cake of overburned semicoke, or even of coke, offering but slight resistance to discharge from the oven. This is effected by providing a heating duct the full length of the hearth.

**Coke oven.** C. Otto & Co. G. m. b. H. Ger. 590,211, Dec. 28, 1933 (Cl. 10a. 13).

**Regenerative coke oven.** Josef Schaefer. U. S. 1,943,558, Jan. 16.

**Heating device for regenerative coke ovens.** Collin & Co. Ger. 588,507, Nov. 23, 1933 (Cl. 10a. 5.20).

**Coke-oven charging apparatus.** Carl Still. U. S. 1,943,034-5, Jan. 16. Structural and mech. features.

**Means for compressing coal in discontinuously operated coke ovens.** Gustav Hilger. Ger. 590,306, Dec. 30, 1933 (Cl. 10a. 15). Addn. to 587,035 (C. A. 28, 883).

**Coking coal.** C. Otto & Co. G. m. b. H. Ger. 588,562, Nov. 29, 1933 (Cl. 10a. 22.01). In coking coal which develops a high pressure during the process, the coal is preheated till the whole of it is at  $300^\circ$ . This prevents excessive local pressures during the coking process.

**Means for withdrawing volatile distillation products from vertical coke-oven chambers.** Carl Still G. m. b. H. Ger. 590,157, Dec. 27, 1933 (Cl. 10a. 19.02).

**Apparatus for dry-cooling coke.** Heinrich Koppers A.-G. Ger. 590,049, Dec. 23, 1933 (Cl. 10a. 17.04).

## 22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. FARAGHER

**Chemical investigation of Italian petroleum.** Aldo Campa. *Chim. ind. agr. biol.* 9, 438-41(1933).—Crude petroleum from Montecchino, which contains no asphalt, gives 34% gasoline. Salsomaggiore petroleum contains 27.5% light oils; that from Ozzano 36.8%; and that from Velleja 54.4%. They contain methyl- and dimethylcyclopentane, cyclohexane and  $\text{C}_6\text{H}_6$ . Petroleum from S. Giovanni-Incarico has d. 0.970, contains 1-2% S and traces of cumene; that from Pico has d. 0.840 and contains  $\text{H}_2\text{S}$  and mercaptans; that from Ripi has d. 0.935 and contains 0.7% S and about 18% bitumen.

**G. A. Bravo**  
**Yields from crude petroleum.** L. Codarcea. *Ann. mines Roumanie* 16, 329-37(1933); *Chimie & industrie* 30, 1319.—A discussion of lab. methods for detg. the com. value of crude petroleum through the yields of the products.

A. Papineau-Couture

**Holley-Mott continuous countercurrent washery as applied to petroleum products.** E. Thornton. *J. Inst. Petroleum Tech.* 19, 957-70(1933).—In the Holley-Mott washery, for use in oil-treating plants, a vertical shaft with three blades in a horizontal plane at the bottom serves for mixing the oil and treating agent. Sepn. by settling is preferred, and countercurrent flow is maintained merely by gravity through the series of vessels all set on the same level. This is due to the differences in sp. gr. between the treated oil, the sep'd. treating agent and the mixts. of the two. Maintenance costs are extremely low. E. E. C.

**Petroleum coke.** Břetislav G. Simek. *Mit. Kohlenforschungsinst. Prag* 1933, 482-4.—Results of expts. on coke from Grozny petroleum, showing that coke is a very valuable fuel and not to be underrated as a competitor of other fuels. Marion E. Headington

**Petroleum coke suitable raw material for making activated carbon.** A. L. Nugey. *Refiner Natural Gasoline Mfr.* 13, 49-53(1934).—A general survey of activated carbons is given. Petroleum coke is activated by a preliminary carbonization in a revolving closed retort heated to  $300^\circ\text{F}$ . and contg. the activating chemicals, followed by a secondary carbonization in the same retort at  $800^\circ\text{F}$ ., cooling, washing, acid treatment with 50% acid, washing and drying with exhaust steam. Such a C contains only 1.0% ash and presents a large absorbing surface. It can be produced for about \$0.03 per lb. including labor, reagents, fuel, fixed charges and maintenance. A one-ton plant would cost approx. \$10,000. The yields are 40-60% of the input. The ash content of competitive carbons varies from 3.0 to 30.0% and the wt. in lb. per cu. ft. varies from 12 to 34. Petroleum activated C weighs 20 lb. per cu. ft. J. L. Essex

**Destructive hydrogenation of petroleum hydrocarbons.** W. J. Sweeney and Alexis Voorhies, Jr. *Ind. Eng. Chem.* 26, 195-8(1934).—Based upon the thermodynamic data of pure hydrocarbons, simple hydrogenation without accompanying pyrolysis and destructive hydrogenation with accompanying pyrolysis are discussed. The effects of H pressure and reaction temp. in both types of hydrogenation are shown graphically. Destructive hydrogenation and ordinary cracking of petroleum oils are compared in respect to gasoline yields. The H content of virgin, cracked and hydrogenated petroleum fractions is graphically presented as a function of the b. p. and A. P. I. gr. Highly refractory and H-deficient gas oils have given yields of 115% by vol. of stable gasoline. The prime requisite of a catalyst for hydrogenation is that it shall be S-resistant. Catalysts are available now

for high-temp. and for low-temp. hydrogenations. A new low-temp. catalyst developed by I. G. Farbenindustrie permits hydrogenation at 343–427° and at a high rate, with resultant high volumetric yield of gasoline of high octane value. Such a catalyst must also possess splitting power as well as hydrogenating power. S, O and N in the oils are removed as  $H_2S$ ,  $H_2O$  and  $NH_3$ . J. L. E.

**Decomposition of saturated petroleum hydrocarbons under oxidizing conditions at low temperatures.** A. W. Burrell. *Ind. Eng. Chem.* 26, 204–7 (1934).—A description of the liquid-phase oxidation, mostly by means of air, of hydrocarbons derived from various petroleum sources, under controlled conditions of temp. and pressure; the temp. is always maintained considerably below the thermal decompn. temp. of the hydrocarbon. The oxidation reactions in the hydrocarbons at cracking temp., and those oxidation reactions taking place where ozone or other O-addition compds. have been formed with unsatd. hydrocarbons and subsequent heating, are discussed briefly. The main reaction involves the entrance of the O at the  $\beta$ -carbon atom of the chain. After other O atoms are introduced this  $\beta$ -carbon atom loses H atoms to become a ketone group and later on the whole mol. splits at the ketonic linkage into two acids, formic acid for one and a high mol. weight acid for the other. Ester formation is less marked in oxidation of paraffin wax than in most distillates. J. L. E.

**Pyrolysis of saturated hydrocarbons.** F. E. Frey. *Ind. Eng. Chem.* 26, 198 203 (1934).—A review of the literature on primary decompn. reactions is given. Paraffins decompose chiefly into simpler complementary olefins and paraffins. High decompn. temps. favor the formation of complementary olefins and  $H_2$ . Two mechanisms are proposed to explain the reactions. Surface catalysis causes dehydrogenation paraffins to corresponding olefins or degradation to  $C$ ,  $H_2$  and  $CH_4$ . The cyclohexanes are converted to corresponding aromatic compds., while the other cycloparaffins form various rearrangement products. J. L. E.

**Kinetics and mechanism of decomposition of hydrocarbons.** A. I. Dintzes. *Compt. rend. acad. sci. U. R. S. S.* [N. S.], 1933, 153–7.—The cracking expts. were carried out in a copper-lined iron tube immersed in a metal bath. The substance was first brought almost to cracking temp. and then passed through the copper-lined tube. Hexane was heated to 525–565° for 6–90 sec., octane to 496–570° for 0–130 sec., and 2,5-dimethylhexane to 492–576° for 3–38 sec. The cracked products were analyzed (data are tabulated). The reactions are (a)  $C_nH_{2n+2} \rightleftharpoons CH_4 + C_{n-1}H_{2n-2}$  and (b)  $C_nH_{2n+2} \rightleftharpoons C_2H_6 + C_{n-2}H_{2n-4}$ , and to some extent (c)  $C_nH_{2n+2} \rightleftharpoons C_3H_8 + C_{n-3}H_{2n-6}$  and (d)  $C_nH_{2n+2} \rightleftharpoons H_2 + C_nH_{2n}$ . Hexane decomposes mainly according to (a) and (b), slightly according to (c) and (d). For octane the reactions are 80–90% according to (a). 2,5-Dimethylhexane decomposes 75–80% according to (a). In each reaction the olefin formed is subjected to a rapid further decompn. according to (e)  $C_{n+m}H_{2n+2m} \rightarrow C_nH_{2n} + C_mH_{2m}$ . For hexane the reaction (e) proceeded to 40–60%, for octane to 60–70% and for 2,5-dimethylhexane to 50–70%. The consts. of the primary decompn. depend upon the temp. and were for hexane at 525–565°  $\log K_1 = 14.58 - (14100/T) \pm 0.06$ , for octane  $\log_{10} K_1 = 14.70 - (14100/T) \pm 0.09$  (495–570°), and for 2,5-dimethylhexane  $\log_{10} K_1 = 6.553 - (7215/T) \pm 0.05$  (490–575°). The activation energies of the primary decompn. of both hexane and octane are accordingly 64,500 and that of 2,5-dimethylhexane is 33,000 calories. The best explanation of the above phenomenon is given by Rice (*C. A.* 25, 2967). A. A. B.

**Sulfonic acids formed in the refining of mineral oils.** R. Fusteig. *Chimie & industrie* 30, 1027–33 (1933).—The work of Holzmann and of von Pilat is reviewed. Tar freed from  $H_2O$  and  $H_2SO_4$  was dissolved in  $C_6H_6$  to remove insol. matter.  $C_6H_6$  was evapd. from the filtrate, the soft, brown residue was taken up in benzene to remove asphaltenes, and the filtrate was treated with milk of lime, which pptd. the Ca salts of the sulfonic acids. The  $Ca$ -sulfonates were insol. in  $H_2O$ ,  $Et_2O$  and benzene.

When they were dissolved in dil. acid and the soln. was treated with benzene, light yellow flakes of a sulfonic acid were pptd. Addn. of  $CH_2O$  to the filtrate from the pptd. black flakes of a sulfonic acid of higher mol. wt.

A. Papineau-Couture  
**Bituminous shales in France.** V. Charrin. *Chimie & industrie* 30, 967–83 (1933).—A description of the method of working bituminous shale deposits and of the principal French deposits, with a discussion of the advantages for France of using them to supply part of her requirements for automotive-engine fuel. A. Papineau-Couture

**Electric condenser process for demulsifying oil.** R. J. Piersol. Ill. State Geol. Survey, *Rept. Investigations* No. 29, 7–38 (1933).—The app. developed consists of 2 concentric electrodes, the outer a metal pipe and the inner a Cu wire enclosed in a glass tube. This glass tube acts as an insulator to prevent the passage of the current through the oil; only the elec. field is set up. A com. unit operates off of a 6 v. storage battery and a Model T Ford spark coil. It has a capacity of 1 bbl. per hr. Tests show that the 3 worst emulsified oils in Illinois can be broken down to less than 0.5% of water by treatment in this app. at 80°F. In districts where elec. power is at hand the app. can be operated by this means. It is fireproof because of sepn. of electrodes. A lengthy discussion of other elec. methods is given. The efficiency of elec. treatment increases at higher temps. but 80°F. was found to be the optimum temp. The essential features of the elec. dehydration consists of coalescence of water globules due to their movement under the influence of an alternating field; hence viscosity has quite an influence upon the speed and travel of these water mols. A very extensive bibliography is included. J. L. E.

**Principles of control of light-oil recovery.** W. Litterscheidt. *Glückauf* 69, 1129–34 (1933).—The law governing absorption of light oil for any given temp. by wash oil is  $P = P_0 (c/78) (u/C)$ , where  $P$  = partial pressure of light oil in the wash oil,  $P_0$  that of light oil in the gas,  $c$  and  $C$  are the percentages of  $C_6H_6$  and wash oil in soln., and  $u$  is the mol. wt. of the wash oil. L. develops charts showing practical washer performance as depending on surface, amt. of wash oil, temp., and relative pressures of  $C_6H_6$  in soln. and in gas. J. D. Davis

**Natural gasoline.** G. R. Hopkins and E. M. Seeley. *Statistical Appendix to Minerals Yearbook, 1932–33, Bur. Mines* 55–65 (1933). Alden H. Emery

**Removal of free sulfur from gasoline by lime and hydrogen sulfide.** Ralph H. Espach, O. C. Blade and H. P. Rue. *Refiner Natural Gasoline Mfr.* 13, 65–9 (1934).—The supernatant liquid removed from a slurry of lime and water through which  $H_2S$  has been bubbled will remove free S from gasolines without forming emulsions. The quantity of S removed appears to be proportional to the percentage of  $H_2S$  added. The sulfides, disulfides and mercaptans are not affected by this soln. Slurries of lime and water alone are not effective; hence  $Ca(SH)_2$  is the active agent. J. L. Esser

**Catalytic hydrogenation of acetylene to gasoline.** A. D. Petrov and L. I. Antzuz. *Refiner Natural Gasoline Mfr.* 13, 79–80 (1934).—Gasoline can be hydrogenated and polymerized easily when in an autoclave under pressure and in the presence of reduced Ni catalyst. The liquid polymer is a gasoline with an end point of 320°F. that contains about 40% of naphthenic hydrocarbons. J. L. Esser

**Application of Raman spectrography to the study of gasoline.** A. Andant. *Chimie & industrie* 30, 1011–19 (1933); cf. *C. A.* 27, 5952.—A detailed account of the Raman spectrographic examn. of 5 different gasolines, which gave the following indications: Sumatra gasoline, b. 111–19°, contained  $C_7H_{14}$ ,  $C_8H_{18}$ ,  $C_9H_{22}$ ; Pennsylvania gasoline, b. 51–143°, contained  $C_6H_{14}$ ,  $C_7H_{18}$ ,  $C_8H_{22}$ , cyclohexane, methylcyclohexane, traces of  $C_6H_6$ ; Borneo gasoline, b. 96.5–227°, contained  $C_6H_{14}$ ,  $C_7H_{18}$ , cyclohexane, cycloheptane, methylcyclohexane, methylcycloheptane; "Esso" gasoline, b. 46.5–188.5°, contained  $C_6H_{14}$ ,  $C_7H_{18}$ ,  $C_8H_{22}$ , cyclohexane, cycloheptane, methylcyclohexane, methylcycloheptane; Mesopotamian gaso-

line, b. 68.5–245°, contained only satd. hydrocarbons, among which  $C_7H_{16}$  and  $C_{10}H_{22}$  were identified.

A. Papineau-Couture

The role of peroxides in the detonation of gasoline engines. Max Serruys. *Compt. rend.* 197, 1592–3 (1933).—By preheating the air to 250° or higher, a one-cylinder engine was caused to knock. With air heated to 310°, a bad, regular knock was produced which continued with a number of explosions after the ignition was turned off. Since peroxides cannot exist above 300°, S. believes that these expts. prove that peroxides are not the sole cause of detonation but only a favorable condition for its appearance. S. believes that this result contradicts Dumanois' conclusions (*C. A.* 27, 5955). *Ibid.* 198, 49–50 (1934).—A correction of the first paragraph of the above paper. Oden E. Sheppard

Combustion in motors. P. Dumanois. *Compt. rend.* 198, 50–1 (1934).—A reply to Serruys' criticism (preceding abstract). D. maintains that Serruys' results are not in contradiction to the peroxide theory of detonation but are explainable on the assumption that at the elevated temps. at which peroxides cannot be formed, the second type of ignition (not due to the spark plugs but ignition of the charge spontaneously) and detonation mentioned by D. (*C. A.* 24, 5498, 5994) take place. O. E. S.

Influence of cracking conditions on the composition and reactivity of cracked benzene. F. Sager. *Petroleum Z.* 29, No. 15, 1–6 (1933).—The gasoline (yield 38%) obtained by cracking Russian mazout in the new type of Dubbs ("full-flashing") plant contained olefins 18.2, aromatic hydrocarbons 48.8, naphthenes 13.5 and paraffins 19.5%, while the corresponding figures for the gasoline (yield 42%) produced in an older type of Dubbs plant were 7.2, 36.1, 16.0 and 40.7%, resp. The main differences in the method of operation responsible for this change in compn. were the rapid and complete removal of the liquid from the reaction chamber, and the increased heat consumption per ton of crude oil. The effects of minor variations in the method of operation are briefly discussed. B. C. A.

Catalytic vapor-phase hydration of ethylene. Frederick J. Sanders and Barnett F. Dodge. *Ind. Eng. Chem.* 26, 208–14 (1934).—The vapor-phase hydration of ethylene has been studied at 360–380° and pressures of 70–135 atms. over  $Al_2O_3$  and  $WO_3$  catalysts with an approx. 1:1 ratio of steam to ethylene. Although yields of ethanol are small, it is produced in significant amts. At 135 atms. pressure considerable polymerization of the ethylene occurs, but at 75 atms. this is prevented. At 400° the conversions of an equimol. mixt. of steam-ethylene are 8.0, 17.0 and 27.5%, resp. for 200, 500 and 1000 atms. For a 10:1 steam-ethylene ratio, the conversions at 400° and 500° atms. would be 29.0%, but the condensate would be quite dil. Lower temps. should give better conversions. No very active catalyst has been developed at present for the vapor-phase hydration of ethylene. To obtain reasonably rapid rates of reactions, temps. must be raised to a point where side reactions become excessive. J. L. E.

Sludge conversion process improves refinery acid recovery. F. J. Bartholomew. *Chem. & Met. Eng.* 40, 642–5 (1933).—This process known as the Hecheubleikner process comprises feeding the refinery acid sludge (light or heavy) into the rear of a rotary kiln where hot gases from burning fuel oil contact it and cause a breaking down of the  $H_2SO_4$  into  $SO_2$ , water and the volatilization and decompn. of the hydrocarbon content of the sludge into lighter gases and coke. The coke is drawn from the front end of the kiln ready for use. It contains 48–50% volatile matter and has a thermal value of 11,000 B. t. u. per lb. The gaseous products of the decompn. pass into scrubbers and condensers where all except the  $SO_2$  are removed. This dry gas is then converted to  $SO_2$  in a catalytic converter and absorbed in 85–93% acid to make 98% acid stock or in 100% acid to make 104% fuming acid stock. The process gives a yield of 90% of the acid charged as sludge. It recovers the acid without any fume nuisance and at a cost of \$4.00 per ton based on 100%  $H_2SO_4$ . Plant requirements are also given. J. L. E.

Design of high-pressure rectifiers. I. N. Beall. *Refiner Natural Gasoline Mfr.* 13, 62–4, 69 (1934).—The necessary changes in columns to take care of the increased pressure are discussed and the calcs. for reboiler heat-transfer surfaces column size, and condenser surfaces, no. and spacing of plates are given. J. L. Essex

The behavior of motor fuels toward sulfuric acid and the determination of the individual hydrocarbon groups. E. Wendehorst and E. Knoche. *Angew. Chem.* 47, 43–7 (1934).—A method was developed which permits the detn. of olefins, aromatic hydrocarbons, naphthenes and paraffins in motor fuels by means of treating with concd.  $H_2SO_4$  in graduated containers. Mixts. of gasoline, benzene, cyclohexane and amylene were prepd. and their reactions with  $H_2SO_4$  studied. Tables and a correction curve are presented which permit the evaluation of the analytical results with consideration of the regularly occurring complications which are designated as "solution mediation." The following combinations are treated: (1) gasoline or benzene, which are analyzed according to the directions given for case (3); (2) mixts. of gasolines and benzene. A mixt. of paraffinic gasoline and benzene is shaken with 100%  $H_2SO_4$  for 1 hr. when all the aromatic constituents are sulfonated and the correction curve will give the aromatic hydrocarbons actually present. If it is desired to obtain a rapid result without correction, then 10% by vol. of pure cyclohexane is added to the mixt. and shaking for 15 min. with 100%  $H_2SO_4$  gives a direct reading. (3) Mixts. of unknown compn. The final b. p. is detd. according to Riesenfeld and Bandtel. Then 100 cc. of the fuel is shaken with 300 cc. of 100% acid for 30 min. If less than 10% naphthenes are present, pure cyclohexane is added to obtain at least that amt. in the mixt. The remaining vol. freed from the acid sludge is redistd. to the same end point and the distillate is measured. The difference with the initial vol. gives the sum (aromatic compds. + olefins). The naphthenes are detd. in the distillate by means of the aniline point. If a residue is obtained in the redistn. which is larger than the previously detd. one, then considerable quantities of olefins are in the fuel, but even without the occurrence of the increased residue olefins may be present. For this purpose another sample is shaken in the graduate with twice its vol. of 85%  $H_2SO_4$ . If a vol. decrease is observed, olefins are present, the amts. of which can be detd. either by vol. decrease or by the vol. of the polymers (redistn.). Alc. addns. do not influence the results of the analysis when 100% acid is used. If olefins are present the alc. must first be removed by extrn. with  $H_2O$ . K. K.

Vacuum distillation applied to lubricating oils. Jules Tilman. *Chimie & Industrie* 30, 518–24 (1933).—A simple, sturdy app. for distg. lubricating oils under high vacuum is described. The table area required is only 50 × 50 cm. Ground-glass joints and rubber connections coated with a celluloid varnish are used. A pump of large capacity compensates for the leakage that may occur through the joints. An oil can be characterized by the trend of its distn. curve and by the mean slope of the curve between 2 arbitrarily selected points; e. g., start of distn. and 80% point. Estimation of the vacuum is made very simple by the use of a Crookes tube. A Pflicker tube reinforces the luminous effects. A. P.-C.

Regeneration of used motor-lubricating oils. T. C. Thomsen, E. Windfeld-Hansen and B. Lévy. *Ingeniøren* 42, No. 32, 29–31 (Aug. 13, 1933); *Chimie & Industrie* 30, 1326.—A discussion of the conditions under which it is economically feasible to reclaim used crankcase oil.

A. Papineau-Couture

A procedure for measuring bleeding of cup greases. Winslow H. Herschel. *Proc. Am. Soc. Testing Materials* 33, Pt. I, 343–7 (1933).—A general description of the app. and the test method is given. Karl Kammermeyer

Contribution to the study of friction in the greasy and semifluid phase. E. Bodart. *Rev. universelle mines* 9, 285–97, 320–9 (1933).—Three kinds of friction are distinguished: dry, without any lubricant, greasy, with an extremely thin film of lubricant—the surfaces feel hardly oily; and fluid or hydrodynamic where a sufficiently thick

layer of lubricant separates the surfaces. The author inserts a semifluid phase between the greasy and fluid phase. The greasy and the semifluid phases were investigated at velocities occurring in practice; i. e., 5–15 m./sec. and at pressures of 2–24 kg./sq. cm. The greasy friction is defined by the value  $V/\sqrt{p} < 0.066$ , where  $V$  is the velocity and  $p$  the pressure. Between 2 and 24 kg./sq. cm. the friction coeff. is independent of the pressure; increasing the temp. up to 100° reduces the friction slightly. The semifluid friction is defined by  $V/\sqrt{p} < 0.066$ . It is more practical to let bearings of machinery operate in the range of the semifluid phase than in the greasy phase in spite of the greater friction coefficient because of the greater reliability of operation and lessened wear. The influence of phys. and chem. factors of the lubricant is not considered in this investigation. Sixteen references.

M. Hartenheim

Some factors involved in the mechanical testing of bituminous mixtures. W. G. Adam and D. G. Murdoch. *Gas J.* 205, 99–102 (1934).—A discussion of the technic for prepg. test specimens from mixts. of mineral aggregates and a bituminous binder and of the tensile, compression and sand-blast attrition tests that shows the conditions necessary for consistent practical results.

P. J. Wilson, Jr.

Proposed method for accelerated weathering tests on bituminous materials. O. G. Strieter, et al. *Proc. Am. Soc. Testing Materials* 33, Pt. I, 381–5 (1933).—The method is intended for detg. the durability of bituminous substances or materials contg. bitumen by producing rapid deterioration of the materials in the lab. under conditions similar to those obtained upon outdoor exposure. The app. required consists of the actual weathering equipment, a trimmer to prep. the bituminous coatings and an instrument to det. the extent of the "weathering" by a cond. test. The app., method of prepg. test panels, test procedure and cond. test are described in detail.

Karl Kammermeyer

Carbonization of "slash." F. Vidron. *2me Congr. intern. carbone carburant* (Milan, Oct., 1932), 180–7; *Chimie & industrie* 30, 1064.—A discussion of the advisability, possibility and advantages of producing charcoal from the "slash" of logging operations.

A. Papineau-Couture

Ailanthus wood charcoal. F. Palazzo. *2me Congr. intern. carbone carburant* (Milan, Oct., 1932), 188–93; *Chimie & industrie* 30, 1064.—Ailanthus wood yields a charcoal that is suitable for various industrial and household uses. Charcoal produced in an old-style vertical retort had the following characteristics: yield approx. 20%,  $H_2O$  3.3–4.4%, ash 2.9–3.2%, volatile matter (including  $H_2O$ ) 8.0, calorific value (Mahler bomb) 7658–7905 cal. Its only drawback is its low d. A. P.-C.

Breaking petroleum emulsions. Melvin De Groot (to Tretolite Co.). U. S. 1,943,815, Jan. 18. An emulsion of the water-in-oil type is subjected to the action of a demulsifying agent contg. the Na salt of a sulfonic acid derived from tetradecyl alc. Cf. C. A. 28, 1516a, 447.

Breaking water-in-oil type petroleum emulsions. John C. Walker (to Empire Oil & Refining Co.). U. S. 1,944,021, Jan. 16. A demulsifying agent is used contg. an alk. salt such as the  $NH_4$  salt of an alkylated polycyclic sulfonic acid.

Oil- and water-separating apparatus suitable for separating water from petroleum oils by heating and gravity. Wilburn D. Champion. U. S. 1,943,367–S, Jan. 16. Structural and operative details.

Petroleum distillates. John W. Orelup. Fr. 756,088, Dec. 4, 1933. Gasoline or other distillates are stabilized against the action of light and pptn. of antiknock compds. such as  $PbEt_4$ , by the addn. of a small amt. of dinaphthylene oxide or dioxide or perylene. Cf. C. A. 27, 3810.

Extraction of petroleum distillates. David F. Edwards and John V. Starr (to The Standard Oil Development Co.). Can. 338,558, Jan. 9, 1934. Solvents for the extn. of petroleum oils are made more fluid by dild. with a cyclic alc.; e. g., PhOH is dild. with cyclohexanol.

Liquefied petroleum gas. Frederick E. Frey (to Phillips Petroleum Co.). U. S. 1,944,175, Jan. 23. A volatile odorizing agent such as dimethylsulfide is added in an amt. sufficient to odorize the leanest flammable mixt. of the gas with air, and a substance such as kerosene is added to avoid the delivery of an excessive concn. of the odorizer from a substantially empty cylinder from which the gas is delivered.

Ethyl chloride manufacture from petroleum refinery gas. Eric B. Hjerpe and Wm. A. Gruse (to Gulf Refining Co.). U. S. 1,944,839, Jan. 23. After fractionating  $C_2H_4$  and lower-boiling constituents from  $C_2H_6$  and higher-boiling constituents, the lower-boiling fraction, in the presence of a catalyst such as anhyd.  $AlCl_3$ , is contacted with HCl in combining proportion to convert the  $C_2H_4$  to  $EtCl$ ; the product is scrubbed with a relatively non-volatile petroleum absorbent oil and the  $EtCl$  is recovered from the oil by distn.

Hydrocarbons. International Hydrogenation Patents Co. Ltd. Brit. 400,580, Oct. 12, 1933. See Fr. 733,991 (C. A. 27, 1157–8).

Hydrocarbons. I. G. Farbenind. A.-G. Brit. 400,844, Nov. 2, 1933. The heat treatment of carbonaceous materials, contg. or giving rise to asphalt, with hydrogenating gases, preferably under pressure, to obtain hydrocarbons is performed in the presence of a catalyst suspended in an oil which is practically free from asphalt, e. g., contains less than 5% thereof, and does not cause flocculation of the asphalt in the material treated. Thus brown coal small coke is activated with steam at 900°, neutralized with  $H_2SO_4$  and impregnated with an ammoniacal soln. of  $H_2MoO_4$  so that the coke contains 2%  $H_2MoO_4$ . This catalyst is ground to colloidal dimensions and mixed with heavy oil from asphalt to form a suspension contg. 30% of catalyst which is added to an asphaltic German petroleum boiling above 325°. The mixt. is heated with H to 475° under 200 atm., 1650 cu. m. of H being used per metric ton of oil, and the products are led into a sepg. vessel from the bottom of which 6% of the high-boiling products, contg. catalyst, are withdrawn while the remainder is fractionated in a column to give a product 55% of which boils below and 45% above 325°, the latter being free from asphalt and used to mix with the catalyst.

Hydrocarbons. Universal Oil Products Co. Fr. 755,819, Nov. 30, 1933. Cracked and other hydrocarbons are decolorized and their gum and S content are reduced by submitting them to the action of HCl in the presence of a metal, alloy or metal compd. (Zn, Zn-Cu, brass or a Cu and Zn ore) at a pressure sufficient to prevent any appreciable vaporization.

Identification of hydrocarbons. Hermanus F. J. Lorang. Fr. 755,820, Nov. 30, 1933. Gasoline, kerosene, lubricating oils, etc., are identified by the addn. of a small amt. of one or more substances which are sol. in the hydrocarbons and are resistant to the action of light, oxidation and moisture, e. g., Me ester of anthranilic acid, acridine,  $PhNH_2$ ,  $PhNMe_2$ , furfural,  $\alpha$ - and  $\beta$ -naphthol, quinoline,  $PhNO_2$ , biacetyl, glycol nitrate, amyl nitrate or  $C_6H$

**Refining hydrocarbons.** Justin F. Wait. Fr. 756,208, Dec. 6, 1933. Hydrocarbon oils, particularly petroleum, are refined by passing the vapors thereof through a large no. of different zones contg. a continuous current of an anhyd. alkali compd., the temp. being 250-500° and condensing the purified vapors. The vapors may be preliminarily treated with an alkali metal or a mixt. of metal and compd. may be used.

**Refining liquid hydrocarbons.** Gerald C. Connolly and Albert F. Wurzbacher (to Chester F. Hockley, as receiver for Silica Gel Corp.). U. S. 1,943,583, Jan. 16. Hydrocarbon material such as a cracked distillate is treated at a slightly elevated temp. with a reagent such as  $H_2SO_4$  which forms a sludge, the heavy sludge is sepd., and steam is introduced into direct contact with the treated hydrocarbon material at a temp. at which the steam condenses, and condensed steam and remaining sludge are settled out. Silica gel may be used in removing gums.

**Removing mercaptans from hydrocarbons.** Ludwig Rosenstein. U. S. 1,943,744, Jan. 16. Hydrocarbon material such as a petroleum product is treated with an alk. soln. such as  $Na_2CO_3$  and  $NaHCO_3$  capable of removing substantially all the  $H_2S$  but of a strength insufficient to remove a substantial portion of the mercaptans present, and is subsequently treated with a stronger alk. soln. in the absence of extraneous S to remove the mercaptans. Regeneration of the mercaptan-removing soln. is effected by oxidation (suitably with air) in the presence of an oxidation catalyst such as sulfides of Ni or Co.

**Cracking hydrocarbon oils.** Frank H. Edson (to Standard Oil Development Co.). Can. 338,559, Jan. 9, 1934. Oil is cracked at greater than atm. pressure and a portion of the cracked oil vaporized under reduced pressure greater than atm. pressure. The vapors are washed with liquid substantially non-volatile at the temp. and reduced pressure to remove tarry material and the waste liquid contg. tarry material is separately withdrawn. The waste liquid is vaporized and the vapors are condensed, whereby the waste liquid is freed from tarry material. The liquid is reused to wash addnl. vapor. The washed vapor is brought into direct contact with charging oil to preheat the charging oil, which is introduced into the cracking zone, and the washed vapor is condensed.

**Cracking heavy hydrocarbon oils.** Georg Zotos. Ger. 588,666, Nov. 25, 1933 (Cl. 23b. 1.04). Addn. to 552,928 (C. A. 26, 5748). The oils are blown on to the surface of fused metal or salt with a velocity which causes deep penetration, the consequent heat and pressure cracking the oils. App. is indicated.

**Cracking and hydrogenating oils.** Arthur G. L. Try and Murray Stuart. Brit. 400,234, Oct. 23, 1933. The process of Brit. 363,360 (C. A. 27, 1500) is applied to distillates from mixts. of oils and solid carbonaceous materials, e. g., coal, lignite, shale. The voltage of the silent discharge may be 8000-100,000 and the frequency 100-35,000. In Brit. 400,604, Oct. 23, 1933, divided on 400,234 and addn. to 363,360, the process is modified by passing only a part of the distillate through the discharge. The vapors may be first condensed, revaporized, mixed with  $CH_4$ , H, etc., or the gases produced in the process, and then passed through the discharge.

**Cracking and coking hydrocarbon oils.** Albert G. Peterkin, Jr. (to Atlantic Refining Co.). U. S. 1,943,096, Jan. 16. Hydrocarbon material such as a heavy oil is heated to produce a coke residue in a coking chamber; evolved vapors are fractionated to form a vapor fraction and a reflux condensate; the vapor fraction is condensed to form a final light distillate; the reflux condensate is passed through a heated cracking coil; resulting cracked products, at cracking temp., are introduced into the coking chamber; a stream of charging stock comprising a petroleum residuum is separately heated to between 200° and a temp. at which substantial amts. of carbon would be deposited from the residuum as the heating proceeds, by indirect heat exchange with uncooled vapors leaving the coking chamber; the heated stream is directed into

the coking chamber; and an unheated gas-oil charging stock is introduced into the heated stream of petroleum residuum entering the coking chamber. App. is described.

**Apparatus for cracking hydrocarbon oils.** Standard Oil Development Co. Ger. 590,166, Dec. 28, 1933 (Cl. 23b. 1.04).

**Desulfurizing hydrocarbon oils.** Homer T. Darlington (to Oil Corp. of America). U. S. 1,944,170, Jan. 23. A mass of liquid hydrocarbon oil is subjected to cracking conditions within a described app. the walls of which (which may be formed of ferrous metal) are subject to the corrosive effects of S, and finely divided particles of metallic Fe in colloidal form produced *in situ* from Fe oxide by reduction are incorporated in the oil for reaction with the S present.

**Hydrogenating heavy sulfur-containing hydrocarbon oils.** Harold W. Fisher (to Standard-I. G. Co.). U. S. 1,944,639, Jan. 23. In hydrogenating heavy S-contg. hydrocarbon oils under high pressure and at elevated temps.,  $H_2S$  and other volatile sulfurous compds. are sepd. from the hydrogenated products by withdrawing a mixt. of hydrogenating gases and normally liquid hydrogenated oils from a hydrogenation zone, cooling the mixt. under high pressure, followed by sepg. the uncondensed gases, and liquid products at such pressure, reheating the liquid products and reducing the pressure on them to vaporize volatile sulfurous compds. dissolved in the liquid without substantial vaporization of the liquid and sepg. the vapor from the heated liquid. App. is described.

**Destructive hydrogenation of heavy hydrocarbon oils.** Robert T. Haslam (to Standard-I. G. Co.). U. S. 1,944,236, Jan. 23. A body of an oil is maintained in a reaction zone (of a described app.), at a temp. above 370° and under over 50 atm. pressure, and a gas rich in H is forced into the body of oil at a rate so rapid that the vapors of lighter hydrocarbons formed are swept out of the liquid as fast as formed; the vapors are immediately removed from the reaction zone and the remaining liquid is subjected to further hydrogenation. Lubricants and motor fuel may be obtained in the process.

**Apparatus (with a twin still containing molten metal such as lead) for continuous distillation of heavy hydrocarbons and removal of asphaltic residue.** Emile A. Barbet. U. S. 1,944,057, Jan. 16. Structural and operative details.

**Green bloom agents for oils.** Herschel G. Smith (to Gulf Refining Co.). U. S. 1,944,851, Jan. 23; Can. 338,701, Jan. 16, 1934. A green bloom agent comprises a clarified hydrocarbon oil contg. the oil-dispersible, green bloom principle extd. from the decompn. products of an  $AlCl_3$  sludge formed by heating  $AlCl_3$  with petroleum oil (the agent being of brownish green color and imparting a brilliant green bloom to oils when added to them in small proportions).

**Apparatus for distillation of pulverized bituminous schists.** Rene Petit (to Société des schistes et pétroles de Franche-Comté). U. S. 1,944,647, Jan. 23. Numerous structural, mech. and operative details are described suitable for use in connection with employment of superheated steam in the distn.

**Furnace and tube bank, etc., for use in oil conversion.** Audley E. Harnsberger and Clyde L. Smith (to Pure Oil Co.). U. S. 1,944,318, Jan. 23. Numerous structural and operative details are described.

**Device for preventing deposition of carbon in conduits such as those of oil-conversion apparatus.** Edwin W. Beardsley (to Petroleum Conversion Corp.). U. S. 1,944,162, Jan. 23. Agitating devices such as scrapers are mounted on a chain or the like so that they can be moved first in one direction and then in the other in the conduit. Various structural and mech. details are described.

**Revivifying mineral absorbents such as fuller's earth used in treating oils.** George R. Lewers. U. S. 1,943,976, Jan. 16. Various details are described of treatment in a furnace with superposed hearths, to effect partial

distn. and partial combustion of oil from the absorbent material.

**Motor fuel.** Società anon. carburanti Italia. Fr. 755,767, Nov. 30, 1933. An antiknock fuel for motors is made by mixing in the cold 40–60% by wt. of MeOH or EtOH (contg. up to 5% of water) with 60–40% of light oils from asphalt or tar, adding 2% of  $C_{10}H_8$ , distg. the mixt. and submitting the vapors obtained to a "cracking" at 350–500°.

**Benzine products.** The Pure Oil Co. Ger. 588,970, Dec. 1, 1933 (Cl. 28b. 1.05). A process is described for removing the resinous residues of benzine distns. by polymerization at high pressure and fractional distn. under reduced pressure. App. is indicated.

**Tower with a shew and horizontal perforated plates** suitable for countercurrent washing of mixed naphtha or similar operations. Paul J. Harrington (to Standard Oil Development Co.). U. S. 1,943,822, Jan. 16. Structural and operative details.

**Separating paraffin from grease and oil in petrolatum.** John D. Zieley (to Amarel Corp.). U. S. 1,944,483, Jan. 23. The petrolatum is atomized and treated with superheated steam and air in a reaction zone maintained at about 540° (the time of treatment being such as to avoid deleterious cracking). App. is described.

**Dewaxing oils.** Paul J. Carlisle (to The Canadian Industries Ltd.). Can. 338,604, Jan. 16, 1934.  $CH_2Cl_2$ , 1–4 vols., is mixed with 1 vol. of a wax-oil mixt. and the resulting mixt. chilled below 0°F. The pptd. wax is filtered from the mixt. and thereafter the  $CH_2Cl_2$  is sepd. from the oil.

**Lubricating oil.** Ulric B. Bray (to Union Oil Co. of Calif.). U. S. 1,944,491, Jan. 23. An oil contg. asphalt and wax is mixed with a volatile solvent such as an overhead product from casinghead gasoline, under superatm. pressure to dissolve the oil and wax and to sep. asphalt, the latter is removed from the oil-wax soln., the pressure on the soln. is released to evap. the solvent and cool the oil to ppt. the wax, and the wax is sepd. from the cooled oil. An arrangement of app. is described. Cf. C. A. 27, 2800.

**Lubricating oils.** Max. B. Miller & Co. Inc. Fr. 756,248, Dec. 6, 1933. Mineral oils contg. naphthenic and paraffinic constituents are refined for the production of lubricating oil by treating them with a solvent for the naphthenic constituents, such as cresylic acid or its homologs and a solvent for the paraffinic constituents, such as  $C_6H_6$ ,  $C_8H_{18}$ ,  $C_{10}H_{18}$ ,  $C_{12}H_{26}$ , etc., and sepg. the 2 layers formed.

**Chassis lubricating oil.** Joseph Bijur (to Auto Research Corp.). U. S. 1,944,164, Jan. 23. A small proportion (suitably about 6–15%) of blown rape-seed oil is admixed with a base of petroleum oil made from asphaltic crude oils and having a viscosity of about 3000 S. U. V.

**Lubricants.** Robert O. King and Ernest W. J. Mardles. Brit. 400,182, Oct. 10, 1933. Bearing surfaces are coated by feeding thereto a vegetable lubricating oil, e. g., castor, rape, etc., contg. a small amt. of an org. Pb compd., e. g.,

tetraethyl, ricinoleate, tetraphenyl, under temp. conditions which effect oxidation of the oil mixt. Mineral oil may be added and also Sn oleate or tetraphenyl to prevent too large a formation of sludge.

**Lubricants containing oil and soap.** Arman E. Becker and Reginald G. Sloane (to Standard Oil Development Co.). U. S. 1,943,806, Jan. 16. A liquid lubricant contg. mineral oil together with not more than 5% of an alkali soap is prepd. by adding to the oil a soln. of the soap in a volatile solvent such as  $H_2O$  or alc. and then agitating and heating the mixt. until the solvent is removed and rapidly cooling the compn. through the temp. range in which gel formation would otherwise take place. App. is described. The soap also may be formed in the oil. Cf. C. A. 28, 632°.

**Lubricant for wire drawing.** George S. Rutherford (to The Western Electric Co. Inc.). Can. 338,571, Jan. 9, 1934. The lubricant is a mixt. of anhyd. Na alginate 1, lubricant (tallow) 4, soap 2 and water 195 parts. Any other salt of alginic acid sol. in water or oil such as  $NH_4$ , K, Li and Mg alginates may be employed.

**Lubricating grease.** Standard Oil Development Co. Ger. 584,539, Sept. 21, 1933 (Cl. 23e. 1). See Brit. 396,147 (C. A. 28, 632°).

**Composition for retarding sludge formation in insulating oils.** Frank M. Clark (to The Canadian General Electric Co. Ltd.). Can. 338,840, Jan. 23, 1934. Maleic, succinic, citric, tartaric, malonic, malic, mucic or adipic acid or anhydride is kept in contact with, or dissolved in, the oil.

**Resolving oil-water emulsions.** Wm. F. Van Loenen (to L. Blake-Smith). U. S. 1,944,479–80, Jan. 23. Various details of operation are described, of a process in which a granular material is used as a resolving agent in treating emulsions. App. is described. Cf. C. A. 27, 4066.

**Bituminous emulsions.** International Bitumen Emulsions Corp. Brit. 400,409, Oct. 26, 1933. In producing an emulsion by adding a portion of molten asphalt to a hot caustic alkali soln., introducing saponifiable material, e. g., oleic acid, and adding the remainder of the molten asphalt, all with agitation, a small quantity of colloidal clay, e. g., bentonite, is added as a stabilizer at any stage of the process.

**Treating wood tar.** H. O. V. Bergström and K. N. Cederquist. Swed. 77,201, May 9, 1933. Wood tar or other liquid distn. products from wood are sepd. in two or more fractions by distn. The lower fraction or fractions are cracked in order to facilitate the production of valuable substances, for instance, phenols.

**Distilling tar, pitch, liquid rosin, hydrogenation oil, and other wood products.** H. O. V. Bergström and K. N. Cederquist. Swed. 78,693, Oct. 24, 1933. The distn. is carried out periodically or continuously in a rotary furnace or otherwise, the material being spread in thin layers. The solid residues are conveyed by means of a scraping device into a container connected with the distn. furnace.

## 23—CELLULOSE AND PAPER

CARLETON E. CURRAN

**The purification of cellulose by bleaching and chlorination.** J. O. Murto. *Tönnilinen Aikakauslehti* 24, 22–9 (1934).—See C. A. 28, 638°.

**The sorption of water by cellulose.** S. E. Sheppard and P. T. Newcome. *Ind. Eng. Chem.* 26, 285–90 (1934).—Regenerated celluloses adsorb more water than mercerized celluloses. Degrading treatments such as acid tendering and oxidation do not materially change the water adsorption of native cellulose. The mol. wts. of native and regenerated celluloses, as indicated by viscosity measurements, show no correlation with water adsorption. Wood pulp (α-pulp) has a higher sorption than cotton cellulose, approaching that of mercerized cellulose. The sorption of water by the wood pulp is unaffected by beating. Certain

cellulose materials adsorb more water from the liquid phase than from the satd. vapor at the same temp. P. T. N.

**The manufacture of cellulose acetate film by the drying processes.** Max Ullmann. *Kolloid-Z.* 66, 119–23 (1934).—Patent review relating to compn. and pouring procedures.

**Lignin content of cellulose products.** A. G. Norman and S. H. Jenkins. *Nature* 131, 729 (1933); cf. C. A. 28, 315°.—A pentose on treatment with cold 72%  $H_2SO_4$  and then boiling with dil.  $H_2SO_4$  gave a quantity of material as resistant as lignin and detd. as such by accepted methods. About 25% of the apparent lignin content of celluloses from cereal straws is secondarily produced from the cellulose fraction, but there is some true lignin or other

equally acid-resistant material present. The detn. of lignin by the 72%  $\text{H}_2\text{SO}_4$  method should be critically examd. B. C. A.

**Pectin as a source of lignin and humus.** O. Aschan. *Finnish Paper Timber J.* 1932, 386-7.—If humus is dried at higher than  $110^\circ$  volatile constituents are lost. When it is dried at lower temp. the compn. agrees with that of Ehrlich's galacturonic acid obtained by the hydrolysis of pectin. B. C. A.

**Natural substances of high molecular weight.** K. Funke. *Protoplasma* 18, 299-309(1933).—A discussion of the structure of cellulose fibers. B. C. A.

**Controlling atmospheric conditions in rayon production.** James A. Lee. *Chem. & Met. Eng.* 41, 60-3(1934).

**Hygroscopic sizes in paper making.** Hermann Nitz. *Chem.-Ztg.* 57, 957-8(1933).—Wrinkling of sized paper when it becomes very dry is due to a greater shrinkage coeff. in the size than in the paper. To prevent wrinkling the hygroscopicity of the size must be increased by adding enough glycerol to equalize the shrinkage coeffs. or hygroscopic sizes must be used. F. L. Browne

**Paper processing for package purposes.** T. Linsey Crossley. *Oil and Soap* 11, 25-9(1934). E. S.

**Life of impregnated paper (Whitehead) 13.** Alloys [for spinning nozzles, thread guides, etc., for rayon] (Fr. pat. 755,701) 9. Film-making app. (Brit. pat. 400,823) 9.

**Lieferbedingungen und Prüfverfahren für Kunstseide.** 3rd ed., revised. Berlin: Beuth-Verlag. 23 pp. M. 0.60.

**Cellulose from red fir.** Johannes Nielsen. *Norw.* 53,189, Oct. 16, 1933. The raw material after disintegration and sorting is treated with solns. of 3 different reagents in succession, the first consisting of a reducing salt, the sec. of alkali or other base, and the third of an oxidizing salt, with washings between each 2 treatments. The treatments are carried out with relatively dil. solns. and at normal temp.

**Hydrolyzing cellulose.** Henry Dreyfus. *Brit.* 400,168, Oct. 9, 1933. See Fr. 750,495 (C. A. 28, 893\*).

**Alkali cellulose.** Franz Steimmig. *Brit.* 400,489, Oct. 26, 1933. See Fr. 751,617 (C. A. 28, 893\*).

**Cellulose tubes for fountain-pen barrels, etc.** Celluloid Corp. *Brit.* 400,442, Oct. 26, 1933. A tube of cellulose acetate or other cellulose deriv. material is formed by winding helically a strip of the material about a mandrel within a tank contg. boiling  $\text{H}_2\text{O}$ , immersing the wound strip or coil on the mandrel in cold  $\text{H}_2\text{O}$  to cause setting, then removing the coil and immersing it in a bath of  $\text{Me}_2\text{CO}$  or other solvent where it is slightly untwisted to cause sepn. of adjacent helical edges and facilitate application of solvent thereto, and finally giving the coil a slight pos. twist, removing from the bath and allowing to dry.

**Cellulosic materials.** Soc. Alfa-Laval. *Fr.* 756,188, Dec. 6, 1933. Collodions contg. about 20% of cellulosic compds. are purified by heating them rapidly to a temp. at which their fluidity is near that of water, centrifuging in an autoclave centrifuge separator which retains the heavy particles in suspension and cooling them rapidly so that the time they are at the high temp. is as short as possible. An app. is described. *Fr.* 756,189. Viscoscs are clarified by the method of *Fr.* 756,188.

**Regenerated cellulose products.** Waldemar Schwalbe and Otto Schnecko (to Kalle & Co. A.-G.). *U. S.* 1,943,346, Jan. 16. A viscose soln. contg. titanin acid is used for producing opaque or turbid sheets, films, tubes, caps, bands, etc., by molding, without appreciably decreasing the strength of the product.

**Esterifying cellulose.** Henri L. Barthelemy (to Ruth-Aldo Co.). *U. S.* 1,943,507, Jan. 16. An ester such as cellulose acetate is formed by treating cellulose (which may be in the form of cotton) with an esterifying agent such as  $\text{Ac}_2\text{O}$  in the presence of org. acids such as  $\text{HOAc}$  as solvents and of a complex catalyst comprising a strong inorg. acid

such as  $\text{H}_2\text{SO}_4$  and an oxidizing agent for the cellulosic material, such as chromic acid. *Cf. C. A.* 27, 5974.

**Cellulose esters.** British Celanese Ltd. *Brit.* 400,249, Oct. 23, 1933. The Ac content of simple org. esters of cellulose which have undergone partial hydrolysis is increased by further esterification. The esterifying agent may be the corresponding acid anhydride or acyl chloride or, in the case of cellulose formate,  $\text{HCOOH}$ . Esterifying catalysts may be used. Among examples (1) cellulose acetate, after ripening, washing, stabilizing and drying, is treated with a mixt. of  $\text{Ac}_2\text{O}$ ,  $\text{ZnCl}_2$ ,  $\text{HCl}$  and  $\text{C}_6\text{H}_6$  to give a product sol. in  $\text{CH}_2\text{Cl}_2$  and in hot  $\text{CHCl}_3$  but insol. in  $\text{Me}_2\text{CO}$  and (2) hydrolyzed cellulose acetate is treated with  $\text{Ac}_2\text{O}$ ,  $\text{H}_3\text{PO}_4$  and  $\text{C}_6\text{H}_6$  to produce a product sol. in  $\text{Me}_2\text{CO}$  and in  $\text{CH}_2\text{Cl}_2$  but difficulty sol. in hot  $\text{CHCl}_3$ . The products may be used in producing rayon, bristles, straw, lacquers, films, coating compns., plastic compns. and molding powders.

**Cellulose esters.** Eastman Kodak Co. *Ger.* 590,235, Jan. 4, 1934 (Cl. 12a. 6). Addn. to 571,388 (C. A. 27, 3073). See *Brit.* 304,278 (C. A. 23, 4818).

**Reducing the viscosity of cellulose ethers.** David Traill and Alfred S. Levesley (to Imperial Chemical Industries Ltd.). *U. S.* 1,943,461, Jan. 16. A cellulose ether such as cellulose ethyl ether is treated with dil.  $\text{HCl}$ ,  $\text{H}_2\text{SO}_4$ ,  $\text{H}_3\text{PO}_4$ ,  $\text{HOAc}$  or formic or oxalic acid at a pressure of 10-75 lb. per sq. in. and a temp. of  $115-160^\circ$  for not over about an hr.

**Cellulose derivatives.** Soc. pour l'ind. chim. à Bâle. *Fr.* 755,870, Dec. 1, 1933. Cellulose derivs. of heterocyclic compds. contg. N, e. g., as described in *Fr.* 687,301 (C. A. 25, 812), are found to be stable not only toward dil. alkalies but also in operations necessitating a more intense action of the reagents, e. g., hot dyeing with vat dyes of the anthraquinone series, boiling with  $\text{Na}_2\text{CO}_3$  and mercerizing.

**Cellulose derivatives.** Otto Sindl. *Fr.* 755,981, Dec. 2, 1933. Cellulose esters are stabilized by removing them from the reaction mixt. and treating them in the swollen state with liquids such as  $\text{EtOH}$ ,  $\text{AcOEt}$  or  $\text{AcOAm}$  which will dissolve the inorg. acids but not the esters. If necessary a raised temp. and pressure are used. *Fr.* 755,982. Cellulose is moistened before esterification or etherification with an org. liquid which penetrates it entirely and is capable of swelling it, e. g., acids, ethers or alcs. The liquid is removed by pressing to a pt. such that the air has free access to the fibers. The cellulose is allowed to remain in this state until it manifests the desired reaction capacity for esterification or etherification.

**Cellulose derivative compositions suitable for coating compositions, films, etc.** Emmette F. Izard (to E. I. du Pont de Nemours & Co.). *U. S.* 1,943,972, Jan. 16. An ester of an aryloxyethoxyethanol such as phenoxyethoxyethanol or the like is used as a plasticizer with cellulose derivs. such as cellulose nitrate. Numerous examples are given.

**Cellulosic sheets.** La Cellophane. *Fr.* 755,953, Dec. 2, 1933. Thin sheets of regenerated cellulose such as Cellophane have deposited on their surface a cellulosic soln. such as viscose which is spread according to a design in the form of continuous or discontinuous lines and coagulated. The ripples are retained after the action of an aq. bath or a dyeing bath.

**Fireproofing plates of cellulosic material.** Ensoplaten Import-G. m. b. H. *Ger.* 588,786, Nov. 27, 1933 (Cl. 39b. 28). The plates are rendered porous by submission to heat and reduced pressure. They are impregnated with the fireproofing soln. in this condition and, if desired, finally treated with waterproofing material.

**Foils.** Henry Dreyfus. *Brit.* 400,597, Oct. 23, 1933. See *Fr.* 754,108 (C. A. 28, 1861\*).

**Films, foils, etc.** Henry Dreyfus. *Brit.* 400,589, Oct. 23, 1933. Solns. of cellulose derivs. are extruded into coagulating baths contg. softening agents for the derivs., the films, foils or sheets produced are subjected, during or continuously with their production, to transverse tension and at least part of the softening agents are afterward

removed. Longitudinal stretching may also be used. App. is described.

Process and apparatus for making films of gelatin, cellulose derivatives, etc. *Folien- u. Flitterfabrik A.-G.* Brit. 400,178, Oct. 16, 1933. Divided on 395,816 (*C. A.* 28, 6387).

Decolorizing films, fibers, etc., of cellulose esters or ethers. *Deutsche Gold- und Silber-Scheideanstalt vormals Roessler (Karl Werner, inventor)* Ger. 588,539, Nov. 20, 1933 (*Cl.* 39b. 13). Films, fibers, etc., are wetted with a liquid exerting no solvent action and treated with Cl. Thus, nitro- or acetylcellulose films are decolorized by wetting with EtOH of 10-90 vol. % and treated with Cl.

Acylation of carbohydrates. *Henry Dreyfus.* Fr. 756,150, Dec. 5, 1933. Cellulose and other carbohydrates and their derivs. are acylated by aromatic anhydrides, e. g.,  $Bz_2O$ . Acyl groups of lower fatty acids are also introduced, the aromatic radical being present in amt. preferably below 10% of the wt. of the cellulose deriv.

Artificial materials. *Kenneth S. Low.* Fr. 755,835, Nov. 30, 1933. Multicolored sheets, bands or films are obtained by dividing aq. solns. of cellulose, capable of being regenerated or coagulated, into a no. of parts which are dyed or colored separately, then reunited and regenerated or coagulated before the parts have had time to mix or diffuse completely.

Vulcanized fiber. *The Koppers Co.* Ger. 590,320, Jan. 2, 1934 (*Cl.* 39b. 15). Cellulosic material is treated at atm. temp. with a concd. soln. of  $Ca(CNS)_2$ , contg.  $CH_3O$ .

Viscose. *Steckhorn Kunsteide A.-G.* Ger. 588,698, Nov. 23, 1933 (*Cl.* 29b. 3.02). Mat fibers, etc., are obtained by spinning viscose solns. contg. finely divided chemically inactive ethers b. 200-300°, and having about the same sp. gr. as viscose, e. g., benzyl ether.

Rayon. *Kurt Doogs.* Ger. 590,352, Dec. 30, 1933 (*Cl.* 29a. 6.06). The spinning speed is raised during the spinning operation, e. g., from 50 to 70 m. per min., and the speed of the pot, reel or other collecting device is correspondingly raised so that the titer of the filament remains const. or does not vary by more than 10%. The rayon produced toward the end of the spinning operation then has the same dyeing properties as that produced at the beginning. Rayon of uniform dyeing properties may also be obtained by increasing the tension applied to the previously formed filaments during processes such as twisting or winding.

Rayon, etc. *Henry Dreyfus.* Fr. 756,149, Dec. 5, 1933. Threads, films, plastic masses, etc., are made from mixed esters or ether esters of cellulose which contain an aromatic acid radical, e. g.,  $Bz$ . The proportion of this radical is preferably below 10% of the wt. of the cellulose deriv., which also contains a radical of a lower fatty acid, e. g.,  $Ac$ .

Rayon, etc. *Henry Dreyfus.* Fr. 755,621, Nov. 28, 1933. The resistance to traction of filaments, threads, ribbons and thin sheets made of org. derivs. of cellulose is increased by softening and drawing during their travel from one pt. to another, the traction force creating the drawing being entirely or practically entirely limited to the softened portion of the material. Fr. 755,622. The materials are treated with shrinking agents in the absence of a tension sufficient to draw them and afterward submitted to a drawing. The shrinking agent may be, e. g.,  $CH_2Cl_2$ ,  $C_2H_5Cl_2$ ,  $CHCl_3$ ,  $C_2H_5Cl$  or  $AcOEt$ .

Rayon, etc. *Henry Dreyfus.* Fr. 755,811, Nov. 30, 1933. Threads, films, etc., made from cellulose acetate, etc., are softened for drawing purposes by means of diesters and ether esters which may be considered as derivs. of alkylidene glycols (i. e., glycols in which the 2 OH groups are joined to the same C atom) by the substitution of 2 ester groups or of an ester group and an ether group for 2 OH groups. Examples are diacetates of methylene, ethylidene and propylidene glycol.

Rayon, ribbons, etc. *Henry Dreyfus.* Brit. 397,881, Aug. 29, 1933. The stretching of artificial filaments, yarns, etc., made from or contg. cellulose acetate or other film-forming substances that are relatively resistant to

penetration by  $H_2O$ , is facilitated by stretching materials from which an addnl. substance has been removed before or during the application of the stretch-assisting agent. The addnl. substance is 1 of different nature from the base of the materials and from the solvent or other substance which is removed from the spinning soln., or like compn., to form the materials, examples being glycerol, cyclohexanol, cyclohexanvl acetate, cyclohexanone, methylcyclohexanol, methylcyclohexanyl acetate, cyclobutanone, acetylacetone, ethers of olefin and polyolefin glycols, benzyl alc., benzyl acetate, ethyl hydroxybutyrate, diacetin, triacetin, tribenzoylglycerol, triphenyl and tritolyl phosphates, diethyl and dibutyl phthalates, diethyl and dibutyl tartrates, *p*-toluenesulfonamide and sulfonanilide, oils, fats and waxes. They may be dissolved out wholly or in part by suitable liquids which may or may not have a solvent action on the substance of the materials. In examples (1) an aq.  $Me_3CO$  soln. of cellulose acetate, contg. 10% triphenyl phosphate, is spun and the filament stretched by the process of Brit. 277,089 (*C. A.* 22, 2465), 323,790 (*C. A.* 24, 3369) or 370,430 (*C. A.* 27, 3088), the triphenyl phosphate being first removed by a  $C_6H_6$  bath, and (2) an aq.  $Me_3CO$  soln. of cellulose acetate, contg. 8-12% diethylene glycol monobutyl ether, is dry-spun, the filaments passed through an aq. 40%  $Me_3CO$  bath to remove the ether and soften them and then stretched 200-400%.

Artificial straw, ribbons, etc. *British Celanese Ltd.* Brit. 400,631, Oct. 27, 1933. Artificial straw, etc., produced by coalescing a no. of yarns or filaments, e. g., as described in Brit. 328,312 (*C. A.* 24, 5497), 354,233 (*C. A.* 26, 4482), 368,738 (*C. A.* 27, 2300) and 371,428 (*C. A.* 27, 3077), is subjected to severe bending so that it splits lengthwise to form a no. of finer straws assocd. together.

Desulfurizing rayon, fluff, hair, films, transparent paper, etc., obtained from cellulose xanthate solutions. *Soie artificielle de Gand, Soc. anon. "Sarga" and Max G. Luft.* Brit. 400,035, Oct. 19, 1933. See Fr. 749,149 (*C. A.* 27, 5976).

Dry spinning of rayon filaments. *Raymond A. J. Theno* (to Ruth-Aldo Co.). U. S. 1,944,378, Jan. 23. A rotary fan within a spinning cell creates a transverse current of gas adjacent to the spinneret at a velocity sufficient to produce a substantial permanent deformation in the contour of the filaments such as serves to reduce the luster of the product. App. is described.

Spinneret for rayon manufacture. *Ernesto Orioli* (to Ruth-Aldo Co.). U. S. 1,944,298, Jan. 23. Structural details. U. S. 1,944,299 relates to app. for dry spinning of rayon filaments.

Gear-wheel pump for rayon spinning apparatus. *Fritz Sieper* (to Barmer Maschinenfabrik A.-G.). U. S. 1,943,491, Jan. 16. Structural and mech. details.

Artificial filaments formed by the dry-spinning method. *Wm. I. Taylor* (to Celanese Corp. of America). U. S. 1,943,353, Jan. 16. Filaments are formed by extruding org. derivs. of cellulose such as a soln. contg. cellulose acetate into an evaporative atm., a luster-modifying liquid such as water or xylene is applied to the filaments and they are subjected to the further action of the evaporative atm. while they contain a relatively high proportion of solvent, in order either to reduce or to increase their luster. App. is described.

Artificial threads, yarns, etc. *British Celanese Ltd. and William I. Taylor.* Brit. 400,180, Oct. 18, 1933. A relatively non-volatile substance, e. g., malic, citric, mandelic, tartaric, tartaric, tartaric, oxalic, malonic, succinic, glutaric, benzoic or salicylic acids, or salts thereof, alanine, valine, tyrosine, glycine, phenylglycine,  $NH_4Br$ ,  $NH_4NO_3$ ,  $KI$ ,  $KBr$ ,  $Ca(NO_3)_2$ ,  $MgBr_2$ ,  $ZnCl_2$ , is added to the spinning soln. so that it contains at least 25% dissolved solids, and the added substance is removed from the filaments subsequently to their production by the evaporative spinning method. A substance is chosen that is more or less incompatible with the filament-forming material and is preferably sol. in  $H_2O$  or other common solvent so that it may be readily removed. Plasticisers and resins, rub-

ber-like substances and gelatin, themselves spinnable into filaments, are excluded. Anthracene and other hydrocarbons insol. in  $H_2O$  may be used provided they can be removed by a solvent which is a non-solvent for the filament material. The process is applicable to spinning solns. of cellulose esters and ethers, and mixed cellulose esters, ethers and ether esters.

Fibers, films and other artificial substances. W. de Marcken de Merken. Belg. 397,196, July 31, 1933. The fiber or film is formed from a cellulosic mass with which is incorporated flake material that gives off a gas on heating, and the article is heated to a temp. slightly higher than the evapn. temp. of the flake material.

Apparatus for the production of artificial filaments by the evaporative method. Henry Dreyfus. Brit. 400,662, Oct. 30, 1933.

Dry-sorting apparatus for wood chips. J. O. Mårland. Swed. 78,354 and 78,355, Sept. 12, 1933.

Apparatus for recovering fibers from the back water in wood grinding mills. Julius Haug. Norw. 52,854, July 24, 1933.

Digester and liquor circulating system suitable for digesting wood chips with bisulfite solutions. Andreas Christensen (to Fibre Making Processes, Inc.). U. S. 1,943,289, Jan. 16. Various structural and operative details are described.

Sulfite digestion of wood. Henry Dreyfus. Brit. 400,974, Nov. 6, 1933. An aq. soln. or solns. of bisulfite with little or no free  $SO_2$  are used throughout the digestion. The ratios of free to combined  $SO_2$  may be 1:2, 10, or 60, etc., in a 2-8% soln. of Na, K, Ca, Mg, etc., bisulfite. In an example spruce chips are heated at  $140^\circ$  and 10 atm. for 8 hrs. in a soln. of alkali metal bisulfite 6 and free  $SO_2$  0.2%, N being forced into the digester.

Digestion of fibrous material. Otto C. Schoenwerk (to Chemipulp Process, Inc.). U. S. 1,943,489, Jan. 16. In operations such as the cooking of wood chips with acid liquor, a relief fluid is vented from a digester during the cooking period, an acid liquor is circulated by pumping it in an annular path, and the relief fluid is introduced into the circulating liquid at the suction side of the pump. App. is described.

Charging cellulose digesters. Albert E. Nielsen. Norw. 52,144, Feb. 6, 1933. The digester is filled with wood chips by suction applied through the bottom in such a way that the vacuum increases downwards through the vessel; steam, air, or other gases may be introduced at the top of the vessel at the same time as the chips.

Reducing the time required for discharging digesters. Aktiebolaget Nordiska Armaturfabrikerna (T. Samson, inventor). Swed. 77,491, June 6, 1933. In order to decrease the temp. of the charge in the digester part of the liquid is drawn off into one or more sep. containers and replaced all or in part by colder cooking liquid, the liquid in the digester being kept in circulation, after a finished cook, during the introduction of the colder liquid.

Strainer for cellulose digesters. S. E. A. Brobeck. Swed. 78,170, Aug. 22, 1933.

Dewatering apparatus with rotary suction strainer. Aktiebolaget Karlstads Mek. Verkstad (J. D. Ullgren, inventor). Swed. 76,779, March 21, 1933.

Cooking cellulose. K. Y. Kylander. Swed. 77,712, July 4, 1933. The chips are pretreated by cooking under pressure with solns. of acetates or phosphates and are finally cooked with an acid or alk. liquid at a temp. above  $145^\circ$ . Cf. C. A. 27, 4076.

Cooking sulfite cellulose. Mo och Domsjö Aktiebolag. (T. E. Waenerlund, inventor). Swed. 76,200, Jan. 3, 1933. The crude acid coming from the acid-prepn. plant is circulated at normal temp. and pressure through an absorption app. where it is enriched in  $SO_2$  chiefly obtained from the waste gas (part of the  $SO_2$  may come from the digester), the gas being first cooled in a heat-exchanging app. The enriched cold crude acid is made to pass under pressure through the heat-exchanger and in the pre-heated state is stored in a container, from which it is introduced into the digester.

Cooking sulfite cellulose. Patentaktiebolaget Gröndal-

1 Ramén (G. Haglund, inventor). Swed. 77,429, May 30, 1933. See U. S. 1,940,136 (C. A. 28, 1536).

Sulfite cellulose from red fir alone or in mixture with spruce. E. L. Rinman. Swed. 78,733, Oct. 24, 1933. The cooking soln. contains not less than 67 g. of  $NaHSO_3$  per l. besides of an excess of free  $SO_2$ .

Bleaching cellulose. C. A. Geijer. Swed. 76,626, Feb. 28, 1933. The bleaching is carried out in several steps between which the pulp is passed through app. for washing, removal of knots, removal of sand, etc.

Pulp-sorting apparatus. Aktiebolaget Kamyrt (H. D. Wells, inventor). Swed. 78,423, Sept. 19, 1933.

Adjusting the concentration of pulp. K. Y. Sundblad. Swed. 77,173, May 2, 1933. The concn. of wood, cellulose or paper pulp is adjusted by mixing a certain part of the pulp with another part that has first been passed through a dewatering app.

3 Control of the concentration of paper pulp. R. Carlstedt. Swed. 79,139, Dec. 5, 1933. An automatic app. is acted upon by variations in the pressure in the pump conduit caused by variations in the viscosity of the pulp and so regulates the addn. of diln. liquid.

Drying pulp. Aktieselskapet Thunes Mek. Vaegsted. Norw. 52,108, Jan. 30, 1933. The pulp is first passed through a drying chamber, where the drying is effected by circulation and indirect heating of the vapor given off by the pulp, and next through another chamber where it is dried by means of air heated by the vapor from the former chamber.

Wet pressing of pulp. Chr. M. Hanssen. Norw. 52,308, March 13, 1933. Of a pair of rollers, the upper has a plain, the lower a corrugated surface with ridges in the rotation direction in order to facilitate the penetration of the water through the felt.

5 Wire mat for pressing water from sheets of wood pulp or cellulose. Nicolay Paus A/S. Norw. 53,295, Nov. 13, 1933. The mat is woven from wire of oval cross-section in order to attain a gentle action upon the pulp sheets, increase the dewatering power, and reduce the wt. of wire per unit of surface.

Defibration of sulfite pulp. J. H. Wallin. Swed. 76,625, Feb. 28, 1933. The pulp coming from the sulfite digester is defibrated in an app. provided with double walls, the inner wall acting as a strainer for the sepn. of liquor.

Apparatus for removing knots from sulfite pulp. Axel C. Andersen and Arne Schie. Norw. 52,240, Feb. 27, 1933.

Apparatus for separating knots from cellulose pulp. Christian August Johansen. Norw. 52,453, April 18, 1933; Norw. 52,830, July 17, 1933.

7 Sorting apparatus for materials in liquid suspension, particularly paper and cellulose pulp. Wessel Waal and Bror Natanael Segerfelt. Norw. 52,661, June 12, 1933.

Alkaline cooking liquor. B. N. Segerfelt. Swed. 77,894, July 25, 1933. The waste lye is dried and burned and the fused  $Na_2CO_3$  residue is dissolved in a strong  $NaOH$  soln. contg. not less than 50 kg. of  $NaOH$  per cu. m.

Evaporating alkali sulfite liquors. Patentaktiebolaget Gröndal-Ramén (G. Haglund, inventor). Swed. 78,171, Aug. 22, 1933. The acid waste liquor obtained by the cooking of cellulose with alkali bisulfite is made neutral or alk. by addn. of the residue of fused salt obtained by evapn.

8 and burning of the waste liquor from a previous cook, and it is then evapd. and burned, the residue all or in part being used for neutralizing new amts. of waste liquor. Cf. C. A. 28, 1145.

Molded articles from coagulated sulfite cellulose waste liquor. Aktieselskapet Toten Cellulosefabrik. Norw. 53,060, Sept. 18, 1933. The coagulation is brought about by means of chromic acid or other oxidizers which are stirred into the mass immediately before or after the introduction of the mass into the molds.

Causticizing crude lye. T. N. J. Apler. Swed. 77,770, July 11, 1933. Mech. features of app. and procedure.

Recovery of the lime used in causticizing cellulose cooking liquor. Högans-Billesholms Aktiebolag (C. Åberg, inventor). Swed. 78,493, Sept. 26, 1933. The

ppt., chiefly consisting of  $\text{CaCO}_3$ , obtained in causticizing, is brought into a suitable plastic consistency by drying or by addn. of drying materials contg. mainly Ca compds. and (or) combustible materials; the mass is formed into pieces, dried and burned.

Recovery of ammonia from cook liquor in the manufacture of paper by the ammonium bisulfite process. Roger W. Richardson (to E. I. du Pont de Nemours & Co.). U. S. 1,943,345, Jan. 16. The hot cook liquor is made alk. and, while still hot, is brought into intimate contact with air, the resulting gas is cooled, part of the condensable  $\text{NH}_3$  is absorbed in the condensed liquid thus obtained, and the remaining uncondensed  $\text{NH}_3$  is recovered by subsequent scrubbing. An arrangement of app. is described.

Heat-exchange apparatus for heating or cooling of cooking liquor. Aktiebolaget Karlstads Mek. Verktad (R. V. Dahlin and J. A. Magnusson, inventors). Swed. 78,806, Oct. 31, 1933.

Recovering heat in cellulose factories. C. Rosenblad. Swed. 78,735, Oct. 24, 1933. Impure secondary vapors are cooled in a mixing condenser by means of polluted waste water at  $50-60^\circ$ , which is added in such regulated amts. that a liquid of  $90-95^\circ$  is obtained. After sepn. of the permanent gases that accompany the secondary vapors, this hot liquid is passed through a heat-exchanging app. for indirect heating of pure water.

Device for utilizing the heat of the gases from the rotary soda furnaces of the liquor-evaporation plants in sulfate or alkali cellulose factories. L. Glöersen. Swed. 78,663, Oct. 17, 1933.

Doctors for paper machines, etc. Andrew N. Russell. Brit. 401,006, Nov. 9, 1933.

Cylinder paper-making machines. Wm. H. Sutherland and Charles L. Ellis. Brit. 400,624, Oct. 27, 1933.

Means for drying paper in a paper machine of the "Yankee" or M. G. type. Samuel Milne. Brit. 400,013, Oct. 19, 1933.

Drying apparatus for paper-making machines. Rudolf Steinmetz. Ger. 588,546, Nov. 25, 1933 (Cl. 55d. 28.70).

Drying cylinders in paper machines. E. A. Öhlin. Swed. 76,201, Jan. 3, 1933. Structural features.

Drier felts for paper-making machines. Eduard von Asten. Brit. 400,502, Oct. 26, 1933. The felts comprise a textile fabric impregnated with rubber latex, etc., so that part or all of the pores in the fibers and threads are closed while the interstices between the threads remain open.

Paper making. Ernst Strupp. Ger. 588,577, Nov. 24, 1933 (Cl. 55b. 1.20). Half stuff for paper making is obtained by treating straw, grass, etc., with sulfite pulp waste lye made alk. by addn. of  $\text{Ca}(\text{OH})_2$ , and digesting.

Sizing fibrous materials such as paper. Hilbert C. Lathrop and Fergus A. Irvine (to Celotex Co.). U. S.

1,943,975, Jan. 16.  $\text{FeCl}_3$  is used as a size precipitant in varying proportions to give a desired color to the sized product.

Absorbent copying paper. Morland & Impey Ltd. Ger. 588,822, Sept. 9, 1933 (Cl. 55f. 16). See Brit. 359,744 (C. A. 26, 4190).

Filled surface paper. Charles F. Boyers (to Champion Coated Paper Co.). U. S. 1,944,836, Jan. 23. Excess aq. mineral coating compn. such as one contg.  $\text{CaCO}_3$ , etc., is applied to a moving web of paper, and the excess coating material is removed to leave a residual coating in the surface pores of the paper, by a smooth rounded surface having a radius of curvature not exceeding five-thirtieths of an in. at the point where the paper leaves the surface. Other details of app. are described.

Cigaret paper. Louis P. Schweitzer and Wm. P. Schweitzer. Fr. 756,094, Dec. 4, 1933. The paper is made resistant to the action of water by impregnation with a resin, with or without a substance of the nature of wax. The resin and wax are applied in soln. in a volatile solvent such as  $\text{CCl}_4$ , acetone or benzene. Cf. C. A. 27, 4082.

Paper tube for shot shells. Watson H. Woodford (to Remington Arms Co.). U. S. 1,943,501, Jan. 16. A paper shot-shell tube is rendered waterproof and charproof by first immersing it in a soln. having char-preventing and lacquer-plasticizing properties, such as castor oil, and then dipping the tube in a soln. comprising a soln. of a lacquer base such as nitrocellulose in a solvent such as acetone to form a lacquer coating on the tube.

Reclaiming printed waste paper. Industrial Products Corp. Brit. 400,415, Oct. 26, 1933. See Fr. 745,802 (C. A. 27, 4401).

Preheating the drying air in paper machines and cellulose-drying machines. Olaf Gunderson. Norw. 51,480, June 26, 1933. Hot air and steam from the drying machines are utilized for preheating fresh air. The preheating is carried out in 2 steps between which the air is made to pass through the factory rooms as heated ventilation air.

Apparatus for the production of sample sheets of paper or board. Linköpings Armatur- och Metallfabriks A.-B. (B. G. Ullstrand, inventor). Swed. 76,250, Jan. 10, 1933. Structural features.

Manufacture of paperboard. C. W. B. Rasch. Swed. 76,567, Feb. 21, 1933. Mech. features.

Apparatus for drying paperboard. Aktiebolaget Svenska Paktfabriken (J. G. Olsson and F. I. E. Stenfors, inventors). Swed. 77,381, May 23, 1933.

Paperboard. J. R. Wiborg and N. Lund. Norw. 52,528, Dec. 4, 1933. A process and machine are described for the manuf. of board consisting of wood pulp with a coating of cellulose.

## 24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE AND C. G. STORM

Modern explosives. Guido Guastalla and Giovanni Raccu. *Industria chimica* 8, 1370-7 (1933); cf. C. A. 28, 6451.—The prepn. and properties of trinitroanisole are summarized.

Trotyl oil as a raw material in the manufacture of ammonites and dynamites. I. Kisilew. *Kriegschemie* (Moscow) 4, 3-7 (1933). Nitrocellulose 4, 228.—The use of trotyl oil (liquid trinitrotoluene) in admixt. with trotyl is inadvisable. Addn. of powd. C reduces the detonating power of the explosive. Trotyl oil should be fused with resins or naphthalene, or absorbed in wood meal, peat, cereal meals, etc.

Ignition of some explosive mixtures by modified coil discharges. B. W. Bradford, G. I. Finch and A. M. Prior. *J. Chem. Soc.* 1934, 75-9.—Further expts. with mixts. of  $2\text{CO} + \text{O}_2 + 5\% \text{H}_2$ ,  $2\text{H}_2 + \text{O}_2$  and  $\text{CH}_4 + 2\text{O}_2$  confirmed the previous conclusion (C. A. 27, 2813) that the efficiency of the capacity component, or high-frequency condensed discharge, in the ignition of explosive

gas mixts. is much less than that of the inductance component. The igniting power of the latter is but little, if at all, increased by a preceding capacity component. The results obtained are in direct conflict with the thermal theory of ignition.

The water-gas reaction in low-pressure explosions. B. W. Bradford. *J. Chem. Soc.* 1933, 1557-63.—Observed variations in the position of the water-gas equil. at low pressures may be due to oxidation and reduction of the reactants through the intermediary of the reaction  $\text{CO} + \text{OH} \rightarrow \text{CO}_2 + \text{H}$ , which is governed by the concn. of the OH radicals produced by dissociation of water. The results obtained confirm the opinion that there is no fundamental difference between cathodic combustion and combustion in flames in general.

Experimental determination of the lowering in temperature obtained by adding various substances to B powder. H. Muraour. *Mém. artill. fr.* 12, 125-38 (1933); *Chimie & industrie* 30, 1932.—The substances which, when

added to the charge, decrease the luminosity at the muzzle of the cannon, fall in 2 classes: (1) substances which inhibit re-inflammation (e. g., alkali chlorides); (2) substances which modify the compn. of the gases or lower their temp. The latter were subjected to lab. tests which consisted in firing shots in a bomb and detg. temp., pressure and combustible gas content of the products of explosion. As the existence or non-existence of  $\text{CH}_4$  at the time of explosion affects the results, the latter were calcd. according to both hypotheses. The method used consisted in igniting a given wt. of powder in the bomb, cooling the gases, measuring their vol. and analyzing them. Condensed  $\text{H}_2\text{O}$  is detd. by difference and the wt. of the residue is subtracted from the wt. of the powder. The temp. is calcd. from the formula:

$$T = \frac{273P(V - \alpha p\omega)}{V_0 p\alpha}, \text{ in which } T \text{ is abs. temp., } V \text{ the vol. of the bomb, } \alpha \text{ the covol., } \omega \text{ the wt. of the powder, } V_0 \text{ the vol. of the gases at } 0^\circ \text{ and } 760 \text{ mm.}$$

Because of the effect of the dimensions of the bomb on the cooling, it is evident that all tests must be carried out in the same bomb. The antiluminous compds. tested fall in 2 classes: (1) products which decomp. water vapor (petrolatum, xylitol), (2) compds. or explosive mixts. having a low combustion temp. (nitroguanidine,  $\text{NH}_4\text{NO}_3$ -charcoal mixts.,  $\text{NH}_4\text{NO}_3$ -paraffin mixts., pure  $\text{NH}_4\text{NO}_3$ ). The former are characterized by a high combustible gas content; the latter, by a decrease in the combustible gas content.

A. Papineau-Couture

Fire and explosion hazards of common refrigerants (Nuckolls, *et al.*) 13. Effect of pressure on the spontaneous inflammation of hydrocarbons (Neumann, Estrovich) 2. Paper tube shot shells (U. S. pat. 1,943,501) 23. Trinitrotoluene (Ger. pat. 590,234) 10. Storing  $\text{C}_2\text{H}_2$  and like explosive substances (Ger. pat. 590,497) 21.

Cameron, A. M.: Chemistry in Relation to Fire Risk and Fire Extinction. London: Sir I. Pitman & Sons, Ltd. 292 pp. 7s. 6d.

Jahn, G.: Der Zündvorgang in Gasgemischen. Munich: R. Oldenbourg. About 80 pp. About M. 6.

Propellant explosive. Robert Burns and Oliver W. Stickland (to Imperial Chemical Industries Ltd.). U. S. 1,943,421, Jan. 16. A stable, non-volatile organo-metallic Sn compd. in which the Sn is linked directly to C and which has no destabilizing action on the constituents of the powder, such as  $\text{SnPh}_4$  or  $\text{SnBu}_4$ , is used (suitably in a proportion of about 3-5%) with explosives such as those contg. nitrocellulose and nitroglycerin to prevent metal fouling in guns or rifles.

Use of a lead salt of 3,5-dinitro-*o*-cresol in priming compositions. Willi Brün (to Remington Arms Co.). U. S. 1,943,513, Jan. 16. Pb nitrate is caused to react with the corresponding Na salt and may be used in primers (suitably together with Hg fulminate,  $\text{Ba}(\text{NO}_3)_2$ , abrasive material, etc.). Cf. C. A. 28, 1866<sup>4</sup>.

Percussion fuse of high sensitivity. Edgar W. Brandt. U. S. 1,944,780, Jan. 23. Structural details.

Matches. André Blanc. Fr. 755,941, Dec. 1, 1933. In making matches having a basis of P sesquisulfide, the  $\text{ZnO}$ , which hydrates or facilitates the decompn. of the sesquisulfide in a moist medium, is replaced by  $\text{MgCO}_3$ , which is more stable and more divided because lighter. The  $\text{MgCO}_3$  may be replaced in part or wholly by  $\text{MgO}$ .

Striking composition for matches. L. E. Larsson. Swed. 78,617, Oct. 10, 1933. A compn. to be applied to the side of a match box consists of an inorg. noncombustible binding substance, e. g.,  $\text{SiO}_2$ , to which has been added a substance that liberates O, such as  $\text{KClO}_3$ . It is suitable for striking matches with a primer contg. P.

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

Production of helioidioscarlet S on the fiber. Morand Baumann. *Bull. soc. ind. Mulhouse* 99, 636(1933). (Sealed note of 1910.) Report. Battagay. *Ibid.* 636-7.—

Dyes derived from phenanthraquinone. Phenanthraquinones. N. Ghatak. *Allahabad Univ. Studies* 7, 199-208(1931).—The following are prepd. by interaction of phenanthraquinone or a deriv. with 9,10-diaminophenanthrene: phenanthraphenazine (tetra-benzophenazine), m. 211-12°; 2,7-dinitro-, m. 231-2° (shrinks 210°); 2,7-diamino-, m. 177°; 2,7-dibromo-, m. 239-40°; 2-nitro-, 4,5-dinitro-, m. 197°; and 4,5-diamino-, m. 182°, *derivs.* 4,5-Dinitrophenanthraquinone melts at 227° (lit. 215-17°). All are  $\text{H}_2\text{O}$ -insol. colored substances with poor affinity (from aq. suspension) for silk and wool, which they dye to dull and poorly developed shades.

B. C. A.

Blue sulfur dyes. E. Keller and H. E. Fierz-David. *Helv. Chim. Acta* 16, 585-92(1933).—After purification

blau" (I) (cf. Bernasconi, C. A. 26, 2981) corresponds with  $\text{C}_{24}\text{H}_{20}\text{O}_4\text{N}_4\text{S}_4$ . When heated with  $\text{KBrO}_3$ -HBr-Br I affords tetrabromomethylene violet, spectroscopically identical with a synthetic specimen. When I is heated with glucose and  $\text{KOH}$  (in  $\text{Na}_2\text{S}$ ) the SO groups are reduced to SH, and subsequent treatment with  $\text{CH}_3\text{COCl}$  affords a small yield of the thioglycolic acid (II), whence the structure I is assigned to the original dye, dissoln. in  $\text{Na}_2\text{S}$  arising from reduction of the quinone groups to the leuco compd. and fission of the disulfoxide groups.

B. C. A.

A proposal for the nomenclature of azo dyes. Hermann Eichler. *Chem.-Ztg.* 57, 1011(1933).—Azo dyes are named by setting down the names of the compds. from which they are formed, with letters to denote the no. of azo groups ( $E = 1, Z = 2, T = 3, V = 4$ ), and nos. for coupling positions. The "diaz component" (the compd. diazotized) is placed on the right and the "azo component" (with which the diazo component couples) on the left. Thus, Congo red is 2[1-naphthylamine-4-sulfonic acid] Z benzidine. Where the coupling position is unknown, "s" denotes acid, and "a" alk., coupling. Austin M. Patterson

Azo dyes and intermediates. XII. Preparation of "homologous" azo dyes of higher molecular weight. Paul Ruggli and Oskar Braun. *Helv. Chim. Acta* 16, 858-73(1933); cf. C. A. 27, 1178.—Series of azo dyes of regularly increasing mol. wt. are prepd. by using J acid (6-amino- $\alpha$ -naphthol-3-sulfonic acid) (I) both as a diazo and coupling component, halogenated middle or end components being used in order to obtain by elementary analysis an exact measure of mol. size. Gradual addn. of Br to an aq. soln. of Na naphthionate (II) gives a ppt. of 2-bromonaphthionic acid (III); at higher temp. 2,4-dibromo- $\alpha$ -naphthylamine, m. 115° (*Ac deriv.*, m.

226°), is formed. Similarly bromination of the Ac<sup>1</sup> deriv. of II gives 1,4-C<sub>10</sub>H<sub>6</sub>BrNHAc. Bromination of a cold aq. suspension of 1,7-C<sub>10</sub>H<sub>6</sub>(NH<sub>2</sub>)SO<sub>3</sub>H gives the 2,4-Br<sub>2</sub> deriv. (IV) (K salt). Diazotized IV coupled (alk.) with I gives the monoazo dye (brownish red), which after re-diazotization couples with I to the disazo dye, IV → I → I; repetition of the process gives the trisazo dye, IV → I → I → I, and finally the tetrakisazo dye, IV → I → I → I → I, the shades of which deepen through reddish violet to deep violet. All are isolated as their cryst. Na salts. For comparison the monoazo dyes, III → I, Cleve's acid [1,6- and 1,7-C<sub>10</sub>H<sub>6</sub>(NH<sub>2</sub>)SO<sub>3</sub>H] → I, and IV → β-C<sub>10</sub>H<sub>6</sub>OH, are prepd. Similar series of dyes are prepd. from tetrazotized 3,3'-dichloro- (V) and 2,2'-dichloro-4,4'-diaminobiphenyl (VI), and 2, 4 and 6 equivs. of I, but the tetrakisazo dye from VI and the hexakisazo dye from both V and VI were made from the dyes, I → I and I → I → I and the tetrazotized diamines. In the former series all the dyes were violet, but increasing in blueness with increasing mol. wt., and in the latter the 1st was a clear brownish red, and the remainder violet. They were isolated by salting out with NH<sub>4</sub> carbonate or NaOAc (the former causes partial conversion into NH<sub>4</sub> salt) and removal of the precipitant by heat or with EtOH. XIII. Influence of molecular size on properties of azo dyes. *Ibid.* 873-84.—Detns. of soly., shade, rate of diffusion, dyeing properties and behavior toward electrolytes (and acids) are made in the above series of dyes. In all cases the effect of increasing mol. wt. is bathochromic, but is less marked in the higher members and quantitatively is dependent on constitution. Increase in mol. wt. in the series from IV causes decreased affinity for wool both in neutral and acid baths, but leads to a regular increase in affinity for cuprammonium rayon so that the dyes contg. 3 or 4 equivs. of I form a characteristic test for this fabric. The dyes from V decrease in substantivity as the series is ascended; whereas those from VI behave in exactly the reverse manner. Substantivity is, therefore, purely a constitutional function, and is not necessarily conferred by mol. complexity. Adsorption by the fiber if the result of poor H<sub>2</sub>O soly. is reversible, but if due to constitutional substantivity is no longer truly reversible.

B. C. A.  
Determination of optimum temperature for dyeing with substantive and acid dyes. N. I. Planovskii and E. K. Ruichkova. *Anilinokrasochnaya Prom.* 3, 88-97(1933).—A cotton fabric was dyed at temps. from 30° to the b. p. and a wool fabric at 70° to the b. p. under standard conditions; both the amt. of dye fixed by the fabric and the quality of the color were taken into account. Some substantive dyes (Anil Orange G, Anil Green 2B, etc.) give approx. the same shade at all temps., while others give varying shades (Anil Red F, Anil Violet B, etc.); others again, though giving equal intensity of coloring, give purer shades at higher temps. (Congo Red AT, Anil Fast Scarlet 4BS, etc.) or *vice versa* (Anil Orange R). These differences could not be connected with the purity of the dye. On wool a few dyes (Benzopurpurin AT4B, Anil Orange C and G, Anil Green B) give the best results, at 90°, the rest at the b. p.; the shades obtained with some (Anil Black FF, etc.) vary considerably with the temp. Acid dyes invariably give better results at the b. p. as regards both intensity and purity of color.

B. C. A.  
Skein dyeing of rayon for use in ingrain hosiery. W. H. Hand. *Textile World* 84, 261(1934).

R. K. W.  
Preventing defects in dyeing silk and rayon hosiery. Geo. H. Clifton. *Textile World* 84, 90(1934); cf. C. A. 27, 3825.—The common causes of holes and uneven shades are discussed and suggestions given for preventing them.

Ruby K. Worner  
Detection of iron on fibers. Kōtarō Tanemura and Kōtarō Nishimura. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 43(1934).—Steeping of samples in tannic acid soln. or acidified ferrocyanide soln. results in a violet or blue-black color and a bluish color, resp., when Fe is present.

Karl Kammermeyer  
Adsorption of iron compounds on fibers of cellulose

origin and its prevention. Kōtarō Tanemura and Minazō Yoshida. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 43-4(1934); cf. preceding abstr.—Cellulose acetate silk did not adsorb sufficient Fe from solns. of any pH to be detectable by the tannic acid test. This test gave neg. results on 6 kinds of com. viscose rayon from different makers, but the degree of adsorption of Fe after steeping in a FeSO<sub>4</sub> soln. was different for all 6 samples, showing no relation to the Cu nos. but being proportional to the Ca contents. A summary of the causes of Fe fixation of cellulose fibers is presented and methods are given for preventing Fe adsorption.

Karl Kammermeyer  
A comparative analysis of three hundred fabrics. Rachel Edgar. *Iowa State Coll. J. Sci.* 7, 17-73(1933).—Three hundred fabrics which included all common fibers, kinds of yarn and construction of fabric were tested. Methods used in testing and data for the following characteristics are given for each: fiber, kind and length, construction, yarn, twist, no. per in., yds. per lb. and percentage of fabric; weight oz. per sq. yd.; thickness; width; finish; water ext.; ash; shrinkage; breaking strength, wet and dry; elongation at breaking load, wet and dry. Eighty-nine diagrams and 35 photographs illustrate constructions of fabrics.

F. E. Brown  
Fabric investigations. VII. Weft cracks in rayon crepe. W. Weltzien, W. Coordt and H. Skamkiewicz. *Mitt. Textilforschungsanst. Krefeld* 8, 17-23(1932); cf. C. A. 27, 3081.—Weft cracks occur more frequently in rayon crepe fabrics when bleached yarn has been used, and are then generally due to local oxidation caused by residues of linseed oil size or of spinning oil contg. traces of metals. Over-twisting of yarn causes a small loss of strength, but is not a probable cause of serious weakness; such weakness can be detected by an increased strength of the yarn when untwisted. Spinning faults and too heavy calendering are other possible causes of weft cracks. VIII. Warp stripes in acetate-rayon cloths. *Ibid.* 25-32.—Warp stripes in acetate-rayon fabrics may be due to variations in the quality of the rayon, in the tension or arrangement of the warp ends, in the luster of partly hydrolyzed acetate or of acetate delustered without hydrolysis, or to faulty desizing.

B. C. A.  
Textile processing. Winn W. Chase. *Textile World* 84, 64-5(1934).—The set-up of the various branches of the processing industry and their inter-relationships are outlined.

Ruby K. Worner  
Analysis of cotton-wool textiles. Ralph T. Mease and Daniel A. Jessup. *Bur. Standards J. Research* 12, 75-86(1934) (Research Paper No. 635).—The results of a study of several methods for detg. cotton and wool mixts. are presented. The inadequacy of some of the methods is shown, and a satisfactory procedure is described. In this method, sizing, finishing materials and natural non-fibrous constituents of the textiles are removed by solvent extn., followed by digestion with a starch-hydrolyzing enzyme and washing. Wool is detd. directly by weighing after removal of the cotton by carbonization with AlCl<sub>3</sub>. Cotton is detd. directly by weighing after removal of the wool with KOH. Results accurate to within 1% of the amt. of total dry fiber are readily obtainable.

Milton Harris  
Measurement of hydrogen-ion concentration in the textile industry. K. Schulze. *Mitt. Textilforschungsanst. Krefeld* 8, 12-16(1932).—An account of current methods.

The foundations of yarn strength and yarn extension. V. The prediction of the spinning value of a cotton from its fiber properties. A. J. Turner and V. Venkataraman. *J. Textile Inst.* 25, 1-48T(1934); cf. C. A. 25, 3841.

Ruby K. Worner  
Wool crepes. G. L. Atkinson. *Textile World* 84, 83(1934).—A routine is suggested for preventing defects and for producing a firm, lofty handle without glaze.

Ruby K. Worner  
Side lights on aging cotton or rayon vat prints. Francis A. Newton. *Textile World* 84, 255-6(1934). R. K. W.  
Multi-color damoisette. Benjamin D. Blackman. *Textile World* 84, 91-3(1934).—An analysis of this fabric

and a description of the various operations required for its fabrication, including the boil-off, dyeing, printing and carbonizing are presented. Ruby K. Worner

**Determination of oil in acetate rayon.** W. Weltzien and W. Königs. *Mitt. Textilforschungsanst. Krefeld* 8, 40-2 (1932).—Oil cannot be removed completely from acetate rayon by extn. with light petroleum (b. 40-65°). It is detd. by steeping the dried rayon overnight at 45° in a soln. contg. 10 g. of Marseilles soap, 10 g. of Laventin KB and 1 g. of Na<sub>2</sub>CO<sub>3</sub> per l., heating at 50-60° for 1 hr., and washing, drying and reweighing. The oil content is very variable. B. C. A.

**Hosiery finishing.** Milton M. Abrams. *Textile World* 84, 87 (1934). An illustrated description is given of a layout for a hosiery-finishing department. It is designed so that the goods pass in a continuous straightline flow from operation to operation, the whole space is utilized without overcrowding, and each operation is segregated. Ruby K. Worner

**Linseed oil sizes.** I. General methods for the investigation of difficulties and faults. W. Weltzien. *Mitt. Textilforschungsanst. Krefeld* 8, 1-5 (1932).—In removing linseed oil size from rayon it is better to soap at 80° than at 95-100°. Residues of size can often be detected by fluorescence in ultra-violet light, by treatment with aq. Na<sub>2</sub>S, or by dyeing with methyl violet (acetate rayon), but none of these methods is certain and they should be applied to the material both before and after a desizing treatment. The best method is microscopical examn. of the filaments. Damage by linseed oil size most often occurs in bleached material, it is found in places where the size is abnormally acid, and it is often due to traces of metals. Size can be tested by heating sized material at 105° for 2 hrs., when little loss of strength should occur. II. Effect of linseed oil sizes on the extensibility and strength of viscose rayon. W. Coordt. *Ibid.* 7-12.—After 3 hrs. at 105°, the breaking load of unsized rayon was unaffected, while the values for sized rayons were lowered and the pH of the aq. exts. was raised. Generally, the more acid sizes had the greater effect, but acidity was not the only controlling factor. B. C. A.

**Cyanine dyes** (Ogata) 10. Diazo compds. [products used in the dye industry] (Fr. pat. 755,908) 10. Diazoazo salts (Fr. pat. 755,816) 10. Casein derivs. [products used as finishing agents in the textile industry] (Fr. pat. 755,676) 18. Acylated cyclohexylphenylamines (U. S. pat. 1,944,514) 10.

**Bary, P.:** Les fibres textiles et la peinture (les collodes dans l'industrie). Paris: Dunod & cie. 256 pp. F. 49; bound, F. 68.

**Schwarz, Edward R.:** Textiles and the Microscope. New York: McGraw-Hill Book Co., Inc. 329 pp. \$4. Reviewed in *Am. Dyestuff Repr.* 23, 102; *Textile Weekly* 13, 40 (1934).

**Dyes.** I. G. Farbenind. A.-G. Brit. 400,870, Nov. 2, 1933. *p*-Aminodiphenylamine or its homologs or substitution products are condensed with 2-alkoxy-3,5-dinitro- or 4-alkoxy-3,5-dinitro-benzoic acids or alkyl esters thereof to give dyes which yield yellow-brown to red-brown fast shades on animal fibers. Among examples 4-aminodiphenylamine-2-sulfonic acid is condensed with 4- and 2-methoxy-3,5-dinitrobenzoic acids (prepd. by nitrating *p*- and *o*-methoxybenzoic acids).

**Dyes.** Soc. pour l'ind. chim. à Bâle. Ger. 588,525, Nov. 24, 1933 (Cl. 22d. 5). S dyes are prepd. by heating leuco compds. of the indophenols from carbazoles and nitrosophenols with finely divided S obtained by the decompn. of polysulfides. Thus, the indophenol from carbazole and nitrosophenol is reduced with a Na polysulfide soln. Urea, *s*-di-*o*-tolylurea and NH<sub>4</sub>Cl are added to the paste, which is then dried *in vacuo*. The product is heated to 200-205°. The resulting dye colors cotton from a clear vat in greenish blue shades. Other examples are given.

**Azo dyes.** Richard Fleischhauer (to General Aniline Works). U. S. 1,943,727, Jan. 16. Dyes of the same general type as those described in U. S. 1,801,390 (C. A. 27, 3342) are formed from components comprising diazo compds. in at least one of which the nitrogenous groups are in *m*-position to one another. Numerous examples, some with details of procedure, are given.

**Azo dyes.** Arthur Zitscher, Heinrich Morschel and Wilhelm Luce (to General Aniline Works). U. S. 1,944,539, Jan. 23. About a hundred different examples are given of dyes of various shades which may be produced on the fiber and which have the general formula

where *x* means the no. 1 or 2, Y stands for an alkoxy or alkylthio group, R<sub>1</sub> for a radical of the benzene, naphthalene, biphenyl or anthraquinone series, and R for a radical of the benzene, naphthalene or biphenyl series. The shades of the dyes obtainable by using a 6-alkoxy-2,3-hydroxynaphthoic acid arylide as the azo-component are considerably nearer to the blue of the spectrum than those of the dyes obtained by means of the known corresponding 2,3-hydroxynaphthoic acid arylides which do not contain an alkoxy group in the 6-position of the naphthalene nucleus. New azo dyes are also made by coupling a suitable diazo compd. with an arylide of a 6-alkylthio-2,3-hydroxynaphthoic acid, or with an arylide of a 5-, 7- or 8-alkoxy-2,3-hydroxynaphthoic acid or of a 5-, 7- or 8-alkylthio-2,3-hydroxynaphthoic acid. By using the 6-alkylthio-2,3-hydroxynaphthoic acid arylides, the shades of the dyes obtained are likewise displaced to the blue side of the spectrum. In the case of the dyes obtainable by using as azo components 2,3-hydroxynaphthoic acid arylides which contain an alkoxy- or alkylthio group in the 5-, 7- or 8-position of the naphthalene nucleus, the shades are not so much altered. The shades of the dyes obtainable from 7-alkoxy-2,3-hydroxynaphthoic acid arylides are not at all, or only somewhat, displaced to the yellow side of the spectrum.

**Azo dyes.** I. G. Farbenind. A.-G. Brit. 400,920, Oct. 16, 1933. H<sub>2</sub>O-sol. azo dyes are made by diazotizing aminoarylides of aliphatic acids contg. at least 10 C atoms and coupling with naphtholdisulfonic acids or derivs. thereof. Acylamino compds. of the C<sub>6</sub>H<sub>5</sub> and C<sub>10</sub>H<sub>7</sub> series are preferred. Coupling components contg. a free amino group may be further diazotized and coupled. Among examples (1) *p*-amino-stearic or -palmitic acid anilide → 2-naphthol-6,8-disulfonic acid and (2) *m*-aminolauric acid toluide → *N*-benzoyl-H acid.

**Azo dyes.** I. G. Farbenind. A.-G. Brit. 400,921, Oct. 16, 1933. H<sub>2</sub>O-sol. azo dyes are made by coupling diazotized aromatic amines substituted by acylamino groups of aliphatic carboxylic acids contg. at least 10 C atoms with ketones capable of forming an enolic isomeric compd. and contg. an aromatic ring to which at least 1 sulfo group is attached. In examples (1) *p*-aminolauranilide → 1-(*m*-sulphophenyl)-3-methyl-5-pyrazolone or 1-(*p*-sulphophenyl)-5-pyrazolone-3-carboxylic acid and (2) *p*-aminostearanilide → sulfoacetoacet-*o*-anilide.

**Azo dyes.** British Dyestuffs Corp. Ltd. and Kenneth H. Saunders. Ger. 580,797, July 17, 1933 (Cl. 22a.). See Brit. 245,865 (C. A. 27, 501).

**Azo dyes.** Ernst Hug and Max Müller (to Durand & Huguenin S. A.). U. S. 1,944,645, Jan. 23. Ger. 588,607, Nov. 25, 1933 (Cl. 22a. 1). See Fr. 748,840 (C. A. 27, 5548).

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Ger. 588,523, Nov. 18, 1933 (Cl. 22a. 1). Azo dyes of the general

formula R<sup>1</sup>N:N:C(OH).NR<sup>2</sup>.N:CMe in which R<sup>1</sup> represents an aryl residue which contains a carboxyl group in the *o*-position to the azo bridge and no OH group in the other *o*-position, and R<sup>2</sup> represents H, aryl or

alkyl, one at least of the aryl groups contg. a HSO<sub>3</sub> group, are treated with a Cr-yielding agent. Thus, the dye from diazotized 5-chloro-2-aminobenzoic acid and 1-(2',5'-disulphophenyl)-3-methyl-5-pyrazolone is heated with CrF<sub>3</sub> to give a dye which colors wool from an acid bath in fast golden yellow shades. Other examples are given.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Ger. 588,524, Nov. 18, 1933 (Cl. 22a. 2). *o*-Hydroxyazo dyes, obtained by coupling diazotized 4-halo- or 4-alkyl- or 4-alkoxy-2-aminophenols with 1-(sulfoaryl)-3-methyl-5-pyrazolone, are treated with a Cr-yielding agent and given an addnl. HSO<sub>3</sub> group. Thus, 4-chloro-2-amino-1-hydroxybenzene-5-sulfonic acid is diazotized and coupled with 1-(3'-sulphophenyl)-3-methyl-5-pyrazolone in soda-alk. soln. The resulting dye is salted out and treated with (Cr<sub>2</sub>O<sub>3</sub>) and Cr<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> soln. The resulting dye colors wool in light- and wash-fast yellowish red shades. Other examples are given. Cf. C. A. 28, 650<sup>1</sup>.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Ger. 588,608, Nov. 23, 1933 (Cl. 22a. 2). *o*-Hydroxyazo dyes obtained by coupling, diazotized *o*-hydroxyaminonaphthalenesulfonic acids with naphthols are treated with chroming agents in neutral or acid mediums, the sepn. of chromed intermediates being prevented by making the end reaction alk. Cf. C. A. 28, 649<sup>2</sup>.

**Azo dyes.** I. G. Farbenind. A.-G. (Hans Thomae, August Modersohn, Fritz Müller and Friederich Muth, inventors). Ger. 588,781, Nov. 27, 1933 (Cl. 22a. 1). Diazo compds. of *o*-aminoaryl alkyl sulfones or their substitution products are coupled with 2,3-hydroxynaphthol acid arylides in the substance or on the fiber. Thus, cotton boiled in water is dried and treated with a soln. of 1-(2',3'-hydroxynaphthoylamino)-2-methyl-4-chlorobenzene and Turkey-red oil in NaOH, CH<sub>2</sub>O and water. The product is developed with a soln. contg. diazotized *o*-aminophenyl methyl sulfone, AcONa and NaCl in water, to give light-fast orange shades. Other examples together with an extensive table of diazo and coupling components and colors produced are given.

**Azo dyes.** I. G. Farbenind. A.-G. (Leopold Laska and Arthur Zitscher, inventors). Ger. 588,782, Nov. 28, 1933 (Cl. 22a. 1). Mono azo dyes are produced by coupling diazonium compds. of 4-amino-3-methoxydiphenylamine or the corresponding *N*-nitroso diazonium compds. with 1-(2',3'-hydroxynaphthoylamino)-3-nitrobenzene, in the substance or on the fiber; the nitroso group may be split off if necessary. Thus, cotton goods are treated with a soln. contg. 1-(2',3'-hydroxynaphthoylamino)-3-nitrobenzene, NaOH and sulfonated castor oil; they are dried and developed with a soln. of the diazonium salt of 4-amino-3-methoxydiphenylamine, to give a clear greenish blue effect. Other examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. (Wilhelm Neelmeier, Heinrich Morschel and Otto Goll, inventors). Ger. 588,897, Nov. 29, 1933 (Cl. 22a. 1). Dyes insol. in water are prepd. in the substance or on the fiber by coupling arylides of 2-hydroxy-5,6-dihydro-7,8-benzocarbazole-3-carboxylic acid with diazo compds., neither component contg. soly.-inducing groups. Thus, cotton is treated with a soln. contg. 1-(2'-hydroxy-5',6'-dihydro-7',8'-benzocarbazole-8'-carbonylamino)-4-methoxybenzene, NaOH and Turkey-red oil. The yarn is dried and developed with a soln. of diazotized 2,5-dichloroaniline to give a fast orange-brown shade. A table of components and colors produced is given.

**Azo dyes.** I. G. Farbenind. A.-G. (Hans Krzikalla and Walter Limbacher, inventors). Ger. 590,190, Dec. 27, 1933 (Cl. 22a. 1). Azo dyes, formed with the use of 8-hydroxyquinoline and its derivs. as coupling components, are converted into complex metal compds. by standard methods. Brown dyes for silk, leather and wool are obtained. Examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. (Richard Stüsser, inventor). Ger. 590,321, Dec. 29, 1933 (Cl. 22a. 1). The complex heavy metal compds., particularly Cr compds., obtainable from 4-aminophenol-2-carboxylic acid, are diazotized and coupled with azo dye compo-

nents. Dyes of various colors are obtained. Examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. (Hans Krzikalla and Karl Holzach, inventors). Ger. 590,375, Dec. 30, 1933 (Cl. 22a. 2). The diazo compds. from *o*-aminophenol, *o*-aminonaphthols or their derivs. are coupled with 2-hydroxytetrahydronaphthalene or its derivs. The dyes may be converted into complex metal compds. by standard methods. Dyes of various colors, useful for dyeing wool, leather or silk or for coloring lacquers, are obtained. Examples are given.

**Disazo dyes; intermediates.** Soc. pour l'ind. chim. à Bâle. Brit. 400,050, Oct. 19, 1933. *o*-Diaminocarboxystilbenes are made from stilbenes that contain in each C<sub>6</sub>H<sub>5</sub> nucleus a group convertible into the anthranilic grouping by known methods. In an example 4,4'-dinitrostilbene-3,3'-dicarboxylic acid, obtained by oxidation of 6-nitro-3-methylbenzoic acid with alk. hypochlorite, is reduced with Na<sub>2</sub>S. Disazo dyes are made by coupling tetrazotized *o*-diaminocarboxystilbenes with coupling components, e. g., 1-amino-8-naphthol-4-sulfonic acid (I), phenyl-J acid (II), 1-naphthol-4-sulfonic acid and II, I and acetoacetic anilide. The disazo dyes may be converted into metal compds. in substance, on the fiber, in the dyebath or during the coupling process. The metal compds. dye wool, cotton, silk, leather, regenerated cellulose, cellulose esters and ethers and varnishes. Among examples the dye obtained by coupling tetrazotized 4,4'-diaminostilbene-3,3'-dicarboxylic acid with II is treated with ammoniacal CuO. Examples of dyeing processes are given.

**Water-insoluble disazo dyes.** I. G. Farbenind. A.-G. Brit. 400,024, Oct. 19, 1933. See U. S. 1,932,577 (C. A. 28, 652<sup>3</sup>).

**Triazo dyes.** I. G. Farbenind. A.-G. (Carl Taube and Josef Hilger, inventors). Ger. 590,472, Jan. 6, 1934 (Cl. 22a. 10). Benzidine or a substitution product is tetrazotized and coupled first with 1 mol. of an *o*-hydroxycarboxylic acid and then with a 1-amino-2-naphthol ether or a sulfonic acid thereof. The product is diazotized and coupled in the presence of a tertiary base with a 1-amino-8-naphtholsulfonic acid or *N*-substitution product thereof. Green dyes are obtained. Examples are given.

**Vat dyes.** I. G. Farbenind. A.-G. (Franz Wieners, inventor). Ger. 590,103, Dec. 27, 1933 (Cl. 22b. 3.03). Aminoanthraquinones, or their substitution products contg. at least one H atom linked to N, are condensed with chloro-1,3,5-triazines or their substitution products in the presence of an aromatic hydroxy compd. The amt. of the latter may be such that addn. of a further solvent is unnecessary. Dyes of various colors are obtained. Thus, 1-aminoanthraquinone and cyanuric chloride, heated in PhOH for 5 hrs. at 110° and then for 2-3 hrs. at 150°, yield a yellow dye, which is sepd. from the mixt. by addn. of pyridine. Numerous other examples are given.

**Vat dyes.** I. G. Farbenind. A.-G. (Richard Herz, Werner Zerweck and Wilhelm Hechtenberg, inventors). Ger. 590,376, Jan. 10, 1934 (Cl. 22a. 7.02). The dyes used in the process of Ger. 525,647 (C. A. 25, 4717) are improved by introducing a SO<sub>2</sub>NH group into the aryl group of the dye, whereby the tendency of the leuco compd. to crystallize from the bath is restrained. It is immaterial whether the SO<sub>2</sub>NH group is linked to the aryl group through the S or the N atom. The dyes may be prepd. by condensing appropriately substituted *o*-aminoaryl mercaptans with aryl quinones, as described in Ger. 445,270 or Brit. 265,641 (C. A. 22, 502<sup>4</sup>).

**Vat dyes.** Felice Benas. Ger. 590,473, Jan. 2, 1934 (Cl. 22b. 2.05). See Austrian 132,374 (C. A. 27, 3617<sup>5</sup>).

**Vat dyes.** Imperial Chemical Industries Ltd. Fr. 755,838, Nov. 30, 1933. Halogen or NO<sub>2</sub> derivs. of 2,2'-dibenzanthronyl (I) are heated either alone or in an inert medium. I may be halogenated in fused phthalic anhydride and the resulting mixt. heated to near its b. p.

**Vat dyes of the benzanthronepyrazoleanthrone series.** Karl Wülke, Josef Stock and Fritz Schubert (to General Aniline Works). U. S. 1,942,710, Jan. 16. Vat dyes

dyeing cotton from the vat blue, gray or green shades are produced by heating a compd. of the general formula:

where X and X<sub>1</sub> stand for H. X<sub>2</sub> represents a polynuclear ring system, or NX<sub>1</sub>X<sub>2</sub> represents a polynuclear heterocyclic ring system, N, X<sub>1</sub> and X<sub>2</sub> being members of the heterocyclic nucleus, with an alk. condensing agent to a temp. of about 90–200°. Numerous examples with details of procedure are given.

**Vat dyes and intermediates.** Scottish Dyes Ltd. Ger. 590,100, Dec. 23, 1933 (Cl. 22b. 3.06). See Brit. 330,217 (C. A. 24, 6031).

**Chromed dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 756,136, Dec. 5, 1933. The *o*-hydroxyazo dyes obtained by the union of 4-halo-, 4-alkyl- or 4-alkoxy-2-diazo-phenols with 1-(sulfo)-aryl-3-methyl-5-pyrazolones and which contain at least one other sulfonic group are treated with chroming agents. The products dye wool red shades. Several examples are given.

**Sulfur dyes.** Herbert A. Lubs and George C. Strouse (to E. I. du Pont de Nemours & Co.). U. S. 1,944,250, Jan. 23. Sulfur dyes are prepd. by thionating indophenols, hydroxyaromatic amines or hydroxyaminophenazines in the monoethyl ether of ethylene glycol. Cf. C. A. 27, 4684.

**Anthraquinone derivatives.** Paul Nawiasky, Berthold Stein and Artur Krause (to General Aniline Works). U. S. 1,943,876, Jan. 16. Products such as 1-methoxyanthraquinone, the corresponding ethoxy and butoxy derivs. (m. about 152° and 116°, resp.), 1,4-diamino-2-methoxyanthraquinone, the corresponding 2-ethoxy and 2-butoxy (m. 186–8°) derivs. (dyeing cellulose acetate clear rose shades), 1,4-diamino-2,3-dimethoxyanthraquinone, m. 183–5°, the corresponding 2,3-diethoxy deriv., m. 151–2°, 2,3-dibutoxy deriv., m. 110°, etc., are produced by treating alkoxyanthraquinones with alkali metal alcoholates. Various examples with details of procedure are given.

**Anthraquinone derivatives.** Imperial Chemical Industries Ltd. Ger. 584,706, Sept. 23, 1933 (Cl. 12g. 37). See Brit. 366,990 (C. A. 27, 2043).

**Anthraquinone derivatives.** I. G. Farbenind. A.-G. (Georg Rösch, inventor). Ger. 590,132, Dec. 23, 1933 (Cl. 22b. 2.06). The leuco compds. of anthraquinone-2,3-arylthioxanthenes are converted into their acid sulfuric esters by standard methods. Examples are given. The products are useful in dyeing.

**Anthraquinone condensation products.** I. G. Farbenind. A.-G. Fr. 756,131, Dec. 5, 1933. 1-Amino-4-haloanthraquinone-2-sulfonic acids or their salts or substitution products are condensed with amides of *p*-aminocinnamic acid to give dyes which may be applied on wool and dye cotton, viscose, etc., directly. The reaction takes place in water with or without the addn. of EtOH or pyridine, at a high temp. and in the presence of an acid-fixing agent and a catalyst such as Cu or its salts. In examples, 1-amino-4-bromoanthraquinone-2-sulfonic acid is condensed with the methylamide, anilide and *p*'-acetylaminosulfonamide of *p*-aminocinnamic acid.

**Carbazole derivatives.** I. G. Farbenind. A.-G. (Heinrich Morschel and Otto Goll, inventors). Ger. 588,042, Nov. 13, 1933 (Cl. 12p. 2). 2-Hydroxy-5,6-dihydro-7,8-benzocarbazole is converted into its 3-carboxylic acid

(I), decomp. above 220°, by heating it, as alkali salt or in the presence of alkali carbonate, to about 260° with CO<sub>2</sub> under about 50 atm. pressure. Arylides of I may be prepd. by standard methods. The *p*-aniside, m. 244°, *o*-methyl-*p*-aniside, m. 234°, *m*-chloroanilide, m. 237°, *p*-chloroanilide, m. 284° and *o*-toluide, m. 247°, of I have been prepd. The products are useful as intermediates for dyes. Cf. Ger. 586,803 (C. A. 28, 1359°).

**Carbazole derivatives.** I. G. Farbenind. A.-G. (Willy Broeg and Heinrich Morschel, inventors). Ger. 588,043, Nov. 16, 1933 (Cl. 12p. 2). 2-Hydroxy-5,6-(or -7,8)-benzocarbazoles are converted into their 3-carboxylic acids (I) and (II), decomp., resp., 245° and 241°, by heating them, as alkali salts or in the presence of alkali carbonate, to about 260° with CO<sub>2</sub> under about 50 atm. pressure. Arylides of I and II may be prepd. by standard methods. The *p*-chloroanilide, m. 292°, *m*-chloroanilide, m. 273°, and *o*-toluide, m. 254°, of I, and the *o*-chloroanilide, m. 237°, *m*-chloroanilide, m. 249°, *p*-chloroanilide, m. 257°, *p*-aniside, m. 246°, 2'-methoxy-4'-chloroanilide, m. 248°, 2'-methoxy-5'-chloroanilide, m. 246°, 2'-methyl-4'-chloroanilide, m. 248°, and 2'-methyl-5'-chloroanilide, m. 243°, of II, have been prepd. The products are useful as intermediates for dyes. Cf. Ger. 586,804 (C. A. 28, 1358°).

**Azo dyes; dyeing.** I. G. Farbenind. A.-G. (Wilhelm Neelmeier and Heinrich Morschel, inventors). Ger. 589,348, Dec. 6, 1933 (Cl. 22a. 1). Arylides of benzo-2-hydroxycarbazole-3-carboxylic acids are coupled in substance or on the fiber with diazo compds. Neither component should contain a group conferring soly. in water. Brown dyes or dyeings are obtained. Numerous examples are given. The prepn. of suitable carbazole derivs. is described in Ger. 588,043 (preceding abstr.).

**Sulfonated oleic acids.** Fettsäure- und Glycerin-Fabrik G. m. b. H. Brit. 400,587, Oct. 16, 1933. Cf. Fr. 734,876 (C. A. 27, 1095). The products or their salts may be used in dyeing, carbonizing, bucking, fulling, sizing and dressing processes, as scrooping agents for rayon and as constituents of spinning oils and compns. for fire-extinguishing, disinfecting and combating insects.

**Color lakes.** Krebs Pigment & Color Corp. Ger. 584,578, Sept. 21, 1933 (Cl. 22f. 12). Color lakes contg. resin soaps and insol. in oil or water are made from insol. monosulfonated monoazo dyes and resin soaps combined with Ba, Ca, Sr, Mg, Cu or Pb. Examples are given.

**Dye intermediates.** Compagnie nationale de matières colorantes et manufactures de produits chimiques de Nord réunies établissements Kuhlmann. Fr. 755,067, Nov. 28, 1933. Acylaminonitroarylsulfonyl chlorides are prepd. by nitrating C<sub>6</sub>H<sub>4</sub> derivs. contg. an alkyl, alkoxy or aralkoxy group in the 1-position, an acylamino group in the 2- or 4-position and a sulfonyl chloride group in the 4- or 2-position. Examples are given of the prepn. of 1-methoxy-2-acetyl-amino-6-nitro-4- (m. 105°), 1-methoxy-4-acetyl-amino-6-nitro-2- (m. 121°), 1-methyl-2-acetyl-amino-6-nitro-4- (m. 148°) and 1-methyl-4-acetyl-amino-6-nitro-2-benzesulfonyl chloride (m. 136°). The acetyl-amino group may be sapond. at the same time as the SO<sub>2</sub>Cl by heating in water, or the compds. may be condensed with Et<sub>3</sub>NH, PhNH<sub>2</sub> or PhNH<sub>2</sub>Et to give the corresponding sulfamide compd. and the acetyl-amino group may then be sapond.

**Dyeing.** David A. W. Fairweather and John Thomas (to Scottish Dyes, Ltd.). U. S. 1,943,787, Jan. 16. Textile materials are treated with sulfuric esters of reduced products of vat dyes, anthraquinones, naphthoquinones or indigos having the ester groups attached to the reduced quinone positions and contg. an azo linkage, and the treated material is then subjected to the action of an oxidizing agent. Various examples are given.

**Dyeing bone objects.** Soc. pour l'ind. chim. à Bâle. Fr. 755,872, Dec. 1, 1933. Bone objects are dyed by treatment with complex metallized dyes, e. g., the chromed dye obtained from 1-diazo-2-naphthol-4-sulfonic acid and *β*-naphthol.

**Dyeing furs.** Soc. pour l'ind. chim. à Bâle. Fr. 755,871, Dec. 1, 1933. Furs are dyed with complex metallized dyes, e. g., the chromed dye obtained from 2-

diazo-1-phenol-4,6-disulfonic acid and 1-phenyl-3-methyl-5-pyrazolone. The furs may be preliminarily treated with agents making them resistant to high temps. and agents increasing their absorptive power. Cf. C. A. 28, 1841.

**Dyeing cellulose derivatives** such as cellulose acetate, etc. George H. Ellis, Henry C. Olpin and Ernest W. Kirk (to Celanese Corp. of America). U. S. 1,944,413, Jan. 23. Dyeing is effected with an aq. dispersion, in unreduced form, of a water-insol. coloring matter comprising a benzo- or naphtho-quinone substituted in the nucleus by at least one NR'R' group in which R' and R represent H and alkyl.

**Dyeing and printing.** I. G. Farbenind. A.-G. (Richard Fischer and Hermann Freund, inventors). Ger. 588,760, Nov. 27, 1933 (Cl. 8s. 1.03). Addn. to 574,355 (C. 4. 28, 3417). In reserve printing with insol. dyes the method of 574,355 is modified by using dye preps. from a diazo-amino compd. and a coupling component after stop-padding with ester salts of leuco vat dyes. A mild reducing agent such as Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> may be added to the dye prep. The stop-padding prep. contains an oxidation accelerator such as NH<sub>4</sub>VO<sub>3</sub> and an oxidizing agent such as alkali chlorate.

**Printing textiles.** British Celanese Ltd., Geo. H. Ellis and Henry C. Olpin. Brit. 400,643, Oct. 23, 1933. Improved penetration of discharging agents into materials made of or contg. cellulose esters or ethers is obtained with the aid of di- or poly-alkylene glycols or ethers, esters or ester-ethers thereof, the processes of Brit. 375,313 (C. A. 27, 4097) and 376,797 (C. A. 27, 4097) being disclaimed. The glycols or their derivs. may be replaced by the corresponding compds. in which an ether (O) atom is replaced by an atom of S. Among examples a cellulose acetate fabric, dyed with benzeneazobenzene-*azophenol*, is printed with aq. prep. contg. gum thickening, SnCl<sub>2</sub>, diethylene glycol, Et lactate, NaCNS and AcOH and the print is dried, aged, washed and dried to obtain a clear white discharge on a yellow ground. In 400,666, Oct. 23, 1933, the fixation by such materials of suspensions or dispersions of coloring matters is effected with the aid of such glycols, etc., the dyed material being then steamed. Processes involving a reduction of the dye on the material are excluded. In an example a cellulose acetate woven fabric is printed with an aq. compn. contg. the dye 1,4-di(methylamino)anthraquinone, gum arabic and diethylene glycol and the print is dried, steamed, washed and dried to obtain a brilliant blue pattern.

**Discharge printing of fabrics.** George Rivat (to Celanese Corp. of America). U. S. 1,944,372, Jan. 23. A dyed fabric contg. cellulose acetate is treated with a printing paste contg. a swelling agent for the fabric, a vat color and a penetrating agent such as dithioglycol which is also a solvent for the vat color.

**Discharge effects on textiles.** British Celanese Ltd., George H. Ellis and Henry C. Olpin. Brit. 400,248, Oct. 23, 1933. Pattern effects are produced on materials made of or contg. cellulose esters or ethers by applying thereto, before or after coloration with a dischargeable ground color, a compn., preferably of acid reaction, contg. a stannous compd., e. g., SnCl<sub>2</sub>, Sn(ClCH<sub>2</sub>COO)<sub>2</sub>, Sn(CNS)<sub>2</sub>, and a leuco deriv. of a vat dye esterified with a di- or poly-basic acid or a salt of such esterified leuco deriv., e. g., "Indigosol," "Soledon." Swelling agents or assistants and also addnl. dyes, e. g., the anthraquinone dyes of Brit. 351,457 (C. A. 26, 5432) may be incorporated. In an example a cellulose acetate fabric, dyed with the azo dye 3,5-dinitro-*o*-anisidine  $\omega$ -hydroxyethyl- $\alpha$ -naphthylamine, is printed with an aq. compn. contg. Indigosol yellow HCG, gum arabic, methylated spirit, NaCNS, citric acid and SnCl<sub>2</sub> and is then aged, treated in an NH<sub>3</sub> atm., steamed, washed, treated in a bath contg. Na<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> and HCOOH, washed and dried to obtain a yellow pattern on a blue ground.

**Stripping dyed textiles.** Imperial Chemical Industries Ltd., John G. Evans and Leslie G. Lawrie. Brit. 400,239, Oct. 19, 1933. Dyeings produced by combination on the fabric of arylamides of 2,3-hydroxynaphthoic acid with

1 suitable diazo compds. are stripped by treatment of the dyed material with a reducing liquor contg. an amine, amine salt or quaternary NH<sub>4</sub> salt carrying a radical which comprises a straight or branched C chain of not less than 10 C atoms. Among examples (1) cotton, dyed with the dye 4-chloro-2-toluidine  $\rightarrow$  (on the fiber) the 4-bromo-*o*-aniside of 2,3-hydroxynaphthoic acid, is treated 10 min. with a boiling aq. soln. contg. small amts. of Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub>, Na<sub>2</sub>CO<sub>3</sub> and  $\beta$ -hydroxyethyl-*N*-octadecylmorpholinium bromide; the dyeing is stripped to a pale yellow which may be cleared by mild Cl treatment, and (2) degummed silk, dyed as in (1), is treated 30 min. with an aq. soln. at 90-95°, slightly acid with AcOH, contg. small amts. of Na formaldehydesulfoxylate and cetyltrimethylammonium bromide; the dyeing is stripped to pale yellow.

**Bleaching vegetable fibers.** I. G. Farbenind. A.-G. Fr. 755,541, Nov. 25, 1933. Vegetable fibers are boiled in a lye which contains, besides alkalis, absorptive inorg. substances (except metal hydroxides) as well as wetting and washing agents. Examples of absorptive substances are SiO<sub>2</sub>-gel, bleaching earth and sol. glass.

**Bleaching vegetable fibers.** H. Th. Röhme A.-G. Fr. 755,637, Nov. 28, 1933. Vegetable fibers are treated with a lye contg. Cl and then directly by a bath contg. active O, without the use of an intermediate bath. The fibers are preferably wetted first with a suitable wetting agent. The treatment with the Cl lye is relatively short.

**Bleaching bast fibers.** I. G. Farbenind. A.-G. (Helmuth Korte, inventor). Ger. 588,872, Dec. 15, 1933 (Cl. 8s. 2). Addn. to 582,239 (C. A. 27, 5991). See Brit. 371,494 (C. A. 27, 3089).

**Apparatus for opening or carding fibers covered with rubber dispersion.** Magyar Ruggyantaarugyar R. T. (to International Latex Process Ltd.). Brit. 400,548, Oct. 26, 1933.

**Apparatus for oiling or moistening cotton, etc., during scutching or opening.** George Hill. Brit. 400,308, Oct. 26, 1933.

**Drying oiled yarn.** Aceta G. m. b. H. Ger. 588,706, Nov. 24, 1933 (Cl. 8s. 1).

**Lubricants for fibers.** John B. Speakman and Norman H. Chamberlain. Brit. 400,681, Nov. 2, 1933. A mixt. of oils contg. more than 10% of hydrocarbon oil is mixed with up to 25% of an aliphatic alc., ether or amine (or a mixt. thereof) that contains more than 8 C atoms in the mol. and preferably has a flash point above 340°F. by the open-cup test and which also reduces the interfacial tension of mineral oil and H<sub>2</sub>O when added in small amt. to the oil and is readily sol. in oil but sparingly sol. in H<sub>2</sub>O or dil. alkali solns. Oleyl alc., the alcs. and ethers derived from wool fat by low-pressure distn. and octadecenylamine are specified.

**Composition for cleansing and degreasing fibrous materials.** Rainer H. Pott (to Chemische Fabrik Pott & Co., Kommandit-Ges.). U. S. 1,944,367, Jan. 23. Hydrogenated naphthalene is rendered miscible with water by use of a small proportion of an emulsifying agent such as a sulfonated fat, alkylated aromatic sulfonic acid or water-sol. salt of such an acid.

**Treating textiles.** Soc. pour l'ind. chim. à Bâle. Brit. 400,031, Oct. 19, 1933. Dyeing and other bath treatments of textile materials made of or contg. animal fibers are effected with an addn. of a sulfonated product obtained by condensing, suitably in presence of H<sub>2</sub>SO<sub>4</sub>, ClSO<sub>3</sub>H, etc., an aromatic compd., contg. nuclear OH, with benzoin and, if necessary, sulfonating the condensation product. The addn. promotes level-dyeing and is useful for producing reserve effects in dyeing mixed fabrics and preventing bleeding of dyes in fulling baths. Among examples (1) half-wool is treated 45 min. at 60° in a bath contg. Chlorantine red 8 BN, Na<sub>2</sub>SO<sub>4</sub> and a neutral product, obtained by condensing Na 2-naphthol-6-sulfonate with benzoin in concd. H<sub>2</sub>SO<sub>4</sub> at 40°, and is then washed, rinsed and dried; the wool is scarcely dyed while the cotton is dyed a strong red, and (2) wool, dyed in an acid bath with the Na monosulfonate of the oxidized condensation product of 4,4'-diethylaminodiphenylcarbonyl

mol with *N*-benzyl- $\alpha$ -naphthylamine, is mixed with an equal wt. of white wool and the mixture is treated for 4 hrs. in a liquor contg.  $H_2SO_4$  and the condensation product of (1); the white wool remains uncolored.

**Fabrics.** British Celanese Ltd. and Robert P. Roberts. Brit. 400,938, Oct. 27, 1933. Fabrics are composed of threads, etc., of cellulose acetate or other org. esters of cellulose, some of the threads being stretched to an extent different from the others. Alternatively the threads may be differentially stretched along their length. On subjection to sapon. and subsequent or simultaneous dyeing color effects are produced. In 400,946, Oct. 27, 1933, fabrics are made from yarns of cellulose esters some of which have been differentially stretched at intervals along their lengths, a streaky or mottled effect being produced on subsequent delustering. The intermittently stretched yarns may be used for the warp and (or) weft and may be assocd. with wool, cotton or silk yarns or with artificial yarns of different character.

**Coated pile fabrics.** Collins & Aikman Corp. Brit. 400,225, Oct. 18, 1933. An impregnating coating compn. comprising a latex (compd.) fortified by the dispersion therein of a previously coagulated rubber provided with a colloid for forming a protective coating for the rubber globules is used for producing pile fabrics as described in Brit. 336,553 (C. A. 25, 2008) and 371,817 (C. A. 27, 3796). Crude or reclaimed rubber may be masticated with 2-10% of casein, saponin, rosin soap or soapy vegetable exts. and dil. latex (compd.) added gradually. Vulcanizers, accelerators and tempering ingredients may be added to the latex, coagulated rubber or mixt. Org. solvents and emulsifying agents may be added to the mixt. In an example a natural latex compd. contg. latex, S, tetramethylthiuram disulfide (I), phenyl- $\beta$ -naphthylamine (II) and ZnO is mixed with a coagulated rubber dispersion contg. pale crepe rubber, I, II and ZnO and applied to a pile fabric, woven from cotton warp, by the coating machine of Brit. 369,910 (C. A. 27, 3090).

**Apparatus for moistening and shrinking fabric webs.** Sanford L. Cluett (to Cluett, Peabody & Co.). U. S. 1,944,001, Jan. 16, 1933. Structural and mech. features.

**Pattern effects on cellulose ester material.** George H. Ellis (to Celanese Corp. of America). U. S. 1,943,377, Jan. 16, 1933. Material which may be in the form of woven fabric and which contains a cellulose ester such as cellulose acetate together with a diazotizable amine such as bisaniline is subjected to diazotization and is exposed to light of varying intensity, and the resulting pattern is fixed by development. Cf. C. A. 27, 5198.

**Treating cellulose acetate threads.** Camille Dreyfus and William Whitehead (to Camille Dreyfus). Can. 338,924, Jan. 23, 1934. Threads and yarns contg. cellulose acetate are treated with a chlorinated aliphatic hydrocarbon, e. g.,  $CH_2Cl_2$ . The pliability, extensibility, strength and luster of the threads and yarns are improved.

**Rayon.** Glanzstoff-Courtaulds G. m. b. H. Brit. 400,760, Nov. 2, 1933. Viscose rayon, wound onto rigid spools as it comes from the pptg. bath and subjected to the entire after-treatment on these spools, is dried after deacidification and before desulfurizing, e. g., with a soln. of  $Na_2S$  or  $Na_2SO_3$ . Differences in shrinkage between the inner and outer windings are thus diminished and the desulfurization is more even. Cf. C. A. 27, 4397.

**Device for supporting rayon cakes during after-treatment.** Arthur Zart. Ger. 590,322, Dec. 30, 1933 (Cl. 29a. 6.08).

**After-treating spools of rayon.** Barmer Maschinenfabrik A.-G. Ger. 588,974, Nov. 30, 1933 (Cl. 29a. 6.08).

**Mercerizing.** Rütgerswerke A.-G. and Leopold Kahl. Brit. 400,135, Oct. 19, 1933. The wetting properties of alk. mercerizing lyes are improved by adding iso-AmOH together with PhOH, cresols and (or) xlenols free from or poor in *o*-cresol.

**Delustering fabric.** Herbert Platt and Camille Dreyfus (to Camille Dreyfus). Can. 338,583, Jan. 9, 1934. Relatively permanent subdued luster is produced on fabric contg. yarns of cellulose acetate by treating the fabric in a bath that acts as a swelling agent for the cellulose acetate, which bath contains a sol. salt of an alk. earth metal and then treating the fabric with a reagent to ppt. the alk. earth metal in the form of an opaque and substantially insol. salt. E. g., a fabric consisting solely of yarns of cellulose acetate is treated for 1 hr. at 70° in a 25° Tw. soln. of  $Ba(CNS)_2$ . It is then treated for 20 min. in the cold in a 1% soln. of  $H_2SO_4$ , after which it is rinsed and dried.

**Delustering rayon.** Imperial Chemical Industries Ltd., Leslie Gordon Lawrie and Harry Donald Mudford. Brit. 400,244, Oct. 18, 1933. Rayon, including regenerated cellulose and cellulose ester and ether products, is delustered by treatment with an aq. medium to which has been added a sulfonated alkylated polynuclear hydrocarbon, or petroleum fraction, and an Al salt. The products of Brit. 274,611 (C. A. 22, 2268) and 311,885 (C. A. 24, 932) may be used as the sulfonated alkylated petroleum fractions.

**Sizing textiles with pectic substances.** Les établissements E. Materné, Soc. anon. Belg. 394,930, April 29, 1933.

**Wetting agents.** I. G. Farbenind. A.-G. Fr. 756,158, Dec. 6, 1933. Wetting agents, particularly for mercerizing lyes, are made by causing  $CS_2$  to react, preferably in the presence of alkali metal hydroxides, with aliphatic secondary amines, one of the alkyl groups of which contains at least 3 C atoms, while the other may contain any no. of C atoms and may be linked with another alkylamine group. Examples are given.

**Fabric-cleaning composition.** Paul S. Denning (one-half each to F. E. Schundler & Co. and Wyodak Chemical Co.). U. S. 1,943,519, Jan. 16, 1933. Bentonite 50-70 is dispersed in water together with  $Na_2CO_3$  30-50 parts for maintaining the bentonite in a "highly fluid" condition beyond the max. gel effect on the bentonite, and a small amount of soap also is used with this compn.

**Composition for "dry cleaning" fabrics, clothing, etc.** Sidney Born. U. S. 1,944,859, Jan. 23, 1934.  $C_2H_5Cl$  1, dichloroethyl ether 3-5,  $CCl_4$  4-6 and "Stoddard solvent" 90% are used together.

**Mothproofing composition.** Elmer W. Adams (to The Standard Oil Co.). Can. 338,896, Jan. 23, 1934. A mothproofing compn. comprises a chlorinated hydrocarbon ext. of cubé incorporated in a mixt. of light hydrocarbon oil 9, and chlorinated hydrocarbon 1 part.

**Mothproofing etc., compositions.** Soc. pour l'ind. chim. à Bâle. Ger. 588,851, Nov. 29, 1933 (Cl. 45f. 3.05). See Fr. 735,959 (C. A. 27, 1824).

## 26—PAINTS, VARNISHES AND RESINS

A. E. SABIN

**Bitumens and related materials in the paint industry.** Hans Hadert. *Farben-Chem.* 5, 12-16 (1934).—The bitumens, tars and pitches are described and classified. Typical formulas using these materials are given. G. G. S.

**The assay of brushable red lead paints.** A. A. Kraff. *Verf. Chronik* 6, 294-6 (1933).—A review of the qualities of ordinary and of "non setting" red lead paints, influence of  $PbO$ ,  $PbO_2$ , of fillers, etc. For detn. of  $PbO_2$  content the

AcOH method of Topf-Diehl is used, rather than the one of Schaeffer (C. A. 10, 1019); the latter gives low results which is probably due to part reduction of  $PbO_2$  during analysis. The D. R. G. (German Railways) heating test is recommended for the non-setting paints.

**The influence of fillers on brush paints and paint pastes.** J. D. Banting. *Verf. Chronik* 6, 293-4 (1933).—A review

(H. Wolff, *Farben. Ztg.* 38, 1188(1933); Klumpp, C. A. 27, 5555).

Paints for aluminum and its alloys. M. Rabaté. *Peintures, pigments, vernis* 10, 64-5, 67-9(1933).—A general account is given of the suitability of coatings made from oils, asphalt, tar, nitrocellulose and synthetic resins and of the prepn. of the metal surfaces. B. C. A.

Lead paint for gas works. F. Williams. *Gas Engr.* 51, 87(1934).

Paints for gas-works plant and buildings. Notes on the formulation of oil paints. J. T. Lawrence. *Gas Engr.* 51, 85, 87(1934); cf. C. A. 27, 1770. P. J. Wilson, Jr.

Aqueous emulsion paints. K. Würth. *Farbe u. Lack* 1934, 5-6, 17-18.—Films of oil emulsion paints are usually porous and of insufficient density for exterior use. However, emulsifying agents of a new type (not named) make satisfactory paints now possible. Suitable pigments are listed. G. G. Sward

Water paints and distempers. H. C. Bryson. *Synthetic and Applied Finishes* 4, 39-43, 50(1933).—The various types of paints based on aq. binding media are summarized, working formulas and precautions necessary in manu. being included. The binders detailed are starch and dextrin, casein, Irish moss, Na silicate, latex, etc., and the relationships between pigment and binder are discussed. B. C. A.

The causes of paint pigment thickening. S. V. Yakubovich and S. V. Kirsanova. *Kolloid-Z.* 65, 333-50 (1933).—Thickening of paints on standing, sealed from air, was followed by noting the consistency to a glass needle every 2 weeks over a period of 44 weeks. Mixts. using lithopone, ZnO and red ochre with 4 samples of blown linseed oil of different degrees of polymerization thickened in the order named but pigment is a minor factor in this rate. Thickening velocity increases with increase in viscosity of the oil but is independent of acid no. Addn. of raw linseed oil lowers the rate. On diln. of a highly polymerized oil with benzine, a ppt. forms which on standing gelatinizes the mass. Addn. of rosin accelerates thickening; ochre and lithopone mixts. thicken faster than ZnO mixts. The principal cause of thickening is not soap formation, except possibly in the case of basic pigments, but is due to colloid reactions causing mol. aggregation leading to gel formation. The velocity of such reactions depends on the degree of polymerization. With oxidized oils, thickening is again a function of viscosity though it occurs faster than with blown oils of like viscosity because of the presence of oxyacids insol. in the benzine thinner. Oils with slight tendency to thicken can be prepd. from sulfurized oils, such as "Novol," in the absence of driers, especially when a long blow period is used after sulfurizing and Cl is removed. Thickening velocity decreases with increase in the percentage of aromatic hydrocarbons in the benzine. Thickening of ready-mixed paints is highly dependent on the oil; slightly polymerized blown linseed oil or an unoxidized sulfurized oil should be used. Arthur Fleischer

The preparation of chrome yellow and chrome green with protective colloids. H. Wagner and J. Gohm. *Farben-Chem.* 5, 5-7(1934).—The addn. of "Gardinol," a sulfonated fatty alc., to the soln. of the Pb salt during the manu. of chrome yellow stabilizes the rhombic form of PbCrO<sub>4</sub>, thereby preventing after-reddening. The influence extends to chrome greens and reduces the flotation of Prussian blue. About 1% based on the Pb salt is required. G. G. Sward

Tung oil from *Aleurites montana* and specification tests. I. A. Jordan. *J. Soc. Chem. Ind.* 53, 21-2T(1934); cf. C. A. 28, 1877<sup>6</sup>.—Examn. of *Aleurites montana* oil shows in comparison with *Aleurites fordii* oil a lower content of eleostearic glyceride, which is the chief polymerizing component of both types of tung oil. As the former will be available as a trade material the following specifications are suggested: I no. 155 (Wijs), no. 1.5130, d<sub>4</sub><sup>20</sup> 0.934; the heat test should not exceed 12 min. and 30% extractive by the Paint Research Sta. method. E. S.

Solvents derived from cyclic alcohols. J. H. Maxwell Wickett. *Oil & Colour Trades J.* 85, 183-8(1934).—

The solvent properties for cellulosic derivs., boiling range, diln. ratio, etc. of cyclohexanone, and some of its derivs. are given. Applications in industrial finishes are discussed. G. G. Sward

The influence of solvents on the viscosity of oil varnishes. Fr. Kolke. *Farben-Chem.* 5, 16-17(1934).—The viscosities of linseed and tung oil, stand. oils thinned with 10-60% of each of "crystal oil 21," solvent naphtha, "crystal oil 30," turpentine oil petroleum and decalin are tabulated. The values for the different thinners increased in the order named. G. G. Sward

Treatment of shellac varnish with sulfur monochloride. M. Venugopalan. Indian Lac Research Inst., *Research Note* No. 12, 1p.(Dec., 1933).—A 0.5-1% varnish with 10% S<sub>2</sub>Cl<sub>2</sub> in CCl<sub>4</sub> showed a water absorption reduction from 30 to 2.4% after one week's immersion. There was no blushing in a month's immersion. The mech. properties were improved. Halsey E. Silliman

Sulfur treatment of shellac. M. Venugopalan. Indian Lac Research Inst., *Research Note* No. 10, 1p.(Nov., 1933).—The best results are obtained by heating shellac at 180° with 3-4% S until a drop of shellac on cooling has a typical green color. Water and abrasion resistance, elasticity, adhesion and molding properties markedly improved. Halsey E. Silliman

Reconditioning shellac. R. W. Aldis. Indian Lac Research Inst., *Research Note* No. 11, 1p.(Nov., 1933); cf. C. A. 27, 3092.—Polymerized shellac is readily sol. in phenols, convenient proportions being 3 parts phenol to 2 parts shellac; it is also sol. in aliphatic acids. Halsey E. Silliman

Tritolyl phosphate and the water resistance of shellac. M. Rangaswami and R. W. Aldis. Indian Lac Research Inst., *Research Note* No. 9, 1p.(Nov., 1933).—Expts. show that tritolyl phosphate does not reduce the amt. of water absorption; hence they do not confirm the results of Paisley (C. A. 26, 1458). Halsey E. Silliman

Analysis of nitrocellulose lacquers. H. Anderson. *J. Intern. Soc. Leather Trades Chem.* 18, 88-90(1934).—Suggested procedures: Ppt. nitrocellulose and pigment with C<sub>6</sub>H<sub>6</sub>, filter, dry, sep. nitrocellulose by soln. in Me<sub>2</sub>CO. Distil the solvent from the filtrate from benzene pptn., dry the residue, remove shellac if present by extn. with dil. alkali, dry the residue and ext. the plasticizer with cold EtOH. Identify the plasticizer by sapon. and identifying acids. Gums remain in the residue insol. in cold EtOH. Solvents are identified by boiling range, odor, sapon. values, etc. H. B. Merrill

Plasticizers for nitrocellulose. Alfred Kraus. *Farbe u. Lack* 1934, 39-40, 53-4; cf. C. A. 26, 5438.—Data for addnl. plasticizers have been obtained and together with those previously obtained are discussed. G. G. Sward

The importance of lac research. A. J. Gibson. *Oil & Colour Trades J.* 85, 247-54(1934).—The early and recent literature on lac and the lac insect is briefly reviewed. Until recently shellac has improved but slightly in quality. While progress has been made in the use of shellac, further development awaits information regarding the structure of this material. G. G. Sward

White nitrocellulose enamels. L. Kern. *Farbe u. Lack* 1934, 31-2, 41.—A few formulas are given for white nitrocellulose enamels suitable for application over baked oil as well as over nitrocellulose lacquer primers. G. G. Sward

Defects in linoleum due to pigments. A. Klemm. *Farbe u. Lack* 1934, 55-6.—Pigments used in linoleum must have reasonable resistance to heat and org. acid fumes developed during the manu. Precautions must be taken not to incorporate pigments with too great a catalytic effect on the oxidation of oils. G. G. Sward

New resin ester. Felix Fritz. *Chem.-Ztg.* 57, 354 (1933).—Stearyl alc., obtained, e. g., during the hydrogenation of technical stearic acid, reacts with coplophony after prolonged heating at 200° to give a liquid resin ester, which suddenly solidifies to a fat-like mass having the viscous properties and odor of coplophony. Possible uses are indicated. B. C. A.

Paint and varnish as wood preservatives (Jordan), 20. Structure of ultramarines (Dominikiewicz), 6. Electrodeposition of shellac (Murty, Sreenivasaya), 4. Azo dyes [for coloring lacquers] (Ger. pat. 590,375) 25. App. for controlling the viscosity of wire enamel compns. (U. S. pat. 1,944,243) 1. Hydrogenated methyl abietate [products used in coating compns.] (U. S. pat. 1,944,241) 10. Rubber-like or resinous masses (Ger. pat. 583,914) 30.

Mehdorn, Walter: *Kunstharzpressstoffe. Eigenschaften, Verarbeitung und Anwendung.* Berlin: V. D. I.-Verlag. 138 pp. M. 8.75.

Scheifele, Bernhard and Kölln, Hermann: *Betriebs-Handbuch der Lacktechnik. Bd. I. Apparate und Maschinen.* Berlin: Union Zweigniederl. 320 pp. M. 21.

Paints. N. V. Philips' Gloeilampenfabrieken. Brit. 401,022, Nov. 9, 1933. A paint for producing an electrically conducting coating on a body, *e. g.*, of glass, ceramic materials, etc., comprises a finely divided metal, *e. g.*, Cu, Zn, mixed with an org. binding agent, *e. g.*, collodion, ester resin and di-Bu phthalate in a solvent such as AmOAc, the metal having been treated to give it a surface free from oxides and other non-conducting compds. Treatment may consist in cleaving, *e. g.*, with  $H_2SO_4$ , and washing with alc. or in pptg. a nobler metal, *e. g.*, Ag, on the metal. The external surface of a thermionic valve may be coated with the paint or an elec. condenser may be made by coating a sheet of mica with layers thereof.

Paint. Soc. anon. John Cockerill. Belg. 397,775, Aug. 31, 1933. Rubber is combined with rosin, pitch or bitumen by means of a nonvolatile solvent acting as condensation agent, such as benzyl alc. The mixt. is heated in an autoclave.

Paints, colors, etc. Karl Gross. Fr. 755,755, Nov. 30, 1933. In making homogeneous mixts. of coloring materials, oily substances and water, more oil is used with respect to the coloring material than when paints are made without the addn. of water. The coloring materials may be made into a paste with water and the oil added. Fr. 755,756. In making colors for printing, contg. coloring material, oil and water, more oil is used than when no water is present.

Decorative paint. Mary B. Parrish. U. S. 1,943,926, Jan. 16. An acid or basic coal-tar dye is used with tincture of hyssop, a thickening material including gelatin, and pancreatin to form a coating compn. suitable for use on leather, celluloid, wood, glass, etc.

Luminous paints, lacquers and molding compositions. I. G. Farbenind. A.-G. Brit. 400,068, Oct. 19, 1933. A luminous substance is mixed with polymerized styrene, vinyl naphthalene, vinyl tetrahydronaphthalene or homologs thereof, *e. g.*, Me or Et styrene, methyl vinyl naphthalene. In examples paints are made by dissolving polymerized styrene in a mixt. of PhMe, xylene and AcOBu, together with tricresyl phosphate as a softener, and adding  $SrS$ ,  $ZnS$ , etc., contg. small amts. of Rb, Mn, Bi, Ag or Cu as excitors. The product obtained by mixing molten  $H_3BO_3$  with phthalic and naphthalic anhydrides may also be used. A molding compn. is made by mixing a luminous paint contg.  $SrS$ ,  $CaS$  or  $ZnS$  with styrene and heating to  $140^\circ$  with a little  $H_2SO_4$ . Cf. C. A. 28, 1557.

Enamel paint for stone materials, particularly asbestocement articles. D. Govaere. Belg. 397,802, Aug. 31, 1933. A mixt. of Na or K silicate with fillers such as  $ZnO$ ,  $Al_2O_3$ ,  $MgO$ ,  $ZnSO_4$  or  $BaSO_4$  is added to an ordinary paint.

Apparatus for coating wire with enamel or the like. Charles B. Fantone and Reuben M. Jameson (to Syncro Machine Co.). U. S. 1,943,818, Jan. 16. Structural and operative details.

Inorganic gel composition from bentonite and calcined dolomite. Roy Cross (to Silica Products Co.). U. S. 1,943,584, Jan. 16. A compn. which may be used in cheap paints, etc., comprises bentonite together with about 0.5-10% calcined dolomite.

Pigments. Frank Rahtjen and Manfred Ragg. Ger.

588,950, Nov. 30, 1933 (Cl. 22f. 10). Finely divided pigments free from oxides are prepd. by heating starting materials contg. Pb oxide compds. with solid, liquid or gaseous reduction agents with exclusion of air. Inactive substances such as ilmenite,  $ZnO$ , silicates, borates, etc., may be added and temps. between the m. p. and vaporizing point of Pb are used.

"Iron red" dry pigments. James B. Castner and Raymond W. Powers (to E. I. du Pont de Nemours & Co.). U. S. 1,943,948, Jan. 16. A raw material for calcining to produce "iron red" dry colors is produced by the reaction of the sludge formed by the reduction of aromatic nitro compds. to amines by Fe with an amount of  $H_2SO_4$  substantially less than the chem. equiv. of the Fe, and setting the resulting mixt.

Printing ink. William H. Laurence. Can. 338,451, Jan. 9, 1934. A quickly drying printing ink consists of a color pigment, a gum such as white or orange shellac crystals or sandrac, a nonhygroscopic agent such as  $TiO_2$ ,  $ZnO$  or lithopone and a highly volatile solvent such as  $Et_2O$ , MeOH or EtOH.

Driers. I. G. Farbenind. A.-G. Brit. 400,797, Nov. 2, 1933. Complex salts of wool grease fatty acids and 1 or more of the acids commonly used in driers, *e. g.*, naphthenic, linoleic or resin acids, or the acids obtained by oxidizing paraffin or petroleum are used as driers for paints, etc. The salts may be prepd. by heating to fusion wool grease, or acids obtained therefrom, and the other acid(s) with oxides, hydroxides, carbonates, acetates, borates, etc., of 1 or more earth, alk. earth or heavy metals, *e. g.*, Co, Mn, Pb, Zn, or by pptn. from a soln. of alkali soaps of the acids by a soln. of 1 or more sol. salts of the metals. About 10% of an amino compd., *e. g.*, triethanolamine, or of 1 or more solid monocarboxylic fatty, olefinic or aromatic acids (or substitution products and derivs. thereof), *e. g.*, palmitic, crotonic, benzoic, anthranilic, cinnamic, hippuric acids, may be added.

Drying oils for use in paints, enamels, etc. Fritz Schmid. U. S. 1,944,813, Jan. 23. See Fr. 730,877 (C. A. 27, 433).

Apparatus for boiling and cooling drying oils. Karl F. Wilhelm. Ger. 590,164, Dec. 27, 1933 (Cl. 22k. 2).

Cleaning iron and steel. Adriaan Nagelvoort (to Delaware Chemical Engineering Co.). U. S. 1,943,875, Jan. 16. Articles of iron or steel are cleaned, as in prep. them for plating or painting by exposing them to air contg. a small proportion of phosgene at a temp. of  $100-200^\circ$ .

Protecting metals. James H. Gravell. Fr. 755,709, Nov. 29, 1933. Metals are protected against corrosion and made ready for painting by the application of a mixt. which contains an acid salt of a tribasic acid, the cation of which is more basic than Fe, *e. g.*,  $Ca(H_2PO_4)_2$  or an arsenate, an absorbent such as wood flour, starch, clay or fuller's earth and an ionizing agent such as water, AcOH, MeOH or EtOH, and preferably also a salt the cation of which is less basic than Fe, *e. g.*,  $Cu(NO_3)_2$ .

Rust-preventing coating. M. Jeanmart and M. Glau-sener. Belg. 397,635, Aug. 31, 1933. The coating contains variable proportions of a double silicate of Al and  $MgO$ , the binder consisting of linseed oil, varnish, etc.

Anti-rust coating. Yves Cornic. Fr. 755,905, Dec. 1, 1933. The coating consists of an aq. dispersion of natural or artificial rubber and cement, in amt. sufficient to cause hardening.

Anti-rust products. Robert Stürzenbinder and Ernest Eppendahl. Fr. 755,805, Nov. 30, 1933. An anti-rust or rust-destroying product is composed of a binder, *e. g.*, a varnish insol. in water and drying in air, and a mixt. sol. in this binder, of an acid attacking the metal, such as  $H_3PO_4$  or  $HCOOH$ , and constituents pptg. from metallic solns., *e. g.*, tannic acid, nucleic acid, benzoic acid or their salts, esters or other compds.

Oil lacquers. I. G. Farbenind. A.-G. (Hanns Bernhard, inventor). Ger. 588,843, Nov. 28, 1933 (Cl. 22k. 3). A lacquer of high gloss is produced by adding aliphatic carboxylic acids with  $\alpha,\beta$ - or  $\beta,\gamma$ -double bonds to the usual constituents. Thus, a lacquer consists of thick oil made from linseed oil and wood oil. Sorbic acid is added

at 100–30°. ZnO is added and subsequently, sanganol, turpentine oil and Co siccativ. Other examples are given.

**Cellulose lacquering.** Herbig-Haarhaus A.-G. Ger. 588,731, Nov. 25, 1933 (Cl. 75c. 5.01). An undercoat for cellulose lacquer consists of oil lacquer contg. at least a 5% addn. of volatile softening agent such as tritolyl phosphate or diethyl phthalate.

**Japanning concrete surfaces.** Sotojiro Asobe. U. S. 1,944,588, Jan. 23. A ground layer is applied comprising a mixt. of raw japan, asphalt, jinoko and tonoko, over which is applied a second layer comprising a mixt. of raw japan and jinoko, and a final finishing layer of japan. Cf. C. A. 28, 351<sup>1</sup>.

**Resin solution suitable for use as a varnish or lacquer.** John H. Schmidt and Rupert S. Daniels (to Bakelite Corp.). U. S. 1,944,867, Jan. 23. A permanently fusible resin, produced from thiourea and formaldehyde, is dissolved, together with an anhyd. CH<sub>2</sub>-contg. hardening agent such as "paraform," in a common solvent such as ethyl lactate, ethylene glycol or ethyl ether of ethylene glycol.

**Fusible and oil-soluble phenol-aldehyde condensation products.** Fritz Seebach (to Bakelite G. m. b. H.). U. S. 1,944,016, Jan. 16. A resinous product of permanently fusible character and which is sol. in vegetable drying oils such as linseed oil and suitable for use in coating compns. is prepd. by heating a phenol-aldehyde condensation product with a phenol contg. more than one OH group, such as a diphenol, dinaphthol or the like until the reaction mass becomes sol. in a vegetable drying oil.

**Resins.** I. G. Farbenind. A.-G. (Eduard Tschunkur and Walter Bock, inventors). Ger. 588,785, Nov. 27, 1933 (Cl. 39b. 4.02). Addn. to 570,980. The method

of 570,980 for producing synthetic resins by mixing butadiene hydrocarbons with olefinic benzenes is extended to include the use of mono- or polyolefin benzenes, their nuclear or side-chain homologs and their semi-polymerizates. In an example, a mixt. of styrene and butadiene is polymerized in the presence of Na stearate to give a resinous product. Other examples are given. Cf. C. A. 28, 1881<sup>2</sup>.

**Synthetic resins.** Imperial Chemical Industries Ltd. and Rowland Hill. Brit. 400,272, Oct. 23, 1933. Oil-sol. resinous compns. are prepd. by condensing the Me or Et ether of 1,3,5-xylenol with CH<sub>2</sub>O, or other compds. contg. a reactive CH<sub>2</sub> group, in an acid medium. The products may be converted into coating compns. by mixing with (semi)drying oils or nitrocellulose. Among examples the condensation product of the Me ether with CH<sub>2</sub>O in presence of HCl is heated with tung oil and mineral spirits, contg. Co linoleate to make a varnish.

**Synthetic resin compositions.** British Celanese Ltd. and Wm. H. Moss. Brit. 400,937, Oct. 27, 1933. Liquid or solid compns., suitable for producing varnishes or molded articles, e. g., gramophone records, comprise animal or vegetable oils together with halogenated synthetic resins of the phenol-aldehyde or -ketone type or synthetic resins of the diphenylolpropane-aldehyde or -ketone type. Cellulose derivs. up to 10% of the synthetic resin, natural resins, other synthetic resins, solvents, diluents, plasticizers, fire-proofing agents and fillers may be added. As examples (1) a varnish is made by mixing diphenylolpropane-CH<sub>2</sub>O resin 10, boiled linseed oil 40, Pb-Co drier 2, turpentine 15 and gasoline 15 parts and (2) a compn. for molding records contains diphenylolpropane-CH<sub>2</sub>O resin 34, diphenylolpropane-Me<sub>2</sub>CO resin 20, castor oil 20, perilla oil 10 and filler 60 parts.

## 27—FATS, FATTY OILS, WAXES AND SOAPS

### E. SCHERUBEL

**Spoilage of fats and oils.** R. Neu. *Allgem. Oel-Fett-Ztg.* 30, 583–8(1933).—W. C. Powick's chain of reactions in explaining the rancidity of fats (C. A. 18, 1580) starts with free oleic acid and finishes with epiphydic aldehyde, the color-producing compd. in the Kreis reaction. N. suggests instead the following chain: olein is oxidized to linolenic acid ester; this by selective oxidation at the 2 outer double bonds becomes an unsatd. diperoxide; by splitting off H<sub>2</sub>O<sub>2</sub> it becomes the corresponding dimonoxide ester and by H<sub>2</sub>O absorption an unsatd. tetrahydroxy acid ester; by splitting again, heptyl and maleic aldehyde result and also the half aldehyde of pimelic acid ester; by losing CO maleic aldehyde forms acrolein and this by oxidation forms epiphydic aldehyde. N. suggests similar reactions for linolin and linolenin, and discusses the work of Pritzker and Jungkuns, Salway, Barnicoat and of Better, who says that autooxidation is not due to the unsatd. condition of the fatty acids, but to the presence or absence of antioxidants. A distinct retardation occurs in ricinolic acid by its introduction of OH which, for further oxidation, must first be dehydrogenated. P. Escher

**Antioxidants for fats and oils.** Geo. R. Greenbank and Geo. E. Holm. *Ind. Eng. Chem.* 26, 243–5(1934).—Of the phenols only the *o*- and *p*-types are active as antioxidants for fats and oils. Some unsatd. polybasic aliphatic acids, notably maleic, are also antioxidants.

E. Scherubel

**Chemical microscopy of fats and waxes.** I. Wilson Greene. *Oil and Soap* 11, 31–2(1934).—This is a review of the methods applied to fats in chem. investigations utilizing the microscope.

E. Scherubel

**Reactions between fatty acid and bicarbonate.** C. Bergell. *Seifensieder Ztg.* 61, 33–4(1934).—A fatty acid of 0° titer will react with concd. bicarbonate soln. in 5% excess at room temp. to complete sapon. in about 1 week. A neutral soap base, on the other hand, showed 1% free fatty acid after exposure for 24 hrs. to air, and when the aq. soap soln. was blown with CO<sub>2</sub>, 7% fatty acids were

liberated. These opposing results are due to unknown changes in the soly. of CO<sub>2</sub> when temp., concn. of salt soln. and surface tension change.

P. Escher

**Heat requirements for fatty acid distillation.** Victor Mills and R. C. Daniels. *Ind. Eng. Chem.* 26, 248–50(1934).—After deducting the heat loss, the preheat required for raising the feed to distn. temp. and the heat absorbed by the agitation steam from the total heat supply, the latent heat of vaporization for recovered grease fatty acids was found to be 108 B. t. u. per lb. and 124 B. t. u. per lb. for red oil.

E. Scherubel

**Twitchell reagents. XII. Properties of principal constituents isolated from Twitchell reagents.** 3. Kyōsuke Nishizawa, Minoru Okuyama and Takahide Inoue. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 34–6(1934); cf. C. A. 27, 200. XIII. Relation between kind of oils and the emulsifying power of Twitchell reagent. Kyōsuke Nishizawa and Takahide Inoue. *Ibid.* 36–8. K. K.

**Regularities in the glyceride structure of some technically important vegetable fatty oils.** T. P. Hilditch and E. C. Jones. *J. Soc. Chem. Ind.* 53, 13–21T(1934).—When an unsatd. fat whose acids belong to the C<sub>18</sub> series is fully hydrogenated it is possible to obtain by systematic fractional crystn. a series of least sol. fractions which contain all the tristearin present mixed only with palmitodistearins. From the sapon. nos. of such fractions it is possible to est. the proportion of tristearin in the hardened fat and, therefore, of the glycerides in the original fatty oil. This procedure is confined to oils in which the unsatd. acids are only oleic, linoleic and linolenic such as olive, cottonseed, linseed and others of the non-drying and drying type. Cottonseed oil appears to consist of nearly 60% of glycerides contg. one palmityl radical and 2 unsatd. C<sub>18</sub> groups with perhaps 15% of dipalmito-olein or dipalmito-linolein; only the remaining 24% consists of unsatd. glycerides. Soy-bean and linseed oils with 86 and 90% of unsatd. C<sub>18</sub> acids in their mixed fatty acids contain 20–25% of mixed satd.-unsatd. acids of glycerides,

mainly palmito-diunsatd. glycerides. The unsatd. acids of soy-bean oil contain 26% oleic, 55% linoleic and 6% of linolenic acids, and those of linseed oil, 8% of oleic, 43% of linoleic and 40% of linolenic acid. In olive and tea-seed oils the proportion of completely unsatd. glycerides is less than 7% of the whole, and since linoleic acid forms nearly 10% of the mixed unsatd. acids it is probable that about 20% of the oils will consist of mixed oleolinoleins, so that the content of triolein in either oil cannot greatly exceed 50%. Peanut oil did not prove amenable to the present method of tristearin estn.

E. Scherubel

Chemical analysis for possible sources of oils of forty-five species of oil-bearing seeds. Salvador P. Padilla and Florencio A. Soliven. *Philippine Agr.* 22, 408-15 (1933).—The results of the principal detns. on the fresh seed are as follows:

Species	Moisture	Ash	Protein	Fat	Carbo- hydrate
<i>Alseodaphne maluccana</i>	2.54	3.27	25.56	63.53	5.10
<i>Alseodaphne trisperma</i>	3.65	3.22	23.31	38.97	30.90
<i>Anacardium occidentale</i>	7.55	2.60	25.41	43.39	21.05
<i>Arachis hypogaea</i>	4.58	2.57	42.77	42.03	8.05
<i>Caesalpinia crista</i>	4.66	3.45	21.19	20.56	50.14
<i>Calophyllum inophyllum</i>	27.73	1.07	6.41	60.72	4.07
<i>Canarium ovatum</i>	4.16	2.99	16.53	72.01	4.31
<i>Cerbera pentandra</i>	8.84	5.40	47.53	34.48	3.75
<i>Chitocheton cumingianus</i>	4.40	2.65	16.38	67.46	9.11
<i>Chitocheton pentandra</i>	12.19	2.41	13.50	13.27	58.63
<i>Chrysobalanus icaco</i>	2.43	1.72	10.74	21.27	63.83
<i>Cinnamomum marcados</i>	16.35	1.71	31.77	43.45	6.72
<i>Cocos nucifera</i>	48.46	0.96	5.39	31.61	13.56
<i>Croton tiglium</i>	4.51	3.18	38.30	37.17	16.84
<i>Delonix regia</i>	6.37	7.42	60.31	9.68	16.22

A. L. Mehring

The fatty oil of *Cassia occidentalis*, Linn. seed. A. Steger and J. van Loon. *Rec. trav. chim.* 53, 28-30 (1934).—The oil was extd. in the lab. from the seeds of "wild coffee," *Cassia occidentalis*. The oil yield is 2.3 or 9.2% when based on kernel wt. Consts. are: sapon. no. 178.7, acid no. 10.2, R.-M. no. 0.5, I no. Wijs, 113.9, thiocyanate no. 78.2, n<sub>D</sub><sup>20</sup> 1.4770. Compn. of the oil is: unsaponifiable 7.4, satd. acids 19.7, oleic acid 30.7, linoleic acid 31.4, linolenic acid 6.3, volatile 0.7, glycerol radical 3.8%.

P. Escher

The fatty oil of millet, *Panicum millaceum*. A. Steger and J. van Loon. *Rec. trav. chim.* 53, 41-4 (1934).—Ether extd. 3% of a semi-drying oil: d<sub>4</sub><sup>20</sup> 0.9383, acid no. 12.8, sapon. no. 191.5, n<sub>D</sub><sup>20</sup> 1.4577, I no. Wijs 129.0, thiocyanate no. 80.0, acetyl no. 16.9, R.-M. no. 1.76. Compn. is: unsaponifiable 3.3, satd. acids 10.7, oleic acid 23.9, linoleic acid 46.9, linolenic acid 7.2, volatile 4.0, glycerol radical 4.0%.

P. Escher

The fatty oil of quince seed, *Cydonia vulgaris*. A. Steger and J. van Loon. *Rec. trav. chim.* 53, 24-7 (1934).—The seed yielded 19.2% oil, based on air-dried kernels: d<sub>4</sub><sup>20</sup> 0.9220, acid no. 15.3, sapon. no. 194.2, ester no. 178.9, I no. Wijs 121.6, thiocyanate no. 82.7, acetyl no. 14.7, n<sub>D</sub><sup>20</sup> 1.4738. Compn. is: unsaponifiable 0.36, satd. acids

1 8.6, oleic acid 38.5, linoleic acid 39.3, linolenic acid 8.9, volatile 1.44, glycerol radical 4.0%.

P. Escher

Making cottonseed oil and its products. J. B. Nealey. *Mfrs. Record* 103, No. 2, 18-19 (1934).—The procedure employed by Trinity Cotton Oil Co., Dallas, Texas, is outlined, and a list given of the principal by-products.

A. W. Furbank

Change in the composition of sunflower oil during ripening of the seed. K. H. Bauer. *Fettchem. Umschau* 41, 1-2 (1934).—The I no. of sunflower oil, extd. from fresh seed while ripening between Sept. 26 and Nov. 15, remained almost const., but the satd. acids decreased steadily from 15.14 to 6.70%, the linoleic acid from 74.74 to 64.91%, while oleic acid increased from 9.81 to 28.35%. After Nov. 16, the compn. of the oil remained practically uniform.

P. Escher

The iodine number of Polish linseed oil. Stefan Bazarewski and Witold Zarnowski. *Polish Agr. Forestal Ann.* 27, 315-32 (332 in French) (1932).—The I no. of linseed oil depends on the method of prep. the oil. Oil extd. with Et<sub>2</sub>O shows the smallest I no.; that obtained by pressure with application of heat shows a medium I no.; that pressed in the cold shows the highest I no. Oil from seed obtained on non-fertilized fields has a somewhat higher I no.; that from fertilized fields a smaller I no.; it is 189.7 and 188.1, resp. With dense sowing the I no. is on the av. 189.9, while with thin sowing 187.9.

Meteorological factors in the period of ripening of the seeds exert a pronounced influence on the properties of the oil. The longer this period lasts, the more unsatd. acids the oil contains and the higher is its I no. The I no. depends also on the origin of the seed. The highest no. shows oil from seeds of Nowo-Swieciany (190.7) and Sejny (190.8); the lowest no. shows oil from seeds of Lomza (177.5), Buczacz (177.7) and Chyrów (177.7). A still lower value showed an Argentine linseed oil (La Plata). The av. I no. of Polish linseed oil obtained by hot pressure is 185.0.

J. Wiertelak

Determination of the iodine number of some East-Indian oils by Kaufmann's bromometric method. N. N. God hole, Amarendra and Urba Datt. *Fettchem. Umschau* 41, 2-3 (1934).—Various drying oils, non-drying oils, fats and fatty acids were tested by the Hanus method and H. P. Kaufmann's bromometric method for the detn. of the I no. A good agreement between these 2 methods was found in all cases.

P. Escher

Gadoleic acid in cod-liver oil. Yoshiyuki Toyama and Tomotaro Tsuchiya. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 14 17 (1934).—Gadoleic acid, C<sub>27</sub>H<sub>52</sub>O<sub>2</sub>, has been isolated from cod-liver oil and its constitution detd by ozonolysis. Among the decompn. products of the ozonide, undecanoic acid, undecanal and azelaic acid were identified. The constitutional formula of gadoleic acid is CH<sub>3</sub>(CH<sub>2</sub>)<sub>10</sub>CH=CH(CH<sub>2</sub>)<sub>10</sub>COOH.

K. K.

Identification of gadoleic acid in Japanese sardine oil, herring oil and liver oil of "Sukoso-Dara" (*Theragra chalcogramma*). Yoshiyuki Toyama and Tomotaro Tsuchiya. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 17-20 (1934).—An eicosenoic acid has been isolated in the pure state from Japanese sardine oil, herring oil and "Sukoso-Dara" liver oil. The acid from the first 2 was identified as gadoleic acid by the ozonide method and that from the liver oil as the same acid by the mixed m-p test.

Karl Kammermeyer

White carnauba wax. G. Schneider and R. Folger. *Fettchem. Umschau* 41, 4-6 (1934).—The customary method of bleaching and refining the carnauba-paraffin mixt is replaced by a fractional crystn. of its benzine (80-130°) soln. at 16°, when crystals m. 80.8° are collected, together with a by-product wax m. 60°.

P. F.

The determination of husks in sunflower cakes. R. Heublyum. *Seifensieder-Ztg.* 61, 34-5, 53-4 (1934).—H. modifies the Russian standard method: Moistn 10 g. of the cake of pea-size with H<sub>2</sub>O; add 2 g. pepsin, treated for 1-2 min. with 50 cc. 5% HCl and add to 200 cc. H<sub>2</sub>O, transfer the pepsin soln. together with the treated cake to a 500-cc. flask, fill to the mark and keep for 12-18 hr. at 37-50°. Shake, settle and decant; transfer the residual

husks to a porcelain mortar and wash several times with 400–500 cc.  $H_2O$ ; transfer with 100 cc.  $H_2O$  to a 250-cc. cylinder and stir several times by pouring 25–50 cc. satd. NaCl soln. into it to float off any remaining kernel particles; decant, wash, dry and weigh the residue. The results varied at most by 2.26% with a husk content of 22.43%.

**Changes in the properties of soap by adding lecithin.** E. L. Lederer. *Seifensieder-Ztg.* 60, 919–20 (1933).—Addn. of 5% or more of soy lecithin to soaps effects better cleansing by increasing the emulsifying and lathering power. Rancidity or formation of brown spots does not occur.

**The active constituents of bile in bile soaps.** Welwart. *Seifensieder-Ztg.* 60, 906–7 (1933).—The active constituent of bile in bile soaps is taurocholic acid, present in bile in relatively small amt. The related "Igepon T" of the German I. G. is the Na salt of a high-mol. fatty acid deriv. of taurine.

**The influence of air when drying soap base.** C. Bergell. *Seifensieder-Ztg.* 61, 15–18 (1934).—Atm.  $CO_2$  will decompose finely divided soap at the temp. of the drying chambers, producing free fatty acid, and will cause spoilage by the formation of brown spots; the soap may nevertheless show an alk. reaction because of surface formation of  $Na_2CO_3$ . An ether extn. is required to detect the free acids.

**Determination of the cleansing power of washing agents.** A. van der Werth. *Allgem. Oel- u. Fett-Ztg.* 30, 588–94 (1933).—A general review is given of prevailing ideas on the cleansing power of washing agents. Apparently there are 3 dominant factors which det. cleansing: absorption of dirt particles, emulsifying power and, to a lesser degree, wetting ability. In special cases of comparison measurements of single properties such as lathering power or surface tension may suffice. Washing tests are essential for evaluating washing agents, but present methods of soiling, type of test pieces, temp. and concn. of liquor, mode of judging cleansing power, etc., are too much at variance. Soap solns., when exactly neutralized by buffering, have no cleansing effect. Dirt particles have a pos. charge, soap particles a neg. charge, because of hydrolysis, thus permitting a union of dirt with soap. Adding neg. ions to a soap soln. increases its cleansing power. It is practically impossible to reproduce all com. conditions in single lab. tests, but in all tests it is desirable to measure those properties that produce a cleansing effect, viz., (1) the 3-min. lathering no., (2) the surface tension (drop no.) and (3) the time required for the test piece to sink in the liquor (all 3 detns. to be made in the presence of oil and soot).

Soy bean (Sayer) 12.

**Krings, Robert:** Die Herstellung der Feinseifen und Toilettenseifen. Ein Handbuch und Nachschlagewerk für die Seifenfabrikanten, Praktiker und Chemiker. Berlin: Allgemeine Industrie-Verlag. 146 pp. M. 5.

**Lunde, Gulbrand, and Stiebel, Fritz:** Quantitative Fluoreszenz-Messungen an Olivenölen. Oslo: Dybwad in Komm. 56 pp. Kr. 5.

**Denaturant for fats.** George McIntyre and Edmund J. Higgins (to The Standard Oil Development Co.). Can. 338,557, Jan. 9, 1934. •Acid oils obtained in the refining of petroleum are treated with 5–30 lb. of 60°Bé. or 98%  $H_2SO_4$  for each 50 gallons of oil and the resulting sludge is allowed to settle. The sludge is washed separately with about an equal amt. of water. The sludge and weak acid are settled and drawn off, leaving the acid oil. The acid oil is neutralized with NaOH, washed with water and reduced to meet the required government specifications for denaturing oil. The denaturing oil is incorporated with the fats by mixing with or without an application of heat.

**Stabilizing fats and oils.** Wm. D. Richardson and Donald P. Grettie (to Swift & Co.). Brit. 401,018, Nov. 9, 1933. See Fr. 736,984 (C. A. 27, 1535).

**Sulfonated oils and fats.** Richard Huttenlocher (to Farb- & Gerbstoffwerke Carl Fleisch, Jr.). U. S. 1,943,319, Jan. 16. See Ger. 564,759 (C. A. 27, 1225).

**Plant for the boiling of whole whale bodies.** H. Edman. Swed. 76,659, March 7, 1933.

**Fish-liver oils.** Abbott Laboratories. Brit. 401,095, Nov. 9, 1933. Oils having high vitamin A, and in some cases vitamin D, contents are obtained by steaming fish livers at below 100°, discarding the aq. liquid produced, rapidly cooling the residue, extg. the oil with an org. solvent, e. g., peroxide-free diethyl ether, and removing the solvent from the extd. oil.

**Soap.** Eugen Better and Felix Munk. Ger. 588,951, Nov. 30, 1933 (Cl. 23a. 5). Crude wool fat for soap making is refined and rendered odorless by treatment with hot dil.  $H_2SO_4$ , washing with water and extg. with alc. to remove free fatty acids. The residue is bleached with Cl, hypochlorites or  $HClO$ , washed with hot water and dried.

**Soap.** V. Boulez. Belg. 396,792, July 31, 1933. Glue (0.5%), which may or may not be in soln., is added to the soap paste.

**Soap powder.** Helios Kemisk-Tekniska Fabriker A.-B. (H. Y. Dalström, inventor). Swed. 78,523, Oct. 3, 1933. A compounded soap powder is manufd. by the mixing and reaction of two or more components, at least one of which is powd. and one liquid. The powd. component is strongly agitated by means of a mech. stirring device while the liquid components are added successively without heating in the form of jets. App. is described.

**Cleaning composition.** A. M. Kruse. Swed. 78,917, Nov. 14, 1933. An aq. soln. of 420 g. of  $Na_2CO_3$ , 210 g. of  $NaHCO_3$  and 4.9 kg. of soap cuttings in 22.5 l.  $H_2O$  emulsified with 80 g. of petroleum and 80 g. lubricating oil and contg. in suspension 10.2 kg. of pulverized pumice; there may be added 30 g. of bitter-almond oil and 10 g. of carmine.

**Cleaning composition.** Thorleif Sørensen. Norw. 45,885, June 20, 1933. A mixt. of an absorptive material, solid fatty acids and alkali, liquid fatty acids and an aq. soln. of alkali salts, with or without soap, dyestuffs and perfumes.

**Detergent.** C. van Overstraeten. Belg. 396,321, June 30, 1933. A product having a high detergent power, suitable for the treatment of clothing and fabrics, is obtained by adding spirit of turpentine and olein to a mixt. of Na perborate and  $NH_4OH$  and adding the resultant emulsion to a soap soln.

**Emulsifying, dispersing and cleansing agents.** Deutsche Hydrierwerke A.-G. Brit. 400,980, Nov. 6, 1933. The agents are obtained by esterifying unsatd. aliphatic alcs., having at least 8 but not more than 20 C atoms, with  $H_2SO_4$  and then halogenating the products. The esterification and halogenation may be effected in reverse sequence and salts of sulfuric esters of the alcs. may be treated with  $HClO$ . In examples (1) olein alc. is treated with  $ClHSO_4$  in presence of  $CCl_4$  and gaseous  $HCl$  is introduced toward the end of the reaction; after neutralization the product may be used to disperse olein in  $H_2O$  to obtain a spinning grease, and (2) wool is washed in a liquor contg.  $Na_2CO_3$  and the product obtained by adding  $HClO$  to oleic sulfuric ester; soaps and solvents may advantageously be present.

**Wetting and other agents.** Karl Ott, Winfrid Hentrich and Helmut Keppler (to I. G. Farbenind. A.-G.). U. S. 1,944,300, Jan. 23. Compds. of aliphatic amine sulfonic acids contg. 8 or more C atoms, sol. in water and suitable for use as wetting, softening, frothing or dispersing agents in the textile industry, such as the Na salt of 2-(heptadecylamino)-ethanesulfonic acid, etc., are formed by causing an alkyl, aralkyl or aryl sulfonic acid or a salt thereof contg. a labile halogen atom in the alkyl or aralkyl or aryl group to react with a higher aliphatic amine of the general formula:  $R^1R^2NH$ , in which the satd. or unsatd. aliphatic radical contains at least 8 C atoms or by causing an alkyl, aralkyl or aryl halide to react with a higher aliphatic amine of the kind referred

to and subjecting the resulting reaction products to a treatment with a sulfonating agent. Several examples with details of procedure are given.

**Wetting and other agents.** R. J. du Pont de Nemours & Co. Fr. 755,769, Nov. 30, 1933. Esters of abietic or hydroabietic acid, which are wetting and penetrating agents, are prepd. by causing an abietic acid compd. contg.

an atom or radical which can be substituted in the carbonyl group to react with a compd. of an aliphatic or cycloaliphatic sulfonic acid contg. a supplementary atom or radical which can be substituted attached to one of the C atoms, e. g., ethanol-, pentanol- or cyclohexanol-sulfonic acid. Thus, compds. which are probably Na  $\beta$ -sulfoethyl-abietate and -hydro-abietate may be prepd.

## 28—SUGAR, STARCH AND GUMS

J. K. DALE

**Terminology of sugars.** A. P. Bryant. *Ind. Eng. Chem.* 26, 231 (1934).—The sugars formed by inversion of sucrose are known under various names, while totally unlike substances are known under the name of "glucose." This confusion should be ended by using only "dextrose" and "levulose" for the sugars referred to. F. W. Z.

**Advances in beet-sugar manufacture in 1933.** Edmond O. v. Lippmann. *Chem.-Ztg.* 58, 87 8, 107-9 (1934).

E. H.

**Sugar refining with "Suma Carb" in Cuba without revivification.** Mario de la Vega. *Intern. Sugar J.* 36, 70-4 (1934).—While it has been definitely proved that refined sugars of the highest quality can be made economically on the plantation by the use of activated carbons without facilities for their revivification, the present data show that this was also accomplished when very inferior grade raw sugars, polarizing 93-6, which had deteriorated during a long period of storage, were used. These sugars were refined by the use of 0.28% "Suma Carb" on the wt. of refined sugar produced. To obtain the proper filtration of the liquors, which would ordinarily filter very slowly, "Hyflo" filter aid was added at the rate of 0.25-0.35% on solids in the first stage and 0.1% at the third stage of filtration. The amt. of "Suma Carb" employed compares very favorably with other activated carbons, of which 1.75-2.25% is required to perform the same work. A flow sheet of the filtration plan is given.

W. L. Owen

**Different methods of defecation.** K. Smoleński. *Gaz. Cukrownicza* 73, 99-119, 155 78 (1933).—These factory studies were made to explain the tech. value of Teatini's method of defecation. The expts. prove that much smaller amts. of CaO (1.0-1.25% against 1.33% normally) may be used in Teatini's method. A higher amt. of CaO applied in the usual moist defecation increases the rate of filtration and the purity coeff., corrects the quality of the sirup and diminishes the coloration and the content of conductometric ash and Ca salts. Dry defecation under identical conditions gives better results than moist defecation. Preliminary defecation in the cold, as an initial step of moist defecation, gives also an increased rate of filtering and a slight amelioration of the quality of sirup. Addn. of SO<sub>2</sub> in the preliminary defecation gives a negligible improvement of the process. Dry defecation without any preliminary treatment gives a higher rate of filtering, while moist defecation with a preliminary defecation gives a better quality of sirup.

J. Wiertelak

**Regeneration of activated carbons.** N. N. Kudelya. *Nauk. Zapiski Tsukrovoy Prom.* 10, No. 32, 37-45 (1933).—Prolonged boiling of activated C in alk. and acid solns. for regeneration which is the general practice, together with excessive strength of the solns., decreases the decolorizing power of a C. K. suggests the following scheme: boil an exhausted C in water for 1 hr., boil again as a suspension of 15-20° Bé. for 1 hr. in 0.5-1% NaOH soln., wash free from alkali; boil again in 1-1.5% HCl soln. for 1 hr., then further regenerate in a muffle at 600°. V. E. B.

**Design of a modern molasses distillery.** Gustave T. Reich. *Chem. & Met. Eng.* 41, 64-5 (1934). E. H.

**The non-fermentable reducing sugars in molasses wort.** A. Carozzi and M. Montessori. *Ind. saccar. ital.* 26, 627-8 (1933).—The total sugars in cane molasses are expressed as sucrose = double polarization plus (0.95  $\times$  reducing sugars). The residual reducing non-fermentable sugars are assumed to be glucose = 2  $\times$  reducing sugars. The

fermentable sugars are thus, total sugars as sucrose - (0.95  $\times$  glucose  $\times$  1/2). Lab. yields were 0.6145-0.6147 l. anhyd. alc. per kg. sucrose. Distillery yields averaged 0.6085. The corresponding yields with no correction for glucose were 0.6004-0.6019 and 0.5816. Molasses may contain up to 10% glucose, if from Cuba, while that from Java has a value under 5%. L. Cusachs

**Failure of a molasses tank.** Husemann. *Arbeitschutz* 1933, 128-30; *Chimie & industrie* 30, 1171.—Examn. of the molasses contained in the tank showed that, in spite of its alk. reaction, it contained considerable invert sugar; carbonaceous particles were observed on the walls along the fractures, indicating that failure was probably due to an explosion. Spengler has suggested that considerable inversion probably occurred in the course of yrs. of storage, and that, under the influence of certain bacteria, the invert sugar was decompd. with formation of H<sub>2</sub> and CH<sub>4</sub>, which could not escape because of a hard, adherent coating of sugar on the walls of the tank, and thus resulted in accumulation of a high pressure; the immediate cause of the explosion remains unknown. It was observed that the walls of the tank, after removal of the adherent sugar coating, showed considerable corrosion, which H. attributes to attack on the Fe by org. acids produced by fermentation of the molasses, the latter also liberating H<sub>2</sub>. The latter remains in the tank and works its way inwardly and forms an explosive mixt. with the atm. O; the finely divided Fe oxide, whose presence was observed on the walls of the tank, acts as contact mass to catalyze the combustion. From a practical standpoint, accumulation of gases in molasses tanks can be avoided by fairly frequent cleanings. A. Papineau-Couture

**Cyanamide as a source of N for sugar cane (Smith) 15.** Fertilizing values of Polish kainites [for sugar beets] (Górski) 15. Value of the sugar-beet crop in relation to its tech. processing (Denis'evskii) 15. The polysaccharide-forming mouth streptococci and the "frog egg" streptococci of sugar factories (Koch) 11C. Gelatinized corn-starch adhesive (U. S. pat. 1,943,382) 18.

**Extraction of beet sugar.** T. Wintzell, N. R. M. Weibull and G. V. Cederborg. *Swed.* 78,831, Oct. 31, 1933. Beet slices are leached in a battery of diffusers according to the countercurrent principle. Water is applied through a gate which automatically interrupts the discharge of sugar juice from the system when a fixed amt. of water has passed through the gate.

**Diffusion batteries for extracting sugar.** Auguste L. Vasseux. *Brit.* 400,034, Oct. 19, 1933.

**Purifying sugar juices.** Berthold Block. *Ger.* 590,358, Jan. 9, 1934 (Cl. 89c. 10). In the continuous purification of sugar juices with milk of lime, the pumps which feed the juices and the lime are coupled together, so as to avoid fluctuations in the alk. of the juices.

**Purification of sugar juice.** Aktiebolaget Separator (O. E. Fröding, inventor). *Swed.* 76,906, April 4, 1933. Sugar juice not contg. sugar crystals, preferably the concd. thick juice obtained by evapn., is treated in centrifuges provided with devices for excluding air, thus avoiding undesirable changes in the sugar juice due to oxidation.

**Purifying sugar-house and refinery juices.** D. Teatini. *Belg.* 396,674, July 31, 1933. After direct clarification, the juice is treated (after addn. of alkali if need be) with an

acid until the alkyl has been reduced to the point which has been found to be best for the subsequent concn. The juice is then concd. directly. Cf. C. A. 27, 1540.

Apparatus for saturating sugar juices. Fritz Blanke. Ger. 590,024, Dec. 20, 1933 (Cl. 89c. 16). Addn. to 559,048 (C. A. 27, 1228).

Automatic apparatus for the detection of sugar in the condensate of sugar-house boilers. Raffinerie Tirlemontoise, Soc. anon. Belg. 395,843, May 31, 1933.

Oil-burning stoves for industrially heating, e. g., sugar-boiling pans. John McGowan. Brit. 400,352, Oct. 26, 1933.

Gums from carob seeds. Soc. industrielle du Neogum (Soc. anon.). Fr. 755,961, Dec. 2, 1933. The seeds are treated with an acid to attack the film superficially and as soon as this takes place the acid (which would dissolve the gums) is replaced by an org. liquid in which the gums are not sol., but which completely removes the film, e. g., EtOH, BuOH, AmOH or a ketone or ketone derivs.

Treatment of juices in the starch and similar industries. D. Téatini. Belg. 396,227, June 30, 1933. The juice is treated with a reagent (preferably liquid  $\text{SO}_2$ ) capable of retarding flocculation of the colloidal matter so as to prevent its deposition on the sepd. starch.

## 29—LEATHER AND GLUE

ALLEN ROGERS

Boric acid and borax in the preparation of leather from hides. Enrico Vigezzi. *Industria chimica* 8, 1377-84 (1933).—A detailed summary of the use of boric acid and borax in the prepn. of leather from hides. A. W. C.

The fine structure of hide fibers. A. Kuntzel. *Collegium* 1934, 1-18.—The difference in weave between hide and tendon fibers is illustrated. Swelling, contraction and staining phenomena do not indicate a difference, except in structure, between the corium major and corium minor. I. D. Clarke

Structure of collagen fibers and the point of attack by proteolytic enzymes. D. Jordan Lloyd and M. E. Robertson. *Nature* 133, 102-3 (1934).—Bacteria penetrate hide through the cut ends of the collagen fibers and not through the sides of the fibers. Points where the epidermis is injured, such as brand-marks, also allow entry of putrefying bacteria. This is paralleled by the fact that trypsin acts only on the ends of collagen fibers (Bergmann, G. Pojarlieff and H. Thiele, *Collegium* 1933, 582) and fits well with the mol. structure postulated for collagen by the authors (C. A. 27, 2864). K. V. Thimann

Microscopic study of animal hair. II. Effects of beam-house treatment. Fred O'Flaherty and Wm. L. Roddy. *J. Am. Leather Chem. Assoc.* 29, 53-66 (1934).—No change occurs during soaking, with or without NaCl or wetting agents, or in 0.05 N acid or alkali. Hair shafts are attacked and disintegrated by strong NaOH; successive histological changes are described. In satd.  $\text{Ca}(\text{OH})_2$ , no change in the hair shaft occurs but contraction of the hair bulb takes place. In satd.  $\text{Ca}(\text{OH})_2$  + 0.05%  $\text{Na}_2\text{S}$ , the hair bulb first contracts and later expands. Hair is attacked in a manner similar to that induced by strong NaOH, at a rate increasing with  $\text{Na}_2\text{S}$  concn. and temp.  $\text{As}_2\text{S}_3$  acts the same but more slowly. Amines have a slight action on the cuticle of the hair shaft only. Red, black and white hairs are attacked in the order named. "At some concns. of  $\text{Na}_2\text{S}$ , hair shafts break off on mech. unhairing, roots are left in the skin, and pigment from hair roots may discolor the skin." H. B. Merrill

Chrome tanning. E. Barbier. *Cuir tech.* 23, 2-5 (1934).—Time required for tannage diminishes progressively as concn. of t-bath Cr liquor is increased (in presence of excess Cr in all cases). The advantages of time saved are offset by waste of material in used strong liquor. It is not economically profitable to recover Cr from such spent liquors. H. B. Merrill

Some discrepancies in  $p_H$  determination of synthetic tannins. J. A. Gilman. *J. Intern. Soc. Leather Trades Chem.* 18, 90-2 (1934).—One "syntan" (undescribed) gave  $p_H$  values varying from -0.5 to 3.0 by different methods in the hands of different analysts. H. B. M.

Investigations into the quality of vegetable-tanned sole leather. I. Robert H. Marriott. *J. Intern. Soc. Leather Trades Chem.* 18, 68-87 (1934); cf. C. A. 28, 1506.—An attempt is made to correlate compn. with type of microscopic structure. H. B. Merrill

A method for determining acid in chrome leather. C. Riess and A. Papayannis. *Collegium* 1933, 719-22.—Heat 2.5 g. of disintegrated leather and 50 cc. of 0.1 N  $\text{NH}_4\text{OH}$  for 1 hr. at 60° under reflux. Filter into 0.1 N

HCl and wash 4 times with  $\text{H}_2\text{O}$  (final wash boiling). Add 5 cc.  $\text{HCHO}$  to the filtrate and titrate with 0.1 N NaOH and phenolphthalein. The percentage of basicity =  $100(a - b)a$ , where  $a$  = cc. 0.1 N  $\text{Na}_2\text{S}_2\text{O}_8$  for the Cr detn., and  $b$  = cc. 0.1 N NaOH in the above titration.

Ira D. Clarke  
Factors affecting the distribution of fat in fat-liquored chrome leather. W. C. Henry. *J. Am. Leather Chem. Assoc.* 29, 66-84 (1934).—Cr-tanned steer hide pieces, prepd. in the lab., were fat liquored for 1 hr. at 40° with a large excess of fat liquor contg. cod oils of 3 different degrees of sulfonation; in certain expts. paraffin oil was added. The fat-liquored pieces were sectioned horizontally with a microtome, and the sections grouped to make up 12 layers. Each layer was vacuum-dried and extd. successively with petr. ether and acetone. "Bound" fat was detd. by decompg. the residual leather with KOH, acidifying and extg. fatty acids with  $\text{Et}_2\text{O}$ . Unsaponifiable matter was detd. when desired to demonstrate differential penetration of paraffin oil into skin. Results were corrected for extractable matter in non-fat-liquored skin. Total oil take-up was independent of degree of sulfonation of the oil. Sulfonated compds. (acetone ext.) and non-sulfonated (petr. ether ext.) were taken up in proportion to their concns. in the oil used. Penetration was greatest for the oil of lowest degree of sulfonation, and for non-sulfonated as opposed to sulfonated components. Some diffusion of oil into the leather occurred on drying; in general the non-sulfonated components showed greatest penetration on drying. H. B. Merrill

Apparatus for the volumetric determination of water absorption by leather. Arthur Miekeley and Gertrud Schnuck. *Ledertech. Rundschau* 26, 1-6 (1934); cf. C. A. 26, 2344.—Rate of absorption of  $\text{H}_2\text{O}$  by leather was measured in an app. similar to that of Freundlich, Schmidt and Lindau (C. A. 26, 5243). The ratio of absorption for a split surface to the flesh surface varied from 1.22 to 2.26, for split to grain, from 1.11 to 3.01. I. D. Clarke

Effective acidity and the penetration of acid dyestuffs into leather. Robert H. Marriott. *J. Intern. Soc. Leather Trades Chem.* 18, 92-5 (1934).—Pieces of sumac-tanned goat skin were brought to  $p_H$  values from about 1 to 6 with buffers, and dyed in 0.1% solns. of 5 acid dyes. Penetration increased with  $p_H$  value, the effect differing from dye to dye; complete penetration was obtained with Crocine Scarlet at  $p_H$  4.5, while Acid Green showed little penetration even at  $p_H$  6. Increased penetration is accompanied by loss in depth of color, which can be partially remedied by subsequent acid treatment. H. B. Merrill

Filling agents for split and patent leather with a nitro-cellulose base. A. Kraus. *Ledertech. Rundschau* 26, 6-10 (1934).—The use of carbohydrates, albumins, waxes and latex for the filling coat for patent leather is discussed. I. D. Clarke

Old and new materials for patent leather. R. Priester. *Collegium* 1934, 18-22.—Review. Linseed oil for patent leather can be thickened best by preoxidizing at a moderate temp. with an air blast and then heating in a closed vessel. I. D. Clarke

Azo dyes [for leather] (Ger. pat. 590,375) 25.

The rubber industry in 1933. Sidney A. Brazier. *Ind. Chemist* 10, 27-30 (1934).

Recent rubber latex patents. Frederick Marchionna. *Rubber Age* (N. Y.) 34, 19-20, 73-5 (1933).—Abstracts of 154 U. S. pats. on latex and its uses in manufactured products from July 1932 to date. C. C. Davis

The effect of temperature on the plasticity of rubber. R. D. Prestwich. *Trans. Inst. Rubber Ind.* 9, 196-204 (1933).—The aim of the expts. was to ascertain the effect of temp. on the plasticity of raw rubber before and after compounding. A parallel-plate plastometer was used, at temps. up to 90°. The data, which are given in detail in tables and graphs, show that, for the mixts. and temps. examd., the temp. and the plasticity ( $K$  in the Williams equation:  $K = \gamma x^n$ ) of raw rubber, and its mixts. with different proportions of china clay, C black, ZnO and whiting, are related by the equation:  $\log K + b \log t = a$ . In general when  $\log K$  is plotted against  $\log t$ , a series of parallel lines is obtained. For soft mixts.,  $b$  was const. at 0.78, while for harder mixts., e. g., heavily loaded C black mixts.,  $b$  was smaller. According to Williams (C. A. 18, 1763)  $n$  in the  $K = \gamma x^n$  equation is a const. for a given app. and procedure, while according to Griffiths (C. A. 20, 2094)  $n$  varies from 0.16 to 0.18, depending upon the rubber, and according to Cotton (C. A. 26, 872) it varies from 0.06 to 0.3, depending upon the extent of mastication. In the present work,  $n$  varied not only with the rubber mixt. but also with the temp. It was therefore const. for each sample at each temp. The variations in  $n$  followed no well-defined rule, for in some cases  $n$  increased with increase in temp., and in other cases it either diminished or rose to a max. and then diminished. The extreme values were 0.215 (for a soft rubber) and 0.042 (for a hard mixt.). C. C. Davis

Coloring rubber. Joseph Rossman. *India Rubber World* 89, No. 1, 27-8; No. 2, 27-8; 34; No. 3, 35-7 (1933).—A review of 46 U. S. pats. relating to the coloring of raw and vulcanized rubber. C. C. Davis

The coloring of rubber in the mass. R. Boxler. *India Rubber J.* 87, 11-12 (1934).—See C. A. 27, 3357.

The distinction between cured and uncured parts of cold-cured rubber. Hidemaro Endô. *J. Soc. Chem. Ind., Japan* 37, Suppl. binding 25-6 (1934).—Cold-cured and uncured rubber strips were dipped in I solns. One % solns. of I in EtOH and 0.1 N I colored the cured part dark chocolate to almost black, while a soln. of ICl did not give any distinctive effects. The uncured part showed a pale yellowish color, like that of the uncured sample. K. K.

Rubber thread. An outline of manufacturing processes used in the production of rubber thread and the performance of different types. Daniel Rhee. *Rubber Age* (N. Y.) 34, 165-6, 176 (1934).—Illustrated with photomicrographs. C. C. Davis

Captax [mercaptobenzothiazole], its history, properties, uses and advantages. Anon. *Vanderbilt News* 3, No. 4, 4-12 (1933).—A large mass of data is given in tables and graphs to show the results obtained in a wide variety of types of rubber products. C. C. Davis

(1933).—Data show the results obtainable with TiO<sub>2</sub> in place of lithopone. C. C. Davis

Bondogen. An effective solvent-activator for rubber-gasoline cements. Anon. *Vanderbilt News* 3, No. 0, 22-5 (1933).—Bondogen (patents pending) reduces the viscosity of cements, the time of premastication and churning, and makes possible a higher rubber content for a given viscosity. Graphs show the results obtainable. C. C. Davis

4. Solution properties of dried rubber. T. H. Messenger. *Trans. Inst. Rubber Ind.* 9, 190-5 (1933).—The effects of thorough drying on the soly. of raw rubber in C<sub>6</sub>H<sub>6</sub> were studied. To this end pale crepe, masticated to various degrees, was dried *in vacuo* over P<sub>2</sub>O<sub>5</sub>, and the proportion sol. in C<sub>6</sub>H<sub>6</sub> and the viscosities of solns. of different concns. were then detd. Drying brought about a considerable increase in the soln. viscosity, e. g., a 3-fold increase with lightly milled rubber, which was followed by a slower diminution to a value much below the original one. On progressive drying, an increasing proportion of the rubber became insol. in C<sub>6</sub>H<sub>6</sub>. The more the rubber was masticated, the smaller was the proportion of insol. under given conditions. This increasing insol. explains in part the diminution of the viscosity in the later stages, where solns. of lower concn. were formed. Concn. alone does not explain the phenomenon, because the viscosities of undried rubber solns. of equal concns. to those of the dried rubber solns. are disproportionately low. The increases in viscosity and in insol. components took place at progressively slower rates with increase in the mastication, e. g., with unmasticated rubber the max. viscosity was reached in 5-6 days, with lightly masticated rubber in 70 days and with normally masticated rubber in 700 days. Drying probably leads to some kind of aggregation, assocn. or polymerization of the rubber mols., even in unmasticated rubber. Such phenomenon has been considered responsible for changes in b. p. and other properties of pure liquids on being dried thoroughly (cf. Baker, C. A. 16, 2441). When solns. of undried rubber were dried by P<sub>2</sub>O<sub>5</sub> in a sp. app. which is described and illustrated, there was no increase in viscosity. C. C. Davis

Speeding up the hard rubber reaction with Vandex (selenium). Anon. *Vanderbilt News* 3, No. 6, 4-7 (1933).—Tests show the utility of Se as an accelerator in the vulcanization of hard rubber, where the scorching, gas formation, surface-marking and brittleness encountered with org. accelerators are avoided. C. C. Davis

Adhesion of rubber to brass plate metal. W. J. McCortney. *Vanderbilt News* 3, No. 6, 8-9 (1933).—An illustrated description of the technic used and the results obtained in the automobile industry. C. C. Davis

Notes on the adhesion of rubber to metal. Anon. *Vanderbilt News* 3, No. 6, 26 (1933).—Suggestions based on experience and gathered from various sources are given (cf. preceding abstr.). C. C. Davis

Reclaimed rubber. Max Kath. *India Rubber J.* 87, 103-4 (1934).—A discussion of the technological value of reclaimed rubber and methods of testing (cf. Palmer, C. A. 28, 1569<sup>a</sup>). C. C. Davis

Automobile inner tubes. Anon. *Vanderbilt News* 4, No. 1, 4-22 (1934).—Data are given to show the quality

obtainable by the use of low proportions of S, with suitable accelerators and pigments (cf. Somerville and Russell, *C. A.* 27, 3857).

**Low-sulfur and high acceleration best for heat-resisting compounds.** Anon. *Vanderbilt News* 3, No. 6, 20-1 (1933).—Further data are given on the same subject (cf. Somerville and Russell, *C. A.* 27, 3857 and preceding abstr.).

**Resin-gutta gums.** Applications of balata, gutta-percha and the lower guttas. I. Torrance Gurman. *India Rubber World* 89, No. 3, 31-2, 34 (1933).—A review and discussion.

**Synthetic rubber.** G. S. Whitby and M. Katz. *Ind. Eng. Chem.* 25, 1204-11, 1338-48 (1933); cf. *C. A.* 26, 332.—A comprehensive, crit. and historical review, with bibliography. Theoretical and practical aspects of chloroprene rubber are also discussed. The authors' expts. show that it is much less swollen by paraffin hydrocarbon than is natural rubber, and somewhat less by  $C_6H_6$  and  $CCl_4$  (cf. Hayden and Krisman, *C. A.* 28, 929<sup>4</sup>). It "freezes" at a higher temp. than natural rubber and loses strength to a greater extent on heating, but not nearly so much as does hydrocarbon synthetic rubber.

**The effect of various loading materials in vulcanized rubber.** Anon. *Vanderbilt News* 3, No. 3, 4-26 (1933).—The effects of different proportions of numerous com. fillers and pigments on the tensile strength (stress-strain), resistance to abrasion, resistance to tearing and aging of vulcanizates composed of the base mixt.: rubber 100, S 0.5, Se 0.5, 1-mercaptobenzothiazole 0.5, tetramethylthiouram disulfide 0.5 are described. The materials included channel gas black, clay,  $TiO_2$ , Mg carbonate, ZnO, lithopone, blanc fixe, "mineral rubber," 2 types of soft C black, 2 grades of natural whiting, and 2 grades of pptd.  $CaCO_3$  ("Kalite"). The complete data are recorded in tabular and graphical form.

**The effect of temperature on the tensile properties of vulcanized rubber.** Anon. *Vanderbilt News* 3, No. 5, 4-30 (1933).—An extension of a paper already published (cf. Somerville and Russell, *C. A.* 27, 6018), with numerous tables and graphs.

**Hard rubber as a covering for wood.** Johann Eggert. *Kunststoffe* 23, 276 (1933); *India Rubber J.* 87, 95-6 (1934).

**Thinning and gelation of rubber cements. Practical methods of inhibiting the effects of light and heat.** C. K. Novotny. *Ind. Eng. Chem.* 26, 170-2 (1934).—The aim of the expts. was to devise a practical way of retarding the thinning of crepe rubber cements under ordinary atm. conditions. Exposed to glass in direct sunlight, gasoline cements in most cases became solvent-thin but in a few cases gelled, while  $CCl_4$  cements all formed rigid gels. The varying phenomena in gasoline are not explained; the gelation in  $CCl_4$  is explained by a curing by ultraviolet light radiation and by Cl resulting from decompn. of  $CCl_4$ . Similar results were obtained at a slower rate in diffused light. Protection of the cements by red filters, e. g., red Cellophane wrappers, greatly prolonged the time required for them to become thin. At 50°, the cements became progressively thinner, even in darkness. Exposure in glass to diffused light, to direct sunlight and to heat of a series of gasoline cements contg. increasing proportions of rubber, masticated for correspondingly increasing times so that the viscosities of all the cements were the same, showed that under all conditions the higher the rubber content of a cement the smaller is the change in its viscosity. Varying and generally unfavorable results were obtained with antioxidants.

**Accelerators of vulcanization.** F. Jacobs. *Caoutchouc and gutta-percha* 30, 16605-7 (1933); 31, 16637-40 (1934); cf. *C. A.* 28, 367<sup>9</sup>.—The properties and behavior of Vulcaid 444, Heptene, Vulkacit T. R., Trimene, Trimene base, Vulcaid base, Vulcaid 777 and T. T. T. are described, with tabulated data.

**Studies on the combined use of two different accelerators. IV. Diphenylguanidine and dibenzothiazole disulfide.** Ichiro Aoe and Hiroshi Yokoshima. *J. Soc.*

*Rubber Ind. Japan* 6, 694-702 (1933); cf. *C. A.* 26, 1153.—By plotting the softening and m. ps. of mixts. of diphenylguanidine (I) and dibenzothiazole disulfide (II), it was found that I and II do not form a mol. compd. or a eutectic mixt. Scorching was greatest with rubber contg. a I-II mixt. corresponding to the lowest m. p. of the curve. The vulcanization efficiencies of various proportions of mixts. of I and II are given. I and II form a mol. compd. by the help of  $H_2S$ , and the results obtained with this mol. compd. are given. The formation of the mol. compd. is also possible during vulcanization, since  $H_2S$  is given off.

**Vulcanization-accelerating power of metallic salts of dithio-1-pipecolinedicarboxylic acid.** I. Tokishige Kusama and Tatsuchi Yokoyama. *Bull. Inst. Phys.-Chem. Research* (Tokyo) 12, 853-70 (1933) (Abstracts 10) (in English) published with *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 22, Nos. 457-67; *J. Soc. Rubber Ind. Japan* 6, 668-85 (1933).—Zn dithio-1-pipecolinedicarboxylic acid is an ultra-accelerator of vulcanization which requires more ZnO and S than other ultra-accelerators of the same type; the vulcanization temp., optimal time of vulcanization and the phys. properties of the vulcanized products are equal to those with other accelerators. The position of the Me group has no effect on the acceleration of vulcanization. Ingredients such as C black and  $MgCO_3$  used with the accelerator give superior phys. properties to the products. Vulcanization at less than 15 lb. per sq. in. steam pressure in the presence of  $MgCO_3$  and C black gives excellent transparent products. In the expts. described, where 1% softening agent was added, a mixt. of cyclohexyl oleate and Zn abietate was most effective.

**The manufacture of artificial horn.** Chr. Stark. *Gummi-Ztg.* 47, Nos. 51, 53, *Celluloid u. plastische Massen* 33, 1327-8, 1375-6 (1933).—A review of the chem. and mech. features.

C black (U. S. pat. 1,944,715) 18. Artificial board for use in automobile tops (U. S. pat. 1,944,533) 20. [Rubber] compns. for coating metals (Ger. pat. 590,217) 18. [Rubber] flooring material (Swed. 78,757) 20. Paint [rubber] (Belg. 397,775) 26.

Hübner, Gustavkarl, et al.: Kautschuk. Eine wirtschaftsgeographische Monographie. Berlin-Steglitz: Chem.-tech. Verlag Dr. Bodenbender. 275 pp. M. 15. Reviewed in *Rubber Chem. Tech.* 7, No. 1, vi (1934).

Rubber Compounding Materials. New York: Barrett Co. 36 pp. Free.

**Rubber latex.** The Naugatuck Chemical Co. Fr. 755,776, Nov. 30, 1933. In forming cream from fresh latex, a small amt. of a soap sol. in water is added in addn. to the usual cream-forming agent.

**Coagulating latex.** Franz Homberger. Brit. 400,969, Nov. 3, 1933. Latex is coagulated by moving a deposition surface alternately through a bath of latex and an atm. of coagulating gas in succession in the same path until a coagulated film of the desired thickness has been formed. App. is described.

**Forming rubber thread from latex or the like.** John R. Gammeter (to Revere Rubber Co.). U. S. 1,943,381, Jan. 16. A film of determinate width is formed by deposition of liquid material upon a travelling surface and the film is then withdrawn from the forming surface and twisted into a thread of round cross-section. Cf. *C. A.* 26, 2621.

**Rubber thread.** Ernest Hopkinson (to National India Rubber Co.). U. S. 1,943,436, Jan. 16. A rubber dispersion is deposited in sep. grooves (of a described app.), moisture is withdrawn from the sep. deposits, the latter are removed in the form of filaments, and a thread is formed by superposing and compacting the filaments. U. S. 1,943,437 relates to a process in which a thin, narrow band of rubber dispersion is formed continuously on a moving surface such as a rotating drum and the band is

coagulated by heating and moisture is withdrawn from it, and it is continuously folded into thread shape and covered with fibrous material. App. is described. U. S. 1,943,438 describes an app. and procedure by which a strip is formed from an aq. dispersion of rubber, the strip is folded transversely, and is rolled into a round thread. U. S. 1,943,439 involves a process in which a plurality of strips are continuously formed from liquid rubber compn., assocd. in plied formation and vulcanized, coiled transversely of the length of the material to form a thread, and covered with fibrous material. App. is described.

**Rubber threads.** International Latex Processes Ltd. Fr. 756,199, Dec. 6, 1933. Threads are made by coagulating one latex with another latex having a different  $p_H$  value, no other coagulant being used. Thus, ordinary latex protected by  $NH_3$  may be coagulated by a latex having a  $p_H$  value of 7-4.5 and prepd. by U. S. 1,699,368-9 (C. A. 23, 1308).

**Apparatus and method for making rubber bands, threads, strips and filaments from rubber dispersions.** Magyar Ruggyantaarugyar R. T. (to International Latex Processes Ltd.). Brit. 400,846, Nov. 2, 1933.

**Apparatus and method for making rubber strips from a rubber-containing liquid, e. g., an aqueous dispersion.** John R. Gammeter (to International Latex Processes Ltd.). Brit. 400,147, Oct. 19, 1933.

**Preventing aging of rubber.** I. G. Farbenind. A.-G. Ger. 588,671, Nov. 23, 1933 (Cl. 39b. 8). Addn. to 501,642 (C. A. 24, 4959). The process of 501,642 for adding indanephenols, their substitution products or salts, to natural or synthetic rubber to diminish aging, is applied to cold vulcanization processes.

**Purified rubber.** Willoughby S. Smith, Henry Jay Garnett, John N. Dean, Bernard J. Habgood and Henry C. Channon. Ger. 581,684, Aug. 1, 1933 (Cl. 39b. 2). See Brit. 320,370 (C. A. 24, 2518).

**Porous rubber.** Dunlop Rubber Co. Ltd. and The Anode Rubber Co. Ltd. Ger. 584,890, Sept. 26, 1933 (Cl. 39b. 9). See Brit. 393,022 (C. A. 28, 374) and 393,023 (C. A. 28, 374).

**Chlorinating rubber.** Chemische Fabrik Buckau. Brit. 400,898, Nov. 2, 1933. Cl is introduced into solns. of rubber of low concn. (2% or less) and viscosity and the resulting rubber chloride soln. is gradually poured into hot  $H_2O$ , which may contain substances to raise the b. p., in which is immersed a disintegrating app., whereby the solvent is evapd. and the chloride reduced to granular state. Prior to introduction into the  $H_2O$ , the soln. may be reduced in viscosity by standing, the addn. of alkali or exposure to light. In an example 35 kg. raw rubber is dissolved in 1700 kg. ethylene bromide, allowed to stand to decrease the viscosity, Cl is passed through, the soln. allowed to stand several days or treated with caustic alkali or exposed to light several hrs. and run into a vessel contg. glycerol 8 and  $H_2O$  1 part, heated to 135-140°, in which an immersed propeller runs at high speed.

**Rubber compounds.** Imperial Chemical Industries Ltd. Fr. 755,913, Dec. 1, 1933. Noninflammable rubber compounds, particularly for making flooring, are made by coating or impregnating rubber compds. with a chlorinated  $C_{10}H_8$ , contg. not less than 2 atoms of Cl per mol., e. g., the product known under the trademark "Seckay."

**Tacky rubber composition.** Harry L. Fisher (to The Dominion Rubber Co. Ltd.). Can. 336,768, Oct. 31, 1933. A highly tacky rubber compn. comprises the reaction product of 100 parts rubber and 2-5 parts of a nitroso compd. of an aromatic hydrocarbon or OH or  $NH_2$  deriv.

**Rubber objects.** Ernst Frölich. Brit. 400,001, Oct. 19, 1933. See Fr. 746,472 (C. A. 27, 4716).

**Ornamenting rubber.** Othmar Möser. Brit. 400,815, Nov. 2, 1933. Bathing caps, etc., are made by building up the articles from smooth rubber sheets, drawing over a

core, the surface of which has a pattern, vulcanizing with-out using a rigid outer mold and turning the vulcanized article inside out.

**Rubber articles.** International Latex Processes Ltd. Brit. 400,874, Nov. 2, 1933. Articles are made direct from aq. rubber dispersions by coagulation with anhydrides or halides of the lower aliphatic acids, i. e., having less than 10 C atoms, e. g., anhydrides of AcOH, propionic, butyric, iso-butyric, formylacetic, chloroacetic, acrylic, crotonic and maleic acids and Ac, propionyl, butyryl, acrylyl, crotonyl, chloroacetyl, oxalyl and malonyl chlorides and bromides. The coagulant may be mixed with adhesive materials, e. g., rubber cement, org. solns. of gelatin and glue, alc. solns. of cellulose nitrate, etc.

**Floor coverings.** Linoleum Manufacturing Co. Ltd. and Alfred A. Godfrey. Brit. 400,177, Oct. 16, 1933. Floor coverings simulating tiles are made by positioning tesserae of vulcanized rubber by a grid on a plastic backing of unvulcanized rubber, removing the grid and forcing the tesserae into the bonding material, so that the latter flows into and fills the spaces between the tesserae, and finally vulcanizing. Cf. C. A. 27, 5579.

**Compound sheet material.** Kirchbach'sche Werke Kirchbach & Co. (personally responsible partner: Max K. Kirchbach). Brit. 400,052, Oct. 19, 1933. Material for use in the manuf. of flexible disk couplings consists of fibrous material in the form of a thin fleece, which is impregnated with rubber soln., a no. of layers being then placed upon one another, pressed together and vulcanized.

**Rubber tires.** Adrian O. Abbott, Jr. (to Morgan & Wright). U. S. 1,944,389, Jan. 23. Mech. features.

**Anti-skid preparations.** Walter Josky. U. S. 1,943,917, Jan. 16. See Brit. 384,219 (C. A. 27, 5910).

**Rubber adhesives.** Walter W. Dunfield (to Naugatuck Chemical Co.). U. S. 1,943,423, Jan. 16. Adhesives suitable for uniting rubber to metals are prepd. by heating rubber for 10-20 hrs. at about 300° and mixing the treated rubber with vulcanizing ingredients and rubber cement. U. S. 1,943,424 relates to adhesives formed from "melted rubber" and Newbrough rubber in various relative proportions, together with a minor proportion of unmelted rubber, solvent and vulcanizing ingredients.

**Hardening surfaces of articles coated with rubber or like material.** Wm. C. Geer. Ger. 590,325, Dec. 30, 1933 (Cl. 39b. 3). See Brit. 320,427 (C. A. 24, 2639).

**Rubber vulcanization accelerator.** Harold A. Morton. U. S. 1,944,843, Jan. 23. An accelerator comprises the condensation product of  $\alpha$ -ethyl hexene aldehyde with aniline or other amine.

**Vulcanization accelerators.** The Rubber Service Laboratories Co. Brit. 400,990, Nov. 6, 1933. See U. S. 1,865,265 (C. A. 26, 4506). Brit. 400,991, Nov. 6, 1933. See U. S. 1,865,728 (C. A. 26, 4506).

**Apparatus for vulcanizing splices in rubber tubes.** Andrew B. Mullin (to Firestone Tire & Rubber Co.). U. S. 1,944,754, Jan. 23. Mech. features.

**Rubber vulcanization.** Carl S. Williams (to E. I. du Pont de Nemours & Co.). U. S. 1,943,570, Jan. 16. For removing water from resin type-rubber vulcanization accelerators, they are treated with a material such as CaO capable of reacting with the water present to produce a compd. non-injurious to rubber.

**Rubber vulcanization.** Joseph R. Ingram (to Rubber Service Laboratories Co.). U. S. 1,943,797, Jan. 16. Vulcanization is effected by heating the rubber with S and an accelerator in the presence of a carboxyl-substituted aromatic ketone such as acetophenone, benzophenone or a benzoylbenzoic acid which serves as a controlling agent.

**Vulcanizing tires.** Società italiana Pirelli. Brit. 400,893, Nov. 2, 1933. Addn. to 341,143 (C. A. 25, 4742).

**Rubber-like or resinous masses.** Canadian Electro Products Co. Ltd. Ger. 583,914, Sept. 12, 1933 (Cl. 39b. 4.02). Addn. to 563,792 (C. A. 27, 1236). See Brit. 295,322 (C. A. 23, 2810).

# CHEMICAL ABSTRACTS

Vol. 28

APRIL 20, 1934

No. 8

## 1—APPARATUS AND PLANT EQUIPMENT

W. L. RADGER

Porous glass fliteffs and their use. M. A. Lifshitz and B. L. Hershman. *J. Chem. Ind. (Moscow)* 1933, No. 9, 61-3.

A new microburet. M. Malmy. *Bull. soc. chim. biol.* 15, 1575-8(1933); cf. *C. A.* 27, 4959.—When the tip of a microburet is drawn out to a fine capillary to decrease the size of the drops, it is easily plugged by dust or sediment. To avoid this the tip is left larger and to its extremity a short fine glass rod is welded in such a way that the liquid runs down its outside and drops off the end, which is tapered to a diam. of approx. 0.3 mm. About 150 drops per cc. are delivered.

A vacuum distillation apparatus. G. W. Ellis. *Chemistry & Industry* 1934, 77-8.—A vacuum distn. app. is described which is convenient for fractionating small aints. of material without loss of vacuum.

An improved apparatus for receiving various fractions when fractionating liquids under reduced pressure. H. F. J. Loring and J. Kluizenaar. *Chem. Fabrik* 1934, 66-7.—A new cock is described.

Economical rapid evaporation of the most strongly foaming liquids. Ernst Jantzen and Hans Schmalfuss. *Chem. Fabrik* 1934, 61-3.—The app., to be mounted on top of the boiling flask, contains revolving blades to break the foam and a cooling coil to condense the vapor. Cf. *C. A.* 22, 4009; 23, 1186, 5079.

Eddy current cryostats. E. Justi. *Physik. Z.* 35, 3-6 (1934).—A substitute for the metal block thermostats of Henning, Holborn, etc., is described in which Hg, contained in a glass tube without feed-wires, is heated by eddy currents. This cryostat avoids the radial and vertical temp. gradients. Measurements made with this cryostat confirm its given quant. theory.

A reliable safety valve for short MacLeod manometers. W. v. Meyeren. *Z. tech. Physik* 15, 51-2(1934).—The valve prevents the Hg in the gage from entering the rest of the system.

An inexpensive Kipp generator. W. Siebeling. *Z. physik. chem. Unterricht* 46, 168(1933).—A U-tube, with the bend filled with glass beads, is used to support the Zn, marble, etc., in one arm. This arm is closed by means of a stopcock. The other end is closed by a stopper carrying a small bent tube.

Microtherm. R. A. Hanne. *Tech. Gemeindeblatt* 37, 30-2(1934).—A thermocouple having 5 leads which can be placed at different points within an autoclave, etc., is described. Temp. changes within a closed sterilizer can be followed during the course of sterilization from readings on a milliammeter.

Automatic elementary analysis. Hans Reihlen and Erwin Weinbrenner. *Chem. Fabrik* 1934, 63-6.—A detailed description of the construction and operation of a gas-fired app. for the macro- and micro-detn. of C, H, N, S and halogens in org. compds. It is completely automatic for high-boiling compds., and almost so for highly volatile substances; the accuracy is quite good, and an operator can easily make 10 C-H detns. in 8 hrs. with 1 app., or 17 detns. with 2 app.

Semi-micro apparatus for the determination of carbon and hydrogen by the method of Orthner and Reichel. J. Lindner. *Chem. Fabrik* 6, 277(1933); cf. *C. A.* 27, 3116.—Errors introduced by using PbO<sub>2</sub> are described.

Extraction apparatus permitting the simultaneous determination of water. V. Cerchez and C. Panaitescu. *Ann. chim. anal. chim. appl.* 16, 58-60(1934).—The app. described is based on the principle of the Soxhlet extrn. The vapors from the extrn. thimble pass through a vertical tube which at the top has a fairly sharp bend leading to a condenser and to another tube which is provided with a graduated scale and 2 stopcocks. When a solvent lighter than water is used, the vapors pass into the condenser and fall back into the graduated tube and the lighter solvent overflows back into the first tube. At the end, the vol. of water can be read. With a solvent heavier than water, the lower stopcocks must be opened from time to time to drain off the solvent and, at the last, to make the vol. of water extend from the zero reading upward.

The use of the spiral absorber for the determination of carbon dioxide. Harry E. Goresline. *J. Biol.* 27, 65-6 (1934).—The absorber consists of a 4-mm. glass tube approx. 15 ft. in length, wound into a close spiral and sealed to a gas delivery tube incorporating a bubble "pump." The glass spiral is inserted in a large test tube which holds the absorbing liquid, and as each bubble of gas ascends the spiral, a small amt. of the liquid (KOH) is pumped in behind it. The gas and KOH are thus in contact until all CO<sub>2</sub> is absorbed. Pressure developed during fermentation will force the gas through, or a current of CO<sub>2</sub>-free air may be used. The results agree with those of the CO<sub>2</sub>-weighing bulb.

Modern apparatus for determining hydrogen-ion concentration. A. Salmony-Karsten. *Zellstoff u. Papier* 13, 513-16(1933); *Gesundh.-Ing.* 57, 16-19(1934); *Reichstoff-Ind.* 9, 8-10; *Kautschuk* 10, 38-40.—A description of some new elec. and optical instruments for measuring pH.

Continuous transport and measurement of small quantities of gas. E. A. Müller. *Z. tech. Physik* 15, 52-4(1934).—A description is given of an app. of glass and Hg which permits the continuous and regular transport and measurement of quantities of gas between 0.1 and 15 cc./min. with an accuracy of 0.1%.

Apparatus for pyrolysis of hydrocarbon gases. Václav Jelínek. *Zprávy Ústavu pro vědecký výzkum uhlí v Praze* 4, 174-81(1932); *Chem. Obsor* 8, Abstract sect. 163; cf. *C. A.* 27, 399.—Two parallel tubes in the same oven are used alternately for pyrolysis of hydrocarbons. While pyrolysis takes place in one tube the other tube is washed with N<sub>2</sub>, the solid residue burned with O and the products of combustion washed out with N<sub>2</sub>. The alternate introduction of gases into the tubes is effected automatically by a mercury control device.

Simple apparatus for thermal gas reactions, especially for the thermal dissociation of water vapor. Heinrich Rheinboldt. *Z. physik. chem. Unterricht* 46, 58(1933).—An inverted 300-ml. Erlenmeyer flask contg. Cu wire electrodes is used. The app. can be adapted for the decomn. of CO<sub>2</sub> to CO, of org. compds. in general (CH<sub>4</sub>, C<sub>2</sub>H<sub>4</sub>, C<sub>2</sub>H<sub>6</sub>) to C<sub>2</sub>H<sub>2</sub>, of O<sub>2</sub> to form O<sub>3</sub>, etc.

Apparatus for determining the gas content of steam. H. Claassen. *Chem.-Ztg.* 58, 136-7(1934).—See *C. A.* 27, 5220.

Dräger-Schröter gas-detection equipment and its use in gas attacks. G. Stampe and G. A. Schröter. *Gas-schutz u. Luftschutz* 4, 16-18(1934).—A compact testing

set is described. In principle it cones the gas by drawing a known vol. of air-gas mixt. through silica gel by means of a small hand pump and then identifies the adsorbed gas by means of a permanganate soln. The sensitivity is about 0.015 mg. per l., and a test is made in less than 3 min.

A. L. Kibler

The Razez-Mulder color analyzer and its use for the measurement of pulp and paper color. R. S. Hatch and H. A. Hauff. *Paper Trade J.* 97, No. 26, 34-6(1933).—A discussion of the theory of color and explanation of the principles on which the Razez-Mulder color analyzer is designed, together with photographs of color curves covering a wide range of pulp and paper colors to illustrate the range and sensitivity of the instrument. A. P.-C.

A new thermocouple for the determination of temperatures up to at least 1800°. G. R. Fitterer. *Trans. Am. Inst. Mining Met. Engrs.* 105, 290-301(1933).—See C. A. 27, 2848.

Alden H. Emery

Servicing a noble-metal thermocouple. R. S. Bradley. *Heat Treating and Forging* 19, 80-1, 108-9(1933).—Practical information applicable to thermocouples used for all purposes.

Downs Schaaf

A new instrument designed for the study of combustion. C. F. Taylor, C. S. Draper, E. S. Taylor and G. L. Williams. *S. A. E. Journal* 34, 59-62T(1934).—A simple element for elec. detn. of the rate of change of pressure in a bomb or cylinder is described. H. A. B.

Calculations for furnaces with radiant roof and floor. B. K. Amerik. *Neftyanoe Khozyaistvo* 25, No. 9, 26-31(1933).—Calcs. are given for (1) detn. of the amt. of heat transferred by radiation from the flame surface and the side walls to the roof, wall and floor radiant tubes, (2) comparison of various types of furnaces, (3) detn. of direct heat transfer, and (4) radiation from floor and wall surfaces.

A. A. Boethlingk

App. for rectifying small quantities of liquefied gas (van Dijk, et al.) 2.

Griffiths, Roosevelt: Thermostats and Temperature-Regulating Instruments. London: Chas. Griffin & Co. Ltd. 157 pp. 10s. Reviewed in *Metallurgia* 9, 114(1934).

Grünwald, Alfred: Temperatur-Mess- und Regelgeräte. Berlin: Siemens & Halske.

Pressure distillation apparatus. Firma E. Merck. Ger. 589,608, Dec. 12, 1933 (Cl. 12a. 2).

Apparatus for exothermic vapor-phase catalytic reactions such as production of phthalic anhydride from naphthalene. Alphons O. Jaeger (to Selden Co.). U. S. 1,945,812, Feb. 6. Various details of construction and operation are described, of a converter having vertical catalyst tubes surrounded by a liquid bath such as molten  $\text{NaNO}_3$  and  $\text{NaNO}_2$  in which are immersed vertical heat-exchange elements through which a gaseous cooling medium such as air may be passed.

Carboy container. John J. Bach and James B. Flaws (to Merrimac Chemical Co.). U. S. 1,945,797, Feb. 6. Structural details.

Surface condenser. Bengt E. Meurk and Wm. M. Kennedy, Jr. Ger. 591,215, Jan. 18, 1934 (Cl. 17d. 5.02). This corresponds to Brit. 382,849 (C. A. 27, 5591).

Electric system, etc., suitable for the control of temperatures, etc., in industrial processes. Anker E. Krogh (to Brown Instrument Co.). U. S. 1,947,297, Feb. 13. Various details of app. and operation are described.

Thermometer. Ralph F. Schneider. U. S. 1,947,175, Feb. 13. Structural details.

Viscometer. Walter A. Nivling (to Automatic Appliance Co.). U. S. 1,945,822, Feb. 6. An app. is described in which liquid such as sizing for yarn is forced at a const. rate into an air trap in which accumulation of liquid and air pressure vary with the viscosity of the liquid so that the air pressure in the trap serves as an indication of viscosity.

1 Rotary viscometer suitable for testing liquids. Adolf Kämpf. U. S. 1,944,983, Jan. 30. Mech. details. Filters. Melitta-Werke A.-G. Brit. 400,077, Oct. 19, 1933.

Rotary-drum filter with associated suction filter. Humboldt-Deutzmotoren A.-G. Ger. 591,055, Jan. 15, 1934 (Cl. 12d. 15.02).

Gas filter (bag type). Standard Filterbau-Ges. m. b. H. Ger. 591,026, Jan. 15, 1934 (Cl. 50c. 6).

2 Filter units, comprising pleated screens with means for defining the space occupied by the screen on all sides. Cecil G. Vokes. Brit. 401,287, Oct. 30, 1933.

Apparatus suitable for filtering air. Kenneth D. Jones and Wm. R. Thomas. U. S. 1,946,744, Feb. 13.

Apparatus for filtering air or other gases. Herman A. Brassert, Arthur J. Boynton and John P. Grilli (to H. A. Brassert & Co.). U. S. 1,947,447, Feb. 20.

3 Acidproof filter plate. Toshiyuki Mizuno. Japan. 100,515, Apr. 11, 1933. A filter plate is made by casting a mixt. of acidproof stone or brick of proper grain size with acidproof cement and a liquid for hardening the cement.

Magnetic separators. Herbert Klinger. Brit. 401,301, Nov. 6, 1933.

Steam separators. Holden & Brooke Ltd. and Robert W. Brooke. Brit. 400,859, Nov. 2, 1933.

4 Apparatus for separating gases and liquids. Harry A. Ward. U. S. 1,947,366, Feb. 13. Structural and operative details are described.

Apparatus for separating mixed liquids such as oil and water by gravity. Thomas W. Barber. U. S. 1,945,766, Feb. 6. Numerous structural and operative details are described.

Apparatus for separation of ores, rocks or coal of various specific gravities by means of compressed air. József Finkey. Hung. 107,224, Sept. 1, 1933. Structural details.

Sifting apparatus. Robids Conveying Belt Co. Brit. 401,176, Nov. 9, 1933.

Drying apparatus. Abraham H. Burgess and Wm. H. Bird. Brit. 402,100, Nov. 24, 1933.

Drying apparatus. The Coe Manufacturing Co. Ger. 589,962, Dec. 20, 1933 (Cl. 82a. 1.01).

6 Band for drying apparatus. Benno Schilde Maschinenbau A.-G. Ger. 587,104, Oct. 30, 1933 (Cl. 82a. 25.01). Addn. to 532,034 (C. A. 26, 342).

Tubular drier. Maschinenfabrik Buckau R. Wolf A.-G. Ger. 587,422, Nov. 3, 1933 (Cl. 82a. 23.01). Addn. to 584,939 (C. A. 28, 9367).

Tubular drier. Fried. Krupp Grusonwerk A.-G. (Hans J. Johlige inventor). Ger. 589,543, Dec. 9, 1933 (Cl. 82a. 23.02).

7 Apparatus for drying beet slices and like organic matter with furnace gases. Oesterreichische Bamag-Büttner-Werke A.-G. Austrian 136,027, Dec. 27, 1933 (Cl. 82a).

Centrifugal apparatus for producing dry granular products from liquids. Norsk Hydro-Elektrisk Kvælstof-aktieselskab. Fr. 756,765, Dec. 15, 1933.

Rotary drying and grinding drum. Arno Andreas. Ger. 591,386, Jan. 19, 1934 (Cl. 82a. 19.02).

8 Rotary grinding and mixing apparatus. Johannes Schwarz. Ger. 591,299, Jan. 19, 1934 (Cl. 50c. 15.20).

Apparatus for mixing and rendering powdered materials homogeneous. Mikael Vogel-Jørgensen. Fr. 756,745, Dec. 14, 1933.

Apparatus for analyzing gases by measuring the thermal conductivity. United States Fire Protection Corp. Fr. 757,034, Dec. 19, 1933.

9 Porous diaphragm gas analyzer suitable for use in combustion control. John D. Morgan (to Doherty Research Co.). U. S. 1,947,303, Feb. 13. Various details of structure and automatic operation are described.

Instrument for indicating proximity of dewpoints in gases such as air. Merit Scott. U. S. 1,945,660, Feb. 6. Structural features.

Apparatus for washing, moistening, drying, cooling, heating, etc., air, gases or liquids. Sulzer Gebrüder, Akt.-Ges. Fr. 757,091, Dec. 20, 1933.

**Apparatus for controlling the admixture of gases and liquids as in treating water with chlorine.** Wm. Smalley (to Paterson Engineering Co., Ltd.). U. S. 1,945,757, Feb. 6. Structural and mech. features.

**Rotary apparatus for condensation and other treatment of fluids.** Walter J. Podbielniak. Brit. 401,484, Nov. 16, 1933. Fluids of different ds. are passed in opposite directions through a rotating spiral conduit of progressively increasing radius, the lighter fluid being introduced at the outer end and caused to travel in the direction of the inner end and the heavier fluid in the direction of increasing radius. The process may be used for absorbing the constituents of gases by liquids. App. is described.

**Centrifugal apparatus for purifying liquids.** János Bányay. Hung. 108,831, Aug. 1, 1933. Mech. details are given.

**Rotary furnaces.** Johan S. Fasting. Fr. 756,807, Dec. 15, 1933. An enlarged portion contg. canals is provided in the heating or calcination zone and has a wall permeable to gas spaced from the canals to provide a space into which the mass is introduced and from which it is distributed to the canals.

**Furnace for oxidizing lead to lead oxide.** N. A. Plotnikov. Russ. 1685, Sept. 30, 1925. Construction details.

**Lids or covers for melting-furnaces.** Wm. F. Wiltshire. Brit. 401,629, Nov. 16, 1933. Divided on 400,956 (C. A. 28, 1898<sup>3</sup>).

**Device for mixing air and gas for gas furnaces.** Pharos Feuerstätten G. m. b. H. Ger. 589,812, Dec. 16, 1933 (C. 1. 24c. 2).

**Apparatus for introducing hot air and hot furnace gas into flame furnaces.** Rekuperator G. m. b. H. Ger. 589,619, Dec. 12, 1933 (C. 1. 18b. 3).

**Tuyère for furnaces.** John C. Goss and Harry L. Crispin. U. S. 1,946,850, Feb. 13.

**Tuyère suitable for power-plant furnaces.** Herbert E. Preston (to American Engineering Co.). U. S. 1,944,948, Jan. 30.

**Tuyère plate suitable for multiple retort underfeed stokers.** James A. Drogue (to American Engineering Co.). U. S. 1,944,931, Jan. 30. Structural details.

**Heat-producing apparatus.** Tellur Ipári és Kereskedelmi R. T. Vegyészeti Gyár. Hung. 107,520, Dec. 1. An app. is described in which is effected an exothermic reaction of an active substance with water. The velocity and duration of the reaction can be regulated by the quantity of added water and the surface of the active matter.

**Heat exchangers.** Robert Kobi (to Sulzer Gebrüder, Akt.-Ges.). Brit. 400,853, Nov. 2, 1933.

**Tubes for heat exchangers.** Georg Krause. Brit. 400,513, Oct. 26, 1933.

**Field-tube heat-exchangers for heating air for drying purposes.** Sidney F. Barclay, Herbert Hoyle and Mather & Platt Ltd. Brit. 401,450, Nov. 16, 1933.

**Heat-exchange apparatus.** A. Sandberg née Mohlin (J. T. Sandberg, inventor). Swed. 75,900, Nov. 22, 1932. Mech. details of app. and operation.

**Heat-exchange apparatus of the shell and tube type suitable for use with air and water, etc.** John A. Potter (to Westinghouse Elec. & Mfg. Co.). U. S. 1,947,109, Feb. 13. Structural features.

**Tube and shell heat-exchange apparatus.** Joseph Price (to Griscom-Russell Co.). U. S. 1,946,234, Feb. 6. Structural details.

**Heat-exchange apparatus suitable for use with air, water, brine, etc.** Thomas W. Carraway and Benjamin G. Littlepage (to General Fire Extinguisher Co.). U. S. 1,945,394, Jan. 30. Structural features.

**Tubular heat-exchange apparatus suitable for cooling liquids.** John G. Kaestner (to E. A. Kaestner Co.). U. S. 1,945,402, Jan. 30. Structural details.

**Heat-exchange system for separating gases such as those of air.** Mathias Fränkl (to American Oxythermic Corp.). U. S. 1,945,634, Feb. 6. Various details of app. arrangement and operation are described.

**X-ray apparatus.** Arthur Mutscheller (to Wappler

1 Elec. Co.). U. S. 1,946,176, Feb. 6. Structural and elec. features.

**X-ray apparatus.** Wm. K. Kearsley (to General Elec. Co.). U. S. 1,946,286-7-8, Feb. 6.

**X-ray tube.** Wm. D. Coolidge (to General Elec. Co.). U. S. 1,946,312, Feb. 6.

**Apparatus for the production of x-rays.** Jean Quivy. Fr. 756,800, Dec. 15, 1933.

**Cathode-ray tubes.** Hans E. Hollmann. Fr. 756,917, Dec. 18, 1933.

**Incandescent cathode tube.** Wilhelm Ullmann and Anton Borowiec. Fr. 756,353, Dec. 8, 1933.

**Photoelectric cells.** Siegmund Strauss and Louis Weisglass. Austrian 135,851, Dec. 11, 1933 (C. 1. 21a.).

**Cathodes for vacuum photoelec. cells are made from an alloy of pure Zn with a subordinate amt. of a metal of higher photoelec. work function, e. g., Ni, Cu, Fe or Pb. The alloy may also contain Cd, Sb and Bi. Specific alloys are described.**

**Electron tubes.** Oskar Heil. Fr. 756,969, Dec. 18, 1933, and 757,011, Dec. 19, 1933.

**Electron tubes.** Telefonaktiebolaget L. M. Ericsson. Fr. 757,019, Dec. 19, 1933. Compensation arrangement.

**Electron-discharge tube.** Henry W. Parker (to Rogers Radio Tubes, Ltd.). U. S. 1,945,979, Feb. 6. Various details are described. U. S. 1,945,980 relates to a cathode-ray tube construction.

**Electron-discharge tubes.** Telefunken Ges. für drahtlose Telegraphie m. b. H. Fr. 756,340 and 756,341, Dec. 8, 1933.

**Discharge apparatus.** Eugene A. Giard (to Igranic Electric Co. Ltd.). Brit. 401,568, Nov. 16, 1933. The surface of a control electrode is composed of BeO. A control electrode, consisting of an imperforate metal sheet surrounding the filament and having apertures in the end facing the anode, is made of a Ni-Be alloy contg. approx. 2% Be. The surface is oxidized by heating in air and is again heated by a high-frequency field during exhaustion of the tube to evap. the Ni oxide. In a modification the BeO may be produced by deposition and subsequent oxidation of Be on a Ni surface.

**Electric discharge devices with arrangements for automatically controlling the temperature of the gas or vapor therein.** Albert W. Hull (to The British Thomson-Houston Co. Ltd.). Brit. 401,379, Nov. 16, 1933.

**Discharge tubes.** N. V. Philips' Gloeilampenfabrieken. Brit. 401,240, Nov. 9, 1933. Addn. to 392,796 (C. A. 27, 5223).

**Discharge tubes.** N. V. Philips' Gloeilampenfabrieken. Brit. 401,471, Nov. 16, 1933. In a gas-filled discharge tube, such as a rectifier having an incandescent cathode, the main body of each anode consists of C, particularly graphite, the surface of which is (partly) polished to prevent disintegration thereof and blackening of the tube walls.

**Positive-column gas-discharge tube.** Leo L. Beck and Aubrey E. Noble (to Claude Neon Lights, Inc.). U. S. 1,946,477, Feb. 13. A tube which radiates positive column light that appears substantially white to the eye contains a principal filling of He together with just sufficient A (suitably about 0.4%) to bleach the tan He radiation.

**Luminescent electric discharge tube.** Aubrey E. Noble (to Claude Neon Lights, Inc.). U. S. 1,946,498, Feb. 13. A tube emitting yellow light has an envelope of an external diam. of about 11-15 mm. and contg. a filling of He at a pressure of about 3-5 mm. and a cold cathode comprising the decompn. products of an alk. earth oxygenated compd. such as Ba suboxide.

**Electric discharge tubes.** N. V. Philips' Gloeilampenfabrieken. Fr. 756,662, and 756,663, Dec. 13, 1933.

**High-tension discharge tubes.** C. H. F. Müller A.-G. Fr. 756,506, Dec. 11, 1933.

**Cathode for electrical discharge devices.** Carl J. R. H. von Wedel (to Electrons, Inc.). U. S. 1,946,603, Feb. 13. A core at least the outer portion of which is Ni is helically wound with a wire such as Ni to which an electron-emitting material such as Ba nickelate is applied.

Hollow anodes for discharge devices. Elektrische Glühlampenfabriken Joh. Kremenezky A.-G. Brit. 401,542, Nov. 16, 1933. Relates to the shape of the anodes.

Water cooling arrangement for cooling discharge tubes. C. Lorenz A.-G. Brit. 401,348, Nov. 13, 1933.

Cooling structure for metallic vapor apparatus. Allgemeine Elektrizitäts-Gesellschaft (to International General Electric Co., Inc.). Brit. 401,308, Nov. 9, 1933.

Thermionic valves for very short waves. Telefunken Gesellschaft für drahtlose Telegraphie m. b. H. Brit. 401,182, Nov. 9, 1933.

Apparatus for making filaments such as those of coated metal for radio tubes. Victor Anderson and Donald G. Trutner (to Alfred Hofmann & Co.). U. S. 1,947,449, Feb. 20. Structural and mech. details.

Potentiometric apparatus suitable for recording and control. Thomas R. Harrison (to Brown Instrument Co.). U. S. 1,946,280, Feb. 6. Various structural, elec. and operative details are described.

Apparatus for indicating relative humidity. Roger Lanquetin. U. S. 1,946,702, Feb. 13.

Rotary atomizer for moistening and heating air. Soc. anon. "Imac" installations modernes pour air et chaleur. Brit. 401,902, Nov. 23, 1933.

Apparatus for detection of combustible gas. Ferenc

Lamprecht and János Schreiner. Hung. 107,149, Sep. 1, 1933. Gas escaping from a pipe or mine gas makes a catalyzer glow; this heat burns a thread or melts a metal which closes an elec. circuit leading to a signaling instrument.

Apparatus for generating combustion products under pressure, mixed with steam. Harry Causton. Brit. 401,188, Nov. 9, 1933.

Vacuum-jacketed vessels. Dudley H. Wright. Brit. 401,445, Nov. 16, 1933.

Surface condensers. Akt. Ges. Brown, Boveri & Cie. Brit. 400,437, Oct. 26, 1933.

Apparatus for removing sludge from tanks such as those used for sewage treatment. Darwin W. Townsend and James Brower (to Chain Belt Co.). U. S. 1,947,429, Feb. 13. Various mech. and operative details are described.

Device for preventing damage from fire or explosion due to injury of a receptacle for inflammable liquid. Jean Gut. Brit. 400,396, Oct. 26, 1933.

Gold-saving apparatus with traveling grizzly screen devices. General L. Covington. U. S. 1,947,035, Feb. 13. Mech. features.

Apparatus for coating pipes internally and externally. Vereinigte Stahlwerke A.-G. (Walter Neuhoß, inventor). Ger. 591,149, Jan. 17, 1934 (Cl. 75c. 6).

## 2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

Joseph Winters England. Anon. *Am. J. Pharm.* 106, 18-19(1934).—An obituary with portrait. W. G. G.

Leon Iosifovich Kordniah, 1878-1932. L. Shtrum. *Uspekhi Fiz. Nauk* 13, 970-5(1933). F. H. Rathmann

Marko T. Leko (1853-1932). M. Krajčnovic. *Arhiv Hem. Farm.* 7, 33-6(1933).—Biographical with a portrait.

Stjepan Mohorovicic. V. Njegovan. *Arhiv Hem. Farm.* 7, 129-42(1933).—Biography and bibliography with a portrait.

Boris Petrovich Orelkin. G. V. Pigulevskii. *J. Gen. Chem.* (U. S. S. R.) 3, 641-2(1933).—Obituary with portrait.

Samuel Wilson Parr. W. A. Noyes. *Trans. Ill. State Acad. Sci.* 25, No. 2, 41(1932).—A memoir.

Reality in a chemical era. Wm. J. Hale. National Fertilizer Assoc., *Proc. 9th Ann. Convention* 1933, 57-68.—An address dealing with the relation of chemistry to the changes occurring in the world's economic structure.

Apparatus for chemical instruction. H. Rheinboldt. *Z. physik. chem. Unterricht* 46, 97(1933).—Tube and crucible furnaces are cheaply made by drilling out kieselguhr bricks in an appropriate manner. An elec. arc furnace can be made by using two flower pots; the space between them is filled with kieselguhr. A thermoscope for rough measurement of heats of soln., neutralization, reaction, evapn., etc., is described. L. Waldbauer

The spinning of rayon as a school experiment. Hans Römisch. *Z. physik. chem. Unterricht* 46, 27(1933).

The relationship of general and analytical chemistry courses to the teaching of metallurgy. Eric R. Jettc. *J. Eng. Education* 24, 401-13(1934).

The blast-furnace process (lecture experiment). K. Posthumus. *Chem. Weekblad* 31, 112-13(1933).—With the aid of a flower pot a lecture expt. can be carried out to demonstrate the blast-furnace process.

Demonstration of a blast furnace. W. Heldmann. *Z. physik. chem. Unterricht* 46, 71(1933).—Two flower pots are used for the furnace.

Experiments in producing artificial smokes. W. Flörke. *Z. physik. chem. Unterricht* 46, 211(1933).

The making of a fire extinguisher. H. Römisch. *Z.*

*physik. chem. Unterricht* 46, 165(1933).—Two forms are described, one contg. an elaborate device for holding the acid in a sealed ampoule, and the other a simple one with the acid in a tube closed at one end, the other end of the tube being open, but above the  $\text{NaHCO}_3$  soln. L. W.

Silicate weathering. W. Flörke. *Z. physik. chem. Unterricht* 46, 119(1933).—The hydrolysis necessary for the weathering of silicates can easily be demonstrated by heating a pinch of finely powd. orthoclase in a hard-glass test tube on a water bath. After cooling, 2 drops of phenolphthalein soln. are added. Not all types of orthoclase are suitable. Louis Waldbauer

The reform of Russian chemical nomenclature. E. A. Shilov. *Uspekhi Khim.* 2, 760-3(1933).—Reforms in the nomenclature of inorg. compds. making the names more nearly transliterations of those used in western Europe are suggested.

Methane in the atmosphere [stratosphere]. Seitaro Suzuki. *Proc. Phys.-Math. Soc. Japan* [3], 16, 35-8(1934).—It is deduced mathematically that the max.  $\text{CH}_4$  content (0.975% ?) of the stratosphere is reached at a height of 100 km.

Content of dissolved oxygen in water of maritime Seine. P. Chauchard. *Compt. rend.* 198, 594-6(1934); cf. C. A. 27, 212.—The  $\text{O}_2$  content of the water of the estuary of the Seine increases on passing from fresh to brackish to fall slightly in the salt water of the open sea. It is reduced by the bore and incoming tide, which stir up a reducing mud, and is increased by insolation.

A method of measuring radiated energy by a thermophotometer. Maksimilijan Plotnikov. *Arhiv Hem. Farm.* 7, 170-84(184-6 in German)(1933).—The method based on the principle of transformation of the radiated into mol.-kinetic energy of a gas by means of a thin absorbing surface which is enclosed in a well-insulated container closed by a quartz plate and connected with a capillary is described. The principle is explained mathematically.

Some thermal data and the atomic weight of krypton. W. Heuse and J. Otto. *Physik. Z.* 35, 57-9(1934).—D. detns. at 15-20° indicated a value of 3.743 as the weight of a normal l. of Kr and 83.66 as its at. wt. The coeff. of expansion,  $\alpha$ , was detd. as equal to  $0.0036609 + 358 \times 10^{-7} p$ ,  $p = 1.00367 - 0.00367 p$ , when  $p$  is about 1 mm. Hg, and the factor for deviation from an ideal gas  $-0.00124$  at 0° and  $-0.00186$  at 100°.

The making of a fire extinguisher. H. Römisch. *Z.*

*physik. chem. Unterricht* 46, 165(1933).—Two forms are described, one contg. an elaborate device for holding the acid in a sealed ampoule, and the other a simple one with the acid in a tube closed at one end, the other end of the tube being open, but above the  $\text{NaHCO}_3$  soln. L. W.

Silicate weathering. W. Flörke. *Z. physik. chem. Unterricht* 46, 119(1933).—The hydrolysis necessary for the weathering of silicates can easily be demonstrated by heating a pinch of finely powd. orthoclase in a hard-glass test tube on a water bath. After cooling, 2 drops of phenolphthalein soln. are added. Not all types of orthoclase are suitable. Louis Waldbauer

The reform of Russian chemical nomenclature. E. A. Shilov. *Uspekhi Khim.* 2, 760-3(1933).—Reforms in the nomenclature of inorg. compds. making the names more nearly transliterations of those used in western Europe are suggested.

Methane in the atmosphere [stratosphere]. Seitaro Suzuki. *Proc. Phys.-Math. Soc. Japan* [3], 16, 35-8(1934).—It is deduced mathematically that the max.  $\text{CH}_4$  content (0.975% ?) of the stratosphere is reached at a height of 100 km.

Content of dissolved oxygen in water of maritime Seine. P. Chauchard. *Compt. rend.* 198, 594-6(1934); cf. C. The making of a fire extinguisher. H. Römisch. *Z.*

The atomic weights of iodine, carbon and sodium. The ratio of iodine pentoxide to sodium carbonate. Gregory P. Baxter and Arthur H. Hale. *J. Am. Chem. Soc.* 56, 615-17(1934).—The end point for the reaction of  $I_2O_5$  with  $Na_2CO_3$  was detd. with bromothymol blue after  $CO_2$  had been expelled. The ratio of  $I_2O_5:Na_2CO_3$  was 3.14950. Various at. wts. of I, C and Na are calcd. by assuming values for any 2 and computing the third. That of I is probably below 126.92 and C above 12.00.

L. P. Hall

Natural classification of chemical compounds. III. F. M. Shenyakin. *J. Gen. Chem.* (U. S. S. R.) 3, 269-78 (1933); cf. *C. A.* 27, 213.—The mol. system is qualitatively different from the at. system. The natural mol. system can be characterized as a generalized diagram of properties built according to the mol. and structural no. and the mol. symmetry. For the zero group of the Mendeleev system the conceptions of mol. and at. no. are equiv. According to the like or unlike mol. no. and symmetry there are constructed 3 basic kinds of tables, each subdivided into 3 groups. Thus are obtained the tables of 9 kinds genetically connected by "the law of centralized cube." In the normal geometrical series each mol. can be designated by a symbol detg. the interrelation of its nodal points. Comparison of the mols. in the system leads to conclusions and predictions regarding their phys. and chem. properties. The phys. consts. of mols. are basically detd. by the type of the inactive gas to which the given mol. belongs, its symmetry, the no. of atoms, the law of periodicity, the interrelation of the magnitudes of its component parts, and the no. and structure of the nodal points.

Chas. Blanc

Three-dimensional models of the potential energy of triatomic systems. C. F. Goodeve. *Trans. Faraday Soc.* 30, 60-9(1934).—The prepn. of models from laminations of plaster of Paris is described and systems  $3H$  atoms, of  $C + 2O$  and of  $2Na + Cl$  are illustrated and discussed. The distances sepg. the atoms are plotted horizontally and the potential energy is plotted vertically.

E. R. Rushton

Atomic and molecular radii. V. Poscjal. *J. phys. radium* [7], 4, 741-8(1933); cf. *C. A.* 27, 224, 5228.—Upon the basis of the previously derived formula the at. radii of Ne, Ar, Kr and Xe are calcd. as 0.92, 1.61, 3.64 and  $7.32 \times 10^{-8}$  cm., resp. These values agree well with values calcd. by others and lead to the statement of a more general approx. relationship for gases in which  $R = 0.769 + 0.002245Z^2$ .  $R$  is the at. radius and  $Z$  the at. no.

Oden E. Sheppard

Covalency, coordination and chelation. R. C. Menzies and H. Overton. *J. Chem. Soc.* 1933, 1290-4.— $Mg_2PtI$  is polymerized in boiling  $C_6H_6$ , while  $MeHgI$  and  $Et_4PbBr$  in freezing  $C_6H_6$  and  $Et_4PbCl$  in  $C_6H_6$  at room temp. are unimol. Attempts to prep. methylmercury acetylacetonate and triethyllead acetylacetonate were unsuccessful. These expts. confirm the generalization that in the organometallic derivs. of the elements from Pt to Pb, inclusive, the stability of the acetylacetonates (and similar compds.) and polymerization of the corresponding organometallic halides in  $C_6H_6$  are connected. They can be correlated by consideration of the valencies and effective coordination nos. of the metals in question.

Louise Kelley

The electronic structure of hexafluorides. Thomas G. Pearson and Percy L. Robinson. *J. Chem. Soc.* 1933, 1427-9.—The d. and the surface tension of  $SF_6$  were measured over a range of temp., and the parachor calcd. therefrom indicates that the octet valency rule is maintained in this compd., 2F atoms being attached to the S atom by covalent linkages and the remaining 4 by semipolar singlet links. The parachors of  $SeF_6$  and  $TeF_6$  reveal a structure identical with that of  $SF_6$ . A. L. H.

The valency angle of sulfur. G. M. Bennett and S. Glasstone. *J. Chem. Soc.* 1934, 128-9.—The dipole moment of thianthrene (*C. A.* 26, 2902) is confirmed and found not to be caused by effect of the solvent or by atom polarization. It is suggested that the thianthrene mol. lies in 2 planes intersecting in the line joining the 2S atoms in space, and that the mol. is flexible about this line

to some extent. This is taken as an indication of a tendency for the valency bonds of S to adopt an angle of less than  $120^\circ$ . Values of dielec. const., d., n, polarization and dipole moment are given for solns. of thianthrene in  $CCl_4$  at  $24.92^\circ$  and in  $CS_2$  at  $24.20^\circ$  and  $0.0^\circ$ .

W. B. Keighton, Jr.

Thermomagnetic study of certain salts of nickel in the solid state. A. Serres. *Ann. phys.* 20, 441-77(1933).—In addn. to her own results for several Ni salts, S. reviews the data given by other investigators. In soln., Ni salts usually obey the Curie law, with the moment of the Ni ion = 16 magnetons. In the solid states these salts obey the Curie-Weiss law approx. but show definite small deviations from it. The moment of the Ni ion is 15 or 15.5 magnetons in  $NiSO_4$  and in  $NiCl_2$ , regardless of the degree of hydration. In  $NiBr_2$  it is 16 magnetons, while in  $Ni(CN)_2$  it is much less. The results can be explained by assuming a const. paramagnetism superimposed on the paramagnetism that varies with temp. This leads to a more generalized law, expressed by  $(\chi - a)(T - \theta) = C$ . The value of  $a$ , detd. by trial, is  $425 \times 10^{-6}$  in the case of  $NiSO_4$ , both anhyd. and hydrated, and  $NiSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$ . For anhyd.  $NiCl_2$  and  $NiCl_2 \cdot 6H_2O$ ,  $a = 284 \times 10^{-6}$ .  $Ni(CN)_2$  seems to obey the simple Curie-Weiss law; hence  $a = 0$ . This const. paramagnetism cannot be attributed to the anion alone for  $a$  does not have the same value for all Ni salts, nor can it be due to the cation alone, since similar salts of Co do not show this effect. It may be due to the deformation of the Ni atom by the cation.

W. W. Stiffler

Magnetic anisotropy of graphite. K. S. Krishnan. *Nature* 133, 174-5(1934).—The magnetic susceptibilities of Ceylon graphite normal and parallel to the principal crystal axis are  $-0.4 \times 10^{-6}$  and  $-22.8 \times 10^{-6}$ , resp.

C. D. West

Experiments on adiabatic cooling of paramagnetic salts in magnetic fields. W. J. de Haas, E. C. Wiersma and H. A. Kramers. *Physica* 1, 1-13(1933); cf. *C. A.* 27, 4452.—Method and results in detail are given of expts. on cold production by demagnetization. The lowest temps. obtained were for  $CeF_3$   $0.13^\circ K.$ ,  $Dy(EtSO_4)_3 \cdot 9H_2O$   $0.12^\circ K.$ ,  $Ce(EtSO_4)_3 \cdot 9H_2O$   $0.085^\circ K.$  and  $KCr(SO_4)_3$   $0.06^\circ K.$  The use of  $KCr(SO_4)_3$ , of fairly high moment, cheap and of regular crystal system, will allow measurement of other phenomena at these low temps.

B. J. C. van der Hoeven

Dielectric-constant studies. III. Aqueous gelatin solutions. A. L. Ferguson, J. Gilbert Malone and L. O. Case. *J. Chem. Physics* 2, 94-8(1934); cf. *C. A.* 28, 9437.—Measurements were made of the dielec. const. of gelatin solns. Results of the effect of  $p_H$  on the dielec. const. agree with Bjerrum's amphoteric ion theory. The application of an equation suggested by Marinova (*C. A.* 25, 3539) indicates that the water bound by the gelatin is still partially free to show its dielec. properties. Calcns. of the mol. wt. of gelatin showed that the mols. are of graded size and of mol. wts. ranging from about 5000 to 100,000. IV. The moments of some inorganic compounds. Mary G. Malone and A. L. Ferguson. *Ibid.* 99-104.—Detn. of the moments of several inorg. compds. yielded:  $SbCl_3$  3.12,  $SbBr_3$  2.47,  $SbI_3$  1.58,  $AsI_3$  0.96,  $AsBr_3$  1.60,  $PI_3$  0.0,  $AsF_3$  2.65 and  $LiClO_4$  7.86 debyes. Solvents were  $C_6H_6$ ,  $CS_2$  or dioxane. The dielec. const. of solid  $AsF_3$  was 5.7. Fair agreement was shown by a comparison of the measured moments with values calcd. from the electronegativity of the elements deduced from measurements of the H compds. or from their periodic relationship.

Allen S. Smith

Dielectric constant of liquid iodine. Alexis Jagielski. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1932A, 327-35(in French).—The dielec. const. of liquid I was detd. by the resonance method with a condenser in which I is sepd. from the electrodes by two glass layers. The elec. cond. of I is very small and does not disturb the measurements. In the temp. range  $118.1$ – $168^\circ$  a rise of the dielec. const. from 11.08 to 12.98 is observed. Thus liquid I is one of the few liquids with a pos. temp. coeff. of dielec. const., and does not obey the laws of Clausius-Mossotti and of Debye.

J. Wiertelak

Dipole measurements with very small quantities of material. P. Cohen Henriquez. *Physica* 1, 41-52 (1933).—A micro method was devised for detg. the dipole moment of compds. in soln. The condenser used, 2 concentric glass tubes, Pt-plated, 0.5 mm. apart, holding 0.53 cc., had a capacity of 8.7  $\mu\text{F}$ ; a 2nd one of 70  $\mu\text{F}$  was used also. Wildschut transmitters for the a. c. waves were used (C. A. 26, 5803). Great care was taken to exclude all moisture. The solvent used was  $\text{C}_6\text{H}_6$  of  $\text{H}_2\text{O}$  vapor pressure equal to that of the air. With 1.4-10.9 mg. substance (0.0013-0.01 mole fraction) the  $\mu \times 10^{-18}$  (e. s. u.) was detd. of isomer I of naphthodioxan: 0.77-0.80, of isomer II 1.89-1.91. Solns. of less than 2% concn. were used to obviate d. detns. The methods of calcn. are discussed at some length, and the method based on dielec. const. and refraction is rejected, the atomic polarization being unknown and the electron polarization of false frequency. The extrapolation method for  $n$  is condemned likewise. The error in the calcn. of  $\mu$  is less than 0.5% if the equation  $\rho P_2 = (0.1889\delta - 0.567\Delta - 0.044\theta)M_{12}/f_2$  or, simplified,  $\rho P_2 = (0.189\delta - 0.57\Delta)M_{12}/f_2$  is used for  $\rho P_2$ , the mol. polarization of the solute,  $\theta$  being the difference in dielec. consts. of solvent (I) and solute (2):  $\epsilon_{12} = \epsilon_1 + \theta$ ;  $\Delta$  is obtained similarly from  $n_{12} = n_1 + \Delta$ ;  $M_{12}$  is the composite mol. wt.,  $f_2$  the solute mol. fraction. In the above equation benzene is solvent at 20° ( $n_1 = 1.501$ ). The  $\epsilon - n$  method is not sufficiently accurate for small dipoles (moment less than  $0.5 \times 10^{-18}$ ) or for temp.-coeff. detn. B. J. C. van der Hoeven

The electric dipole moments of nitrosomesitylene and of the bimolecular forms of nitrosomesitylene and 2-nitroso-2,5-dimethylhexane. Dalziel L. Hammick, Randal G. A. New and R. Branton Williams. *J. Chem. Soc.* 1934, 20-32.—The elec. dipole moments,  $\mu$ , (and also ds., dielec. consts.,  $n$ s and polarizations, at several concns.) were detd. for: nitrosomesitylene (I) (prepn. described) in  $\text{C}_6\text{H}_6$  soln. at 25°,  $\mu = 3.67 \pm 0.01$  (in e. s. u.  $\times 10^{-18}$ ); nitrosomesitylene (II) in  $\text{C}_6\text{H}_6$  soln. at 8° and 25°; 2-nitroso-2,5-dimethylhexane (III) in  $\text{CCl}_4$  soln. at 0°. By comparing  $\mu$  for I with  $\mu = 3.94$  for  $\text{PhNO}_2$ , polarizations for unimol. II are calcd. From this  $\mu$  for bimol. II is calcd.: at 8°  $\mu = 1.37 \pm 0.13$ ; at 25°,  $\mu = 1.63 \pm 0.09$ . For the dimeric form of III,  $\mu = 0.99 \pm 0.10$ . This is evidence in support of the structure  $\text{R}-\text{N} \rightarrow \text{N}-\text{R}$  for the bimol.

forms of nitroso compds. (cf. C. A. 26, 1261, 2716).

The isotherms of nitrogen between 0° and 150° at pressures up to 400 atmospheres. J. Otto, A. Michels and H. Wouters. *Physik. Z.* 35, 97-100 (1934).—From measurements at 25° intervals from 0° to 150° and with pressures from 45 to 414 atms. formulas were derived for  $p$  with  $p$  or  $d$  as the independent variable. L. P. Hall

Determining the specific gravity of liquids with a new pycnometer. J. M. Aas. *Fetchem. Umschau* 41, 3-4 (1934).—III. A 25-cc. dilatometer with a neck 3.5-4.0 mm. wide graduated in 0.01 cc. is used. After calibration for  $\text{H}_2\text{O}$ , the sp. gr. varies in the 5th decimal at temps. reading to 0.1° and vols. reading to 0.002 cc. P. Escher

Properties of liquids. James R. Pound. *Chemistry & Industry* 1934, 71-6.—The ds., viscosities, optical rotations and  $n$ s of many org. liquids kept at room temp. away from light were detd. from time to time during 11 years. L. W. T. Cummings

The optical properties of ideal solution immersion liquids. M. J. Buerger. *Am. Mineral.* 18, 325-34 (1933).—Mixts. of 2 chemically very similar liquids give rise to a series of ideal solns. whose optical properties are straight-line functions of compn. Refractive index, temp. coeff. and dispersion are discussed, and a method is given for prepg. a correction chart. A. M. Brant

Immersion liquids of intermediate refraction (1.450-1.630). Robert D. Butler. *Am. Mineral.* 18, 386-401 (1933).—A high-boiling kerosene fraction and  $\alpha\text{-C}_{10}\text{H}_7\text{Cl}$  are the end members used, constituting an optically ideal soln. series. The properties are described and presented in graphic form. A. M. Brant

Determination of specific gravity of minerals by use of index liquids. V. B. Meen. *Univ. Toronto Studies Geol. Ser.* No. 35, 47-50 (1933).—Mixts. of Thoulet's soln. and glycerol can be used as immersion media for powd. mineral. By observing whether the small particles sink or float in the layer of liquid on the microscope slide and finally by mixing two members a sp. gr. equal to the mineral is reached. By using a refractometer the  $n$  of this liquid can be obtained and the sp. gr. by referring to a calibration chart. A. M. Brant

Refractive indexes of L-ascorbic acid. Sterling B. Hendricks. *Nature* 133, 178 (1934).—A material isolated from peppers gives the characteristic absorption spectrum of L-ascorbic acid with a max. coeff. at 2650 Å. From  $\text{MeOH}$ , m. 188°,  $\alpha = 1.465$ ,  $\beta = 1.600 \pm 0.006$  and  $\gamma = 1.747$  for  $\lambda 5780$  Å. No evidence was found for structural polymorphism. Results substantiate Cox's deduction of a plane configuration for the mol., which accords with the accepted furanose ring structure. W. J. Peterson

High-frequency losses and molecular structure. P. Debye. *Physik. Z.* 35, 101-6 (1934).—The temp. rises of liquids between condenser plates proved that pure solvents with nonpolar mols. show no losses, that with polar mols. the losses increase with increasing dipole moment ( $\mu$ ) and that with compds. with the same moment they increase with the size of the mol. The "relaxation time" ( $\tau$ ) (about  $10^{-12}$  sec.) is related to the viscosity ( $\eta$ ), which is a const. to be experimentally detd.  $\tau = 4\pi a^2 \eta / kT$ , where  $a$  is a radius,  $k 1.37 \times 10^{-16}$  erg, Boltzmann's const.; and  $w = [(e + 2)/3]^2 \times (\omega^2 \tau / 2V) \times (N \mu^2 / 3kT) \times f E^2$ , where  $w$  is the heat energy (erg/cc./sec.),  $\omega$  the frequency,  $V$  the molar vol.,  $f$  the mol. fraction,  $E$  the elec. field strength,  $e$  the dielec. const.,  $N$  Avagadro's no., etc. This formula may be modified for the calcn. with mixts. L. P. Hall

Heating in the high-frequency condenser field on the ground of anomalous absorption. Heinz Haase. *Physik. Z.* 35, 68-76 (1934); cf. C. A. 26, 1838, 2910.—The temp. rises of hexyl, amyl and butyl alcs. alone and in various solns. of  $\text{C}_6\text{H}_6$  were measured in a high-frequency field, by starting at 20° and using wave lengths between 300 and 600 cm. In a high-frequency condenser field with wave lengths from 300 to 650 cm. the temp. rises at 20° were measured for hexyl, amyl and butyl alcs. and their Br derivs., for  $\text{C}_6\text{H}_6$  and  $\text{C}_6\text{H}_5\text{Me}$ , and for  $\text{C}_6\text{H}_6$  solns. of these alcs. at various concns. Absorption of energy decreased as the solns. became dil., while the resonance band became wider and the maxima shifted to shorter wave lengths. The sign and magnitude of these effects agreed in general with the Debye theory. L. P. Hall

Surface tension of liquid metals. V. The surface tension of the lead-tin alloys. L. L. Bircumshaw. *Phil. Mag.* 17, 181-91 (1934); cf. C. A. 25, 5408.—Surface tensions were detd. by the bubble-pressure method for Pb-Sn alloys over the complete compn. range at temps. from 200° to 800°. Surface tension decreases with temp. rise. The Gibbs adsorption equation was applied to obtain the adsorption of Pb at the interface of Sn-rich alloys. At all temps., the max. adsorption occurs at compns. near the eutectic compn. For an alloy of eutectic compn. the surface layer may consist of a unimol. layer of Pb atoms. E. J. Rosenbaum

Capillary ascent or depression of liquids in cylindrical tubes. II. Wide tubes. Alfred W. Porter. *Trans. Faraday Soc.* 29, 1307-9 (1933); cf. C. A. 25, 3895. By use of the equations both of Rayleigh, and Bashford and of Adams, values of the magnitudes  $k/\beta$  and  $h_0/\beta$  were calcd. for tubes for which  $r/\beta$  varies from 1 to 10 by units and for variations of angle of contact from 0° to 90° at 10° intervals. F. E. Brown

Standards for measurement of the rate of flow of liquids. Duchene. *J. usines gas* 57, 399-403, 439-46 (1933).—A review of the theory of turbulent flow and the methods of measurement of liquid flow with discussion of German and French standards. B. J. C. v. d. H.

Theory of liquid viscosity. Daniel Silverman. *Trans. Faraday Soc.* 29, 1285-94 (1933).—Previous equations for

calc. viscosity of liquids are discussed. A kinetic equation based on the assumptions of Maxwell's equation and the formation and decompn. of clusters of mols. in liquids (cybotaxis) is developed. Calc'd. viscosities are compared with accepted data. The agreement is excellent.

F. E. Brown

Heavy water inert, due to low association. Eugene C. Bingham and W. H. Stevens, Jr. *J. Chem. Physics* 2, 107-8(1934).—From viscosity considerations, it appears that deuterium oxide is less assoc'd. than ordinary  $H_2O$  and the temp. coeff. of assocn. is less.

G. M. Murphy

The relation between constitution and association, especially in reference to aromatic compounds. Eugene C. Bingham and John A. Geddes. *Physics* 5, 42-52(1934).—The fluidities and sp. vols. of  $o$ ,  $m$  and  $p$  isomers of chlorotoluene, bromotoluene, nitrotoluene, phenetidine and bromoaniline were det'd. from  $0^\circ$  to  $100^\circ$ . The degrees of assocn. are compared at equal fluidities, and the effect of chem. groups on the assocn. is discussed. By means of  $CCl_4$ ,  $CFCl_3$ , the atomic-temp. consts. of  $F$  are calc'd. to be 51.4, 54.5, 62.0 and 71.5 at fluidities of 50, 100, 200 and 300 rhes. The  $F$  atom is protective; it is less assocg. than  $H$ , and more than  $Cl$ . Substitution of a halogen atom on a  $C$  atom that also has an electropositive  $H$  atom attached increases the assocn.; substitution of an  $F$  atom on a  $C$  atom that has no  $H$  atom attached decreases the assocn.; substitution of  $F$  atoms for all the  $H$  atoms attached to a  $C$  atom decreases the assocn. G. M. P.

The viscosities of liquids and their vapor pressures. E. W. Madge. *Physics* 5, 39-41(1934).—Equations relating the viscosity and vapor pressures of liquids, and their phys. significance, are discussed. G. M. Petty

The vapor pressure of fluorine. Wm. H. Claussen. *J. Am. Chem. Soc.* 56, 614-15(1934).—The vapor pressure of  $F$  (b.  $85.2 \pm 0.1^\circ K.$ ) between 6.3 and 75.2 cm. is:  $\log P$  (cm.) =  $-462.66/T + 8.7202 - 0.01656T$ . The heat of vaporization is 1560 cal., and the entropy of vaporization is 18.3.  $F$  is a normal liquid. Albert L. Henne

Rate of evaporation of liquids in an air current. M. Tzentsherver, C. Wekerówna and Z. Majewska. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1932A, 369-82 (in German).—The rate of evapn. of  $H_2O$ ,  $C_6H_6$  and toluene is proportional to the velocity of the air current, provided the temp. in the surface layer of the liquid is const. The transition of mols. from the liquid to the gaseous phase takes place rapidly, a characteristic of a phys. phenomenon. The rate of evapn. under the conditions studied depends solely on the rate of diffusion of mols. of vapor through the film of air adhering to the surface of the liquid. J. W.

The parachors of some substituted methanes. Dalziel I. Hamrick and Harold F. Wilmut. *J. Chem. Soc.* 1934, 32-4.—For many substances that have an accumulation of neg. atoms or groups in the mol., the calc'd. parachor is greater than the observed parachor. This anomaly is not evident in the  $Cl$ -substituted methanes; it is found in  $CBR_4$  but not in  $HCBR_3$ , in  $C(NO_2)_4$  but not in  $HC(NO_2)_3$ , in  $HCPH_3$  but not in  $H_2CPh_3$ . The existence of these anomalies throws doubt on Sugden's formulation of the structures of sulfonal and trional (*C. A.* 22, 2152) based on parachor values. The following measurements were made:  $H_2CPh_3$ , d. and  $\gamma$  at  $29.9-60.0^\circ$ ,  $P_{obs.} = 419.6$ ,  $P_{calc'd.} = 419.0$ ;  $HC(NO_2)_3$ , d. and  $\gamma$  at  $20.0$  and  $25.0^\circ$ ,  $P_{obs.} = 247.0$ ,  $P_{calc'd.} = 244.2$ ;  $C(NO_2)_4$ , d. and  $\gamma$  at  $20.0-50.0^\circ$ ,  $P_{obs.} = 280.8$ ,  $P_{calc'd.} = 301.2$ ;  $C(NO_2)_4$ , in  $C_6H_6$  solns., d. and  $\gamma$  at  $25.0^\circ$ ,  $P_{soln.} = 280.0$ ,  $P_{calc'd.} = 301.2$ ;  $CBR_4$  in  $CCl_4$  solns., d. and  $\gamma$  at  $25.0^\circ$ ,  $P_{soln.} = 200.1$ ,  $P_{calc'd.} = 276.8$ .  $P_{obs.}$  for  $HCPH_3$  from the measurements of Przyluska (*C. A.* 4, 581) is 578,  $P_{calc'd.} = 591.9$ . W. B. Keighton, Jr.

Fractionation of liquid binary mixtures. II. I. Rabcewicz-Zubkowski. *Roczniki Chem.* 12, 655-61(1932).—When both components of a mixt. are unassoc'd. or are assoc'd. to the same degree, the quotient  $p_A/p_B$ , where  $p_A$  and  $p_B$  are the vapor pressures of the more ( $A$ ) and the less volatile components ( $B$ ), resp., rises with fall in temp.; this increase in  $p_A/p_B$  is usually more marked when  $A$  is unassoc'd. and  $B$  is assoc'd. When  $A$  is assoc'd.

and  $B$  unassoc'd.  $p_A/p_B$  may increase, remain const., or diminish with fall in temp. B. C. A.

Foreign materials that are capable of modifying the crystal habit of a dissolved substance when they are added to the mother liquor of a solution. L. Royer. *Compt. rend.* 198, 185-7(1934); cf. *C. A.* 24, 3686; Gaubert, *C. A.* 19, 1359-60.—It has long been known that the simple forms of crystals that originate from a soln. can vary when the soln. contains certain dissolved foreign materials. R. shows that there exist among the foreign materials, capable of modifying the crystal habit, well-defined structural relations that permit a choice in each case of the appropriate foreign material. Reuben Roseman

Modification of form of crystals grown in solution containing foreign material. L. Royer. *Compt. rend.* 198, 585-87(1934); cf. preceding abstr.—Examples of such modifications are (figures in brackets denote interionic distances in  $A.$  in the (111) plane in which in all cases all the ions in one plane are alternately metal or halogen): the production of octahedral crystals of  $NaCl$  (3.97) by addn. to its soln. of  $CdCl_2$  (3.85),  $ZnCl_2$  (3.77) or  $MnCl_2$  (3.79), while these have no effect on  $KCl$  (4.43); and of octahedral faces on crystals of both salts by addn. of  $NaNO_2$  (5.07) to aq.  $NH_4I$  (5.09), and to a smaller extent if added to aq.  $KI$  (4.97) or  $KBr$  (4.70), but not if added to  $NaCl$  (3.07). C. A. Silberrad

Preparation of crystals of sparingly soluble salts. W. Conrad Fernelius and Kenneth D. Detling. *J. Chem. Education* 11, 176-8(1934).—A method is described of prepg. fair-sized crystals of slightly sol. salts in pure condition by slow mixing (diffusion) of the requisite ions (cf. *C. A.* 8, 1373). W. C. Fernelius

The electrolytic growth of metal crystals. T. Erdey-Gruz. *Naturwissenschaften* 21, 799-800(1933).—The growth of  $Ag$  crystals was studied. A Bridgman monocrystal of 5-6 mm. was used as cathode and 2 concentric half spheres of  $Ag$  were used as anode. The expts. were followed for periods of 3-12 weeks, with  $10^{-3}$  to  $10^{-4}$  amps. No regular development was possible in  $AgNO_3$ ,  $AgClO_4$ ,  $AgF$  or  $KAg(NO_3)_2 + KNO_3$  solns.;  $Ag$  deposited on certain parts of the crystal only, other parts being "passive." In solns. of  $KAg(CN)_2 + KCN$ ,  $AgI + KI$ ,  $Ag_2O + NH_3$ ,  $AgCl + NH_3$ ,  $AgBr + NH_3$ , the electrolysis was such that the originally faceless monocrystal developed the crystal faces, most markedly in  $NH_3$  solns. The explanation is that the complex salts have better anion adsorbability with consequent blocking of the more active parts of the crystal surface; possibly also a dissolving action is exerted on the passive protective layers. The rate of growth of each crystal face is a function of the type of soln., and evidently the adsorption potential on each face depends on the anion. B. J. C. van der Hoeven

Mosaic crystals of zinc. Harold K. Schilling. *Physics* 5, 1-3(1934).—Optically mosaic crystals of 3 types were grown by the Czochralski-Gomperz method from 9 lots of pure  $Zn$ . The growth appears haphazard. H. A. B.

General theory for the pollution of binary systems. D. Balarev. *Z. anal. Chem.* 96, 81-91(1934).—The ppts. produced in the lab. are of a highly dispersed nature and take up impurities because of their "mosaic-like" structure. Classification of the possible ways in which ppts. can take up impurities forms a basis for a general theory. The probability that an "inner absorption" takes place is pointed out (cf. *C. A.* 27, 3372, 4496). W. T. H.

Diffusion of water in a zeolite crystal. Arne Tiselius. *Nature* 133, 212-13(1934).—The rehydration of partially dehydrated crystals of heulandite was observed between crossed Nicol prisms. As many as 7 black bands were observed; their displacement was proportional to the square root of the time. Gerald M. Petty

The diffusion of potassium into glass. Bela v. Lengyel. *Z. physik. Chem.* A167, 295-311(1933).—The diffusion of  $K$  from different molten salts into glass was det'd. directly by measuring the change in weight and indirectly by measuring the change in resistance. The Fick diffusion equation  $dc/dt = D^2c/x^2$  applies, where  $c = \text{conc'n.}$ ,  $t = \text{time}$ ,  $x = \text{distance from surface}$ , and  $D = \text{diffusion const.}$  The amt. of  $K$  diffused and the increase in resistance vary

linearly with  $\sqrt{t}$ . Validity of the diffusion equation is independent of the Na content of the glass. Don Brouse

Crystals and molecules as systems of mixed dimensions. D. Vorländer. *Naturwissenschaften* 21, 781-4(1933).—Cryst. fluids are discussed in relation to the spatial shape of mols. B. J. C. van der Hoeven

Solidification in pressed metal powders. W. Trzebiatowski. *Z. physik. Chem.* B24, 75-86(1934).—Finely divided Cu and Au powders were subjected to pressures as great as  $3 \times 10^4$  atm. The samples were then outgassed *in vacuo* and their d. and hardness followed as a function of pressure applied and temp. of outgassing. X-ray patterns show that the lines are broadened. G. M. Murphy

Electric conductivity of synthetic metallic bodies. W. Trzebiatowski. *Z. physik. Chem.* B24, 87-97(1934).—The elec. conductivities of Cu and Au powders prepd. as described in the preceding abstract were studied between 18° and 600°. The temp. coeffs. are pos. up to 100°, then neg. and become pos. again at 300°. These changes were also followed dilatometrically and are ascribed to adsorbed gases and recrystn. G. M. Murphy

A contribution to disintegration chemistry E. Berl and R. Schmitt. *Kolloid-Z.* 66, 87-91(1934); cf. Chwala, *C. A.* 24, 4685.—Increased reactivity on grinding is due to the formation of fragmentary particles metastable with respect to crystal particles. Difficultly sol. Fe compds. ground with  $\text{NH}_4\text{SCN}$  gave a red substance extractable by ether, indicating reaction. Alkali thiocyanates do not react. Pyrite, chalcopyrite and sphalerite with 12% Fe, gave strong reactions; sphalerite with 2% Fe, hematite, siderite and limonite gave moderately strong reaction, while rouge and fused  $\text{Fe}_2\text{O}_3$  gave none. Grinding sulfidic ores with  $\text{NH}_4$  phosphomolybdate and then digesting in  $\text{H}_2\text{O}$  gives a blue color in a short time, probably due to  $\text{H}_2\text{S}$  inclusions. Grinding sphalerite with NaCN or KCN forms turbid solns. on suspension in  $\text{H}_2\text{O}$ . The effect is not obtained with pptd. ZnS. Other substances that form complex salts, as  $\text{NaNO}_2$ ,  $\text{K}_2\text{Fe}(\text{CN})_6$ ,  $\text{K}_2\text{Fe}(\text{CN})_6$ , produce the same effect, while NaOH,  $(\text{NH}_4)_2\text{SiF}_6$  and  $\text{NH}_4$  tartrate have no effect. PbS is not peptized by KCN, because no complex forms. Arthur Fleischer

Plasticity in single crystals. H. Schlechtweg. *Physik. Z.* 34, 404-7(1933).—The classical method of calcg. plasticity fails for single crystals. The phenomenon of plastic slipping in a single crystal can be explained without assuming a mosaic structure by means of a combination of the Polanyi theory and the Prandtl model of a solid body based on the kinetic theory. B. C. A.

Methods of measuring electrolytic conductivity, without electrodes and with high frequency. E. Denina and Francesco De Paolini. *Gazz. chim. Ital.* 63, 634-54(1933); cf. De Paolini, *Nuovo cimento* 4, No. 9, cxc-cxcv(1927); *C. A.* 21, 2836.—The paper deals with measurements of the elec. cond. without polarizable electrodes, together with a crit. comparative study of the principal methods already known, including capacity, electromagnetic and high-frequency methods. The underlying principles of 3 new methods are also described: (1) a method in which a capacity is introduced into the circuit; with this, abs. measurements of good precision, particularly with liquids unstable with metal electrodes, are possible; (2) a method in which the electrolyte is placed in an electromagnetic field; the app. is termed an *electrolytic electrodynamicometer*; and (3) a *differential thermionic method*, with high frequency, involving app. similar to that of Wien, but with 2 sym. diodes. Method (1) is developed from a qual. demonstration by Scarpa of the cond. of electrolytes by electrostatic induction (cf. *C. A.* 19, 2156). In method (2) a current is induced in the electrolyte (constituting the secondary of a transformer), and measurable in several ways. C. C. Davis

The electrical conductivity of compressed graphite powder. J. Brunner and H. Hammerschmid. *Z. Elektrochem.* 40, 60-7(1934).—The elec. conductivities of powd. graphite from 20 different sources, of 72-100% purity, were detd. at pressures up to 300 kg./sq. cm. The cond. varies greatly but for any given sample under

pressures from 37 to 300 kg./sq. cm. it is roughly proportional to  $\sqrt{p}$ . Gerald M. Petty

Electric conductivity of nickel oxide. H. H. v. Baumbach and C. Wagner. *Z. physik. Chem.* B24, 59-67(1934); cf. *C. A.* 27, 4976.—The elec. cond. of NiO between 800° and 1000° increases with O pressure like that of  $\text{Cu}_2\text{O}$  and is proportional to the 4th root of O pressure between  $2 \times 10^{-4}$  and 1 atm. The thermal e. m. f. of Pt-NiO-Pt was measured between 950° and 1000° in O, air and N. Cond. of NiO is by electron defect. The excess O content is so small that its order of magnitude only can be detd. and that only indirectly from the diffusion coeff. G. M. Murphy

Electrical conductivity and diffusion in solid silver sulfide, selenide and telluride. Mechanism of the formation of these compounds from their elements. C. Tubandt, H. Reinhold and Anne-Lise Neumann. *Z. Elektrochem.* 39, 227-44(1933).—Pure solid  $\alpha\text{-Ag}_2\text{S}$ ,  $\alpha\text{-Ag}_2\text{Se}$  and  $\alpha\text{-Ag}_2\text{Te}$  conduct electrolytically, the cond. being abnormally high, although the diffusion coeffs.,  $D$ , are of the same order as those of other solid electrolytic conductors. If excess Ag is present, some metallic conduction occurs, while if free S or Se is present, the cond. is lowered. The  $\beta$ -forms are metallic conductors.  $D = 18.37e^{-1470/T}$  for  $\alpha\text{-Ag}_2\text{Se}$ ,  $3.33e^{-1500/T}$  for  $\alpha\text{-Ag}_2\text{Te}$ ,  $5.19 \times 10^{-4}$  sq. cm. per day for  $\beta\text{-Ag}_2\text{Se}$  at 107°, and  $6.86 \times 10^{-4}$  sq. cm. per day for  $\beta\text{-Ag}_2\text{Te}$  at 107°. When  $\alpha\text{-Ag}_2\text{X}$  (where X = S, Se or Te) is formed in the solid state from its elements, the Ag becomes covered with a film of  $\text{Ag}_2\text{X}$ . Further formation of  $\text{Ag}_2\text{X}$  occurs by diffusion of Ag through the  $\text{Ag}_2\text{X}$  to X, and not by diffusion of X. It is suggested that  $\text{Ag}^+$  and electrons move through the  $\text{Ag}_2\text{X}$ , and combine with X when they reach the X phase, forming  $\text{Ag}_2\text{X}$ . The excess X left in the  $\text{Ag}_2\text{X}$  layer then combines with Ag at the surface of the metallic Ag phase. B. C. A.

Electric conductivity in solid silver sulfide, selenide and telluride. C. Tubandt and H. Reinhold. *Z. physik. Chem.* B24, 22-34(1934).—Measurements of the rate of formation of  $\alpha\text{-Ag}_2\text{S}$ ,  $\text{Ag}_2\text{Se}$  and  $\text{Ag}_2\text{Te}$  indicate that these compds. are mixed conductors with electronic cond. accounting for more than 99% of the total cond. G. M. Murphy

The conduction of the electrolyte in the determination of the resistance of palladium wires containing hydrogen: notes on a reply by Donald P. Smith. C. A. Knorr and E. Schwartz. *Z. Elektrochem.* 40, 36-8(1934); cf. *C. A.* 27, 5650.—The previous explanation of this phenomenon (*C. A.* 27, 3650) is upheld. John R. Hill

Nonconducting modifications of metals. Johannes Kramer. *Ann. Physik* 19, 37-64(1934); cf. *C. A.* 27, 644.—The nonconducting modification is obtained by condensing the vapor obtained by cathode sputtering. For Sb the resistance is  $10^4$  times its normal value, the characteristic x-ray lines disappear and the resistance is no longer affected by a magnetic field. The temp. coeff. of resistance for the nonconducting modification is neg. At a characteristic temp. the resistance drops sharply and the temp. coeff. increases to its normal value. An empirical relation between normal cond. and transformation temp. is given. Louis Goldmar

Crystalline state of thin sputtered film of platinum. G. P. Thomson, Norman Stuart and C. A. Murisou. *Proc. Phys. Soc. (London)* 45, 381-8(1933).—Films of Pt sputtered in various gases were examd. by electron diffraction. They show patterns indicating that the small crystals are oriented with one face parallel to the surface of the specimen, the crystals being otherwise at random. The width of the rings formed by diffraction shows that in many cases the crystals are very small, of the order of  $5 \times 10^{-7}$  cm. Some films of  $\text{PtO}_2$  showed crystals of the order of  $2 \times 10^{-7}$  cm. B. C. A.

Optical properties of calcium aluminates and ferrites. Kei-ichi Akiyama and Gentaro Sawayama. *Bull. Waseda Applied Chem. Soc.* 21, 17-26(in English 3-4A)(1933).— $3\text{CaO} \cdot \text{Al}_2\text{O}_3$  was obtained by heating the raw mixt. at 1500° for 2 hrs. and cooling slowly. It was well sintered

and showed a greenish white color, isotropic crystals with  $n = 1.710$ . Two forms of  $8\text{CaO} \cdot 3\text{Al}_2\text{O}_3$  (I) were known heretofore, but a new form,  $\beta$ -I, was found which was made by heating the raw mixt. at  $1450-70^\circ$  for 2 hrs. and cooling slowly. It was well fused with reddish yellow color and contained no free  $\text{CaO}$  or  $\text{Al}_2\text{O}_3$ . The double refraction was very weak and the interference color was gray of the 1st order. The crystal showed gridiron twinning, wavy extinction and parallel extinction, and was optically uniaxial and neg.  $n = 1.6152 < n_1 < n_2 < 1.6175$ ,  $d = 2.70$ . Methods of prepn. and optical properties of  $\alpha$ - and  $\alpha'$ -I,  $(\text{CaO} \cdot \text{Al}_2\text{O}_3)_n$ ,  $8\text{CaO} \cdot 5\text{Al}_2\text{O}_3$ ,  $\text{CaO} \cdot \text{Fe}_2\text{O}_3$ ,  $2\text{CaO} \cdot \text{Fe}_2\text{O}_3$ , and  $(\text{CaO} \cdot \text{Al}_2\text{O}_3) \cdot \text{Fe}_2\text{O}_3$  are given. K. Kitaura

Thermal expansion of the crystal lattices of silver, platinum and zinc. R. A. Owen and E. L. Yates. *Phil. Mag.* 17, 113-31(1934); cf. *C. A.* 27, 5604.—X-ray powder photographs were taken of Ag, Pt and Zn in a vacuum camera at  $50^\circ$  intervals in the temp. range  $20-600^\circ$ . Values of the coeffs. of thermal expansion agree with previous data. The expansion of Zn was measured in the direction of, and perpendicular to, the hexagonal axis. The lattice expands to within  $4^\circ$  of the m. p. The thermal expansion of the crystal lattice is the same as that of the material as a whole. E. J. Rosenbaum

Crystal structures and expansion anomalies of  $\text{MnO}$ ,  $\text{MnS}$ ,  $\text{FeO}$ ,  $\text{Fe}_2\text{O}_3$  between  $100^\circ\text{K}$ . and  $200^\circ\text{K}$ . Bennett S. Rilefson and Nelson W. Taylor. *J. Chem. Physics* 2, 58-64(1934).—Discontinuities in the sp.-heat curves of  $\text{MnO}$ ,  $\text{MnS}$ ,  $\text{FeO}$  and  $\text{Fe}_2\text{O}_3$  are accompanied by thermal-expansion anomalies but not by polymorphic transitions.  $\text{Fe}_2\text{O}_3$  and  $\text{MnO}$  contract with increasing temp. in the range  $115-160^\circ\text{K}$ . C. D. West

An approach to an explanation of the surface work functions of pure metals. Joseph F. Chittum. *J. Phys. Chem.* 38, 79-84(1934).—The following hypothesis, with substantiation from exptl. data, is proposed to explain the net-work function: The slope of the force-distance parabola is identified with the lattice energy of the metal crystal and can be assumed equal to a const. times the electrostatic potential energy of the crystal. F. D. R.

The second principle of crystal chemistry. A. Kapustinskii. *Z. Krist.* 86, 359-69(1933).—On the basis of a general formula for the lattice energy of crystals of any structure (*C. A.* 27, 5227), there is proposed a 2nd principle of crystal chemistry which states the relation of the energetics and properties of crystals to their chem. structure by the equation:  $U = 256\eta\eta_1\eta_2\eta_3/(r_K + r_A)\text{kg.-cal.}$ , in which  $U$  = lattice energy,  $\eta$  = no. of atoms or ions,  $r_K$  and  $r_A$  = their dimensions,  $\eta_1\eta_2\eta_3$  = their valencies. This does not hold for  $\text{Ag}^+$ ,  $\text{Cu}^+$  and  $\text{Tl}^+$ , but is valid for a large no. of compds. L. S. Ramsdell

The crystal structure and the swelling of montmorillonite. Ulrich Hofmann, Kurd Rndell and Diederich Wilm. *Z. Krist.* 86, 340-8(1933).—Analysis of montmorillonite gave  $\text{SiO}_2$  49.0,  $\text{Al}_2\text{O}_3$  23.0,  $\text{Fe}_2\text{O}_3$  0.3,  $\text{CaO}$  1.8,  $\text{MgO}$  2.9,  $\text{H}_2\text{O}$  23.0. The unit cell is orthorhombic, with  $a = 5.095$ ,  $b = 8.83$  and  $c = 15.2$  Å. The structure consists of layers of double  $\text{SiO}_4$  sheets, with the free O atom of each  $\text{SiO}_4$  tetrahedron toward the center. The Al ions and OH groups are between the  $\text{SiO}_4$  sheets. The swelling with water is one-dimensional and reversible. The distance between layers varies from 19.6 Å. with over 30%  $\text{H}_2\text{O}$  to 9.8 Å. when heated to  $550^\circ$  (4.6%  $\text{H}_2\text{O}$ ). The structurally similar pyrophyllite does not swell with  $\text{H}_2\text{O}$ . L. S. Ramsdell

The x-ray diffraction of vitreous silica. B. E. Warren. *Z. Krist.* 86, 349-58(1933)(In English).—Vitreous  $\text{SiO}_2$  shows a broad diffraction ring which is attributed to the strongest line (111) of cristobalite crystals about 15 Å. in size. There are 3 objections: (a) the band is slightly displaced; (b)  $\text{SiO}_2$  glass does not show the cristobalite vol change between  $200^\circ$  and  $300^\circ$ ; (c) heat treatment does not increase the sharpness of the band, although crystallites should grow larger and the diffraction effects sharper. It is concluded that  $\text{SiO}_2$  glass consists of a non-cryst. network of  $\text{SiO}_4$  tetrahedra. Each Si is surrounded by 4 O ions, and each O is shared between two tetrahedra. Each tetrahedron has 4 nearest neighbors at 3.1 Å., and

12 next nearest neighbors at 5.0 Å. Beyond this the distances are indefinite. The intensity of scattering from such an arrangement agrees satisfactorily with the exptl. data. L. S. Ramsdell

Softening of vitreous substances. E. Rencker. *Compt. rend.* 198, 571-73(1934).—The rate of penetration of a needle subjected to a fixed pressure is plotted against temp. Penetration begins at a definite "temp. of softening," at which there is a discontinuity in the coeff. of plasticity. This temp. is slightly lower than that of rapid change in the coeff. of dilatation (cf. *C. A.* 28, 2142<sup>2</sup>). The method is illustrated by application to vitreous  $\text{Se}$ ,  $\text{B}_2\text{O}_3$ , xylonite and pollopas. C. A. Silberrad

Structure of the crystals of 12-phosphotungstic acid. J. F. Keggin. *Nature* 132, 351(1933); cf. *C. A.* 27, 5228.—The crystals of 12-phosphotungstic acid which crystallize from aq. solns. at room temp. as colorless octahedra contain 30 mols.  $\text{H}_2\text{O}$  per mol.  $\text{H}_3\text{PW}_{12}\text{O}_{40}$ . The structure is cubic, the edge of the unit cube being  $23.281 \pm 0.002$  Å. There are 8 mols. of acid in the unit cube, the centers of the acidic anions being arranged in positions corresponding to the diamond structure. The anions are  $\text{PW}_{12}\text{O}_{40}$ . The salts of 12-phosphomolybdic and 12-silicomolybdic acids have a similar structure, and their unit cubes measure approx. 23 Å. Albert L. Henne

The crystallographic and optical properties of potassium pentacalcium sulfate, and its density. F. Kröll and O. Vetter. *Z. Krist.* 86, 389-94(1933).— $\text{K}_2\text{SO}_4 \cdot 5\text{CaSO}_4 \cdot \text{H}_2\text{O}$  ("penta salt") is monoclinic. It is biaxial pos., with  $\alpha = 1.550 \pm 0.003$ ,  $\beta$  about 1.565 and  $\gamma = 1.583 \pm 0.003$ .  $2V = 85^\circ$  and  $n_g$  is 0.  $d^{25} = 2.897$ . Analysis of crystals prepd. by van't Hoff's method gave  $\text{K}_2\text{O}$  10.60,  $\text{CaO}$  32.19,  $\text{SO}_3$  55.10,  $\text{H}_2\text{O}$  2.08, sum 99.97%. In contact with  $\text{H}_2\text{O}$  it slowly changes to a porous gypsum pseudomorph. L. S. Ramsdell

Lattice constants, 1933. M. C. Neuburger. *Z. Krist.* 86, 395-422(1933).—A bibliography and tabulation of recent x-ray data for the elements (cf. *C. A.* 26, 13).

Precision measurements of the lattice constants of Carborundum. G. Borrmann and H. Seyfarth. *Z. Krist.* 86, 472-3(1933).—Precision measurements of the 2nd modification of  $\text{SiC}$ , with diamond as standard, give  $a = 3.076 \pm 0.003$  and  $c = 15.07 \pm 0.015$  Å. Calcd.  $d = 3.212$ . L. S. Ramsdell

X-ray investigation of the compounds  $\text{MgZn}$  and  $\text{MgZn}_2$ . L. Tarschisch. *Z. Krist.* 86, 423-38(1933).—The existence of  $\text{MgZn}$  is proved by x-ray data. The structure resembles that of  $\text{MgZn}_2$ . The latter has a hexagonal unit contg. 4 mols. ( $4\text{Mg} + 8\text{Zn}$ ). A similar unit for  $\text{MgZn}$ , with  $a = 5.33$  and  $c = 8.58$  Å. contains 6 mols. ( $6\text{Mg} + 6\text{Zn}$ ), but certain weak reflections indicate that the true unit cell should be doubled. For  $\text{MgZn}_2$ ,  $a = 9.92$ ,  $c = 16.48$  Å., with 16 mols.;  $D_4$ , calcd.  $d = 6.60$ . Both structures consist of alternating layers of Mg and Zn atoms. L. S. Ramsdell

The structure of silver amalgam. A. Weryha. *Z. Krist.* 86, 335-9(1933).—By adding drops of Hg to a dil. soln. of  $\text{AgNO}_3$ , prismatic crystals of  $\text{Ag}_2\text{Hg}$  were obtained. These were six-sided and proved to be cubic. Powder photographs of these crystals, and also of Ag wire dipped in Hg, indicate a unit cube with  $a = 1.09$  Å., contg. 4 mols., space group  $O_h$ . At. positions are suggested. L. S. Ramsdell

The crystalline structure of  $\text{PrMg}$ . A. Rossi and A. Iandelli. *Atti accad. Lincei* 18, 166-61(1933).—The structure of  $\text{PrMg}$  was detd. by the powder method. On the basis of the structure detd., the  $d$  is calcd. as 4.65 (4.67 detd.). The structure should be cubic with 2 atoms each of Mg and Pr at the diagonally opposite corners. The side  $a$  would then be 10.8 Å., whereas the value found for  $a = 2$  is 7.77 Å.; hence this supposed structure cannot be correct. A. W. Conteri

Crystal structure of copper sulfate. C. A. Beavers and H. Lipson. *Nature* 133, 215(1934).—The unit cell of  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$  contains 2 mols., and has the dimensions  $a_0 = 5.12$ ,  $b_0 = 10.7$ ,  $c_0 = 5.97$  Å.,  $\alpha = 82^\circ 16'$ ,  $\beta = 107^\circ$

26',  $\gamma = 102^\circ 40'$ . The only symmetry of the crystal is a center of inversion. The positions of the atoms are given.

Gerald M. Petty

The structure of thallium and potassium thiocyanates. W. Büsemm, P. Günther and R. Tubin. *Z. physik. Chem.* B24, 1-21(1934).—Contrary to the literature TICNS crystallizes in the rhombic system. The space group is  $V_h^{11}$ ;  $a = 6.80$ ;  $b = 6.78$ ;  $c = 7.52$  Å. The  $d$  is 4.958. There are 4 mols. in the elementary cell. For KCNS the space group is also  $V_h^{11}$ ;  $a = 6.67$ ;  $b = 6.65$ ;  $c = 7.54$  Å., and there are 4 mols. in the elementary cell. Although a linear CNS group is not excluded, it appears to be bent with an angle of  $125-30^\circ$ .

G. M. Murphy

Crystal structure of lanthanum, cerium and praseodymium hydrides. Armando Rossi. *Nature* 133, 174 (1934).—In these hydrides the metal atoms are closely packed in cubes of edges 5.63 Å. (La), 5.61 Å. (Ce).

C. D. West

Alkaline alkylarsonates. Gaston Gilt. *Bull. soc. chim. Belg.* 42, 443-7(1933).—Crystallographical.  $(\text{CsO})_2\text{OAsMe}_2\text{H}_2\text{O}$ , orthorhombic,  $a:b:c = 1.3074:1:1.6643$ ;  $(\text{NaO})_2\text{OAsEt}_2\text{H}_2\text{O}$ , monoclinic,  $\beta = 109^\circ 4'$ ,  $a:b:c = 2.8108:1:2.0309$ ;  $(\text{RbO})_2\text{OAsEt}_2\text{H}_2\text{O}$ , orthorhombic,  $a:b:c = 0.4518:1:0.4848$ .

A. L. H.

The crystal structure of potassium dithionate. Maurice L. Huggins. *Z. Krist.* 86, 384-8; *Am. Mineral.* 18, 455 7 (1933).—There are 2 errors in the paper by Huggins and Frank (*C. A.* 26, 4991). The K parameters for  $\text{K}_2\text{S}_2\text{O}_6$  should be  $u_k = 0.375$  and  $u'_k = 0.690$ . The proper values were used in the calcns., and it is believed that the parameters are more nearly correct than those of Hugg and Helwig (*C. A.* 26, 5468; 27, 2361).

L. S. Ramsdell

The "variable structure" of cadmium bromide. J. M. Bijvoet and W. Nieuwenkamp. *Z. Krist.* 86, 466-70 (1933).—Sublimed  $\text{CdBr}_2$  has a  $\text{CdCl}_2$  type of structure, while powder photographs of  $\text{CdBr}_2$  crystd. from aq. soln. show only a portion of the lines characteristic of the sublimed material. The lines appearing are those common to both the  $\text{CdCl}_2$  and the  $\text{CdI}_2$  types. A structure is proposed in which there is a random distribution of layers of both types. The unit cell has the dimensions  $a = 2.30$  Å. and  $c = 6.23$  Å., and contains  $1/2$  mol. Prolonged grinding of the sublimed material gives the mixed type, while the latter changes slowly at room temp. and rapidly at higher temps. to the  $\text{CdCl}_2$  type.

L. S. Ramsdell

Diamminozinc bromide Crystallographic study. S. Kozik. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1932A, 318-23.— $\text{ZnBr}_2 \cdot 2\text{NH}_3$ , like  $\text{ZnCl}_2 \cdot 2\text{NH}_3$ , crystallizes in the rhombic system. It has a rather high  $n$  and strong double refraction ( $n_\gamma - n_\alpha = 0.0608$  approx.), but only very slight dispersion in the visible region. The compds. are deposited in Leclanché cells charged with  $\text{NH}_4\text{Br}$  and  $\text{NH}_4\text{Cl}$ .

B. C. A.

Crystal structure of ferric oxychloride. S. Goldsztaub. *Compt. rend.* 198, 667-9(1934).—Rotation photographs of  $\text{FeOCl}$  show that its unit cell has  $a = 3.75$ ,  $b = 7.95$ ,  $c = 3.3$  Å. and contains 2 mols., space group  $V_h^{11}$ -mm. Coordinates of the atoms are given. The structure consists of layers, each made up of 2 (subordinate) layers of Cl atoms with 2, each of alternate Fe and O atoms, between them, Cl-Cl in the same (principle) layer being 3.3, in different layers 3.75; the perfect cleavage parallel to (010) is thus explained.

C. A. Silberrad

The index of refraction of water for waves 3-3.6 meters long. M. M. Alimova and N. S. Novosilzev. *Ann. Physik* 19, 118-20(1934).—Values of  $n_{17.0}$  correct to 0.2% are recorded as a function of wave length. No change in  $n$  occurs between 2.2 and 3.6 m.;  $n = 9.00$ .

Louis Goldman

The confining layer on lead sulfide. F. Heineck. *Physik. Z.* 35, 113-18(1934).—With inactive, doubly sublimed PbS a weak detector effect is produced by  $\text{H}_2$ ,  $\text{O}_2$ ,  $\text{N}_2$  and  $\text{CO}_2$ .  $\text{H}_2\text{S}$  has no effect, while that of  $\text{H}_2\text{O}$  (gas) is pronounced. The effects disappear on evacuation. The vapors of  $\text{C}_2\text{H}_6$ ,  $\text{Me}_2\text{CO}$  and  $\text{MeOH}$  act like  $\text{H}_2\text{O}$ . No relation was found between contact potential and rectification.

L. P. Hall

The melting point of potassium nitrite. Bela v. Lengyel. *Naturwissenschaften* 21, 848(1933).—A sample contg. 96.5%  $\text{KNO}_2$ ,  $m. 419 = 3^\circ$ . The pure salt certainly melts at a still higher temp. instead of  $297.5^\circ$  as usually reported.

B. J. C. van der Hoeven

Densities of molten inorganic nitrate mixtures. K. Laybourn and W. M. Madgin. *J. Chem. Soc.* 1934, 1-7.—The ds. of  $\text{KNO}_3$ ,  $\text{NaNO}_3$ , of binary mixts. of  $\text{KNO}_3$  with the nitrates of Na, Pb, Ba, Sr and of  $\text{NaNO}_3$  with  $\text{Pb(NO}_3)_2$ , and the ternary mixt.  $\text{KNO}_3$ - $\text{Ba(NO}_3)_2$ - $\text{Sr(NO}_3)_2$  were detd. from the f. p. to about  $150^\circ$  higher with a precision of  $\pm 0.001$  by weighing a known vol. of liquid in a Pyrex bulb. The ds. vary linearly with temp. The isothermal sp. vol.-compn. curves for the 5 binary systems deviate only slightly from straight lines.

W. B. Keighton, Jr.

Change of density of carbon disulfide and nitrobenzene with temperature. Józef Mazur. *Acta Phys. Polonica* 1, 53-62(1932)(in French); cf. *C. A.* 26, 354, 2358.

J. Wiertelak

The freezing temperature of organic substances. II Serwy. *Bull. soc. chim. Belg.* 42, 483-501(1933).—A tabulation of precise measurements of phys. properties of pure substances.  $\text{Cl(CH}_3)_2\text{Cl}$ ,  $m. -99.5^\circ$ ,  $b. 120.4^\circ$ ,  $\text{Cl(CH}_3)_2\text{Cl}$ ,  $m. -72.8^\circ$ ;  $b. 182.3^\circ$ ;  $d_4 1.11622$ ,  $d_4^{25} 1.10158$ ,  $d_4^{20} 1.08692$ ; viscosity 1928 at  $15^\circ$ , 1481 at  $30^\circ$ ;  $\eta$  at  $15^\circ$  1.45858,  $\eta_{25} 1.45903$ ,  $\eta$  He yellow 1.46101,  $\eta$  He green 1.46075,  $\eta$  1.46801,  $\eta$  He blue 1.47180,  $\eta$  1.47681,  $\text{Br(CH}_3)_2\text{Br}$ ,  $m. -34.2^\circ$ ,  $b. 167.34^\circ$ ;  $d_4 2.01618$ , 1.98922 and 1.96238; viscosities 2241 and 1746;  $\eta$  1.52121, 1.52174, 1.52546, 1.53252, 1.53416, 1.53932 and 1.54051,  $\text{Br(CH}_3)_2\text{Br}$ ,  $m. -39.5^\circ$ ,  $b. 222.3^\circ$ ,  $b_{12} 99^\circ$ ;  $d_4 1.72952$ , 1.70876 and 1.68788; viscosities 3888 and 2818,  $\eta$  1.50908, 1.50960, 1.51311, 1.51970, 1.52131, 1.52634 and 1.53072;  $\text{NC(CH}_3)_2\text{CN}$ ,  $m. -29.45^\circ$ ,  $b_{12} 160.4^\circ$ ,  $d_4 1.00293$ , 0.99112 and 0.97930; viscosities 8104 and 5226,  $\eta$  1.43426, 1.43461, 1.43699, 1.44137, 1.44242, 1.44573 and 1.45048;  $\text{NC(CH}_3)_2\text{CN}$ ,  $m. -31.4^\circ$ ,  $b_{12} 177.8^\circ$ ,  $d_4 0.96181$ , 0.95070 and 0.93961; viscosities 9080 and 5791,  $\eta$  1.44010, 1.44044, 1.44278, 1.44721, 1.44816, 1.45167 and 1.45721;  $\text{HO}_2\text{C(CH}_3)_2\text{CO}_2\text{H}$ ,  $m. 134.8^\circ$ ;  $\text{HO}_2\text{C(CH}_3)_2\text{CO}_2\text{H}$ ,  $m. 98.0^\circ$ ;  $\text{HO}_2\text{C(CH}_3)_2\text{CO}_2\text{H}$ ,  $m. 153.0^\circ$ ;  $\text{HO}_2\text{C(CH}_3)_2\text{CO}_2\text{H}$ ,  $m. 105.7^\circ$ ;  $\text{EtO}_2\text{C(CH}_3)_2\text{CO}_2\text{Et}$ ,  $m. -23.80^\circ$ ,  $b. 233.68^\circ$ ,  $b_{12} 117.6^\circ$ ;  $d_4 1.04202$ , 1.02704 and 1.01210; viscosities 3260 and 2311;  $\eta$  1.42294, 1.42333, 1.42570, 1.42982, 1.43080, 1.43382 and 1.43820;  $\text{EtO}_2\text{C(CH}_3)_2\text{CO}_2\text{Et}$ ,  $m. -19.9^\circ$ ,  $b_{12} 131^\circ$ ,  $d_4 1.02589$ , 1.01165 and 0.99744; viscosities 3871 and 2618,  $\eta$  1.42673, 1.42708, 1.42924, 1.43362, 1.43463, 1.4378, and 1.44335;  $\text{PrO}_2\text{CCH}_2\text{CO}_2\text{Pr}$ ,  $m. \text{about } -95^\circ$ ,  $b. 229.2^\circ$ ,  $b_{12} 113^\circ$ ;  $d_4 1.02929$ , 1.01453, 0.99977; viscosities 3161 and 2230;  $\eta$  1.41967, 1.42010, 1.42243, 1.42660, 1.42768, 1.43092 and 1.43569;  $\text{PrO}_2\text{C(CH}_3)_2\text{CO}_2\text{Pr}$ ,  $m. -45.5^\circ$ ,  $b. 264.9^\circ$ ,  $b_{12} 142.4^\circ$ ;  $d_4 1.00766$ , 0.99385, 0.98001; viscosities 4437 and 3033;  $\eta$  1.42723, 1.42760, 1.42990, 1.43420, 1.43521, 1.43848 and 1.44144;  $\text{PrO}_2\text{C(CH}_3)_2\text{CO}_2\text{Pr}$ ,  $m. -34^\circ$ ,  $b_{12} 165.8^\circ$ ;  $d_4 0.98676$ , 0.97371, 0.97074, viscosities 5017 and 4019;  $\eta$  1.43224, 1.43247, 1.43485, 1.43914, 1.44015, 1.44312 and 1.44890;  $\text{BuO}_2\text{CCH}_2\text{CO}_2\text{Bu}$ ,  $m. -83^\circ$ ,  $b. 251.5^\circ$ ,  $b_{12} 137.4^\circ$ ;  $d_4 0.990930$ , 0.98760, and 0.97191; viscosities 3873 and 2682;  $\eta$  1.42520, 1.42664, 1.42792, 1.43218, 1.43324, 1.43658 and 1.44133;  $\text{BuO}_2\text{C(CH}_3)_2\text{CO}_2\text{Bu}$ ,  $m. -60.6^\circ$ ,  $b. 292.8^\circ$ ,  $b_{12} 162.9^\circ$ ,  $d_4 0.98534$ , 0.97227 and 0.95922; viscosities 5424 and 3659;  $\eta$  1.43147, 1.43189, 1.43426, 1.43845, 1.43955, 1.44279 and 1.44443;  $\text{BuO}_2\text{C(CH}_3)_2\text{CO}_2\text{Bu}$ ,  $m. -30.5^\circ$ ,  $b_{12} 188.0^\circ$ ;  $d_4 0.97509$ , 0.96295 and 0.95084; viscosity 8214 and 5262;  $\eta$  1.43460, 1.43673, 1.43910, 1.44344, 1.44445, 1.44771 and 1.45283;  $\text{AmO}_2\text{CCO}_2\text{Am}$ ,  $m. -9^\circ$ ,  $b_{12} 154.1^\circ$ ;  $d_4 0.98404$ , 0.97050 and 0.95718; viscosity 4983 and 3330;  $\eta$  1.42789, 1.42825, 1.43063, 1.43607, 1.43606, 1.43934 and 1.44496;  $\text{AmO}_2\text{CCCH}_2\text{CO}_2\text{Am}$ ,  $m. -60.0^\circ$ ,  $b_{12} 162.4^\circ$ ;  $d_4 0.97853$ , 0.96550 and 0.95234, viscosities 5297 and 3642;  $\eta$  1.43041, 1.43080, 1.43316, 1.43748, 1.43847, 1.44180, 1.44293;  $\text{AmO}_2\text{C(CH}_3)_2\text{CO}_2\text{Am}$ ,  $m. -35.1^\circ$ ,  $b_{12} 180.8^\circ$ ;  $d_4 0.97607$ , 0.96367 and 0.95133; viscosities 8375 and 5308;  $\eta$  1.43597, 1.43631, 1.43868, 1.44513, 1.44411, 1.44740 and 1.45293;  $\text{AmO}_2$

6  $\text{CO}_2\text{Et}$ ,  $m. -23.80^\circ$ ,  $b. 233.68^\circ$ ,  $b_{12} 117.6^\circ$ ;  $d_4 1.04202$ , 1.02704 and 1.01210; viscosities 3260 and 2311;  $\eta$  1.42294, 1.42333, 1.42570, 1.42982, 1.43080, 1.43382 and 1.43820;  $\text{EtO}_2\text{C(CH}_3)_2\text{CO}_2\text{Et}$ ,  $m. -19.9^\circ$ ,  $b_{12} 131^\circ$ ,  $d_4 1.02589$ , 1.01165 and 0.99744; viscosities 3871 and 2618,  $\eta$  1.42673, 1.42708, 1.42924, 1.43362, 1.43463, 1.4378, and 1.44335;  $\text{PrO}_2\text{CCH}_2\text{CO}_2\text{Pr}$ ,  $m. \text{about } -95^\circ$ ,  $b. 229.2^\circ$ ,  $b_{12} 113^\circ$ ;  $d_4 1.02929$ , 1.01453, 0.99977; viscosities 3161 and 2230;  $\eta$  1.41967, 1.42010, 1.42243, 1.42660, 1.42768, 1.43092 and 1.43569;  $\text{PrO}_2\text{C(CH}_3)_2\text{CO}_2\text{Pr}$ ,  $m. -45.5^\circ$ ,  $b. 264.9^\circ$ ,  $b_{12} 142.4^\circ$ ;  $d_4 1.00766$ , 0.99385, 0.98001; viscosities 4437 and 3033;  $\eta$  1.42723, 1.42760, 1.42990, 1.43420, 1.43521, 1.43848 and 1.44144;  $\text{PrO}_2\text{C(CH}_3)_2\text{CO}_2\text{Pr}$ ,  $m. -34^\circ$ ,  $b_{12} 165.8^\circ$ ;  $d_4 0.98676$ , 0.97371, 0.97074, viscosities 5017 and 4019;  $\eta$  1.43224, 1.43247, 1.43485, 1.43914, 1.44015, 1.44312 and 1.44890;  $\text{BuO}_2\text{CCH}_2\text{CO}_2\text{Bu}$ ,  $m. -83^\circ$ ,  $b. 251.5^\circ$ ,  $b_{12} 137.4^\circ$ ;  $d_4 0.990930$ , 0.98760, and 0.97191; viscosities 3873 and 2682;  $\eta$  1.42520, 1.42664, 1.42792, 1.43218, 1.43324, 1.43658 and 1.44133;  $\text{BuO}_2\text{C(CH}_3)_2\text{CO}_2\text{Bu}$ ,  $m. -60.6^\circ$ ,  $b. 292.8^\circ$ ,  $b_{12} 162.9^\circ$ ,  $d_4 0.98534$ , 0.97227 and 0.95922; viscosities 5424 and 3659;  $\eta$  1.43147, 1.43189, 1.43426, 1.43845, 1.43955, 1.44279 and 1.44443;  $\text{BuO}_2\text{C(CH}_3)_2\text{CO}_2\text{Bu}$ ,  $m. -30.5^\circ$ ,  $b_{12} 188.0^\circ$ ;  $d_4 0.97509$ , 0.96295 and 0.95084; viscosity 8214 and 5262;  $\eta$  1.43460, 1.43673, 1.43910, 1.44344, 1.44445, 1.44771 and 1.45283;  $\text{AmO}_2\text{CCO}_2\text{Am}$ ,  $m. -9^\circ$ ,  $b_{12} 154.1^\circ$ ;  $d_4 0.98404$ , 0.97050 and 0.95718; viscosity 4983 and 3330;  $\eta$  1.42789, 1.42825, 1.43063, 1.43607, 1.43606, 1.43934 and 1.44496;  $\text{AmO}_2\text{CCCH}_2\text{CO}_2\text{Am}$ ,  $m. -60.0^\circ$ ,  $b_{12} 162.4^\circ$ ;  $d_4 0.97853$ , 0.96550 and 0.95234, viscosities 5297 and 3642;  $\eta$  1.43041, 1.43080, 1.43316, 1.43748, 1.43847, 1.44180, 1.44293;  $\text{AmO}_2\text{C(CH}_3)_2\text{CO}_2\text{Am}$ ,  $m. -35.1^\circ$ ,  $b_{12} 180.8^\circ$ ;  $d_4 0.97607$ , 0.96367 and 0.95133; viscosities 8375 and 5308;  $\eta$  1.43597, 1.43631, 1.43868, 1.44513, 1.44411, 1.44740 and 1.45293;  $\text{AmO}_2$

$C(CH_3)_3CO_2Am$ , m.  $-28.9^\circ$ ,  $b_{74}$  213.4–3.5°;  $d$  0.95879, 0.94671 and 0.93471; viscosities 9428 and 5911.

Albert L. Henne

The adsorption of carbon dioxide by activated charcoals in the presence of carbon tetrachloride and hydrogen cyanide. R. Chaplin. *Trans. Faraday Soc.* 30, 249 (1934); cf. *C. A.* 23, 1331; 25, 5328.—The low-pressure  $CO_2$  isothermals at  $25^\circ$  were detd. for several different active charcoals in the presence of  $CCl_4$  and of HCN adsorbed singly and together. The vapors adsorbed singly impede but do not change the nature of the adsorption process for  $CO_2$ ; when adsorbed together, however, they suppress the irreversible adsorption of  $CO_2$  completely and allow only superimposed simple adsorption. The theory is advanced that neither  $CCl_4$  nor HCN adsorbed singly can completely occupy all the active points on the charcoal surface because their moles. are too large. This theory is based mainly on considerations of the adsorption and displacement of  $CO_2$  at low pressures but is supported by other facts.

Reuben Roseman

Determination of adsorptive power of activated charcoal for methylene blue and iodine from aqueous solutions. E. Erdheim. *Kocsniki Chem.* 12, 888–95 (1932).—A standard method and app. are described. B. C. A.

Studies in chemisorption on charcoal. II. Experiments on the formation of the acid constituent of charcoal. Alexander King. *J. Chem. Soc.* 1934, 22–6; cf. *C. A.* 27, 1980.—Addnl. expts. on the formation of some org. acid on exposure of moist charcoal to O led to the conclusion that acid formation results from the oxidation of chemically adsorbed water. A thoroughly dried charcoal after exposure to  $O_2$  for 3 days and subsequent evacuation evolved only CO when heated to  $470^\circ$ ; furthermore, placing such an O-satd. and thoroughly dried charcoal sample in water resulted in no acid formation. P. H. Emmett

Adsorption of hydrogen on tungsten. J. K. Roberts. *Proc. Cambridge Phil. Soc.* 30, 74–9 (1934); cf. *C. A.* 28, 1233.—The accommodation coeff. of Ne on W having been detd., a new type of adsorption of H on W can be studied. The characteristics of this are (1) satn. is reached at max. pressures of H of  $4 \times 10^{-4}$  mm.; (2) even at this pressure the time taken for satn. is small. This indicates a chem. nature. The accommodation coeff. for such a H-covered W filament is 0.17 at  $295^\circ K.$  and 0.32 at  $79^\circ K.$

Gregg M. Evans

Adsorption of benzene vapors from air by alkaline, neutral and acid silica gels. M. O. Kharmandar'yan and I. L. Kopeliovich. *Ukrain. Khim. Zhur.* 8, Wiss. Teil 21–31 (1933).— $SiO_2$  gels in acid, neutral and alk. medium were prepd. from a 13°Bé. water glass and a 10% HCl soln. Acid gels are hard, translucent and possess a fine structure, but they are less active (static adsorption of  $C_6H_6$  vapors) than alk. gels, which are soft, turbid and possess a coarse structure. Drying alk. gels before washing decreases their activity approx. 5 times while drying neutral and acid gels is beneficial. Washing with hot water is recommended. Activity of alk. gels is improved by HCl treatment and that of acid gels by  $NH_3$  treatment. The degree of improvement is greater the further the gel is from neutrality. Neutral gels are not improved by such treatment. Dynamic methods of testing gels show that acid gels are more active than alk. gels, which is the reverse of results obtained by static methods.

V. A. Kalichevsky

Effect on the activity of alumina gels of the relative proportions of reagents used in their preparation. V. K. Markov. *Ukrain. Khim. Zhur.* 8, Wiss. Teil 34–5 (1933).— $Al_2O_3$  gels prepd. from  $Al_2(SO_4)_3$  and 25%  $NH_3$  soln. show greatest activity (adsorption of  $C_6H_6$  vapors) for definite  $Al_2(SO_4)_3/NH_3$  ratios. V. A. Kalichevsky

Adsorption and catalysis on alumina. Guichard. *Compt. rend.* 198, 573–5 (1934).— $Al_2O_3$  was prepd. by pptn. of  $NaAlO_2$  with HCl and drying at  $500^\circ$ . The adsorption of  $H_2O$ ,  $EtOH$  and  $Et_2O$  by this  $Al_2O_3$  separately was detd. for various temps. at const. pressure, and at various pressures at const. temp. At  $240^\circ$  (the usual temp. for dehydrating  $EtOH$  by catalysis) adsorption of  $H_2O$  and  $Et_2O$  is practically nil, while that of  $EtOH$  is still

appreciable, its dehydration being thus accelerated. This explains the action on the assumption that adsorption occurs when the 3 vapors are present simultaneously as when they are separate (cf. *C. A.* 20, 2274; Senderens, *C. A.* 6, 1607).

C. A. Silberrad

The adsorption of neon on glass at liquid-hydrogen temperatures. W. H. Keesom and G. Schmidt. *Proc. Acad. Sci. Amsterdam* 36, 825–32 (1933).—Between  $14.45^\circ$  and  $20.28^\circ K.$ , the adsorption of Ne on glass is given by the equation:  $q^s = p/[0.7(p_s - p) + p]$ , in which  $q$  is the fraction of wall covered (for a monomol. layer),  $p$  is the pressure and  $p_s$  the satd. vapor pressure.

L. E. S.

An apparatus for rectifying small quantities of liquefied gas, and the purification of krypton. H. van Dijk, J. Mazur and W. H. Keesom. *Proc. Acad. Sci. Amsterdam* 36, 822–5 (1933).

L. E. Steiner

Isothermals of helium at temperatures of  $0^\circ$ ,  $20^\circ$  and  $100^\circ$  and pressures from 5.5 to 16.5 atmospheres. W. H. Keesom and J. J. M. van Santen. *Proc. Acad. Sci. Amsterdam* 36, 813–21 (1933).—From the isothermals of He, the values of  $B$  in the Onnes equation of state were found at  $0^\circ$ ,  $20^\circ$  and  $100^\circ$  to be  $0.502 \times 10^{-3}$ ,  $0.498 \times 10^{-3}$  and  $0.481 \times 10^{-3}$ , resp.

L. E. Steiner

Measurements on the adsorption of helium on glass at liquid-helium temperatures. W. H. Keesom and G. Schmidt. *Proc. Acad. Sci. Amsterdam* 36, 832–5 (1933).—The adsorption of He on glass between  $1.13^\circ$  and  $3.56^\circ K.$  is given by the equation:  $q^s = p/[0.26(p_s - p) + p]$ , in which  $q$  is the fraction of wall covered (for a monomol. layer),  $p$  is the pressure and  $p_s$  the satd. vapor pressure.

L. E. Steiner

Adsorption of hydrogen atoms and iodine on calcium fluoride. J. H. de Boer and J. J. Lehr. *Z. physik. Chem.* B24, 98–102 (1934); cf. *C. A.* 28, 18.—Adsorption of I atoms, and H atoms on  $CaF_2$  layers sublimed *in vacuo* shows that if the surface of the salt is not too great, twice as much H as I is adsorbed. For large surfaces the H does not penetrate the interior of the  $CaF_2$  and much smaller amts. of I are adsorbed.

G. M. Murphy

The partition of small quantities of substances between liquid and crystalline solid phases. I. The distribution of barium nitrate between a saturated aqueous solution and crystals of lead nitrate. A. Polissitskiĭ. *Z. physik. Chem.* A167, 304–9 (1934).—It is shown that the Nernst law applies to the distribution of small quantities of  $Ba(NO_3)_2$  between satd. solns. and crystals of  $Pb(NO_3)_2$ . A method was developed for detg. small quantities of Ba in satd. solns. of  $Pb(NO_3)_2$  by means of radioactive indicators.

Roy H. Baechler

Relation between ascent of colloidal particles in porous substances and their adsorption by such. A. Boutaric and M. Peyraud. *Compt. rend.* 198, 651–2 (1934).—The velocity of ascension,  $v$ , in vertical strips of filter paper, and the adsorption-concn.,  $\sigma$ , were detd. for a mixt. consisting of a sol of  $As_2S_3$  or  $Fe(OH)_3$  dild. with  $H_2O$  or with aq. NaCl or  $FeCl_3$ , resp. With  $As_2S_3$  and  $H_2O$   $\sigma$  is zero; it increases, while  $v$  decreases, with the concn. of NaCl. With  $Fe(OH)_3$  and  $FeCl_3$   $v$  increases to a max. and then decreases as the concn. of  $FeCl_3$  increases, while  $\sigma$  changes in reverse fashion. Colloidal dyes with neg. granules behave as  $As_2S_3$ , those with pos. as  $Fe(OH)_3$ ,  $v$  always varying oppositely to  $\sigma$  (cf. *C. A.* 28, 1245°).

C. A. Silberrad

Adsorption of mercury vapors by some adsorbents and catalysts, and amalgam of manganese peroxide. E. V. Alekseevskii. *J. Gen. Chem.* (U. S. S. R.) 3, 360–6 (1933).—Weighed samples of the adsorbents and catalysts were placed in containers on a wire gauze resting on a glass crystg. dish  $1/2$  filled with the purified and redistd. Hg, the whole being inserted in a desiccator contg. a thick layer of  $P_2O_5$ . The adsorption of Hg was detd. by chem. analysis once every year. The results of 5 years' exposure are shown by the increase in wt. and the analysis: animal charcoal (Merck) 1.04, 0.06; activated C (Kahlbaum) 0.04, 0.045; American "charcoal" 0.07, 0.04; activated  $Al_2O_3$  0.05, traces; "Adelheim" clay 0.02, none; activated  $MnO_2$  72.5, 41.8;  $CoO$  1.45, 1.05 and Zn dust

(Kahlbaum) 0.09%, 0.017%. The microscopic investigation of  $\text{MnO}_2$  contg. 42% of adsorbed Hg disclosed a uniform mass without any globular agglomeration of Hg. The activated  $\text{MnO}_2$  kept for 105 days in the lab. hood contg. 0.000006 mg. Hg per 1 cu. m. of air adsorbed 0.015% Hg. The high Hg-adsorptive activity of  $\text{MnO}_2$  is made clear by its ability to give amalgam with Hg by grinding. The amalgamation takes place in all proportions after a short time of grinding in an instant without any thermal effect, giving off a peculiar odor strongly irritating to the mucous membrane of the nose. The inactivated (natural)  $\text{MnO}_2$  does not show Hg-adsorptive ability and gives no amalgam with Hg. Chas. Blanc

The vaporous state of myristic acid films on aqueous solutions. S. A. Moss and E. K. Rideal. *J. Chem. Soc.* 1933, 1525-8.—By means of special app. the lowering of the surface tension of water by films of myristic acid was measured at 17°. The following relation was realized:  $FA = \pi RT$ , where  $F$  is the lowering of the surface tension and  $A$  is the reciprocal of the surface concn.  $\pi$  was found to be 0.5, from which it is inferred that long-chain fatty acids below their crit. temp. exist as assoc. complexes of 2 mols., which are extremely stable. J. H. Reedy

Theory of Brownian motion and the operational method. J. Métadier. *Compt. rend.* 197, 29-31(1933); cf. *C. A.* 27, 647.—Math. B. C. A.

Observation of Brownian movement with the unaided eye. N. N. Andreev. *Compt. rend. acad. sci. U. R. S. S.* [N. S.], I, 62(in German)(1934).—A drop of the colloid to be observed is placed on a partially oxidized metal plate showing diffraction coloring. Brownian movement is indicated by the observed color fluctuations. F. H. R.

Representation of Brownian movement. Mizuho Sato. *Science Repts. Tôhoku Imp. Univ., First Ser.* 22, 599-613 (1933); cf. *C. A.* 27, 2363.—A description and theoretical discussion of an app. for representation of Brownian movement. William E. Vaughan

The electric double layer of colloids. IV. The adsorption of ions of coagulating electrolytes by the particles of silver iodide sols. E. J. W. Verwey and H. R. Kruyt. *Z. physik. Chem.* A167, 312-28(1933); cf. *C. A.* 28, 1589<sup>1</sup>.—Freundlich's theory postulates coagulation when the charge on the particles is reduced to a certain min. by adsorption of electrolyte ions of opposite charge and requires that equiv. amts. of adsorbed coagulating ions exert equal effects. The fact is extent of adsorption of ions and change in cataphoretic charge are not directly related. Measurements on AgI sols, whose cataphoretic and total charges were of the same order, showed that the adsorption of the oppositely charged ions by the AgI particles belongs to a type of exchange phenomenon and, therefore, has no significance for a general theory of coagulation. Coagulation occurs in general when an increase of the electrolyte concn. reduces the  $\zeta$  potential through a crowding together of Gouy's (*C. A.* 4, 2231) ionic atm. in the sense of Müller's theory (*C. A.* 22, 2503). Don Brouse

Measurement of permeability of porous media. R. D. Wyckoff, H. G. Botsch, M. Muskat and D. W. Reed. *Bull. Am. Assoc. Petroleum Geol.* 18, 161-90(1934).—A detailed technic is described for measuring the permeability of porous media by the use of either liquids or gases. Formulas for computing the permeability from the lab. measurements are derived. Alden H. Emery

Diffusion in molecularly dispersed solutions. R. O. Herzog, R. Illig and H. Kudar. *Z. physik. Chem.* A167, 329-42(1934).—The Einstein-Sutherland diffusion equation,  $D = kT/4\pi\eta$ , is valid when spherical mols. without dipole moment (such as satd. hydrocarbons) diffuse in a solute free from dipoles. Tables are given showing results with some 33 solutes and 23 solvents. Don Brouse

Diffusion of rod-shaped colloids. R. O. Herzog and H. Kudar. *Z. physik. Chem.* A167, 343-53(1934).—The diffusion formula,  $D = kT[\ln(c/a) + 0.69]/6\pi\eta c$ , in which  $a$  = radius of particle,  $c$  = long axis,  $\eta$  = viscosity coeff. and  $T$  = temp., applies for  $\text{C}_{60}\text{H}_{12}$  and satd. hydrocarbons of lower mol. wt. The equation does not hold for hemi-colloids and must be modified if applied to eu-colloids. Don Brouse

Importance of dialysis in the study of colloids. I. Colloidal ferric hydroxide. B. N. Desai and S. K. Borkar. *Trans. Faraday Soc.* 29, 1269-85(1933).—Freshly prepd samples of  $\text{Fe}(\text{OH})_3$  sol were dialyzed for 25 days. Samples were removed at intervals and tested for cataphoretic speed, stability and viscosity. Cataphoretic speed increased to a max. at 11 days and then decreased. The principal cause is preferential adsorption but hydration and particle size have some effect. Sols begin to coagulate at the same cataphoretic speed. When partially dialyzed sols are dild. their cataphoretic speed changes just as though dialysis had been continued. Comparison of viscosity and cataphoretic speed shows that neither Smoluchowski's theory of a hindering elec. field, nor Dhar's theory of increased hydration and consequent increase of viscosity with decreasing charge is supported. The addn. of a peptizing electrolyte reverses the effects of dialysis except probably an irreversible growth in size. F. E. Brown

Importance of dialysis in the study of colloids. II. Colloidal thorium hydroxide. B. N. Desai and A. K. Desai. *Trans. Faraday Soc.* 30, 265-71(1934).—In a previous paper (Desai and Borkar, preceding abstr.) the results of simultaneous measurements of cataphoretic speed, stability and viscosity of colloidal solns. of  $\text{Fe}(\text{OH})_3$  dialyzed and dild. to different extents were given. In the present paper similar results obtained with colloidal  $\text{Th}(\text{OH})_4$  are presented. The behavior of this sol as regards dialysis, dildn. and crit. potential is similar to that of  $\text{Fe}(\text{OH})_3$ ; the viscosity changes on dialysis and in the presence of electrolytes are, however, different. Reuben Roseman

Gold sol. Hitoaki Tominaga and Bampu Sasaki. *Bull. Inst. Phys.-Chem. Research (Tokyo)* 12, 935-45(1933)

The properties of Au sol were examd. by observing the state of a Au sol prepd. in the presence of KOH to which various electrolytes were added, and the changes in elec. cond. due to the diffusion of a sol prepd. in electrolyte soln. Addn. of 0.001-0.01 N KOH, pure water-0.000001 N or pure water-0.00001 N KCl, KBr, KI,  $\text{K}_2\text{CrO}_4$ , or  $\text{K}_4\text{Fe}(\text{CN})_6$  stabilized the sol ( $\text{KNO}_3$  and  $\text{K}_2\text{SO}_4$  caused complete pptn.); 0.001 N  $\text{Ba}(\text{NO}_3)_2$ ,  $\text{BaCl}_2$  and  $\text{BaBr}_2$  coagulated the sol, and complete pptn. occurred in 0.001 N soln. Pure water-0.000001 N  $\text{Cu}(\text{NO}_3)_2$ ,  $\text{CuCl}_2$ ,  $\text{CuBr}_2$  and  $\text{HgCl}_2$  behave like Ba salts. In higher concns. the behavior was quite different, which is attributed, as verified by the inversion of the direction of endosmosis in 0.0001 N Cu salt soln., to formation of  $\text{Cu}(\text{OH})_2$  from the Cu salt and KOH and the occurrence of positively charged sol particles. From these expts the order of the strength of ions in K, Ba and Cu salts is as follows:  $\text{NO}_3^- < \text{SO}_4^{--} < \text{OH}^- < \text{Cl}^- < \text{Br}^-$ ,  $\text{CrO}_4^{--}$ ,  $\text{Fe}(\text{CN})_6^{--}$ ;  $\text{NO}_3^- < \text{Cl}^- < \text{Br}^-$ ;  $\text{Br}^- < \text{Cl}^- < \text{NO}_3^-$ . Cond. of a Au sol prepd. in pure water or KOH soln. increased; while it decreased when prepd. in KOH soln. When KCl was used, the concn. increased; standing over night or heating at 60-70° for 1 hr. increased the concn. The order of strength of anions toward Au sol particles is  $\text{NO}_3^- < \text{OH}^- < \text{Cl}^-$ . K. Konda

The lyotropic series and the spreading of proteins. Evert Gorter. *Proc. Acad. Sci. Amsterdam* 37, 20-2 (1934).—At  $p_H$  8 the spreading of pure ovalbumin is affected by univalent anions as follows:  $\text{Cl}^- < \text{Br}^- < \text{I}^- < \text{CNS}^-$ . At  $p_H$  6 the spreading of pepsin is affected by univalent cations as follows:  $\text{NH}_4^+ < \text{Li}^+ < \text{K}^+ < \text{Na}^+$ . Equimol. amts. of  $\text{Mg}^{++}$ ,  $\text{Ca}^{++}$ ,  $\text{Sr}^{++}$  and  $\text{Ba}^{++}$  all have the same strong influence on the spreading of proteins. Rachel Brown

Furfural as a lyophilic dispersion medium. Robert Taft and Lloyd E. Malm. *Trans. Kansas Acad. Sci.* 36, 125-30(1933).—Qual. data are given for the dispersion of 122 substances in furfural at -10°, 25° and 95° including carbohydrates, proteins, cellulose nitrates, gums, resins, waxes, rubber, dyes, soaps and miscellaneous substances. W. A. Moore

Notes on a paper by E. Hatachek on "The elastic properties of glycerol gelatin gels hardened with formaldehyde". H. J. Poole. *Trans. Faraday Soc.* 29, 1305-7(1933).—

If the structure of gels is fibrillar, lenticular bubbles should form. They should be perpendicular to the line of stress in reversibly stretched gels, and parallel to the line of stress in irreversibly stretched gels, parallel to the line of compression in reversibly compressed gels and perpendicular to the line of compression in irreversibly compressed gels. H. finds this orientation of bubbles in gelatin. This method may be used to discriminate between gels that have a fibrillar structure and those that do not.

F. E. Brown

Effect of an electric field on the stratified diffusion of alkali carbonates in gelatin. Suzanne Veil. *Compt. rend.* 198, 258-60 (1934).—Rings similar to those of Liesegang are formed when alkali carbonates on gelatin are placed in an elec. field. The phenomenon is conditioned by the peculiar reactions of gelatin in the field.

W. J. Peterson

X-ray interpretation of the molecular structure of gelatin. W. T. Astbury and W. R. Atkin. *Nature* 132, 348 (1933).—The work of Astbury (*C. A.* 27, 2168) is confirmed. The fundamental dimensions in gelatin and in collagen are 2.84, 4.56 and 10.0 Å. Since the d. is 1.346 and the weighed mean residue weight is 96, it follows that the calcd. no. of residues (1.1) assocd. with the chosen x-ray dimensions agrees well with the no. (1) predicted.

Albert L. Henne

The solubility of some organic salts in liquid ammonia at  $-33.9^\circ$ . Warren C. Johnson and Orus F. Krumboltz. *Z. physik. Chem.* A167, 249-59 (1933).—The solubilities, expressed in g. salt per 100 g.  $\text{NH}_3$ , of 10 salts in liquid  $\text{NH}_3$  at  $-33.9^\circ$  are:  $\text{NaCl}$ , 3.325;  $\text{NaBr}$ , 17.62;  $\text{KCl}$ , 0.218;  $\text{KBr}$ , 0.32;  $\text{CH}_3\text{COOK}$ , 1.026;  $\text{KCN}$ , 4.55;  $\text{NH}_4\text{Cl}$ , 14.75;  $\text{NH}_4\text{Br}$ , 90.75;  $\text{LiCl}$ , 0.538;  $\text{AgCl}$ , 0.215.

Don Brouse

Solubility of cupric hydroxide in ammonia. G. Ettisch, F. Hellriegel and D. Krüger. *Ber.* 67B, 22-4 (1934).—The soly. of  $\text{Cu}(\text{OH})_2$  in aq.  $\text{NH}_3$  solns. was detd. (1) by adding weighed quantities of  $\text{Cu}(\text{OH})_2$  to a given  $\text{NH}_3$  soln. until a permanent turbidity was obtained, and (2) by measuring iodometrically the Cu content of  $\text{NH}_3$  solns. satd. with  $\text{Cu}(\text{OH})_2$ . The molar ratio  $\text{NH}_3$ :Cu was plotted against the molarity of the  $\text{NH}_3$ , giving a curve showing a min. between 4 and 6 M  $\text{NH}_3$ . This min. indicates complexes other than  $\text{Cu}(\text{NH}_3)_4^{++}$  at high  $\text{NH}_3$  concns. The insoly. of  $\text{Cu}(\text{OH})_2$  in liquid  $\text{NH}_3$  may be due to existence of the latter as  $\text{NH}_3\text{:NH}_3$  only.

J. H. Reedy

The solubility of lead chromate. Application to the titration of lead. M. Huybrechts and Ch. Degard. *Bull. soc. chim. Belg.* 42, 331-46 (1933).—At  $20^\circ$ , one l. of water dissolves 0.00017 g. = 0.00002  $\text{PbCrO}_4$ . In the presence of a trace of  $\text{CrO}_4$  ion, the soly. decreases to about 0.00001 g. per l., while the presence of  $\text{NH}_4\text{OAc}$  increases the soly. markedly. The soly. in a weak soln. of  $\text{NH}_4\text{OAc}$  and  $\text{HOAc}$  is about the same as in water. Pb should be titrated at room temp. in the presence of  $\text{Ca}(\text{NO}_3)_2$  (about 0.3 g. per l.) by adding a known quantity of alkali chromate and back-titrating the excess.

Albert L. Henne

The solution of magnesium in aqueous salt solutions. III. L. Whitby. *Trans. Faraday Soc.* 29, 1318-31 (1933); cf. *C. A.* 27, 5040, 5044.—Thin sheets of Mg with surface areas of 2, 8, 16 and 24 sq. cm. were hung in a 0.001 N soln. of  $\text{KOH}$  and in solns. of  $\text{K}_2\text{SO}_4$ ,  $\text{KCl}$ ,  $\text{KBr}$ ,  $\text{KI}$ ,  $\text{Na}_2\text{SO}_4$ ,  $\text{NaCl}$ ,  $\text{NaBr}$  and  $\text{NaI}$ . The results indicate that OH ion is preferentially discharged. The acid ions are discharged only after local impoverishment of the OH ion has occurred. The soly. of the  $\text{Mg}(\text{OH})_2$  formed is an important factor in the rate of attack. Solubilities  $\times 10^4$  of  $\text{Mg}(\text{OH})_2$  at  $25^\circ$  were found as follows: in  $\text{H}_2\text{O}$ , 4.6; in 0.001 N  $\text{KOH}$ , 2.2; in  $\text{KCl}$ , 3.3; in N  $\text{KBr}$  2.9; in N  $\text{KI}$ , 3.2; in N  $\text{K}_2\text{SO}_4$ , 9.0. This explains the slow corrosion in dil.  $\text{KOH}$  and the rapid corrosion in solns. of  $\text{K}_2\text{SO}_4$ . The rate of corrosion per sq. cm. decreases with increasing area of specimen.

F. E. Brown

Measurement of diffusion rate in the process of dissolving gases in solid phases. H. Dönwald and C. Wagner. *Z. physik. Chem.* B24, 53-8 (1934).—The general

methods for measuring diffusion rate of gases dissolving in solids are outlined and discussed. The cases of plates, cylinders and spheres are treated specifically. G. M. M.

Diffusion of hydrogen through palladium. Victor Lombard and Charles Eichner. *Bull. soc. chim.* 53, 1176-1208 (1933); cf. *C. A.* 27, 2079, 4454.—The diffusion of H through a 0.307-mm. sheet of Pd from a third com. sample was given by the equation  $D = 4.325 \times 10^{-10} \exp \frac{10000}{T}$  for the temp. range  $350-600^\circ$ , and by  $D = 15.85 \times 10^{-10} \exp \frac{10000}{T}$  for the range  $600-850^\circ$  (cf. *C. A.* 27, 4454). However, the whole range is covered by  $D = 20.73 T^{1/2} \times e^{-10000/T}$  ( $T$  in  $^\circ\text{K.}$ ) based on Richardson's formula. (Note error in the exponent of  $e$  in this formula in *C. A.* 27, 4454.)

L. E. Steiner

Diffusion through a membrane. Colin Barnes. *Physics* 5, 4-8 (1934).—An exact soln. is given of the equation for diffusion through a membrane sepp. 2 stirred solns. of different concns. It is shown that the usual soln., which assumes a linear gradient across the membrane throughout the diffusion, involves no appreciable error in the usual type of cell, provided that the gradient is initially linear.

H. A. Beatty

Endosmosis through a spherical expandable semipermeable membrane. Adam Skapski. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1932A, 347-51 (in English).—A formula was derived for the rate of endosmosis  $dp/dt$  of a substance through a semipermeable spherical expandable membrane. The elastic resistance of the membrane,  $P$ , is opposed to the acting osmotic pressure,  $p$ , so that the process follows the formula  $dp/dt = -kS(p - P)$ , in which  $S$  is the surface permeable to  $\text{H}_2\text{O}$ . If it is assumed that the membrane is a swollen gel with the character of a viscous liquid,  $P$  equals  $4\sigma/r$  or  $\gamma p^{1/2}$  ( $\sigma$  = surface tension,  $\gamma$  = a const.). Thus, the differential equation can be integrated if  $S$  is assumed const. The equation is applied to expts. of S. Skowron (*Acta Biol. Exptl.* 7 (1932)) performed on the osmotic regulation of *Illex pomatia*.

J. Wiertelak

Properties of electrolytic solutions. X. The freezing point of solutions of an electrolyte in a nonpolar solvent. Charles A. Kraus and Raymond A. Vingee. *J. Am. Chem. Soc.* 56, 511-16 (1934); cf. *C. A.* 27, 5618.—Simple app. suitable for use between  $0^\circ$  and  $25^\circ$  at concns. as low as  $10^{-3}$  N and precise to 1% is described. The f.-p. const. is 5.065° for  $\text{C}_6\text{H}_6$  and 4.83° for dioxane. Values of mol. wts. calcd. from f.-p. depressions have a mean deviation of 0.6% from theoretical. The f.-p. curve for iso- $\text{Am}_2\text{NNO}_2$  in dioxane from 0.001 to 0.011 N deviates greatly from the theoretical straight line but approaches it tangentially below  $10^{-3}$  N. The deviation is attributed to assocn. of ion-pairs to more complex aggregates. At 0.011 N nearly 4 ion-pairs are assocd. F. L. Browne

Ethylacetanilide as a solvent in cryoscopy and the molecular weight of several cellulose ethers dissolved in this solvent. F. Garelli and G. Raccui. *Atti accad. Lincei* 18, 150-5 (1933); cf. *C. A.* 27, 2370.—Ethylacetanilide, mannol, was found better suited as a solvent in cryoscopy than triphenyl phosphate, previously suggested (*C. A.* 27, 652), because it crystallizes better. Its cryoscopic const. is  $K = 87$ . It is a good solvent for cellulose deriva. Dil. solns. of nitro-, acetyl- and ethylcellulose in mannol are found to have mols. of  $(\text{C}_6)$ , dimensions. A. W. C.

Methods of measuring electrolytic conductivity. Wilhelm Fink and Philipp Gross. *Monatsh.* 63, 271-84 (1933).—A relatively simple method of high precision, (0.02%), for measuring electrolytic cond. is described. For solns. of equal cond. the capacity of the cond. cell is independent of the nature of the electrolyte. Cells were constructed whose capacities were independent of the sp. cond. of the soln. Cond. data are given for  $\text{Na}_2\text{SO}_4$  in the range: 0.01 - 0.0002 N, and for *o*-nitrobenzoic acid in the range: 0.02 - 0.001 N.

L. E. Steiner

Differences between conductivity coefficients of strong electrolytes in identical solvents. M. Hlasko. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1932A, 336-46 (in French).—The cond. coeffs.  $f_\pm = \lambda_0/\lambda_\infty$  of strong electrolytes were detd. in  $\text{H}_2\text{O}$ , acetonitrile,  $\text{MeOH}$ ,  $\text{EtOH}$ ,

PROH, BuOH, pyridine and aniline by Kohlrausch's method. The dielec. const. varies between 80 and 7. For equiv. concns. the cond. coeffs. decrease in the order: HI, HBr, HCl, KOH, NaOH, LiOH. Their differences are:  $-f_{\mu}^{\text{HI}} - f_{\mu}^{\text{HBr}} < f_{\mu}^{\text{HBr}} - f_{\mu}^{\text{HCl}}$ , and  $f_{\mu}^{\text{KOH}} - f_{\mu}^{\text{NaOH}} < f_{\mu}^{\text{NaOH}} - f_{\mu}^{\text{LiOH}}$ . In the case of salts with an identical cation ( $\text{Li}^+$ ,  $\text{Na}^+$ ,  $\text{K}^+$ ,  $\text{Rb}^+$ ,  $\text{Cs}^+$ ,  $\text{NH}_4^+$ ) the value of  $f_{\mu}$  increases in the order F, Cl, Br, I, and the difference is proportional to that of the corresponding acids. In the case of salts with an identical anion ( $\text{Cl}^-$ ,  $\text{I}^-$ ,  $\text{NO}_3^-$ )  $f_{\mu}$  increases in the order Li, Na, Rb, Cs. The difference  $f_{\mu}' - f_{\mu}''$  increases but slightly with rising concn.; with a decreasing dielec. const., however, this difference may be enormous. These large differences are probably due to the presence of undissocd. ions. The individual properties of ions play a greater role the smaller the dielec. const.

J. Wiertelak  
Conductivity in the transition range from strong to weak electrolytes. Raymond M. Fuoss. *Physik. Z.* 35, 59 (1934); cf. *C. A.* 27, 5233.—Math. relationships are developed for cond., concn., dielec. const., ionic diams., etc. When the parameter  $b = e^2/aDkT$  is small and when the dielec. const. or the mean diam. of the electrolyte is large, the electrolyte is strong. As  $b$  becomes large, the electrolyte becomes weak.

L. P. Hall  
Absolute measurement of absorption by electrolytes dissolved in glycerol and glycerol-water mixtures in high-frequency electrical fields. J. Hiegemann. *Physik. Z.* 35, 91-3 (1934); cf. *C. A.* 27, 5614; 26, 1176.—The increase in cond. was detd. at 25° for 0.1 to 0.001 M solns. of KCl and  $\text{MgSO}_4$  in glycerol and glycerol-water mixts. contg. 5, 10, 20 and 50% water, by using frequencies of 23, 40 and 92 m. wave lengths. The cond. increases with the longer wave lengths.

L. P. Hall  
Contrasting properties of ions, "zwitterions" and uncharged molecules. Edwin J. Cohn. *Science* 79, 83-4 (1934).—Variation of the apparent molal vol. with concn. is discussed, with particular reference to amino acids; it appears to depend largely on the polarity of the groups in the mol.

H. A. Beatty  
Electrostatic theory of ionic equilibrium. I. Chemical equilibrium in aqueous solution as an electrostatic problem. Ju. W. Chodakow. *Z. physik. Chem.* B24, 35-52 (1934).—The "theory of dominating molecular species" is presented in great detail with application to ionic equil. in aq. soln. of a no. of common acids and bases. The theory is similar to that of Kossel (*C. A.* 10, 2054) except that the point of departure is based on the "monolith postulate," which assumes that certain complex ions are electrostatically equiv. to simple ions of the same radius and charge.

G. M. Murphy  
Equilibrium law for strong electrolytes. Alkali metal bromides and iodides. K. Jablczynski and A. Balczewski. *Roczniki Chem.* 12, 880-7 (1932).—The expression  $n'/n_0 = K$  ( $n_0$  is the concn. of undissocd salt and  $n'$  of one of its ions) is verified cryoscopically for Li, Na, K,  $\text{NH}_4$  and H bromide and iodide, a const. value being obtained for  $K$  if the hydration of the ions is taken into consideration ( $\text{Li}^+ 10.3$ ,  $\text{Na}^+ 3$ ,  $\text{K}^+ 0$ ,  $\text{NH}_4^+ 0$ ,  $\text{H}^+ 9$ ,  $\text{Br}^- 1$  and  $\text{I}^- 2$  mol.  $\text{H}_2\text{O}$ ). The values of  $K$  for LiBr in presence of HBr, and of KI in presence of HI, are the same as for the bromides alone, this indicating that only a part of the salt undergoes ionic dissocn. The degree of hydration of ions can be detd. from cryoscopic measurements of the apparent mol. wt. of mannitol in presence of increasing concn. of salt; the values thus obtained diminish with the concn. and degree of hydration of the ions present.

B. C. A.  
The statistical basis of the theory of electrolytes. Otto Halpern. *J. Chem. Physics* 2, 85-93 (1934); cf. *C. A.* 27, 2865.—The application of various statistical-thermodynamic methods to strong electrolytes is investigated. The statistical and thermodynamic basis of Bjerrum's theory of ionic assocn. is reviewed. Allen S. Smith

A theory of concentrated solutions of strong electrolytes.

1 Possibility of its application to the calculation of osmotic coefficients. G. B. Bonino and G. Centola. *Atti accad. Lincei* 18, 145-9 (1933).—Math. By means of the equation developed by Bonino (*Mem. accad. Italia* 1933) the lowering of the vapor pressure of concd. solns. of NaCl and KCl at 25° was calcd.; satisfactory results were obtained.

A. W. Contieri  
A glass electrode potentiometer system for determining the  $p_{\text{H}}$  values of weakly buffered solutions such as natural and treated waters. John O. Burton, Harry Matheson and S. F. Acree. *Bur. Standards J. Research* 12, 67-72 (1934) (Research Paper No. 634); cf. *C. A.* 28, 1225.—Comparison of the H (A), quinhydrone (B) and glass electrodes (C) shows that A may be used for solns. where concns. are 0.0001 M or more, B for solns. with concns. greater than 0.001 M, with a  $p_{\text{H}}$  less than 8.5 and with absence of oxidizing agents or other compds. acting on quinhydrone, and C for solns. of any concn. from 0.1 M to purest water with an accuracy of at least 0.1  $p_{\text{H}}$  and for solns. that are colored or turbid or contain oxidizing or reducing agents.

L. P. Hall  
The use of the quinhydrone electrode in the determination of the activity of the hydrogen ion in a solution of sucrose that is undergoing catalytic inversion by hydrochloric acid at 25°. Willis W. Floyd. *Trans. Kansas Acad. Sci.* 36, 118 (1933).—The cell: Ag(s), AgCl(s), Cl ion (0.1 M HCl + 0.1 M sucrose) || H ion (0.1 M HCl + 0.1 M sucrose) + quinone(s), hydroquinone(s), Au(s) does not give reproducible potentials in solns. of sucrose undergoing catalytic inversion or in solns. of invert sugar.

W. A. Moore  
Hydrogen-ion concentration and its measurement. A. Lottermoser. *Med. Klin.* 29, 901-4 (1933).—Methods for detg.  $p_{\text{H}}$ , including the electrometric method employing a Pt or quinhydrone electrode and the indicator method are discussed. The disadvantage of the quinhydrone method lies in the fact that  $p_{\text{H}}$  above 7.0 cannot be detd. The indicator method may be used either with or without a buffer. For rapid detn. the colorimetric method of Wulff is mentioned.

Louis J. Soffer  
The structure of the cathode deposit. A. Glazunov. *Z. physik. Chem.* A167, 399-406 (1934).—The process of metallic sepn. by electrolysis is, in a sense, a crystal process in which the no. of crystn. centers ( $KZ$ ) and the velocity of crystn. ( $KG$ ) are affected by more factors than in the usual crystal processes. A method is described for using the microscope to det.  $KG$  and  $KZ$ . Besides crystal in the direction of current flow ( $KG_I$ ), crystal proceeds in a direction at right angles thereto ( $KG_{II}$ ), the velocity of the former being greater than that of the latter. In increasing c. d. increases  $KG_I$ ,  $KG_{II}$ , and  $KZ$ ; increasing concn. lowers  $KZ$  and  $KG_I$  but increases  $KG_{II}$ .

Don Brouse  
Piezochemical studies. XXX. The effect of pressure on the equilibrium in condensed systems. Ernst Cohen and K. Piepenbrock. *Z. physik. Chem.* A167, 365-93 (1934).—Exptl. quant. study shows that Planck's equation, which expresses the effect of external pressure on equil., covers the exptl. errors. Each of the following suitable reactions was employed: the pressure coeff. of the equil. const., and the differential change in vol. accompanying the transformation of 1 g. equiv. An indirect elec. method involving an irreversible galvanic circuit was used to det. the equil. const. at high pressures. In studying the reversal of poles accompanying a change of pressure at a given temp. the e. m. f. became zero at a calcd. pressure which allowed for the exptl. error. The values of the equil. consts. at a fixed pressure and various temps. were controlled by means of van't Hoff's reaction isochore.

Roy H. Baechler  
Hydrazine: The dissociation pressures of hydrazinium dichloride and dibromide. B. E. Christensen and E. C. Gilbert. *J. Am. Chem. Soc.* 56, 393-5 (1934).—The dissocn. pressure of  $\text{N}_2\text{H}_4 \cdot 2\text{HCl}$  is given by  $\log P$  (mm.) =  $13.4779 - 4989.96/T$  ( $^{\circ}\text{K.}$ ); that of  $\text{N}_2\text{H}_4 \cdot 2\text{HBr}$  is about equal, but the latter compd. undergoes rapid decompn. below the m. p.

H. A. Beatty  
Dissociation pressure of strontium carbonate. John

Chipman. *Trans. Faraday Soc.* 29, 1286-9(1933). —  $\text{SrCO}_3 \rightleftharpoons \text{SrO} + \text{CO}_2$ ;  $\Delta C_p = 1.2 - 0.00707T$ . By substituting in the free-energy equation and dividing by  $-RT$ :  $\log p = -\Delta H_0/4.575T + 0.604 \log T - 0.000765T + \text{const.}$  When  $\log p - 0.604T + 0.00765T$  is plotted against  $1/T$  a straight line results. The following values were found by using this graph.  $\Delta F^\circ = 53570 - 1.27 \ln T + 0.00357T^2 - 31.69T$ . The heat of dissocn.,  $H = 53570 + 1.27 - 0.00357T$ . The dissocn. pressures from 650 to 1250 inclusive at 50° intervals are: 0.016, 0.069, 0.25, 0.79, 2.32, 6.08, 14.6, 32.5, 68, 134, 249, 444 and 755.

F. E. Brown

Direct oxidation of saturated hydrocarbons at high pressures. Peter J. Wiezevich and Per K. Frolich. *Ind. Eng. Chem.* 26, 207-26(1934).—Vapor-phase oxidation of  $\text{CH}_4$ ,  $\text{C}_2\text{H}_6$ ,  $\text{C}_3\text{H}_8$ ,  $\text{C}_4\text{H}_{10}$ , iso- $\text{C}_4\text{H}_{10}$ , crude  $\text{C}_4\text{H}_{12}$  and  $\text{C}_5\text{H}_{12}$  (liquid phase) and natural gas with air or  $\text{O}_2$  at 33-200 atm. in the absence of catalysts was studied on lab. and plant scales for the recovery of useful products. Data are given showing the effects of temp., pressure, concn., contact time and recirculation. Pyrolysis of  $\text{CH}_4\text{O}$  and  $\text{MeOH}$  at high pressure is noted. Bibliography.

Calculation of the equilibrium constants of the reaction  $\text{C}_2\text{H}_4 + \text{H}_2 \rightleftharpoons \text{C}_2\text{H}_6$  according to spectroscopic data. A. V. Frost. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1933, 158-61 (in English 161-4).—Math. A. A. Boehlingk.

Equilibrium in the reduction of nickelous oxide by carbon monoxide Motoo Watanabe. *Science Repts. Tôhoku Imp. Univ. First Ser.* 22, 436-47(1933).—For  $\text{NiO} + \text{CO} \rightleftharpoons \text{Ni} + \text{CO}_2$  in the temp. range of 663° to 552°,  $\Delta F^\circ = -9771 + 11.77T \log T - 0.003624T^2 + 0.00000031T^3 - 33.59T$ . For  $\text{Ni} + \frac{1}{2}\text{O}_2 = \text{NiO}$ ,  $\Delta F^\circ = -57739 - 5.44T \log T - 0.000824T^2 + 38.05T$ . For  $\text{NiO} + \text{H}_2 \rightleftharpoons \text{Ni} + \text{H}_2\text{O(g)}$ ,  $\Delta F^\circ = 329 + 7.60T \log T + 0.000826T^2 + 0.00000037T^3 - 34.13T$ . W. E. V.

Equilibrium in the reduction of cuprous chloride by hydrogen. Motoo Watanabe. *Science Repts. Tôhoku Imp. Univ. First Ser.* 22, 423-35(1933).—For  $2\text{CuCl(l)} + \text{H}_2 \rightleftharpoons 2\text{Cu} + 2\text{HCl}$  in the temp. range 436° to 726°,  $\log K_p = -(2303/T) + 3.1880$ ; for  $2\text{CuCl(s)} + \text{H}_2 \rightleftharpoons 2\text{Cu} + 2\text{HCl}$  in the temp. range 304° to 401°,  $\log K_p = -(4009/T) + 5.7510$  and  $\Delta F^\circ = 24140 + 24.73T \log T + 0.00306T^2 - 102.39T$ . Also the entropy of  $\text{CuCl(s)}$ ,  $S_{298}^\circ = 20.66$  cal./deg.; and for  $\text{CuCl(s)} \rightarrow \text{CuCl(l)}$ ,  $\Delta H_{\text{fus}} = 3871$  cal.

William E. Vaughan

Equilibrium in the reduction of antimony trioxide by carbon monoxide. Motoo Watanabe. *Science Repts. Tôhoku Imp. Univ. First Ser.* 22, 407-13(1933).—In a static system the equil.  $\text{Sb}_2\text{O}_3(\text{s}) + 3\text{CO} \rightleftharpoons 2\text{Sb(s)} + 3\text{CO}_2$  was studied in the temp. range 502° to 596°.  $\Delta F^\circ = 33461 + 34.286T \log T - 0.01110T^2 + 0.00000093T^3 - 88.65T$ .

William E. Vaughan

Equilibrium in the reduction of silver chloride by hydrogen. Fusao Ishikawa and Motoo Watanabe. *Science Repts. Tôhoku Imp. Univ. First Ser.* 22, 393-406(1933).—In static systems the following equilibria were investigated and these data obtained:  $2\text{AgCl(l)} + \text{H}_2 \rightleftharpoons 2\text{Ag(s)} + 2\text{HCl}$  in the temp. range 450° to 710°,  $\log K_p = -(1104/T) + 3.1012$ ,  $\Delta F^\circ = 20173 + 44.4169T \log T - 0.00207T^2 - 160.10T$ ; and  $2\text{AgCl(s)} + \text{H}_2 \rightleftharpoons 2\text{Ag(s)} + 2\text{HCl}$  in the temp. range 383° to 417°,  $\log K_p = -(3552/T) + 6.3790$ ,  $\Delta F^\circ = 20155 - 3.6170T \log T + 0.01923T^2 - 0.000000250T^3 - 34.80T$ . William E. Vaughan

Thermo-optical dissociation of sulfur dioxide. K. Wieland. *Trans. Faraday Soc.* 30, 260-5(1934); cf. C. A. 27, 664-5.—The absorption spectrum of gaseous  $\text{SO}_2$  was photographed in the Schumann region at temps. up to 450°. At room temp. it shows a well-developed band spectrum between 2400 and 1700 Å. with a predissocn. limit at about 1900 Å., corresponding to a dissocn. into  $\text{SO}$  and  $\text{O}$ . At 450° and at a pressure of 1.5 mm. the bands due to  $\text{SO}_2$  have almost completely vanished, and a new spectrum appears. This consists of very faint bands between 2800 and 2600 Å., due to  $\text{S}_2$ , and a much stronger band system below 1800 Å., which also belongs to  $\text{S}_2$ . After the absorption tube is recooled, the  $\text{SO}_2$  bands reappear with the same intensity as before heating. Thermo-

optical dissocn. of  $\text{SO}_2$  into  $\text{S}_2$  and  $\text{SO}$  seems reasonable (cf. Kornfeld and Weegmann, C. A. 25, 2641-2).

Reuben Roseman

Energy relations in the dissociation of the water vapor molecule into its atoms. Ottilie Riecheneier, Hermann Senftleben and Hans Pastorff. *Ann. Physik* 19, 202-17 (1934).—A new exptl. method is described for measuring the dissocn. into  $\text{H}$  and  $\text{OH}$ . The final products are  $\text{H}_2$  and  $\text{H}_2\text{O}_2$ , and these results are obtained:  $\text{H}_2\text{O} + (5.11 \pm 0.04)\text{v.} = \text{H} + \text{OH}$ ;  $\text{OH} + (5.29 \pm 0.14)\text{v.} = \text{H} + \text{O}$ . These results disagree with a value 6.10 v. or lower for the heat of dissocn. of  $\text{O}_2$  because under the conditions of the expt.  $\text{OH}$  should then be dissocd. at every collision.

A. B. F. Duncan

Equilibrium constants in terms of activities from cryoscopic data. II. The dissociation of pyridine *o*-chlorophenoxide in *p*-dichlorobenzene. H. M. Glass and W. M. Madgin. *J. Chem. Soc.* 1933, 1431-5.—The equil. const.  $K_a$  for the dissocn. of pyridine *o*-chlorophenoxide in melted *p*-dichlorobenzene (m. 52.9°) was detd. from cryoscopic data, from activities instead of concns. Similar measurements were made previously for  $\text{C}_6\text{H}_5$  solns. (C. A. 27, 2368). These two solvents are very similar, since they have practically the same dielec. const., their dipole moments are zero and their internal pressures are about equal. From these data and van't Hoff isochore the heat of formation of pyridine *o*-chlorophenoxide is calcd. to be -8800 cal.

J. H. Reedy

The validity of the law of mass action. II. Determination of the solubility of radium sulfate in sodium sulfate solutions and in water. Boris Nikitin and Paul Tolmachev. *Z. physik. Chem.* A167, 260-72(1933); cf. C. A. 26, 1810. The soly. of  $\text{RaSO}_4$  in water at 20° is  $2.1 \times 10^{-4}$  g. per 100 cc. water. The soly. of  $\text{RaSO}_4$  in solns. contg.  $\text{SO}_4^{--}$  ions follows accurately the law of mass action if the exptl. procedure excluded errors due to absorption. The soly. product remains const. at  $4.25 \times 10^{-11}$  over a wide range of ionic concns.

Don Brouse

Basic salts. VI. Equilibrium relations of the difficultly soluble basic salts. W. Feitknecht. *Helv. Chim. Acta* 16, 1302-15(1933); cf. C. A. 27, 4147.—The soly. product of  $\text{ZnSO}_4 \cdot 3\text{Zn(OH)}_2$  is  $1.12 \times 10^{-17}$  when the concn. of  $\text{ZnSO}_4$  is 0.01 *N* (cf. Kolthoff and Kameda, C. A. 25, 2626); that of  $\text{Bi(OH)}_3\text{Cl}$  is  $1.58 \times 10^{-21}$  when the activity of  $\text{Bi}^{+++}$  is  $2.0 \times 10^{-3}$  (cf. Jellinek and Kuhn, C. A. 17, 3637). An equation is derived for the equil. conditions for coexistence of basic salt and hydroxide in a soln. of a second easily sol. salt having the same anion. From this equation, the soly. product of active  $\text{ZnO}$  is  $1.6 \times 10^{-17}$  (cf. Dietrich and Johnston, C. A. 21, 3010). The relative magnitudes of the soly. products of hydroxide and basic salt det. which is formed when a soln. of metallic salt is treated with alkali. The observed titration curve for  $\text{ZnSO}_4$  differs from the theoretical curve because the basic salt slowly changes in an excess of alkali to a more basic salt contg. a max. of 6-7 mols. of  $\text{Zn(OH)}_2$ . A similar higher basic salt is formed with  $\text{ZnCl}_2$ . X-ray examn. shows that these salts have a layer structure similar to that of the common basic salts. W. C. Fernelius

Double decomposition in the absence of a solvent. XVI. System:  $\text{Ti}_2\text{Br}_2 + \text{Ag}_2\text{SO}_4 \rightarrow \text{Ti}_2\text{SO}_4 + \text{Ag}_2\text{Br}_2$ . N. S. Dombrovskaya. *J. Gen. Chem.* (U. S. S. R.) 3, 291-308(1933); cf. Palkin, C. A. 27, 656.—In conformity with the pos. thermal effect of the reaction and the direction of the reaction in aq. solns., the equil. in the fused system  $\text{Ag}_2\text{SO}_4 + \text{Ti}_2\text{Br}_2 \rightleftharpoons \text{Ag}_2\text{Br}_2 + \text{Ti}_2\text{SO}_4$  is sharply shifted toward the right. A study of the systems  $\text{Ti}_2\text{SO}_4 + \text{Ag}_2\text{Br}_2 + \text{Ti}_2\text{Br}_2$  and  $\text{Ti}_2\text{SO}_4 + \text{Ag}_2\text{Br}_2 + \text{Ag}_2\text{SO}_4$  indicates the existence of the compds.  $\text{AgBr} \cdot 2\text{TiBr}$  and  $\text{Ag}_2\text{SO}_4 \cdot \text{Ti}_2\text{SO}_4$ . The reciprocal soly. in the system  $\text{Ti}_2\text{SO}_4$ -Ag halide is greater than in that of  $\text{TiNO}_3$ -Ag halide.

Chas. Blanc

Rate of absorption of gases by liquids. R. C. Brimley. *Chemistry & Industry* 1933, 472-3.—The rate of soln. of  $\text{CO}_2$  in  $\text{H}_2\text{O}$  or aq.  $\text{NaOH}$  is controlled by the low rate of diffusion of  $\text{CO}_2$  through the surface layer of the liquid and varies with the age of the surface. The same conclusion

can be reached from the data of D<sub>2</sub>N and Mook (C. A. 24, 3157).

**The velocity of solution of electrolytes in acids.** M. Tzentnershner and M. Straumanis. *Z. physik. chem.* A167, 421-9 (1934).—The velocity of soln. of electroc. c. p. Zn in dil. acids is less than that of sublimed Zn about equal to that of the less readily sol. alloy of Zn w 0.2% Cd. Zn plates rubbed with emery cloth dissolve with an initial max. velocity which rapidly decreases and approaches a limit characteristic for the metal and acid. Activation of the Zn plates by rubbing with concd. acids results in a lower limit than does mech. activation. The reactivity of the Zn plates is preserved by keeping in distd. water. Based on its relation to the concn. of HCl (up to 2 N) the velocity of soln. of electrolytic Zn can be expressed by the linear equation:  $dv/dt = K(C - C_0)$ .

**Effect of temperature on the rate of solution of chemically pure thallium in nitric acid.** M. Tzentnershner and S. Lewi. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1932A, 362-8 (in German); cf. C. A. 26, 361.—The rate of soln. of pure Tl in HNO<sub>3</sub> is controlled by the rate of the chem. reaction on the interface metal-liquid. HNO<sub>3</sub> shows no pronounced catalytic effect upon the soln. process. This fact, according to Abel (C. A. 24, 5113), is related to the fact that stirring promotes the soln. process.

**Effect of surface-active substances upon the rate of evolution of carbon dioxide from supersaturated solutions.** N. A. Held and A. D. Tkachev. *Compt. rend. acad. sci. U. R. S. S. [N. S.]* 1933, 296-9 (in German 299-302).—The amount of CO<sub>2</sub> liberated in unit time was measured when the HCl equiv. was added to 25 cc. of Na<sub>2</sub>CO<sub>3</sub> to which had been added varying amounts of butyl, isoamyl, heptyl or octyl alc. or *o*-toluidine. For each of the alcs. there was a max. in the curve of ratio of normally evolved CO<sub>2</sub> to that evolved in the presence of the alc. ( $v_0/v_{\infty}$ ) vs. alc. concn. For each alc.  $v_0/v_{\infty}$  is a const., 1.80, except for BuOH, 2.22. This max. corresponds to that concn. for which the adsorption layer is unsatd. *o*-Toluidine curves show two max.

**Unimolecular decomposition at high pressures.** Louis S. Kassel. *J. Chem. Physics* 2, 106 (1934).—K. disagrees with the conclusions of Coffin and Geddes (C. A. 28, 1915).

**Thermal decomposition of deuterium iodide.** D. Rittenberg and H. C. Urey. *J. Chem. Physics* 2, 106-7 (1934); cf. C. A. 27, 1811. The thermal equil. between I and H contg. various amts. of H<sup>2</sup> was detd. The temps. were 398° and 468° and the concns. of H<sup>2</sup> were 13.5% at the lower temp. and 40 and 72.1% at the higher temp. The fraction decomposed agrees well with that calcd.

**The thermal decomposition of tertiary butyl and tertiary amyl alcohols. Homogeneous unimolecular reactions.** Raymond F. Schultz and G. B. Kistiakowsky. *J. Am. Chem. Soc.* 56, 395-8 (1934).—The homogeneous, unimol. decompns. of Me<sub>3</sub>COH and Me<sub>3</sub>EtCOH, studied by the static method in a quartz bulb with "poisoned" walls, have the rate consts.  $4.8 \times 10^{14} e^{-40000/RT}$  and  $3.3 \times 10^{14} e^{-40000/RT}$  per sec., resp. The former begins to fall off at about 2 mm., corresponding to 19 classical oscillators for the activation; the latter is not reproducible at low pressures.

**The temperature coefficient of the decomposition of hydrogen peroxide in the presence of potassium iodide.** Wm. C. K. Hender and Robert A. Robinson. *Trans. Faraday Soc.* 29, 1300-5 (1933).—Reaction velocities for the decompn. of H<sub>2</sub>O<sub>2</sub> in the presence of KI at 15°, 25°, 30°, 35° and 45° were detd. by titration for slow reactions and measuring O<sub>2</sub> evolved for rapid reactions. Supersatn. of O<sub>2</sub> retarded the reaction; so all solns. were stirred. H<sub>2</sub>O, MeOH, EtOH and glycol were the solvents employed. When it is assumed that the reaction is unimol. with respect to H<sub>2</sub>O<sub>2</sub> but occurs only when there is a triple collision between H<sub>2</sub>O<sub>2</sub>, H<sub>2</sub>O and the iodide, satisfactory agreement between calcd. and observed consts. of reaction

is found. Temp. coeffs. and viscosity corrections are applied. A similar hypothesis is successful when MeOH or glycol is the solvent. The reaction seems to involve only H<sub>2</sub>O<sub>2</sub> and the iodide when EtOH is the solvent.

**Kinetic study of the potassium iodide-hydrogen peroxide reaction in acid solution.** Mme. P. Rumpf. *Compt. rend.* 198, 266-8 (1934).—H<sub>2</sub>O<sub>2</sub> and KI react in acid soln. to give I<sub>2</sub>. A spectrographic study of the reaction in stirred solns. indicates that at low concns. of the reactants the reaction is independent of the acidity. In high concns. the reaction is probably  $2I^- + H_2O_2 + 2H^+ \rightleftharpoons I_2 + 2H_2O$ .

**Kinetics of the reaction between iodine and the hydrochlorides of diazine and hydroxylamine.** A. Berthoud and Daniel Porri. *Helv. Chim. Acta* 17, 32-43 (1934).—The exptl. results agree with the following equations, which were derived assuming HIO to be the active oxidizing agent.  $d(I)/dt = k[(N_2H_5^+)(I_2^-)]/[(I^-)^2(H^+)]$  and  $d(I)/dt = k[(NH_2OH \cdot HCl)(I_2^-)]/[(I^-)^2(H^+)]$ . Between 20° and 30° the temp. coeffs. are 3.4 and 4.0 for the N<sub>2</sub>H<sub>5</sub> and H<sub>2</sub>OH reactions, resp. These values do not agree with the detd. by Bhattacharya and Dhar (C. A. 24, 5629). Both reactions are less sensitive to light than reported by Band D.

**The effect of neutral salts on ionic reactions in concentrated salt solutions.** A. v. Kiss. *Z. physik. Chem.* A167, 354-64 (1934).—Velocities in different concns. of several neutral salts, were measured for the following reactions:  $CH_3COOCH_2COO^- + H^+ \rightarrow CH_3(OH)COO^- + CH_3COO^-$  (I),  $COOCHBrCH_2COO^- + OH^- \rightarrow COOCHBr:CHCOO^- + Br^- + H_2O$  (II). Since both are bi-mol., the velocity consts. were calcd. from the equation:  $k = (a - x)/t$ , in which  $a$  = initial concn., and  $x$  = amt. remaining after time,  $t$ . Log  $k$  varied linearly with the concn. of the neutral salt from 1 N to 8 N. The accelerating action of the salts for reaction I is in the order: BaCl<sub>2</sub> > Na<sub>2</sub>SO<sub>4</sub> > NaCl > KCl > NaClO<sub>4</sub> > NaNO<sub>3</sub> > KNO<sub>3</sub>, for reaction II: BaCl<sub>2</sub> > Na<sub>2</sub>SO<sub>4</sub> > NaCl > NaClO<sub>4</sub> > NaNO<sub>3</sub> > KNO<sub>3</sub>.

**Kinetics of the thermal isomerization of cyclopropane.** Thomas Seal Chambers and G. B. Kistiakowsky. *J. Am. Chem. Soc.* 56, 399-405 (1934).—The thermal transformation of cyclopropane to propylene was investigated over the temp. range 470-519°; it is homogeneous and unimol. The rate consts. depend upon pressure, 25 squared terms being required in the energy function to account for this pressure dependence on the basis of classical localized energy theories of unimol. reactions. The high-pressure const. can be calcd. by the equation  $\log K_{\infty} = 15.17 - (65,000/2.3RT)$ .

**Kinetics of ethylene polymerization.** H. H. Storch. *J. Am. Chem. Soc.* 56, 374-8 (1934).—Data are presented concerning the compn. and amounts of products formed by C<sub>2</sub>H<sub>4</sub> polymerization at 377° and 141.5 cm. pressure. Butylene is the primary product, propylene formation being secondary. Minute quantities of Cu<sup>2+</sup> accelerate the reaction. The polymerization seems to be autocatalytic. The energy of activation is about 42,000 cal.

**Reactions of calcium oxide with carbon dioxide and with sulfur dioxide.** J. Zawadzki and S. Bretsznajder. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1932A, 271-86.—The initial process in the reaction between CaO and CO<sub>2</sub> is the adsorption of the gas on the surface, in which the mols. move freely and finally combine at active spots. At higher CO<sub>2</sub> pressures nuclei are formed, especially at the active spots, and the velocity of growth of the nuclei governs the velocity of absorption of CO<sub>2</sub>. Similar relations hold for the decompn. of CaO at very low pressures. Abs. rates of absorption depend on the no. of nuclei and the condition of the surface of the CaO. The behavior with SO<sub>2</sub> is rather similar and eventually follows approx. the equation  $4CaO + 6SO_2 = 4CaSO_3 + S_2$ .

**The complexity of arsenic trioxide.** A. Smits and E. Beljaars. *Z. physik. Chem.* A167, 278-9 (1933).—The P-T diagram of As<sub>2</sub>O<sub>3</sub> was accurately detd. between 240° and 380°. Below 240° the vapor pressure was too low to

measure accurately. From soly. detns. in Et benzoate solns., the octahedral modification of  $\text{As}_2\text{O}_3$  is stable below  $221^\circ$  and the monoclinic modification is stable above  $221^\circ$ . The stable triple point,  $S_2 + L + G$ , was found at  $312.3^\circ$  and 66.1 mm. Hg the metastable triple point,  $S_1 + L + G$ , at  $272.1^\circ$  and 26.1 mm. Hg. A change of the  $S_2$  modification to a hitherto unknown  $S_3$  modification was observed in the metastable region at  $258.4^\circ$ . This metastable  $S_3$  modification reached its triple point,  $S_3 + L + G$ , at  $280.6^\circ$  and 40.7 mm. Hg.

Don Brouse

**Phase equilibria in hydrocarbon systems.** II. Methane-propane system. Bruce H. Sage, Wm. N. Lacey and Jan G. Schaafsma. *Ind. Eng. Chem.* 26, 214-17 (1934); cf. C. A. 28, 1254<sup>4</sup>.— $\text{CH}_4$ - $\text{C}_3\text{H}_8$  system was studied over the range of pressures and temps. commonly found in petroleum formations, i. e., 1 to 200 atms. and  $20$ - $90^\circ$ . Ds. and compns. in both the 1- and 2-phase regions were detd., including the region above the crit. pressures.

W. A. Moore

**Thermal equilibrium in binary systems of phenacetin, urea, ethylurethan, antipyrine, menthol, salol and quinine.** Konstanty Hrynakowski and Franciszek Adamanis. *Bull. soc. chim.* 53, 1168-75 (1933).—The soly. diagrams for all possible binary systems among the components, menthol, ethylurethan, antipyrine, salol, phenacetin and quinine were investigated. Salol and quinine form a non-cryst. mass; salol-urea and quinine-urea are immiscible; menthol-urea and phenacetin-urea are partially miscible in the liquid phase; ethyl urethan and urea form a 1:1 compd. with incongruent m. p. All the other systems are of the eutectic type.

L. E. Steiner

**The system: manganese-tin-mercury.** Alan N. Campbell and Herbert D. Carter. *Trans. Faraday Soc.* 29, 1295-1300 (1933).—Tin can be dissolved in Hg easily, and a soln. of Mn in Hg can be made by depositing Mn in a Hg cathode. These solns. were mixed and solubilities were detd. at  $30^\circ$ ,  $55^\circ$  and  $70^\circ$ . The breaks in the soly. curves indicate that the compd. having the formula  $\text{Mn}_2\text{Sn}$  exists at higher temps. and has a transition temp. near room temp. It is believed that systems of metals in Hg can be studied in a manner analogous to that of studying salts in water. By this means exact information can be obtained as to mutual relationships, compd. formation, etc., of metals at, or near, room temp. This pair of metals did not form solid solns., or Hg compds. similar to hydrates.

F. E. B.

**Equilibrium of the system  $\text{Na}_2\text{SiF}_6$ - $\text{NaCl}$ - $\text{H}_2\text{O}$ .** V. Ya. Anosov and S. K. Chirkov. *J. Applied Chem.* (U. S. S. R.) 6, 224-7 (1933).—The soly. isotherms as well as those of the sp. gr. at  $15^\circ$  were studied for the system  $\text{Na}_2\text{SiF}_6$ - $\text{NaCl}$ - $\text{H}_2\text{O}$ . The soly. isotherm consists of 2 branches which cross at a point corresponding to the satn. of both salts. The soly. of  $\text{Na}_2\text{SiF}_6$  in the presence of increasing amts. of NaCl decreases rapidly at first (up to 0.079 g.  $\text{Na}_2\text{SiF}_6$  and 1.18 g. NaCl in 100 g. of the soln.). The decrease is then slower and finally very slow (beyond 0.017 g.  $\text{Na}_2\text{SiF}_6$  and 7.87 g. NaCl in 100 g. of soln.). After the addn. of 2.5 g. of NaCl to 100 g. of the satd. soln. of  $\text{Na}_2\text{SiF}_6$  only small amts. are sepd. upon further addns. The isotherm of the sp. gr. consists of 2 branches which cross at the point of satn. of both salts. The sp. gr. is continuously increasing upon addn. of NaCl. A new method for detg. the soly. properties as functions of the compn. is applied to the construction of the isotherm of the sp. gr. According to this method the point of the given soln. is connected with the beginning of the coordinates and the line obtained is used for the recording of the section indicating the magnitude of the particular properties. The ends of sections obtained in the above manner are connected in a uniform curve.

A. A. Boetlingk

**The diagrams of state of the systems  $\text{HgSO}_4$ - $\text{HgI}_2$ ,  $\text{HgSO}_4$ - $\text{HgBr}_2$ , and  $\text{HgSO}_4$ - $\text{HgCl}_2$ .** M. Paic. *Archiv. Hem. Farm.* 7, 161-9 (169 in French) (1933).—A new app. for detg. the temp. of fusion is described. The system  $\text{HgSO}_4$ - $\text{HgI}_2$  is examd. by thermal and x-ray analysis and the formation of a compd.  $\text{HgSO}_4\cdot\text{HgI}_2$  is found; it m.  $332^\circ$  and decomposes into the single sulfates. Such a

compd. is not formed in the system  $\text{HgSO}_4$ - $\text{HgBr}_2$ .  $\text{HgSO}_4$  is still less sol. in fused  $\text{HgCl}_2$  than in  $\text{HgBr}_2$ . J. K.

**The system  $\text{Na}_2\text{S}_2\text{O}_3$ - $\text{Ag}_2\text{S}_2\text{O}_3$ - $\text{H}_2\text{O}$  at  $25^\circ$ .** Henry Bassett and John T. Lemon. *J. Chem. Soc.* 1933, 1428-7.—The following salts may exist in  $\text{Na}_2\text{S}_2\text{O}_3$ - $\text{Ag}_2\text{S}_2\text{O}_3$  solns. of suitable compn. at  $25^\circ$ : (1)  $\text{NaAg}(\text{S}_2\text{O}_3)\cdot 2\text{H}_2\text{O}$ , rhombic, sol.; (2)  $\text{NaAg}_2(\text{S}_2\text{O}_3)_2\cdot 2\text{H}_2\text{O}$ , microscopic needles, sol.; (3)  $\text{NaAgS}_2\text{O}_3\cdot \text{H}_2\text{O}$ , granular crystals, sparingly sol.; (4)  $\text{NaAg}_2(\text{S}_2\text{O}_3)_2\cdot \text{H}_2\text{O}$ , microscopic rectangular platelets, very slightly sol. The last salt has not previously been reported. Isomerism in the Na Ag thiosulfates reported by Meyer and Eggeling (C. A. 1, 1520) was not confirmed. The formation of complex ions is attributed to the effect of the extra S atom in the  $\text{S}_2\text{O}_3^{--}$  group.

J. H. Reedy

**Equilibrium diagram of the system: aluminum-copper-manganese.** Hachio Sawamoto. *Suuyokwai-shi* 8, 289-44 (1933).—The constitution of Al-rich Al-Cu-Mn alloys contg. up to 40% Cu and 30% Mn was investigated by differential thermal analysis and microscopic examn.; the equil. diagram was detd. Peritectic-eutectic reaction liquid +  $\text{Al}_3\text{Mn} \rightleftharpoons \text{Al}_2\text{Mn} + (\text{Al})$  occurred at  $630^\circ$  and at the compn. 8.3% Cu, 1.75% Mn, 89.95% Al and a ternary eutectic reaction liquid  $\rightleftharpoons \text{CuAl}_2 + \text{Al}_3\text{Mn} + (\text{Al})$  took place at  $544^\circ$ , its compn. being Cu 30.5, Mn 0.65 and Al 68.85%.

Hideo Nishimura

**Kinetic measurements on strong, concentrated acids.** Bruno Flaser. *Z. physik. Chem.* A167, 441-57 (1934).—The hydrolysis of hypophosphoric acid,  $\text{H}_4\text{P}_2\text{O}_6 + \text{H}_2\text{O} \rightarrow \text{H}_2\text{PO}_3 + \text{H}_2\text{PO}_4$ , is a reaction catalyzed by acids and so conveniently measurable that it can be used to det. the strength of concd. acids. Measuring the hydrolysis of fluorosulfonic acid and testing by safranin indicator agreed with the results from the hydrolysis of hypophosphoric acid. The activity of the acids investigated increased very markedly with concn. with the sole exception of  $\text{HNO}_3$ , whose activity did not increase so sharply and even decreased at the higher concns. Addn. of small amts. of water lowered the activity markedly: a 70% soln. of perchloric acid had 3 times the activity of a 60% soln.; a 31% soln. of HCl had double the activity of a 26% soln.

Don Brouse

**Sulfonation reaction. III. Kinetics of the monosulfonation of naphthalene.** I. S. Ioffe. *J. Gen. Chem.* (U. S. S. R.) 3, 963-72 (1933).—See C. A. 28, 957<sup>4</sup>.

E. J. C.

**Homogeneous catalysis of stereoisomeric change in oximes.** Thomas W. J. Taylor and D. C. V. Roberts. *J. Chem. Soc.* 1933, 1439-44.—The rate of change of  $\alpha$ -into  $\beta$ -benzil monooxime in alc. soln. was followed by pptg. the  $\alpha$ -form as an insol. Cu complex. Most of the measurements were made at  $55^\circ$ , with HCl, LiCl,  $\text{NMe}_4\text{Cl}$  and KCl as catalysts. Undissocd. mols. of the catalysts are responsible for the catalytic effect. The mechanism of the reaction is attributed to an interaction between the electronic systems of the catalyst and the C:N group of the oxime.

J. H. Reedy

**The energetics of catalysis. II. The poisoning coefficients and energies of activation in hydrogenation.** Edward B. Maxted and Victor Stone. *J. Chem. Soc.* 1934, 26-9.—The fractional decrease in activity of a Pt catalyst caused by poisoning with a given concn. of  $\text{HgCl}_2$  was the same for the hydrogenation of crotonic, oleic and benzoic acids. The energies of activation were 3100, 4600 and 9700 cal. per mol., resp., for the three acids between  $20^\circ$  and  $60^\circ$ . The sp. rates at  $40^\circ$  were 11.3, 7.25 and 0.65, resp.

P. H. Emmett

**A catalyzed reaction of hydrogen with water.** J. Horiuchi and M. Polanyi. *Nature* 132, 819 (1933); cf. Oliphant, C. A. 28, 1265<sup>4</sup>.—The exchange of atoms between  $\text{H}_2\text{SO}_4$  and heavy H in contact with it was catalyzed by Pt black, so that the deuterium content of the H fell to 0.66% of its original value in 1 hour, at room temp. When no Pt black was used, no perceptible exchange occurred. The suggested explanation is that the exchange of atoms between H and water is due to the ionization of H corresponding to the electromotive process of the H electrode.

H. S. H.

**Decomposition of nitric oxide by platinum catalysts.** 1 Joseph Zawadzki and Georges Perlinski. *Compt. rend.* 198, 260-2(1934).—Studies of the effect of temp. (854-1055°) on the velocity of dissocn. of NO with Pt catalysts lead to the equation for a monomol. reaction retarded by one of the products of decompn. ( $O_2$ ). The retarding action of added  $O_2$  is less than that of the  $O_2$  formed by the decompn. of NO. W. J. Peterson

**The catalytic activity of palladium and the overvoltage of hydrogen.** C. A. Knorr and E. Schwartz. *Z. Elektrochem.* 40, 38-43(1934).—The relation between current  $d$ . and overvoltage is given by the equation,  $\eta = -b \log [(A F + J)/A F]$ , in which  $\eta$  is the overvoltage,  $A$  the catalytic activity of the Pd electrode,  $J$  the current  $d$ .,  $F$  the Faraday and  $b$  is a const. for a given activity  $A$ . The change in the overvoltage with time is attributed to a change in the activity of the electrode surface that depends on the purity of the electrolytic soln. John R. Hill

**The heterogeneous combustion of carbonic oxide on quartz: water as a negative catalyst.** B. W. Bradford. *J. Chem. Soc.* 1934, 73-5.—A series of expts. on the rate of reaction of a  $2CO:O_2$  mixt. in a thoroughly dried quartz tube revealed a unimol. const. whose variation with temp. in the range 333° to 602° indicated an apparent energy of activation,  $E$ , of about 25,000 cal. A similar series of expts. made in the presence of 15 mm. water vapor immediately after the dry expts. indicated an  $E$  of about 40,000 cal. and showed that the rate had decreased to about  $1/10$  the "dry" value. The characteristics of both the moist and the dry reaction were consistent with heterogeneous combustion. P. H. Emmett

**The effect of methyl substitution on the catalytic dehydration of six-membered cyclic hydrocarbons.** A. A. Balandin and A. M. Rubinstein. *Z. physik. Chem.* A167, 431-41(1934).—In the presence of Ni on  $Al_2O_3$  the velocity of dehydration is about 20% greater for methylcyclohexane than for cyclohexane. The energy of activation was nearly the same for both compds. and for a mixt. of them; namely, 13,500 cal./mol. No noticeable amts. of  $CH_4$  were split from methylcyclohexane at a temp. of 300° in the presence of these catalysts. A relation was observed between the energy of activation and the pre-exponential members of Arrhenius' equation. Roy H. Baechler

**"Exergic" and "endergic" reactions.** W. Blum. *Science* 79, 84(1934).—Proposed definitions are: "Exergic reactions are those that occur with a decrease in free energy" and "Endergic reactions are those that occur with an increase in free energy." H. A. Beatty

**Measurement of thermal conductivity of poor and medium heat-conducting materials.** R. W. B. Stephens. *Phil. Mag.* 15, 857-80(1933).—Observation was made of the rate of change in the temp. of a mass of liquid contained in a cylindrical tube of the substance whose thermal cond. is being measured. The tube was in a bath kept at a suitable temp. The data confirm the theoretical treatment of the method. E. J. Rosenbaum

**Experimental detection of transport heats in electrolytic Peltier heats.** E. Lange and T. Hesse. *Z. Elektrochem.* 39, 374-84(1933); cf. *C. A.* 27, 1566.—A method of measuring Peltier heats by means of the  $Ag | AgCl$  electrode is described. The significance of heats of transport is discussed. The values are probably about 100-300 g.-cal. per mol. They depend little on concn. or activity, but are related to transport no. B. C. A.

**Heat conduction in gas mixtures.** Ottilie Riechmeier, Hermann Senfleben and Hans Pastorff. *Ann. physik* 19, 218-24(1934).—It is assumed that heat cond. in a mixt. depends on the total pressure and not on the partial pressures of the individual gases. This is proved by observations in a system contg.  $H_2O$  and its dissocn. products  $H_2$  and  $H_2O_2$ . A. B. F. Duncan

**Internal equilibria and partial vapor pressures of mixtures of primary normal alcohols with normal paraffin hydrocarbons.** Guenther v. Elbe. *J. Chem. Physics* 2, 73-81(1934).—Heats of mixing for mixts. of the first 4 normal alcs. and hexane and heptane were detd. down to practically infinite alc. diln. over a temp. range from 10° to 45°. The heat of mixing is always neg., and the heat

absorption per mol. of alc. increases with increasing diln. of the alcs. to a limit of 5800 cal. per mol.; the curves of the molar heat absorption vs. molar alc. concn. are identical for all systems. The fact that normal hydrocarbons can be mixed without any heat effect was confirmed. The results are discussed theoretically and equations are developed for the partial vapor pressures of alcs. in hydrocarbons and for the calcn. of the degree of dissocn., and therefore the heat of mixing, for any temp. and concn. Allen S. Smith

**Vapor tensions and latent heat of vaporization of some normal nitriles.** G. Heim. *Bull. soc. chim. Belg.* 42, 467-82(1933).—The vapor tensions were measured, and from them latent heats of evapn. and Trouton's const. were computed at many temps. and pressures. Acetonitrile,  $\log p = 3.16338 - (1739.98/T) + 1.75 \log T - 0.00230987$ ; propionitrile,  $\log p = 3.49640 - (1888.77/T) + 1.75 \log T - 0.00272563$ ; butyronitrile,  $\log p = 4.98045 - (2282.80/T) + 1.75 \log T - 0.00459317$ ; valeronitrile,  $\log p = 4.63143 - (2370.569/T) + 1.75 \log T - 0.00386797$ ; capronitrile,  $\log p = 3.63135 - (2319.355/T) + 1.75 \log T - 0.00242357$ ; heptanonitrile,  $\log p = 3.25005 - (2340.32/T) + 1.75 \log T - 0.00199747$ ; octanonitrile,  $\log p = 5.64288 - (3017.288/T) + 1.75 \log T - 0.00446777$ ; *cis*-crotonitrile,  $\log p = 3.88070 - (2008.41/T) + 1.75 \log T - 0.00325373$ ; *trans*-crotonitrile,  $\log p = 4.17674 - (2152.42/T) + 1.75 \log T - 0.00352618$ ; vinylacetonitrile,  $\log p = 4.50080 - (2225.313/T) + 1.75 \log T - 0.00391339$ . A. L. H

**A summary of the entropies of aqueous ions.** Wendell M. Latimer, Philip W. Schutz and J. F. G. Hicks, Jr. *J. Chem. Physics* 2, 82-4(1934).—A crit. survey of the existing data on the heats, free energies and entropies of reactions involving 20 pos. and 12 neg. ions in aq. soln. F. D. Rossini

**Calculation of thermodynamic quantities from spectroscopic data for polyatomic molecules; the free energy, entropy and heat capacity of steam.** A. R. Gordon. *J. Chem. Physics* 2, 65-72(1934).—The methods of calcn. are extended to the case of the triatomic unsymmetrical rotator. Values of  $(F^\circ - E_0^\circ)/T$ ,  $S^\circ$  and  $C_p^\circ$  for  $H_2O$  (gas) are computed for the range 298.1 to 1500° K. Revised values of the equil. const. for the water-gas reaction agree closely with exptl. data. F. D. Rossini

**Thermodynamic properties of real gases as explicit functions of the pressure and temperature.** T. C. Huang and K. C. Su. *Science Repts. Natl. Tsing Hua Univ.* A2, 37-48(1933).—Theoretical. B. C. A.

**Two remarks on the review of H. Zeise: Spectral physics and thermodynamics.** Klaus Clusius. *Z. Elektrochem.* 40, 98-101(1934).—A criticism of those portions of Zeise's review (*C. A.* 28, 404<sup>2</sup>) dealing with the normal potential of  $N_2O$ , and his conclusions to parts 1 (*C. A.* 27, 4970) and 2. Gerald M. Petty

**The thermodynamics of the electrocapillary curve I. The general equations.** F. O. Koenig. *J. Phys. Chem.* 38, 111-28(1934).—The inconsistencies in the existing theory of the electrocapillary curve are removed by starting from only one assumption, that of perfect polarizability, which is defined as meaning impermeability, to electrically charged particles, of the boundary layer between two conducting phases. The Lippmann-Helmholtz equation is found to depend only on the foregoing assumption and holds for all perfectly polarized systems regardless of their compn. F. D. Rossini

**Theory of electrocapillarity II. Thermodynamics of capillarity.** S. R. Craxford, O. Gatty and J. St. I. Philpot. *Phil. Mag.* 17, 54-64(1934), cf. *C. A.* 28, 3924.—The temp. and pressure coeffs. of surface tension are derived. The relationship of surface tension to radius of curvature is examd. The partial molar free energy of a substance in the interphase is derived for interphase thicker than monomol. The Gibbs adsorption equation is generalized to hold for interphases of finite thickness and small radius of curvature. E. J. Rosenbaum

**Supplement to paper on atomic heats and heats of fusion and transition of gallium, indium and thallium.** W. A. Roth, Ingr. Meyer and H. Ziemer. *Z. anorg. allgem.*

*Chem.* 216, 303-4(1934); cf. *C. A.* 28, 1917<sup>9</sup>.—The av. sp. heat of Ga between 0° and 16.2° was redetd.:  $C_p = 5.491 + 0.003147T - 11644/T^2$ . The sp. heat of liquid Ga is const.,  $0.0977 \pm 0.0014$ , from 21 to 100°. The heat of fusion of Ga is  $-10.16 \pm 0.01$  cal./g. or  $-1.336 \pm 0.007$  kg.-cal./g.-atom. The heat of transition  $\beta \rightarrow \alpha$  Tl (erroneously calcd. in the previous paper) is  $0.40 \pm 0.01$  cal./g. or  $0.082 \pm 0.002$  kg.-cal./g.-atom; the heat of fusion of Tl is  $-5.040 \pm 0.01$  cal./g. or  $-1.030 \pm 0.0025$  kg.-cal./g.-atom. F. L. Browne

The heat of ionization of some metals. W. A. Roth and A. Büchner. *Z. Elektrochem.* 40, 87-9(1934).—The heats of soln. of the anhyd. salt, and the heats of ionization of the metals are:  $\text{GaCl}_3$ ,  $+45.1 \pm 0.2$ ,  $+51$ ;  $\text{InCl}_3$ ,  $+23.25 \pm 0.1$ ,  $+32.7$ ;  $\text{AlCl}_3$ ,  $+78.00$ , --;  $\text{ZnCl}_2$ ,  $+16.63 \pm 0.01$ ,  $+37.08$ ;  $\text{CuCl}_2$ ,  $+11.90 \pm 0.02$ ,  $16.6$ . The heat of ionization of  $\text{Cl}_2$  is  $+79.3$ . G. M. Pettit

Correction of heat value calculations in bomb-calorimeter tests. Henrik Edenholm and Torsten Widell. *Isa* 1934, No. 1, 2-7.—In Sweden, heat values from bomb-calorimeter tests are calcd. from the equation  $W' = (100 - x)/100 [W''_{\text{wet}} - 600 \times 9 \times (H_2/100)] - 600 (x/100)$ , where  $W'_{\text{wet}}$  = the value obtained on a water-free sample,  $H_2$  = the total H content in percentage, and  $x$  the percentage of moisture. This value is somewhat low, because no regard is taken of the vol. change, and because the heat of formation of  $\text{H}_2\text{O}$  is taken as 600 instead of 585 cal. per kg. With fuel oil, the error may be 19 cal. per kg. Graphs show the errors with various fuels. E. M. S.

Thermochemistry of aluminum. A. Meichsner and W. A. Roth. *Z. Elektrochem.* 40, 19 26(1934).—Carefully analyzed Al and  $\text{Al}_2\text{Cl}_3$  were ignited in a sintered aluminum dish by means of a cotton thread smeared with petrolatum. The mol. heats of formation of  $\text{Al}_2\text{O}_3$  and  $\text{Al}_2\text{Cl}_3$  are  $393.00 \pm 0.4$  Cal. and  $20 \pm 3$  Cal. at 20° and const. pressure. Curtis L. Wilson

Indicator for concentration of hydrogen ion. Shinobu Yamada. Japan. 90,664, Feb. 21, 1933. Thymol blue 0.005 g., methyl red 0.0125 g., bromothymol blue 0.05 g. and phenolphthalein 0.10 g. are dissolved in 100 cc. of pure alc., neutralized with 0.05 N NaOH and the whole is made to 200 cc. with water. The color is red when  $p_H$  is 4.0, orange at 5.0, yellow at 6.0, green at 7.0, blue at 8.0, indigo-blue at 9.0, and violet at 10.0.

## 5 SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

W ALBERT NOYES, JR

Some aspects of modern chemistry. Louis D'Or. *Rev universelle sciences* 9, 313-20(1933).—The tendency in modern phys. chemistry to explain valency, affinity and at. and mol. phenomena on the basis of the knowledge of the structure of the atom and of energy levels of the electrons is discussed and illustrated by several examples of mech. models. M. Hartenheim

Note on the paper "On models of the electric field and of the photon." J. J. Thompson. *Phil. Mag.* 17, 197-8 (1934); cf. *C. A.* 28, 81<sup>9</sup>. E. J. Rosenbaum

Influence of condensation nuclei and dust particles on atmospheric ionization. P. J. Nolan. *Proc. Roy. Irish Acad.* A41, 61-69(1933).—Available data on the relation between the rate of disappearance of small ions in a closed vessel and the concn. of nuclei and dust agree with the deduction that small ions combine with dust particles as well as with condensation nuclei. Respective combination coeffs. are deduced. The square-root law of recombination is explained in the expl. indications that at high

concns the disappearance rate is proportional to the square of the concn., and is a coagulation process, and at low concns. is proportional to the concn., and is a diffusion process. B. C. A.

Theory of elementary particles. L. Goldstein. *Compt. rend.* 198, 454 6(1934).—A relativistic wave equation of the Dirac type for a particle of given rest mass will allow only a spin of  $1/2$  in the usual units if other conditions imposed by quantum mechanics are to apply. G. M. M.

The neutron and the positron. W. Bothe. *Naturwissenschaften* 21, 825-31(1933).—A review. B. J. C. van der Hoeven

Electron spin and theory of the neutron. W. Wessell. *Z. Physik* 82, 415-44(1933).—Completion of Dirac's equation by addn. of a spin potential leaves H fine structure unchanged, but gives proper functions of very high energy values, and these may be identified with neutrons. B. C. A.

Probability of electron shifts into the region of negative

energy levels. S. Saczeniwski. *Acta Phys. Polonica* 1, 363-86(1932)(in German).—See C. A. 27, 4159.

J. Wiertelak

Application of the phase-integral method to the hydrogen molecule ion. E. M. van Engers and H. A. Kramers. *Z. Physik* 82, 328-36(1933).—The phase-integral method gives results in agreement with earlier calcns. B. C. A.

The masses of the proton and electron. Arthur Eddington. *Proc. Roy. Soc. (London)* A143, 327-50(1934).—Math.

Calvin Brous

The ultra-violet radiation of the sun. M. Minnaert. *Physica* 13, 277-84(1933).—A lecture with particular reference to the O<sub>3</sub> layer in the upper atm., its concn., altitude, causes, etc. B. J. C. van der Hoeven

The effect of alkali ions on the photoelectric emissivity of tungsten. A. Keith Brewer. *Phys. Rev.* 44, 1016-19(1933). L. S. Kassel

Energy balance, electron temperature and voltage gradient in the positive column in mixtures of sodium vapor with neon, helium and argon. M. J. Druyvesteyn and N. Wurmoltz. *Phil. Mag.* 17, 1-27(1934); cf. C. A. 27, 659.—The energy balance was studied for pos. columns of Na vapor, He, Ne, A and mixts. of Na vapor with He, Ne and A. For a discharge in pure Na vapor the power input is equal to the sum of the rates at which energy is radiated and is transferred to the wall. This is also true for Na vapor plus a rare gas at a few mm. pressure, but at higher gas pressures the power input is considerably larger than the power output. The difference is attributed to energy lost by the electrons in elastic collisions with rare-gas atoms. It is concluded that the electrons have a Maxwell distribution, although the current-voltage characteristic is disturbed by the probe with currents larger than 4 amps. In the Na-Ne column the voltage gradient increases with Ne pressure up to a pressure of 0.5 mm. Ne; at higher Ne pressures the voltage gradient is independent of the pressure. The properties of the Na-rare gas pos. column can be accounted for by the equations for the pos. column. E. J. Rosenbaum

The light emission during gas discharges. II. W. de Groot. *Physica* 1, 28-34(1933); cf. C. A. 27, 1568.—Math.

B. J. C. van der Hoeven

Theory of ionization measurements in gases at high pressures. D. E. Lea. *Proc. Cambridge Phil. Soc.* 30, 80-101(1934).—The columnar theory of Jaffé (cf. C. A. 23, 4134) has been extended to  $\beta$ -rays by taking account of the clusters of secondary ionization. This agrees reasonably well with exptl. results in this case and with proton tracks in H produced by neutrons. With N nuclei in Na, however, the recombination is only about  $1/100$  that of the theory. This is explained by assuming that recoil-nuclear ionization is almost entirely primary. Exptl. results are given graphically as well as tabularly. Gregg M. Evans

Gregg M. Evans

Fatigue phenomena of light receptors. J. H. de Boer. *Physica* 13, 285-8(1933).—A lecture on fatigue of Cs photocells (Cs at. layer adsorbed on Cs<sub>2</sub>O) caused by space charge in the oxide carrier. The cell is revived by rest in the dark, by heating and by red or infra-red irradiation. B. J. C. van der Hoeven

Investigation of electron-counting chambers. Carl Bosch. *Ann. Physik* 19, 65-98(1934).—The counting effect depends on the presence of impurities, as moisture, and disappears when the electrodes are cleaned by baking and glowing and pure gases are used. Such a tube gives the counting effect if a cathode of small dimensions is used. Cathodes of ordinary size behave similarly as a result of points of impurities. The effect is attributed to pos. space charge. Louis Goldman

Quantum yield in "light-counters." K. W. Hauser and K. H. Kreuchen. *Z. tech. Physik* 15, 20-3(1934).—The photoelec. quantum yield in a "light counter" of Al, Zn, Cd, Fe, Cu or brass was studied between 254 and 400 m $\mu$ . The results show agreement with values detd. in a photocell. J. B. Austin

Measurements of ionic mobilities in the positive column. Sidon Harris. *Phil. Mag.* 17, 131-45(1934).—The speed of rotation of the pos. columns of H and air

around a central radial magnetic field was measured with a stroboscope. The transverse Hall effect was measured in the pos. column as a function of current through the discharge and the gas pressure. From these data, ionic mobilities were calcd. which were half as large as those of ions produced by x-rays in H and in air at atm. pressure. The values obtained for the mobilities of the neg. ions agree with the values of Townsend for free electrons. E. J. Rosenbaum

E. J. Rosenbaum

Ionization density and critical frequency. Lewi Tonks. *Nature* 132, 710-11(1933).—The coeff.  $1/2$  in Hartree's expression (*Proc. Cambridge Phil. Soc.* 27, 143(1931)) for the relation between electron concn. and crit. frequency in an ionized gas results from his treatment of the ions as the bound ions of a dielectric. If the elastic binding force is replaced by a Coulomb force, the coeff. becomes unity. Louis Goldman

Louis Goldman

Measurement of the Townsend coefficients for ionization by collision. Frederick H. Sanders. *Phys. Rev.* 44, 1020-4(1933). L. S. Kassel

The production of secondary electrons by argon positive ions and by argon atoms. Charles J. Brasefield. *Phys. Rev.* 44, 1002-5(1933).—Argon pos. ions with energies up to 150 v. are found to be much less efficient in producing secondary electrons than are neutral, possibly metastable, atoms of the same velocity. Conclusion: Pos. ions as such have nothing to do with the maintenance of a cold-cathode discharge. L. S. Kassel

The passage of slow positive ions through highly rarefied gases. Otto Beeck. *Physik. Z.* 35, 36-52(1934).—A review. M. McMahon

M. McMahon

The concentration of excited sodium atoms and of sodium ions in a sodium low-voltage arc. M. J. Druyvesteyn. *Physica* 1, 14-27(1933).—By means of a reversal method the ratio of Na atoms in 2p and in normal state was detd. for a Na low-voltage arc. The electron temp. (17,000°abs.) was detd. by a probe electrode. For increasing c. d. the total no. of atoms per cc. increases from  $19$  to  $96 \times 10^{11}$ , that of normal atoms from  $5.7$  to  $14.7 \times 10^{11}$ . By the Kohn method (C. A. 27, 1271) the ratio of excited to normal atoms was calcd. from measurements of the reversal temp. This ratio, the fraction of atoms in 2p state, is 0.12; the fraction of atoms in higher excited states is probably 0.05; the no. of Na<sup>+</sup> ions (at 4-5 amps.) 216-537 per 100 normal 1 s atoms. B. J. C. van der Hoeven

B. J. C. van der Hoeven

Excitation potentials of light metals. II. Beryllium. H. W. B. Skinner. *Proc. Roy. Soc. (London)* A140, 277-301(1933); cf. C. A. 26, 2112.—Measurements have been made of the "excitation curve" ( $\Delta i/\Delta V$  plotted against  $V$ ) for Be, with both W and dull-emitter filaments, and it is found that the "break potential" (values of  $V$  for which abrupt changes in  $\Delta i/\Delta V$  occur) are displaced correspondingly with the change of filament. When a correction for the work function of the filament is applied, the break potentials are consistent. Excitation starts at 8.5 v., rises continuously up to 92 v., where large and abrupt changes in  $\Delta i/\Delta V$  occur and persist up to 125 v. There is an appreciable difference between the min. K-excitation potentials of Be in the form of metal and of a polar compd. An approx. model for the excited state of the metal, based on the state of the corresponding at. system, is proposed. B. C. A.

B. C. A.

Investigation of copper oxide films by electron diffraction. C. A. Murison. *Phil. Mag.* 17, 96-98(1934).—Oxide films were formed on Cu blocks and were investigated by electron diffraction. The patterns obtained were those due to Cu<sub>2</sub>O, to CuO and a pattern for which the structure has not been detd. The new pattern could be formed by heating Cu to 300-500° and blowing air or O through the furnace. The substance giving the new pattern is another crystal form of CuO. It is sensitive to mech. treatment. E. J. Rosenbaum

E. J. Rosenbaum

Diffraction of electrons by mica. James A. Darbyshire. *Z. Krist.* 86, 313-24(1933)(in English).—Expts. on the passage of high-speed cathode rays through thin slips of muscovite are described, and a table is given showing the variation of the effect with thickness (measured by

means of the Michelson interferometer). Also the nature of the patterns obtained by reflection from freshly cleaved slips is discussed. As the azimuth is changed, pseudosym. effects occur when the incident beam travels along the more important zone axes lying in the cleavage plane.

L. S. Ramadell

**Electron diffraction and the imperfection of crystal surfaces.** L. H. Germer. *Phys. Rev.* 44, 1012-15(1933); cf. *C. A.* 27, 3863.—Electrons of 0.05 Å. wave length were used to det. "rocking curves" for single crystals of Fe, Ni and W. The estd. widths at half max. are 0.8°, 1.5° and 1°, as compared with 14', 24' and 6', resp., for x-ray rocking curves. The crystal surface is thus more imperfect than the interior; even x-rays do not have sufficient penetration to give results certainly characteristic of the whole crystal.

L. S. Kassel

**Electron conductivity in crystals.** R. W. Pohl. *Physik. Z.* 35, 107-11(1934).—Electrons introduced into transparent crystals of KCl, KBr, KI and NaCl give rise to optical phenomena which can be measured. Absorption spectra-frequency curves are bell-shaped, the position of the max. depending on temp. By calcn. it is shown that a cu. cm. holds about  $10^{17}$  electrons. The speed of the electrons through the crystal increases with temp. The free path of electrons varies from about  $10^{-6}$  cm. in NaCl to 1 cm. in AgCl. The behavior of electrons is related to photoelec. effects and formation of photographic latent images.

L. P. Hall

**Atom collisions. I. Production of slow atomic beams by discharge and their measurement with a thermoelement.** Otto Beecck. *Ann. Physik* 19, 121-8(1934).—A new method is described for obtaining slow at. beams of uniform energy and measuring their abs. energy. **II. Ionization of argon by neutral argon.** Otto Beecck and Harold Wayland. *Ibid.* 129-42.—The app. described above is used to study the ionization of A by an A beam having the energy 350-650 ion v. equivs. The no. of collisions producing ions is large. The exptl. work agrees with the theory of Weizel and Beecck (*C. A.* 26, 5829).

A. B. F. Duncan

**Magnetism of free radicals.** Samuel Sugden. *Trans. Faraday Soc.* 30, 18-24(1934).—A discussion of magnetic susceptibility in its relation to the no. of electrons in the mol. and as a test for free radicals. Some data on the ketyls are given. This method makes possible an approx. estimate of a magnetic moment when the concn. of the free radical is 3-5%. It is suitable only for free radicals of long life.

E. R. Rushton

**Nuclear physics.** Theodor Seel. *Physik. Z.* 35, 119-41 (1934).—A discussion and correlation of the work on the scattering of  $\alpha$ -particles in heavy and light nuclei, emission of  $\alpha$ -particles, etc. A short bibliography is given.

L. P. Hall

**General chemical equation.** W. Harrison. *Chemistry & Industry* 1933, 370.—If the elements are represented by formulas of the type  $A_xN_y$ , where  $x$  is the at. wt. and  $y$  the at. no., radioactive changes and the transmutations of light elements may be represented by equations which resemble ordinary chem. equations, e. g.,  $Li + H = 2He$  becomes  $A_7N_3 + A_1N_1 = 2A_4N_2$ .

B. C. A.

**Representation of nuclear transformations.** G. Petiau. *Compt. rend.* 198, 564-6(1934).

C. A. Silberrad

**New applications of radioactivity.** Hans Kading. *Arch. Pharm.* 272, 38-54(1934).—Applications in chemistry, physics and medicine are reviewed. W. O. B.

**Anomalies in the proportions of the elements and the origin of the radioactive elements.** W. M. Elsasser and K. Guggenheimer. *Compt. rend.* 197, 1627-9(1933).—The rare gases are found on earth in very minute quantities compared to their neighboring elements. This may be explained if one postulates that at one time the noble gases were present in similar proportions to the other elements in the earth's atm. and the earth was subject to neutron bombardment. A neutron may be captured by a nucleus and the product emit a  $\beta$ -particle and this process continued repeatedly. By this process A and Kr may have been converted into radioactive K and Rb isotopes 41 and 87. Meteors may have passed through swarms of

neutrons and thus had nuclei built up as large as possible. This would explain formation of the radioactive elements and also why they are found only on the surface of the earth and are not of primary origin. O. E. S.

**Theory of positrons.** V. A. Fok. *Compt. rend. acad. sci. U. R. S. S. [N. S.]* 1933, 265-7(in German 267-71).—Math.

Howard Agnew Smith

**A new type of radioactivity.** Irène Curie and F. Joliot. *Compt. rend.* 198, 254-6(1934).—Certain light elements (Be, B, Al) which have been irradiated with  $\alpha$ -rays of Po will emit pos. electrons for a time after the removal of the source of  $\alpha$ -rays;  $1/3$  hr. in the case of B. W. J. P.

**Chemical separation of new positive electron-emitting radioelements.** Irène Curie and F. Joliot. *Compt. rend.* 198, 559-61(1934); cf. preceding abstr.—The probable formation of radioactive, positron-emitting  $N^{11}$ ,  $Si^{27}$  and  $P^{30}$  (for which the names *radio-nitrogen*, *-silicon* and *-phosphorus* are proposed) with half lives of 14, 2.5 and 3.5 min., by capture of  $\alpha$ -particles from Po by B, Mg and Al, resp., is supported by chem. examn. of irradiated BN and Al. A source of about 100 millicuries of Po was used, producing about  $10^8$  atoms of the radioactive element. That from B behaved like N, that from Al as P.

C. A. Silberrad

**The neutron.** Arthur Bramley. *Science* 79, 160(1934).—Remarks on nuclear stability. G. M. Murphy

**An attempt to detect a neutral particle of small mass.** J. Chadwick and D. E. Lea. *Proc. Cambridge Phil. Soc.* 30, 59-61(1934).—Energy considerations in  $\beta$ -ray emission from certain elements such as Ra E seem to demand a neutral particle of varying energy of mean value about  $6 \times 10^4$  v. Search for such a *neutrino*, however, was fruitless. The expts. were such that a particle of the mass of an electron, with a magnetic moment of 1 Bohr magneton, would have been detected. Gregg M. Evans

**Possibility of the emission of neutral particles of no intrinsic mass during the  $\beta$ -ray radioactive changes.** Francis Perrin. *Compt. rend.* 197, 1625-7(1933).—The apparent energy loss during a  $\beta$ -ray emission has not been explained and in order to explain conformation of these  $\beta$ -ray changes to the law of conservation of energy P. proposes that one assume a neutral particle of no intrinsic mass is produced and has an amount of energy corresponding to this apparent loss. Pauli has already assumed a similar particle but with the same mass as the electron and has called it a *neutrino*. Neutrinos, then, are more nearly related to photons than to electrons. O. E. S.

**Hoffmann Stösse and the origin of cosmic-ray ionization.** W. F. G. Swann. *Phys. Rev.* 44, 1025-7(1933).—It is calcd. that the observed frequency of Hoffmann Stösse is sufficient to give a considerable fraction of the total cosmic-ray ionization.

L. S. Kassel

**Measurement of the ionization per centimeter of path by individual secondary cosmic rays.** W. F. G. Swann. *Phys. Rev.* 44, 961-8(1933); *J. Franklin Inst.* 217, 79-86 (1934).—By a novel statistical method the ionization per cm. path for cosmic-ray secondaries is found to be 89 ions at atm. pressure, equiv. to 61 and 57 for N and O, resp. Higher values found in other ways are due to multiple secondaries, the existence of which is shown.

L. S. Kassel

**The radium-uranium ratio and the number of actinouranium isotopes.** Arthur E. Ruark and Forrest Western. *Phys. Rev.* 45, 69-70(1934).—Data on the Ra-U ratio in pitchblendes, and on the Act branching ratio indicate that there is only a single actinouranium isotope.

L. S. Kassel

**An attempt to decompose the lead atom.** A. Smita, H. S. Vening Meinesz, J. A. A. Kruger and H. G. Roeberson. *Z. Elektrochem.* 40, 71-3(1934).—A Pb plate in air, exposed to x-rays, showed an activity which was not shown by Al, or by either metal in a vacuum. This activity was not shown when Pb was exposed to sunlight. The activity of Pb from a roof is probably due to the pptn. on it of radioactive dust from the air. Gerald M. Petty

**The disintegration of lead by means of penetrating radiation.** B. Rossi. *Nuovo cimento* 10, 349-54(1933).—The secondary radiation generated by penetrating rays

(cf. C. A. 26, 3991) arises in a nuclear process of the type photographed by Blackett and Occhialini (cf. C. A. 27, 2874). Its immediate cause is a radiation, also generated by penetrating rays, which has the property of being absorbed by at. nuclei.

J. B. Austin  
Equations of motion of the neutron. W. M. Elsasser. *Compt. rend.* 198, 441-3(1934).—Math. G. M. M.

Theoretical remarks on the emission of corpuscular radiation ( $\beta$ -rays and positrons) and the symmetry between particles and antiparticles. Jean L. Destouches. *Compt. rend.* 198, 467-9(1934). G. M. Murphy

Radiative collisions of neutrons and protons. H. S. W. Massey and C. H. O. Mohr. *Nature* 133, 211(1934).—The calcd. expectation of combination between a neutron and a proton is 1:1000 under the conditions of Lea's expt. (C. A. 28, 1921<sup>9</sup>); he observed 1:4. G. M. P.

Slow neutrons emitted by beryllium by the action of  $\alpha$ -rays. P. Auger. *J. phys. radium* [7], 4, 719-24(1933); cf. C. A. 26, 5256; 27, 1570.—By use of the app. previously described (C. A. 21, 1591) photographs at right angles of proton trajectories were made. Stereoscopic photographs were also obtained when the automatic compression chamber was in an electromagnetic field. Photographs of proton trajectories were also obtained when a chamber supporting 2.5 atm. pressure of H (instead of 1 atm. as in 2 previous cases) satd. with  $H_2(O)$  vapor was used. The protons ejected by the neutrons obtained from Be by bombardment with  $\alpha$ -particles from Po divide themselves distinctly into 2 classes: the ones corresponding to the action of neutrons of high energy, and the others corresponding to neutrons of low energy—about a tenth that of the first group. Of 418 trajectories photographed under 2.5 atm. pressure 343 showed ranges less than 50 mm., 26 were doubtful and 49 greater. Analysis of the photographs indicates that the slow neutrons are mostly emitted directly (independently of secondary effects, diffusion and inelastic collisions) and form a diffuse group. The slow neutrons are probably emitted from Be when an excitation of a Be nucleus by  $\alpha$ -particles occurs without capture, a part at least of the exciting energy being used to emit the slow electrons. O. E. S.

Calculations on the range-velocity relation for  $\alpha$ -particles and protons. W. R. Duncanson. *Proc. Cambridge Phil. Soc.* 30, 102-13(1934).—Math. G. M. P.

Anomalous heat effects of some radioactive minerals. A. Dorabialska. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1932A, 352-6(in French); cf. C. A. 27, 2091. J. Wiertelak

A simple method for determining the diffusion coefficient of radium emanation. Nella Mortara. *Atti accad. Lincei* 17, 949-51(1933).—A 50-cm. tube of Pb, fitted with a hole at one end and a glass needle contg. Ra in the other, is placed in the jaws of a press. After 15 min. the tube is flattened in the press and cut into 3-cm. lengths. The radioactivity of each length is detd. The diffusion coeff. is 0.11, in agreement with previous values. J. B. A.

Method of preparation of sources of radium E. M. Hatssinsky. *Nature* 132, 317(1933); *J. chim. phys.* 31, 43-6(1934); cf. C. A. 27, 5243. G. M. P.

A zero method for the determination of radium by  $\gamma$ -radiation. A. Piccard and L. Meylan. *J. phys. radium* [7], 4, 715-18(1933).—By using 2 identical ionization chambers 20 cm. in diam. contg.  $CO_2$  under 10 atm. pressure connected to the same electrode and leaf system, an app. following the principles of Rutherford and Chadwick's  $\gamma$ -ray method for the detn. of Ra is obtained which enables more accurate measurements to be made more quickly. The unknown sample is moved until its effect exactly balances the known and the scale reading observed. The refinements introduced make the method suitable for rapid measurements of av. precision.

Oden F. Sheppard

Photoelectric absorption of  $\gamma$ -rays by heavy elements. J. McDougall and H. R. Hulme. *Nature* 132, 352-3(1933).—Math. A. I. Henne

Nuclear  $\gamma$ -absorption. Th. Heiting. *Naturwissenschaften* 21, 800(1933).—Previously (C. A. 28, 406<sup>4</sup>) the appearance of secondary radiation with  $\lambda = 24$  =

1 X. U. on irradiation of Al, Fe, Cu or Pb with Th C<sup>+</sup>  $\gamma$ -rays was found. This wave length corresponds to the energy  $h\nu = mc^2$ . Recently (Anderson, C. A. 27, 5241) the formation of positrons from the action of hard Th C<sup>+</sup>  $\gamma$ -rays on heavy metals was observed. If the positron unites with an electron an energy of  $2mc^2$  is liberated in 2 quanta of  $mc^2$  each. This explains the above radiation as one of recombination, hence independent of at. no. The nuclear absorption is interpreted as a splitting up in the field of the nucleus of the primary  $\gamma$  quantum into a pos. and a neg. electron. B. J. C. van der Hoeven

Action of  $\beta$ - and  $\gamma$ -rays on rock-salt crystals. P. W. Burbidge. *Proc. Cambridge Phil. Soc.* 30, 62-9(1934).—Rock salt, on application of an elec. field and illumination with blue light, after small dosages of  $\beta$ - or  $\gamma$ -rays, gave a photoelec. current which decreased exponentially with time. This could be repeated cyclically. The increase of total charge collected is plotted against increase of field. The variation of charge with dosage and light frequency is also shown. A crystal 4 sq. cm. in area was found to collect  $7 \times 10^8$  quanta from  $\gamma$ -rays and  $40 \times 10^8$  from  $\beta$ -rays. The electron efficiency is low, only about 1 electron per  $\beta$ - or  $\gamma$ -ray. Gregg M. Evans

Effects of  $\alpha$ -particles on aqueous solutions. I. The decomposition of water. II. The oxidation of ferrous sulfate. Carl E. Nurnberger. *J. Phys. Chem.* 38, 47-60(1934).—The decompn. of water by  $\alpha$ -rays from dissolved Rn and from Rn contained in a glass bulb was studied by measuring the gas produced. After corrections were applied a yield of 0.371 cc. per millicurie was obtained for dissolved Rn and the percentage transmission for glass bulbs was detd. The percentage of  $FeSO_4$  oxidized rises linearly with the  $\alpha$ -ray dosage, and hence the reaction goes to completion. It is evolved in accordance with Cameroun and Ramsay's law and side reactions take place.

Louis Goldman

Naming hydrogen isotopes. Willis A. Boughton. *Science* 79, 159-60(1934). E. H.

Concentration of the heavy hydrogen isotope by electrolysis. H. Erlennmeyer and Hans Gartner. *Helv. Chim. Acta* 17, 30-1(1934).—Electrolysis of 8 l. of 0.1 N  $H_2SO_4$  on Pb electrodes to a final vol. of 13 cc. yielded 12 cc. of water weighing 5.6 mg. more than the control sample of ordinary water. L. W. Elder

Manufacture of pure heavy hydrogen isotope by diffusion. G. Hertz. *Naturwissenschaften* 21, 884-5(1933). The expts. for isotope sepn. by diffusion were continued, 48 sepn. units being used. The process applied to normal Ne gave Ne<sup>22</sup> spectroscopically free from Ne<sup>20</sup>.  $H_2$  from  $H_2O$  and Mg was treated in the same app. with an added discharge tube to convert  $H^+H^+$  mols. into  $H_2^+ + H_2$ . The  $H_2^+$  made gave a spectrum for almost pure  $H_2^+$ .

B. J. C. van der Hoeven

The diffusion of hydrogen through metals: fractionating the hydrogen isotopes. Colin G. Pink, Harold C. Urey and D. B. Lake. *J. Chem. Physics* 2, 105-6(1934). Two sheets of steel welded together and used as cathode in the electrolysis of an acid soln. eventually bulged bc cause of the pressure of H between the sheets. Similar effects were obtained with tubes of Fe, Ni and Pd. A Pd tube was then used as cathode in a soln. contg. fuming  $H_2SO_4$  and  $H_2O$ , the latter having 0.5%  $H^2$ . At the end of 28 hrs. the H that had diffused through the Pd was analyzed after having been converted to  $H_2O$ . Its d. was 1.00020, showing that some fractionation of  $H^2$  had occurred. The rate of passage of H through the Pd was also detd. but no O passed through when the Pd was made the anode. On the basis of the overvoltages involved, calcn. shows that the pressures of H passing through the metal are of the order of a million atm.

G. M. Murphy

Isotopic fractionation of hydrogen. Herschel Hunt. *J. Chem. Physics* 2, 108(1934).— $H_2O$  contg. 1 part  $H^2$  to 200 parts  $H^1$  was electrolyzed and the H evolved passed over CuO in such a way that half the gas recombined to form  $H_2O$  at 200° and the rest reacted at 600°. The  $H_2O$  obtained at the low temp. had a mass of 6.6 less than the 10 ml. collected at 600°. By use of 2 cells

in series so that the H flow was twice as great the mass difference was 5 mg.

**Chemical separation of deuterium from hydrogen.** A. Parkas and L. Parkas. *Nature* 133, 139(1934).—It is anticipated that reactions for which the energies of activation are small enough to render them sensitive to the difference in zero-point energies will react at different rates. Deuterium and H behave thus, there being a difference in the velocity of liberation of these isotopes when metals are dissolved in water or acid. The rates of production of H and deuterium for Zn, Al, Ca and Na stand in the ratio of 4, 2, 1.5 and 1.2 to 1, resp. Analogous reactions with compounds contg. H are being investigated.

**The weight ratio of the lithium isotopes  $\text{Li}^7$  and  $\text{Li}^6$ .** L. S. Ornstein, J. A. Vreeswijk, Jr. and G. Wolfsohn. *Physica* 1, 53-9(1933).—van Wijk and Koevring (C. A. 25, 5001) detd. the ratio  $\text{Li}^7:\text{Li}^6$  as 7.2 by band-spectrum measurements (cf. Schuler's value of 10.5, C. A. 25, 1734; Nakamura's of 8, C. A. 26, 1187; also van Wijk, C. A. 26, 1510). The work was repeated by study of the Li line of 6708 Å. in a Schuler discharge tube. A Hilger step grating was used. From the intensity ratios in the triplet  $V = i_1/2i_2$  or  $(i_1 - 2i_2)/i_2$  the av. ratio was found to be  $8.1 \pm 0.4$ . The at. wt. calcd. from this value, 6.904  $\pm$  0.005 (cf. Bainbridge, C. A. 27, 4164), is not in agreement with the chemically detd. value of 6.940.

**The measurement of x-ray emission wave lengths in the M-series by means of the ruled grating.** E. G. Purdom and J. M. Cork. *Phys. Rev.* 44, 974-6(1933). Wave lengths are detd. for 13 elements with at. no. greater than 71; the results are consistently 0.32% higher than those found by the crystal method.

**The K absorption discontinuities of the elements zirconium to iodine.** P. A. Ross. *Phys. Rev.* 44, 977-83(1933).—A double-crystal spectrometer was used to study the K absorption edge for Zr, Nb, Mo, Ru, Rh, Pd, Ag, Cd, Sn, Sb, Te and I. The width of the main step increases with at. no. The position of the inflection point of the absorption curve is detd. to  $\pm 0.02 \times \lambda$ .

**The natural widths of the L-series lines in the x-ray spectra of elements 74 to 83.** John H. Williams. *Phys. Rev.* 45, 71-5(1934).

**The relative intensities of certain L-series x-ray satellites in cathode-ray and in fluorescence excitation.** F. R. Hirsh, Jr., and F. K. Richtmyer. *Phys. Rev.* 44, 955-60(1933).—The problem of the origin of x-ray satellites is attacked by a study of their relative intensities when excited by 20-kv. electrons and by Ag L radiation. The elements studied were Zr(40), Mo(42), Ru(44), Rh(45), Pd(46) and Ag(47). The results for fluorescent excitation suggest an origin in LM ionization, but the rapid variation with at. no. of the intensities for electron excitation show that the outer electrons must be involved. Satellite intensities up to that of 72% of the parent line, as for Rh, offer difficulty to any theory of double ionization.

**Some fundamental concepts of the technic of x-ray measurement.** Robert Jaeger. *Z. tech. Physik* 15, 39-42(1934).—Differences are pointed out between the dose detd. for monochromatic and for heterogeneous radiation.

**X-ray diffraction in long-chain liquids.** B. E. Warren. *Phys. Rev.* 44, 969-73(1933).—The theory of Zernicke and Prins (C. A. 21, 1730) is extended and applied to the data of Stewart (C. A. 21, 2206; 22, 1008). Long-chain mols. are straight in liquids, and neighboring mols. are roughly parallel. The main peak, obtained with all hydrocarbon compds., is detd. by the distance to a concn. of scattering matter, and is about 8% larger than the lateral chain sepn. The inner peak for alcs. and fatty acids is detd. by the distance from the end group to the gap at the other end of the chain.

**Wave lengths and spectral laws.** F. Paschen. *Sitzber. preuss. Akad. Wiss. Physik.-math. Klasse* 1933, 876-85.—

It is shown that the errors in wave no. affecting spectrum lines are least for wave lengths measured in the red and infra-red. Therefore, spectral terms derived from measurements of such lines are more accurate than those derived from lines of shorter wave length, and may be used, in consequence of the combination principle, to calc. the wave nos. of lines in the ultra-violet and Schumann region where standard wave lengths are still not available and the precision of measurement is not high. Illustrative examples are chosen from the spectra Al I and Al II.

**The Stark effect of the Lyman series.** Rudolf Frerichs. *Ann. Physik* 19, 1-8(1934).—Theoretical and measured values for the no., sepn. and intensity of the components of the 1st 3 lines of the Lyman series for H are given. Only the intensity values disagree with theory. L. G.

**Relative intensity of atomic spectral lines from a hydrogen discharge tube.** W. W. Jackson. *Phil. Mag.* 17, 33-53(1934).—The at. spectrum of H was obtained free from background. The intensity of the lines was measured with a thermoelement and a sensitive galvanometer for values of the discharge current in the range 200-800 ma. When the intensity of  $H\alpha$  is plotted against the current, the curve is parabolic; for  $H\beta$  and  $P\alpha$  (Paschen series) the variation is linear. The ratio of the intensities of  $H\alpha$  and  $H\beta$  increases linearly with the current, while the ratio of  $H\beta$  to  $P\alpha$  is a const. equal to 2.9. The ratio of the corresponding transition probabilities is 0.7.

**Effect of pressure on high terms of alkaline spectra.** E. Amaldi and E. Segrè. *Nature* 133, 141(1934).—The expectation that the high terms of the Na 3S - nP series would be destroyed by adding a foreign gas was unfounded. Na-N<sub>2</sub> and Na-H<sub>2</sub> mixts. were studied at atm. pressure. A slight broadening of the high terms occurred in Na-N<sub>2</sub> mixts. In the Na-H<sub>2</sub> mixts. a shift to the violet was evident in the high terms. With a concn. of  $4.8 \times 10^{19}$  mols. of H<sub>2</sub>/cc. a displacement of 7.5 cm.<sup>-1</sup> was observed. The shift is proportional to the concn. of the gas.

**Broadening of spectral lines due to an increase in pressure.** Antonio Carrelli. *Rend. accad. sci. Napoli* [4], 3, 39-64(1933).—A math. treatment of the broadening of spectral lines due to the presence of quasi-mols. II. *Ibid.* 101-9.—The distribution of intensity is studied in lines emitted from Na and K vapor of high d. The results point to the presence of quasi-mols. J. B. A.

**The ionization potential of Fe II.** J. C. Dobbie. *Phys. Rev.* 45, 76-8(1934).—Two new terms found in the spark spectrum of Fe permit the principal ionization potential of Fe II to be calcd. as 16.16 v.

**Hyperfine structure absorption in optically excited mercury vapor.** M. L. Pool and S. J. Simmons. *Phys. Rev.* 44, 997-1001(1933); cf. C. A. 28, 1270<sup>a</sup>.—The linear absorption coeffs. for the various components of  $\lambda$  4047 passing through excited Hg vapor were detd.

**Multiplet and hyperfine structure analyses of Bi IV.** Discussion of perturbation effects. A. B. McLav and M. F. Crawford. *Phys. Rev.* 44, 986-96(1933). L. S. K.

**New spectrum of zinc; Zn IV.** L. Bloch and E. Bloch. *Compt. rend.* 198, 645-7(1934).—Vacuum spark spectra are superior as regards intensity and definition to spark spectra in air, resembling, but being more satisfactory than, spectra obtained with the oscillating electrodeless discharge. In this way 133 lines (4039.34 - 2580.9) of Zn IV have been measured. This spectrum contains no lines between 4900 and 4040, or beyond 2580 Å. (cf. C. A. 20, 1952).

**Quenching of atomic thallium fluorescence by foreign gases.** N. A. Prilezhayeva. *Compt. rend. acad. sci. U. R. S. S.* [N. S.], 1933, 280-1 (in English 282-3); cf. C. A. 27, 3141, 3142.—Expts. were made with Tl I in a quartz tube at 400°, the pressure of the quenching gases N<sub>2</sub>, O<sub>2</sub>, CO, CO<sub>2</sub>, H<sub>2</sub>, H<sub>2</sub>O and A being varied from 0 to 500 mm. The line ( $^2S_{1/2} \rightarrow ^2P_{1/2}$ ) at 5351 Å. emitted by the excited Tl atom was studied. The exciting light was generated by a condensed spark between metallic elec-

trodes, the intensity of the fluorescence being measured photometrically.  $N_2$ ,  $CO$ ,  $H_2O$  and  $A$  are effective in quenching through collisions of the second kind, while  $H_2$  fails to act at all in quenching. Quenching is greatest with  $CO_2$  and  $O_2$  where reaction with the excited  $Tl$  atom is possible.

Howard A. Smith

Weiss constant of paramagnetic ions in the  $S$ -state. Akshayananda Bose. *Nature* 133, 213(1934).—The magnetic susceptibility of  $Mn^{++}$  ions in solns. from room temp. to  $98^\circ$  obeys the simple Curie law; the max. value of the Weiss const. is  $<3$ . The Curie const. for  $Mn^{++}$  is 4.19 in  $MnCl_2$  and 4.11 in  $Mn(NO_3)_2$  solns.; these correspond to 28.8 and 28.5 Weiss magnetons, resp.

Gerald M. Petty

Continuous spectrum of neon. Tsi-Ze Ny and Shueh-Ling Voo. *Compt. rend.* 198, 350-8(1934).—The continuous spectrum of Ne was compared photographically with that of  $H_2$  and was found to increase regularly with increasing wave length from about 2500 Å. in the ultra-violet to a max. at 3400 Å. The intensity of various portions of this spectrum varies proportionately with the current through the discharge tube, thus indicating that it is not due to recombination of electrons with ionized atoms.

C. C. Kiess

The spectrum of atomic nitrogen ( $N I$ ) in ammonia and in mixtures of hydrogen and nitrogen. D. Séférian. *Compt. rend.* 198, 358-40(1934); cf. *C. A.* 28, 19247. — An arc between  $W$  electrodes in atms. of  $NH_3$  and of various mixts. of  $N_2$  and  $H_2$  emits 3 groups of lines of  $N I$  in addn. to the first 4 Balmer lines of  $H$  and the ultimate rays of  $W$ . A continuous spectrum was observed, distinct from that of the incandescent electrodes, which is ascribed to the  $W$  atom.

C. C. Kiess

Predissociation in the upper level of the Ångström bands of carbon monoxide. D. Coster and F. Brons. *Nature* 133, 140(1934).—In the  $P$ ,  $Q$  and  $R$  branches of the  $0 \rightarrow 1$  band ( $1^2\Sigma \rightarrow 1^1\Delta$ ) the lines abruptly decrease in intensity beginning with the same value  $J = 38$  of the upper level. From the observed energy of predissocn. the disson. energy of the normal state is calcd. as  $D = 9.82$  v. The disson. energies of other terms are:  $A^1\Pi$ , 1.82;  $B^1\Sigma$ , 2.28;  $a^1\Pi$ , 3.84;  $a^1\Sigma$ , 3.94; and  $d^1\Pi$ , 3.10 v. The upper zero vibration level of the Herzberg bands lies about  $3100\text{ cm}^{-1}$  higher than the disson. term  $^3P + ^1D$  and are thus more difficult to get than the Ångström bands.

Howard A. Smith

Fluorescence of vapor of iodine excited by circularly polarized light and viewed longitudinally. P. Daure and A. Kastler. *Compt. rend.* 198, 557-9(1934).—Theory requires that the short-wave component of a doublet in the fluorescent spectrum of  $I$  vapor should be purely vibrational ( $\Delta J = 0$ ), while its long-wave satellite is vibration-rotational ( $\Delta J = +2$ ), and therefore should exhibit circular inversion (*C. A.* 12, 1148). By a method similar to that of Hanlé (*C. A.* 26, 3728) this has been verified for the doublet of order 1.

C. A. Silberrad

The fluorescence of diatomic arsenic molecules. P. Swings and M. Migotte. *Compt. rend.* 197, 836-8(1933).

Four resonance series due to  $As_2$  are excited by the Hg arc. The distance between atoms is calcd. to be  $1.94$  Å. and the moment of inertia is  $234 \times 10^{-40}$  g. sq. cm.

J. B. Austin

Existence of oxygen in the atmosphere of Mars. D. I. Bropkin. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1933, 100(in English 100-1); cf. *C. A.* 28, 423.—E. suggests a study of the 3200-3400 Å. region for  $O_2$  bands to settle the question of the existence of  $O$  on Mars.

F. H. Rathmann.

The infra-red bands and molecular constants of hydrobromic acid. E. K. Plyler and E. F. Barker. *Phys. Rev.* 44, 984 5(1933).—The fundamental and first harmonic bands were examd. with high resolution. The data give  $\nu_0 = 2649.74\text{ cm}^{-1}$ ,  $r_0 = 1.4096 \times 10^{-8}$  cm. and certain anharmonic const.

L. S. Kassel

Electronic levels of polyatomic molecules. I. Levels of the  $C \equiv C$  double bond. C. P. Snow and C. B. Allsopp. *Trans. Faraday Soc.* 30, 93-9(1934).—Mulliken's

theoretical work on the  $C \equiv C$  double bond in  $C_2H_4$  (*C. A.* 27, 2374) was tested experimentally, and the upper states of trimethylethylene and cyclohexane are shown to be very similar to those of  $C_2H_4$ . The range of transition derivs. permitted by the theory is not observed. Assignment of the principal bands of trimethylethylene and cyclohexane are tentatively made on the same lines as  $C_2H_4$ ,  $(x+x)(x-x)^1B$  upper state,  $(x+x)(s+s)^1A$  ground state, and very weak bands,  $^1A \rightarrow ^1B$ , the multiple analogs of the above transitions.

E. R. Rushton

The infra-red absorption of ozone. G. Hettner, R. Pohlman and H. J. Schumacher. *Naturwissenschaften* 21, 884(1933).—The  $O_3$  spectrum was studied from visible region to  $27\text{ }\mu$ ; no new selective absorption was found beyond that at  $13.8$  and  $14.4\text{ }\mu$  (*C. A.* 27, 4735). The basic vibration at  $7.6$  (or  $7.39\text{ }\mu$ ) (Gerhard, *C.* 1 27, 2094) does not belong to  $O_3$ , nor does the band at  $11.38\text{ }\mu$ . Both bands are due to traces of  $N_2O_5$  present in impure  $O_3$ . A partial pressure of  $1.7\text{ mm. NO}_2$  causes these bands to appear strongly.

B. J. C. v. d H

Infra-red absorption spectra of  $NO_2$  and  $N_2O_4$ . Louis Harris and G. W. King. *J. Chem. Physics* 2, 51 7(1934).—Several new bands of  $NO_2$  and  $N_2O_4$  in the region  $1-4\text{ }\mu$  are reported and analyzed. The spectra are shown to favor angular  $NO_2$  mols. and double mols.  $O_2N-NO_2$ , for the latter possible configurations are discussed.

C. D. West

The ultra-violet absorption of binary liquid mixtures III. The system propionaldehyde-ethyl alcohol. Max Pestemer and Paula Bernstein. *Monatsh.* 63, 236 14(1933); cf. *C. A.* 27, 5248. —Since the reaction between  $EtCHO$  and  $EtOH$  to form the hemiacetal is rapid and reversible, the equil. mixt. cannot be detd. by analysis. In the region  $2300-4000$  Å. only the aldehyde has an absorption band (which is due to the  $CO$  chromophore group). A mixt. of aldehyde and alc. has a band of the same form as the pure aldehyde, and has the max. at the same wave length. For a series of mixts., therefore, the observed extinction at the max., compared with that calcd. from the dilg. effect of the alc. if no reaction occurs, gives the extent of the acetal formation. The data show that the hemiacetal is formed.

L. S. Steiner

Absorption spectra of salts with haloid complex ions Hans Fesefeldt. *Nachr. Ges. Wiss. Göttingen, Math.-physik. Klasse* 1932, 353-5. —The absorption spectra of thin layers of cryst.  $KCN$ ,  $KCNS$  and  $Pb(CNS)_2$  show bands at  $169$ ,  $183$  and  $183\text{ m}\mu$ , resp. For  $KCN$  the Coulomb fraction of the lattice energy is calcd. as  $7.62$  v.  $TICNS$  exhibits deformation.

B. C. A

Adapting a laboratory spectrometer to a study of the Raman effect. Harvey A. Zinszer and Richard H Zinszer. *Trans. Kansas Acad. Sci.* 36, 164 5(1933)

W. A. Moore

The intensity of the Raman effect in water. A. Carrelli and F. Cennamo. *Nuovo cimento* 10, 330-2(1933) —An analysis of the broad band at  $\Delta\nu = 3660\text{ cm}^{-1}$  indicates that it may be composed of 3 components:  $3210$ ,  $3400$  and  $3590$ .

J. B. Austin

The Raman effect in nitric acid alone and in solution L. Médard and H. Volkringer. *Compt. rend.* 197, 833 6(1933).—99.8% acid gives lines at  $612$ ,  $674$ ,  $922$ ,  $1048$ ,  $1103$ ,  $1295$ ,  $1537$ ,  $1679\text{ cm}^{-1}$ . Diln. with  $H_2O$  shifts the lines to higher values. The  $H_2O$  bands appear in solns. contg. less than 52%  $HNO_3$ . Solns. in  $CHCl_3$  show bands due to  $HNO_3$  and  $CHCl_3$  throughout.

J. B. Austin

The Raman effect. XXVIII. The Raman spectra of organic substances (isomeric paraffin derivatives. 4) K. W. F. Kohlrausch and F. Köppl. *Monatsh.* 63, 255-70(1933); cf. *C. A.* 28, 443. —Raman spectra were obtained for *sec*-butylamine, *sec*- and *tert*-butyl mercaptans, *tert*-amyl mercaptan, for the chloro derivs. of hexane, heptane, octane, nonane and decane, and for *sec*- and *tert*-butylcarbinol, methylpropylcarbinol, methylisopropylcarbinol, diethylcarbinol and *tert*-amylcarbinol. The known data for the mercapto-, chloro-, bromo-, iodo- and hydroxy-paraffins are correlated.

L. E. Steiner

Raman spectra of several unsaturated nitriles. Marc de Hemptinne and Joseph Wouters. *Ann. soc. sci. Bruxelles*

B53, 215-18(1933).—The Raman spectra of vinylacetonitrile, crotononitrile and isocrotononitrile were studied by Wood's method, with a Pyrex Hg lamp. For  $\text{—C}\equiv\text{N}$  a Raman line at about  $\Delta\nu = 2250$  was observed, for  $\text{C—H}$  lines about 1400 and 2900, and for  $\text{—C=C—}$  about 1650. The latter value is greater for cis than for trans isomers. L. P. Hall

**Raman spectra of anhydrite and anglesite.** Hisamitsu Nishi. *Proc. Phys.-Math. Soc. Japan* 15, 463-9(1933); *J. C. A.* 27, 5248.—Raman spectra were obtained for anhydrite and anglesite by using a quartz Hg arc for the exciting radiation. For anhydrite the shifted line due to the principal inactive vibration of  $\text{SO}_4^{--}$  is single and the shift is  $10\text{ cm.}^{-1}$  larger than for gypsum. The other lines are double and triple, indications that the  $\text{SO}_4$  group is distorted from a regular tetrahedron but these results do not agree with those obtained from x-ray analysis. For anglesite the shifts are larger than those obtained with other sulfates. There are intensity anomalies in each case but the explt. results are not complete enough to afford any very certain conclusions. G. M. Murphy

**The Zeeman effect of the absorption lines of ruby.** Hans Lohmann. *Ann. Physik* 19, 99-117(1934).—The observed splitting and relative intensities of the components of the absorption lines 6933.7 and 6919.8 Å. of ruby as a function of the orientation of the crystal lattice to the magnetic field and polarization plane at  $-190^\circ$  are given. The optical axis has a 6-fold symmetry. The effect on the lines varies in accordance with the symmetry of the crystal lattice. Louis Goldman

**The para-ortho conversion of hydrogen.** R. Kh. Burshten. *Uspekhi Khim.* 2, 691-9(1933).—A review. F. H. Rathmann

**Determination of the probability of energy transfer during collisions.** N. N. Semenov. *Trans. Faraday Soc.* 30, 227-30(1934).—A method is presented for detg. the probability that a quantum of oscillatory energy will be transmitted, based on a study of the recombination of free radicals. E. R. Rushton

**Free radicals and spectroscopy.** R. Mecke. *Trans. Faraday Soc.* 30, 200-14(1934).—A general discussion of pos.-ray analysis, band spectroscopy, mol. dimensions, mol. vibrations and disson. energies. Radicals were found to retain their dimensions in their stable compds. A purely spectroscopic stereochemistry is predicted. E. R. Rushton

**Free radicals and the photochemistry of solutions.** J. Franck and E. Rabinowitch. *Trans. Faraday Soc.* 30, 120-31(1934).—The majority of photochem. processes in gases take place through the intermediary of free atoms or radicals, and every act of absorption leads to disson. The absorption spectra of liquids or solns. are nearly always continuous, but this cannot be considered as proof for disson. as the primary effect of absorption. When a photochem. reaction in soln. or in a pure liquid shows a primary quantum yield of approx. unity, without a pronounced influence of temp., light intensity or wave length, no atoms or radicals are involved; reactions involving free radicals must exhibit characteristic deviations from the equivalence law, depending on wave length, concn., light intensity and temp. E. R. Rushton

**Free radicals and ions as factors in chemical change.** M. Lowry. *Trans. Faraday Soc.* 30, 3-9(1934).—The majority of photochem. reactions and thermal decomposition appear to depend on the formation and interaction of neutral free radicals. All mols. which possess an odd no. of electrons are regarded as free radicals, although this is not an essential characteristic of free radicals, since unsatisfied valencies may appear at two points in the same mol. E. R. Rushton

**Oxygen molecules as radicals. Interaction of oxygen molecules.** W. Steiner. *Trans. Faraday Soc.* 30, 34-41(1934).—Absorption spectra in O at  $20^\circ$  and 6-30 atm. in columns of 250-750 cm. were investigated and details are to be published soon. At the lowest pressure, the Herzberg spectrum was observed almost exclusively, whereas, at the highest pressure only the bands previously described by S. (*C. A.* 27, 1824) appeared. At

10-16 atm., the 2 spectra are superposed, as shown by the photometer curves given. The absorption is a measure of the stationary concn. of a collision pair, and its calcn. is shown. The  $\text{O}_2$  mol. is not a free radical, because the spin interaction between  $\text{O}_2$  mols., which is a type of valence activity, has a very low energy, not of the order of magnitude of that of a chem. reaction. E. R. R.

**Hydrogen atoms, oxygen atoms and the hydroxyl radical.** Paul Harteck. *Trans. Faraday Soc.* 30, 134-41(1934).—A stream of H, rich in H atoms, was produced at 0.1 to 1 mm., mixed with the gas with which it was to react, and the product studied. H atoms were found to be stable in the presence of  $\text{O}_2$  for at least 0.1 sec. They do not react with  $\text{H}_2\text{O}$  vapor, or with  $\text{N}_2$  or  $\text{NH}_3$ . CO and  $\text{CO}_2$  react very slowly.  $\text{Cl}_2$  and  $\text{Br}_2$  react very rapidly.  $\text{H}_2\text{S}$  is rapidly decompd. and S is deposited. O atoms were produced in a discharge tube, special precautions being necessary to reduce the amt. of  $\text{O}_2$ . O reacts violently with HBr and HCl. With  $\text{NH}_3$ ,  $\text{H}_2\text{O}$ , N and the oxidation products of  $\text{NH}_3$  are formed. The lifetime of the OH radical is much less than those of H and O, and there is little possibility of studying its reactions without the presence of secondary reactions. E. R. Rushton

**Formation of hydroxyl radical from the photolysis of water and the generation of formaldehyde.** N. R. Dhar. *Trans. Faraday Soc.* 30, 142-8(1934).—The water vapor present in the upper atm. appears to be photochemically decompd. by the ultra-violet light of the sun. The H present may reduce  $\text{CO}_2$  to  $\text{CH}_3\text{O}$ , which is washed down by the rain. The decompn. of  $\text{CH}_3\text{O}$  is hindered by the presence of H in the atm. E. R. Rushton

**Intensity measurements on artificial sources of ultra-violet light.** A. van Wijk and E. H. Recink. *Physica* 13, 289-98(1933).—A review. B. J. C. van der Hoeven

**Primary photochemical production of some free radicals.** Ronald G. W. Norrish. *Trans. Faraday Soc.* 30, 103-20(1934).—Light absorbed by one group may cause a reaction in a different part of the mol by processes of resonance. The thermal values of the C links as calcd. from the heat of sublimation of C require adjustment for the  $^1\text{S} - ^3\text{P}$  transition to obtain results in agreement with photochem. data. The photochem. production and stability of free alkyl radicals and the CH and  $\text{CH}_2$  radicals are discussed. There is evidence for the existence of C in the bivalent ( $^1\text{P}$ ) state. A new type of predissociation in acetone is described (*C. A.* 27, 5645). E. R. R.

**Electronic structure and the interaction of some simple radicals.** J. E. Lennard-Jones. *Trans. Faraday Soc.* 30, 70-93(1934); cf. *C. A.* 24, 4220.—The method of non-localized mol. orbitals, as developed by Mulliken (*C. A.* 27, 2374), is applied to a series of simple radicals which have equal nos. of electrons, though different nos. of nuclei. This gives a general, though necessarily qual., picture of the actual processes involved. The electron states and a comparison of the electron structure are given and the energy of rearrangement of radicals and mols. is discussed. E. R. Rushton

**Possible application of molecular ray technic to the study of free radicals.** Ronald G. J. Fraser. *Trans. Faraday Soc.* 30, 182-7(1934).—The method of Estermann and Stern (*C. A.* 28, 34<sup>6</sup>) is suggested for the detection and analysis of mol. rays. The power of the method could be greatly increased by combining it with a magnetic analysis of the mixed beam. It could be used, for example, to analyze the products of the thermal decomposition of  $\text{CH}_4$  and  $\text{C}_2\text{H}_4$ . E. R. Rushton

**Quenching of fluorescence by organic compounds.** K. Weber and M. L. Savic. *Z. physik. Chem.* B24, 68-74(1934); cf. *C. A.* 27, 26.—Quenching of fluorescence was studied in various solvents with org. compds. contg. OH and  $\text{NH}_2$  groups. The solns. were Na naphthionate in  $\text{H}_2\text{O}$ ; quinine sulfate in aq.  $\text{H}_2\text{SO}_4$  soln.; pinakryptol yellow in  $\text{H}_2\text{O}$  and EtOH; fluorenone in  $\text{C}_6\text{H}_6$  and esculin in EtOH. The effect of the solvent is to cause a shift in the extinction curves. G. M. Murphy

**Influence of solvent on law of variation of fluorescent power of dyes as a function of concentration of solution.** J. Bouchard. *Compt. rend.* 198, 649-51(1934).—The

linear relation between  $\log \Phi$  and  $c$  in the equation  $\Phi = \Phi_0 e^{-kc}$ , where  $\Phi$  is the fluorescent power as measured by Perrin's fluorometer,  $\Phi_0$  its limiting value,  $c$  the concn., and  $k$  a const. (cf. C. A. 18, 3145) was verified for a no. of fluorescent dyes in various solvents, provided that the  $p_H$  is const.;  $\Phi_0$  is independent of the solvent,  $k$  dependent on it. With aq. MeOH, EtOH or iso-PrOH of varying concn. but viscosity,  $\eta$ , approx. the same as that of  $H_2O$ , as solvent,  $k$  varies with the sp. inductive capacity,  $\epsilon$ , according to  $k = (A - B\epsilon)^{-1}$ ,  $A$  and  $B$  depending on the fluorescent solute. If  $\eta$  is markedly  $>$  that of  $H_2O$ ,  $k$  decreases more rapidly. The equation giving  $\Phi$  in the presence of an inhibitor (cf. C. A. 27, 2624) is valid only when the inhibitor does not appreciably affect  $\eta$  or  $\epsilon$ ; if it does, the equation becomes  $\Phi = \Phi_0 e^{-(kc + ks - \alpha sc)}$ ,  $s$  being concn. of inhibitor and  $\alpha$  a const. C. A. S.

**Photooxidation of nitrite to nitrate.** N. R. Dhar, S. P. Tandon, N. N. Biswas and A. K. Bhattacharya. *Nature* 133, 213-14 (1934).— $N/525$  solns. of  $NaNO_2$  contg.  $TiO_2$  or  $Fe_2O_3$  as catalyst, and a  $N/112.4$  soln. of  $KNO_3$ , with  $Fe_2O_3$  catalyst, were completely oxidized to the nitrates by exposure for 100 hrs. to sunlight and air. In each case, the vol. of the soln. was 100 cc., and 5 g. of the catalyst was used. Gerald M. Petty

**The chemical action of light on vinyl iodide.** Guy Emschwiller. *Compt. rend.* 198, 464-6 (1934); cf. C. A. 27, 2933.— $CH_2=CHI_2$  irradiated 124 hrs. by a Hg-vapor lamp gave at ordinary temp.  $C_2H_2$ ,  $C_2H_4$  and  $I$ . On the walls of the flask were crystals of  $I$  and droplets of liquid which contained  $HCO_2H$ ,  $CH_2O$  and  $CH_2(OH)CHO$ . A mechanism is suggested for the formation of these products. Julius White

**The action of ultra-violet light on glycine.** V. Henri, Ch. Weizmann and Y. Hirshberg. *Compt. rend.* 198, 168-70 (1934).—A pure aq. soln. of glycine was exposed to ultra-violet light in a quartz flask. The main reaction was:  $CH_2(NH_2)CO_2H + H_2O = CH_2(OH)CO_2H + NH_3$ . The glycolic acid was detected and the  $NH_3$  detd. at intervals. The sp. cond. and  $p_H$  of the soln. were also detd. periodically. By means of control solns. it was found that the  $NH_3$  concn. could be detd. from the sp. cond. At the end of 15 hrs. 13.1% of the  $NH_3$  had been liberated, the sp. cond. was  $71.2 \times 10^{-3}$ , and the  $p_H$  was 7.45 (the sp. cond. of the glycolic soln was  $1.54 \times 10^{-3}$  and its  $p_H$  4.8). That there were side reactions was shown by the fact that a gas rich in CO was evolved during the irradiation. John E. Millery

**Separation of photochemical and thermal action in the photobromination of cinnamic acid.** Walter H. Bauer and Farrington Daniels. *J. Am. Chem. Soc.* 56, 378-85 (1934).—The photobromination at 0-30° of cinnamic acid in  $CCl_4$  soln., by means of the Hg 4360 line, comprises a primary photoreaction of one mol. of Br per quantum, followed by a chain reaction of 0-14 or more mols. which depends on the concn. of Br and the temp. Expts. with light of 540 and 579  $m\mu$  give similar yields. It seems probable that the reaction is an energy chain involving activated Br mols. H. A. Beatty

**A photobromination experiment.** Wayne W. Umbreit. *J. Chem. Education* 11, 175-6 (1934).—The photobromination of cinnamic acid in  $CCl_4$  can be followed colorimetrically and constitutes a good lab. expt. on photochemistry. W. C. Fernelius

**Polarized photoluminescence of adsorbed molecules of dyes.** A. Jablonski. *Nature* 133, 140 (1934).—The variation of the polarization of phosphorescent and fluorescent light excited by natural and polarized light in a dye (euchrysin) adsorbed on cellophane has been measured as a function of the azimuth. An angular periodic variation in polarization is found which differs for ordinary and polarized light. Different dyes have the same form of curves but the amt. of the polarization varies from dye to dye. Howard A. Smith

**An unpublished photochemical experiment by Hauser.** W. Kossel. *Z. tech. Physik* 15, 23-5 (1934).—Passage of current through a photographic emulsion increases the sensitivity at the cathode and decreases it at the anode. The effect appears to be assocd. with Br ions. J. B. A.

**Free radicals in the electric discharge.** E. J. B. Willey. *Trans. Faraday Soc.* 30, 230-48 (1934).—A general discussion of  $CH$ ,  $OH$  and  $NH$  radicals with a large bibliography. Some unfinished work on the effect of a special thyatron-operated circuit, which gives an intermittent discharge of very brief duration and of variable frequency, on a mixt. of  $CH_4$  and a large excess of  $N_2$  is mentioned. The yield of  $C_2H_2$  was much greater than when a. c. or d. c. discharges of the same watt-input were used. E. R. Rushton

**Free radicals in electrical discharges.** Wm. D. Harkins. *Trans. Faraday Soc.* 30, 221-7 (1934); cf. C. A. 27, 2096.—App. for electrodeless and glow discharges are described with diagrams. The principal radicals found were  $CH$ ,  $OH$ ,  $CH$ ,  $NH$  and  $CN$ , all diat. No bands corresponding to  $CH_2$ ,  $CH_3$  or  $NH_2$  were found. The absence of bands of triat. and higher mols. may be due to the small no. of such radicals present, or pos. ions of the type of  $CH_2^+$ , etc., may dissoc. on taking up an electron or may undergo predissocn. The Baldet-Johnson bands of  $CO^+$  are found in the glow discharge but not in the electrodeless discharge. E. R. Rushton

**Decomposition of hexane, cyclohexane and benzene in the positive-ray tube.** R. Conrad. *Trans. Faraday Soc.* 30, 215-20 (1934).—A large no. of radicals is observed on mass spectrograms obtained with hexane,  $C_6H_6$  and cyclohexane. The alternating intensities of the parabolas and the differences in their no. allow of definite conclusions as to the step-by-step decompn. of the initial compn. in the elec. discharge, in which the stability of the intermediate products plays a part. Conclusion: A pos. charge indicates satn. of a C valency, and a C atom with a free valency tends to form a double bond by expelling a H atom. E. R. Rushton

**Decomposition of chloroform by radiations from radon.** G. Harker. *J. Proc. Roy. Soc. N. S. Wales* 67, 96-117 (1933); cf. C. A. 28, 1276°.—The decompn. of  $CHCl_3$  by Ru was detd. with different metal filters. Secondary radiation from metal or glass does not effect the decompn. In  $\gamma$ -radiation the decompn. of  $CHCl_3$  requires 251,300 cal. per mol., while in x-radiation 29,800 cal. is required. A. B. F. Duncan

**Effect of  $\gamma$ -radiations on chloroform.** W. B. S. Bishop. *J. Proc. Sydney Tech. Coll. Chem. Soc.* 5, 66-9 (1933).— $\gamma$ -Rays (and x-rays) liberate Cl from  $CHCl_3$ . After prolonged irradiation HCl and  $C_2Cl_4$  are formed with disappearance of Cl. B. C. A.

**Intermittent stimulation by light. IV. A theoretical interpretation of the quantitative data of flicker.** Sch. Hecht and Cornelis D. Verrijp. *J. Gen. Physiol.* 17, 269-82 (1933); cf. C. A. 26, 3850.—Of photochem. interest. C. H. Richardson

**Photochemical oxidation reactions.** Franz Nozicka (to Vereinigte Chemische Fabriken Krcidl, "Heller & Co."). U. S. 1,945,067, Jan. 30. A compd. to be oxidized, as in the production of benzoic acid from toluene, is subjected to irradiation in the presence of O and at least 2 different oxidation catalysts, one of which is an "anthraquinone type" catalyst, such as anthraquinone and milk of lime. Various other examples are given. Cf C. A. 27, 2098.

**Ultra-short wave oscillation generation.** Clarence W. Hansell (to Radio Corp. of America). U. S. 1,945,039, Jan. 30. A discharge is passed through a colloidal soln. contg. metallic particles.

#### 4—ELECTROCHEMISTRY

COLIN G. PINK

**The electric melting and heat treatment of iron and steel.** A. G. Robiette. *J. West Scotland Iron & Steel Inst.* 41, 41-52 (1933).

**Electric furnace with controlled atmosphere.** R. F. Benzinger. *Heat Treating and Forging* 19, 105-7 (1933).

**The rare earths. XLI. Electrolytic preparation of rare earth amalgams. 3. Amalgams of lanthanum, neodymium, cerium, samarium and yttrium. Metallic lanthanum, neodymium and cerium by thermal decomposition of their amalgams.** E. E. Jukkola, L. F. Audrieth and B. S. Hopkins. *J. Am. Chem. Soc.* 56, 303-4 (1934); cf. C. A. 27, 3403.—Dil. amalgams are prepd. by electrolysis of satd. solns. of the resp. rare earth metal chlorides in EtOH by means of a Hg cathode. Preliminary vacuum concn. at temps. up to 235° yields solid amalgams contg. 15% rare earth metal. Complete removal of Hg with formation of pure Ce, La and Nd is effected by heating in a vacuum to 1000°.

**The swelling of graphite at the anode and the mechanical disintegration of carbon anodes.** Heinrich Thiele. *Z. Elektrochem.* 40, 26-33 (1934); cf. C. A. 26, 5804.—The mech. disintegration of C anodes is due to a swelling of the graphitic C, which occurs when O is given off at a potential of 1.6 v. in the presence of  $\text{SO}_4^{2-}$ ,  $\text{ClO}_4^-$ ,  $\text{NO}_3^-$  and  $\text{F}^-$  ions, with sufficient c. d. and absence of water. Swollen graphite contains more O than the primary oxide of C. Graphite swells easily and is difficultly oxidizable; amorphous C swells with difficulty and is easily oxidizable.

**The electrical extraction and refining of metals.** G. H. Stanley. *J. S. African Inst. Elec. Engrs.* 24, 301-2 (1933); cf. C. A. 27, 5649.—Discussion. At the Zn plant at Broken Hill slime settlement has been eliminated and all the pulp from the Dorr classifier goes to the Si-Fe-V pptn. V is pptd. separately, removed from the soln., and retreated for the production of fused  $\text{V}_2\text{O}_5$ . Glue and cresylic acid are added in varying amts. to suit the existent conditions.

**Absorption of hydrogen by iron.** Friedrich Korber and Heinrich Ploum. *Z. Elektrochem.* 39, 252-5 (1933).—Absorption of  $\text{H}_2$  by Fe, when the latter serves as cathode in the electrolysis of aq.  $\text{H}_2\text{SO}_4$ , or when it is dissolved in  $\text{H}_2\text{SO}_4$ , occurs only in presence of catalysts, of which the most powerful are S (especially as  $\text{H}_2\text{S}$ ), As, P and other elements which form volatile hydrides. Ni and Hg have a slight catalytic action; Cu and Ag none at all.

**Selection of electroplate coatings for iron and steel components.** E. E. Hall. *Synthetic and Applied Finishes* 4, 45-50 (1933).—Electrodeposited coatings of the "sacrificial protection" and the "blanket" types are discussed with special reference to the electromotive series of the metals. Metals prone to passivity cannot be used as "sacrificial" coverings. The relative behaviors of metals under mild corrosive conditions is often reversed under more rigorous attack. The outstanding features of Zn, Cd, Ni, Cu and Cr electrodeposits are summarized.

**Electrodeposition of alloys. I. Nickel-cobalt alloys.** S. A. Pletenev and V. V. Kuznetsova. *Z. Elektrochem.* 39, 201-4 (1933).—The electrodeposition of Co-Ni alloys from acid solns. of  $\text{NiSO}_4$  and  $\text{CoSO}_4$  in which Ni:Co = 15:1 has been studied. The influence of  $p_{\text{H}}$  (kept const. during electrolysis by addn. of  $\text{H}_2\text{SO}_4$  or  $\text{NH}_3$ ), temp., c. d., ve-

locity of rotation of cathode, and agitation by means of a stream of air on the compn. of the deposit and the percentage of the total Co deposited has been investigated. Under the optimum conditions (Ni 80, Co 5-33 g. per l., c. d. 100 amp. per sq. m.,  $p_{\text{H}}$  3.5, 20°, 2000 r. p. m.) 90% of the Co is deposited as a 41% alloy in 26 hrs.

**Platinum-plating on noble and base metals.** Edmund R. Thews and Ralph W. Harbison. *Chem.-Ztg.* 57, 980-1 (1933).—Pt plating lasts longer than Ag or Au. Relative costs are discussed, and the resistance to corrosion is reported. The methods are described and the present use of  $\text{Pt}(\text{NH}_3)_4(\text{NO}_3)_2$  is endorsed.

**The electrodeposition of rhodium.** G. Grube and E. Kesting. *Z. Elektrochem.* 39, 948-58 (1933).—In a qual. expt., sulfuric fluosilicic, fluoboric, perchloric and oxalic acids give excellent Rh deposits, and the baths can be regenerated through soln. of freshly produced  $\text{Rh}(\text{OH})_3$ . In a quant. expt. for Rh deposition, c. d.-potential curves and the current yield in HCl soln. of  $\text{Na}_3\text{RhCl}_6$  (20°, 40°, 60°) and  $\text{RhCl}_3$  (40°) in oxalic acid soln., in  $\text{NH}_4\text{Rh}$  phosphate soln. (50°), in soln. of Rh perchlorate (20°, 40°, 60°), Rh fluosilicate (20°, 50°) and  $\text{Rh}_2(\text{SO}_4)_3$  (20°) and the effect of excesses of free acid on the deposit are tabulated. The sepn. occurs with high polarization so that at relatively low c. d. the metallic deposit results with H evolution.

**The electrodeposition of columbium.** II. N. Izgaruishev and G. E. Kaplan. *Z. Elektrochem.* 40, 33-6 (1934); cf. C. A. 27, 3671.—Metallic Ch is only partially deposited from solns. contg. KOH or oxalic acid. In the course of the electrolysis, compds. are formed which are not further decomd. With citric acid solns. this action is complicated by the regeneration of the original soln.

**Dispersion of electric current in electrodeposition.** M. A. Rabinovich and S. Ya. Pasechnik. *Ukrain. Khim. Zhur.* 8, Wiss. tech. Teil 127-31 (1933).—A brief literature survey and the exptl. work show that dispersion of elec. currents in electroplating, which results in a non-uniform deposition of metals, is due to local overvoltage because of the differences in smoothness of the surfaces of processed articles.

**Chromium-plating-literature. XXII.** L. H. Decke. *Platers' Guide* 30, Feb. 13-14 (1934); cf. C. A. 28, 18063.

**Anodes for chromium plating in solutions containing hydrofluoric acid.** Erich Müller and Jón E. Vestdal. *Z. Elektrochem.* 40, 14-18 (1934).—Pb is the only anode material which permits the  $\text{Cr}^{+++}$  ions formed at the cathode to be oxidized to  $\text{CrO}_3$ . If F ions are present, the  $\text{PbF}_2$  which is formed during an interruption of the electrolysis increases the cell resistance. This resistance is eliminated by addn. of 10-30% Sb or Bi to the Pb.

**Electrochemical oxidation of trivalent chromium to chromic acid.** N. S. Drozdov. *J. Gen. Chem.* (U. S. S. R.) 3, 345-50 (1933).—The investigation of the influences of various factors on the course of anodic oxidation of trivalent Cr salts confirmed the findings of Muller and Soller (*Z. Elektrochem.* 11, 863 (1905)).

**Platinized glass electrode.** H. Muraoka and K. Hiruma. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 161 (1933).—Platinized glass filter plates form suitable electrodes for electroanalysis expts.

**The theory of passivity phenomena. XX. Passivity**

of nickel. W. J. Müller and E. Löw. *Z. Elektrochem.* 39, 872-9(1933).—Polemic with Georgi (*C. A.* 26, 5853). XXI Film theory. W. J. Müller. *Ibid.* 880-3.—Polemic with E. Müller and Schwabe (*cf. C. A.* 27, 4739). Reply. Erich Müller and Kurt Schwabe. *Ibid.* 884.

Film or layer theory? W. J. Müller. *Z. Elektrochem.* 40, 18(1934).—Mainly polemic with Schwabe (*C. A.* 28, 47<sup>4</sup>). Curtis L. Wilson

Electric oxidation of aluminum. The eloxal method. J. Loewenthal. *Teknisk Ukeblad* 80, 561-4(1933).—An electrolytic method is described for the coating of articles of Al or Al alloys with a 0.02-4 mm. film of  $\gamma$ -oxide. As a rule a.c. is employed, and no counterelectrodes are necessary. Articles of limited size are treated in rubber-lined sheet Fe vats at a temp. of 15-30°. In most cases 3.5-4.5 kw. hrs. per sq. m. surface will be sufficient, the treating being completed in 15-20 min. Wires or ribbons are drawn continuously through the bath. Tube spirals and similar articles that cannot be treated in the bath are treated by a special spraying app., the article being grounded and serving as one electrode, the elec. current playing between the sprayed surface and a counterelectrode on the spraying app. through the jet of electrolyte. The latter is an acid soln. contg. oxidative substances, no further details being stated. The oxide film can be colored by treating with solns. of org. or mineral dyestuffs. The oxide film obtained by the eloxal method is claimed to be far superior to other oxide coatings with respect to elec. resistance, non-porosity, and chem. resistivity.

C. A. Robak

The rate of decay of hydrogen and oxygen overvoltages. G. Armstrong and J. A. V. Butler. *Trans. Faraday Soc.* 29, 1261-6(1933).—When no assumption of at. H or O is made, the rate of decay of overvoltage is expressed by the equation  $dV/dt = i/B$ , where  $dV$  is the change in voltage in the time  $dt$ , and  $i$  is the rate of transfer of ions across the double layer whose capacity is  $B$ . When this equation is integrated and  $\epsilon_H$ , the electrode potential, is plotted against  $\log t$ , a straight line is found from an initial  $\epsilon_H = 1$  to  $\epsilon_H = 0.35$  for Hg electrodes. Electrode potentials above 1 were due to impurities, especially Na. The rates of decay of overvoltages of such contaminated electrodes were slower than those of the uncontaminated. For Pt electrodes the overvoltages are lower and the rate of decay near the reversible H potential is considerably less than theoretical, probably because of adsorbed or dissolved  $H_2$ . The rate of decay of O overvoltages on Pt is slower than theoretical for the first 100 sec. but agrees with theory from 100 to 1000 sec.

F. E. Brown

The anodic passivity of lead. P. Porfiriov. *J. Gen. Chem.* (U. S. S. R.) 3, 590-5(1933).—The bath consisted of  $H_2SO_4$  in concns. of 10, 20 and 96%, satd. with  $PbSO_4$ . A Pb plate served as anode and Pt as cathode. The temp. was kept at 25°. The passivity of the anode was detd. by measuring the change in resistance of the bath to anode with time. Transformation of the Pb into insol. form takes place in 2 stages. In the 1st stage under the influence of the current, a normal soln. of the Pb takes place. The difficultly sol.  $PbSO_4$  deposits on the anode in the form of a fine cryst. layer, covering part of the surface, this increasing the c. d. on the uncovered part. This accelerates crystn. of the sulfate, which causes formation of a colloid and results in an increase in interfacial resistance between liquid and anode and further increase in c. d. When the c. d. reaches a certain point, the 2nd stage sets in. O begins to deposit on the anode and  $PbO_2$  forms, this completing the cycle: Pb sol.  $\rightarrow$  Pb insol. The 1st stage is mech. and the 2nd chem. The process of passivation of Pb in  $H_2O$ -free  $H_2SO_4$  is limited to the mech. stage.

S. L. Madorsky

The development of lead batteries for vehicles. W. Röddiger. *Elektrotech. Z.* 54, 1256-7(1933).—Brief historical review.

F. W. Jung

The electrolytic etching process. III. The side-etching. Masataka Nagano. *J. Electrochem. Assoc.* (Japan) 2, 56-60(1934); *cf. C. A.* 27, 5651-2. The effects of etching conditions have been examd. The side etching may be reduced by an average of 30% by applying electrolytic etching instead of chemical. Thus side etching is decreased when a Cu surface is electrolyzed in 2.5%  $KNO_3$  acidified with 2 N AcOH with c. d. of 2 amp./sq. cm.; similarly for a Zn surface in N  $NH_4Cl$  with c. d. of 3 amp./sq. cm.

K. Konda

Electrolysis of alkali fluophosphates. Juan M. García Marquina. *Anales soc. españ. fis. quim.* 31, 840-51(1933); *cf. C. A.* 27, 4883.—Electrolysis of aq. solns. of Na, K and  $NH_4$  monofluophosphates showed formation of 2 peroxo-acids corresponding to  $O:PF(OH)O.OH$  and  $O:PF(OH)O.OPF(OH):O$ , which have not been isolated but whose compn. has been shown by the variation in the alkyl of the electrolyte.

E. M. Symmes

The electrolysis of sodium sulfide. W. Bohnholtz and Fr. Heinrich. *Z. Elektrochem.* 39, 939-47(1933)

The electrolyses of aq. solns. of pure  $Na_2S$  and polysulfides are conducted with Pt electrodes in a decompn.-voltage flask and calomel cell with a capillary electrometer. C. d.-potential curves are shown for the anode potential and c. d. The periodic phenomena which Kuster assumed to be a single resistance layer formed periodically does not explain the stages of a, b, c, d of these curves summarized as follows: In the first segment (a) the c. d. is low for a low potential at 0° but increases slightly at 50° and only polysulfides are formed. In the b phase the electrode is covered with a current-resistance film thought to be monoclinic S. Since c. d. is almost zero, no electrolytic products are formed. In the c phase the electrode is covered with loose, probably rhombic, S. The S dissolves to polysulfides and no other compd. appears. In d, the electrode is clean and c. d. small, with sulfate and some dithionate produced. In the d<sub>1</sub> the c. d. is high and the electrode covered with S contg. O bubbles. Sulfur, polysulfides, sulfates and dithionates are found. In d<sub>2</sub> the S is generally oxidized to the sulfate and the electrode is practically free from S.

Leona Marsh

Electro-organic oxidations in concentrated aqueous organic salt solutions. Reactions with toluene, oleic acid, benzoin and other substances. Ralph H. McKee and Joe R. Heard, Jr. *Trans. Electrochem. Soc.* 65, 10 pp. (preprint)(1934).—The electrolytic oxidation of several org. compds. dissolved in concd. Na xylene-sulfonate solns. was studied in a cell arranged for measurement of anode gas evolution. Toluene, naphthalene, anthracene and borneol are not oxidized in alk. solns. Oleic acid was oxidized with a higher anode gas absorption efficiency in alk. soln. than under slightly acid conditions, while with the linseed org. acids, the reverse was true. Under strongly acid solns., toluene and the solvents are oxidized to phenolic compds. Naphthalene depolarized a graphite anode in a strongly acid soln. with the formation of quinone and phenol products. Benzoin was oxidized to BzOH under alk. conditions at higher current efficiencies than previously reported. Halogenation of the solvents and toluene took place simultaneously, with halogen preference for substitution in the hydrocarbon ring rather than the side chain. It had been shown (McKee and Brockman, *C. A.* 26, 3734) that BzH and  $PhCH_2OH$  exhibited remarkable solubilities in concd. aq. Na benzenesulfonate solns. Other similar compds. such as Na xylene- and cymene-sulfonates which have a greater percentage solv. by wt. at comparable temp. likewise show a better solvent action for different org. compds. A wide variety of types of water-insol. org. compds. are sol. in these solvents, e.g., toluene, naphthalene, anthracene, hydroquinone, borneol, oleic acid, linseed org. acids and benzoin. The behavior of the compds. mentioned when subjected to electrolytic oxidation in these nonvolatile and conducting sulfonate solvents was detd. The possibility of electrolytic halogenation of toluene in these solvents was likewise investigated.

C. G. F.

Mechanism of the Kolbe reaction. S. Glasstone and A. Hickling. *Nature* 133, 177(1934).—In the electrolysis

of acetate solns. the presence of relatively small amts. of various ions has a profound influence on the course of the Kolbe reaction. Addn. of 0.001 M  $\text{Pb}(\text{OAc})_2$  to a soln. of N AcOK and N AcOH reduces the efficiency for  $\text{C}_2\text{H}_5$  formation at the anode from 70 to 0% (c. d. 0.025 amp. per sq. cm.). The effect of the ions tested is in the order  $\text{Pb}^{++} > \text{Mn}^{++} > \text{Cu}^{++} > \text{Co}^{++} = \text{Fe}$ . It is suggested that possibly  $\text{H}_2\text{O}_2$  is the effective agent in  $\text{C}_2\text{H}_5$  formation by the Kolbe reaction. W. J. Peterson

**Electrochemical research with *p*-fluorotoluene and fluorobenzoic acid; di-*p*-fluorobenzoyl peroxide and its decomposition.** Franz Fichter and Jakob Rosenzweig. *Helv. Chim. Acta* 16, 1154-8 (1933).—The electrochem. oxidation of *p*-fluorotoluene gives immediately *p*-fluorobenzoic acid, and the intermediary aldehyde cannot be detected. The Na salt of the acid does not give the Kolbe electrolysis. Di-*p*-fluorobenzoyl peroxide, obtained from *p*-fluorobenzoyl chloride and  $\text{BaO}_2$ , is decompd. by heat to give *p,p'*-difluorobiphenyl, together with by-products. A. L. Henne

**Electrochemical reduction of pyridine.** N. S. Drodzov. *J. Gen. Chem. (U. S. S. R.)* 3, 351-9 (1933).—Contrary to Emmerl (*C. A.* 7, 2753, and Rülke and Glotofskii, *Ger. pat.* 420,445 (1920)) the course of the electrochem. reduction of  $\text{C}_5\text{H}_5\text{N}$  with a diaphragm is detd. by the amt. of  $\text{H}_2\text{SO}_4$  and not by the concn. of  $\text{C}_5\text{H}_5\text{N}$  in the electrolyte. Thus with the increasing excess of  $\text{H}_2\text{SO}_4$  the yield of  $\text{C}_5\text{H}_5\text{N}$  is increased and that of the di- and polypiperidyls is decreased to 7%. The concn. of  $\text{C}_5\text{H}_5\text{N}$ , the c. d. and the temp. (within 15-35°) do not affect the results of the electrolysis. The electrolysis without the use of a diaphragm is complicated by the anodic oxidation of  $\text{C}_5\text{H}_5\text{N}$  and  $\text{C}_5\text{H}_5\text{N}$  and the cathodic reduction of the oxidation products, which contradicts the findings of Ahrens (*Z. Elektrochem.* 2, 577 (1895-1896) and Merck (*Ger. pat.* 101,308 (1896); 104,664 (1898)). Chas. Blanc

**Electrolysis of silver acetate in acetic acid and pyridine. Silver diacetate and the Kolbe reaction.** C. Schall and B. M. Schall. *Z. Elektrochem.* 40, 5-8 (1934).—The expts. of S. and Melzer (*C. A.* 17, 698) and S. and Wiedmarkter (*C. A.* 23, 4412) were continued. The Ag diacetate occurred combined with pyridine. C. L. Wilson

**A type of silver chloride electrode suitable for use in dilute solutions.** Alfred S. Brown. *J. Am. Chem. Soc.* 56, 646-7 (1934); cf. *C. A.* 23, 5422.—Highly reproducible Ag/AgCl electrodes were prepd. by plating Pt wires with Ag and electrolyzing  $\frac{1}{2}$  hr. at 2.5 milliamp./sq. cm. in 0.1 N HCl. L. P. Hall

**Silvering of mirror surfaces by cathode sputtering.** M. Romanova, A. Rukhtov and G. Pokrovskii. *Compt. rend. acad. sci. U. S. S. R. [N. S.]* 1, 15-16 (in German 17-18) (1934). Silvering was carried out in a  $\text{H}_2$  atm. of 0.05 mm. with a current of 15-20 ma., and a potential of 1400 v. Mirrors obtained had a reflectivity of 98% (normal -93%) only very slowly decreasing. Partially transparent mirrors absorbed less than 1% of incident light. F. H. Rathmann

**The synthesis of ammonia in the electrodeless discharge.** Walter C. Schumb and Louis Goldman. *Proc. Im Acad. Arts Sci.* 69, 160-88 (1934).—The pressure drops observed when a mixt. of  $\text{N}_2$  and  $\text{H}_2$ , 1:3 by vol., is circulated through an electrodeless discharge are plotted as a function of wave length between 200 and 300 m. with 5-8 amp. and initial pressures of 0.5-1.5 mm. The pretreatment of the reaction tube necessary for reproducibility, the pressure rise obtained on baking after  $\text{NH}_3$  formation, colorimetric verification of pressure changes, and the effect of increasing the pressure drop by increasing the surface in the discharge or by decreasing the vol. of the system lead to a hypothesis for the part played by the wall. The reaction is not an equil. reaction. L. G.

**Electrical precipitation of silica dust.** W. R. Franks and F. L. Harrison. *Trans. Roy. Soc. Can., Sect. V*, 27, 141-7 (1933).—The presence of moisture and  $\text{SO}_2$  do not decrease the electrostatic pptn. of silica dust. The use of this method of dust pptn. is suggested for clearing dust from air in mine drifts. W. Gordon Rose

**Synthetic corundum for jewel bearings.** E. G. Sand-

meier. *J. Inst. Elec. Engrs. (London)* 72, 505-14 (1933).—A general description of mfg. processes used in the production of rough synthetic corundum and of jewel bearings for elec. meters and other measuring instruments. W. H. Boynton

**Mfg. glass for elec. bulbs in tank furnaces** (Khovanskii, *et al.*) 19. Modern elec. drive and equipment for a wood pulp factory (Kuhl) 23. Ethyl-, benzyl- and acetyl-cellulose and their iodoec. properties (Speter) 23. Testing Sn coating on soft sheet [Pb detn. by electrolysis] (Bisenkolb) 7. Electroanalysis of Mo (Nemoto, Tanabe) 7. Analyses of inclusions in high-C tool steels (Styri) 7. Diamminozinc bromide (Kozik) 2. AcOH [by electrolysis] (*Fr. pat.* 757,155) 10. Prevention of corrosion of Al and its alloys (*Japan. pat.* 100,100) 9. Films, plates, etc. [for use in electrotechnics] (*Fr. pat.* 756,422) 18. Alkali chlorides [for electrolysis] (*Fr. pat.* 756,413) 18.  $\text{CuS}$  [for neg. electrode] (*Ger. pat.* 591,168) 18.

**Primary battery.** Arthur Cassan. *Ger.* 588,442, Nov. 23, 1933 (*Cl.* 21b. 7.01). Addn. to 510,829 (*C. A.* 25, 882). A Zn-C cell is formed with a concave base of metal or elec. inactive material.

**Dry-cell electrolyte.** Jaroslav Jan Pála. *Ger.* 591,163, Jan. 17, 1934 (*Cl.* 21b. 5.02). See *Brit.* 398,038 (*C. A.* 28, 1608').

**Dry-cell battery.** Henry W. Brownson, Richard Chadwick and Imperial Chemical Industries Ltd. *Brit.* 402,117, Nov. 27, 1933. The container of a dry cell is made of an alloy of Zn with 1% or less of Hg. The alloy may be made by dissolving 25 parts Hg in 75 parts Zn and then adding this alloy to molten Zn in requisite quantity.

**Electric multicell battery.** Carl H. King (to Globe-Union Mfg. Co.). *U. S.* 1,945,694, Feb. 6.

**Storage batteries.** Jeremiah A. Downing and Thomas Blake. *Brit.* 401,281, Nov. 8, 1933. The pos. plates are treated with an oxalic acid soln. after the battery has been discharged and emptied. The soln. may be sprayed over the plates and after a short interval a small quantity of dil  $\text{H}_2\text{SO}_4$  is similarly introduced. After a further short interval the cell is filled with  $\text{H}_2\text{O}$  which may contain a little pyrogallol.

**Storage batteries.** Drumm Battery Co. Ltd., James J. Drumm and Albert G. Burnell. *Brit.* 401,717, Nov. 20, 1933. Addn. to 365,125 (*C. A.* 27, 2631). The grids, envelopes or tubes of the pos. electrodes of the storage battery of 365,125 are made of Ni-plated rustless Fe or of steel or Fe which has been plated with alternate layers of Ni and Cr or Cd. The final outer layer of Ni having been plated thereon, the article is annealed in H. The container is made of Ni-plated rustless steel.

**Storage-battery plates.** Otto E. Huebner (to Mechanical Development Corp. of America). *U. S.* 1,947,473, Feb. 20. Structural features.

**Casting electrolyte-forming material in electric batteries.** Peter R. Aronson (to National Carbon Co.). *U. S.* 1,945,673, Feb. 6. Various details of app. and operation are described suitable for casting caustic alkali electrolyte.

**Electrodeposition of alkaline earth metal carbonates on metals such as cathodes of electric discharge tubes.** Emil Theisz (to Égysült Izzólámpa és Villamosági R. T.). *U. S.* 1,945,623, Feb. 6. Deposition is effected from a soln. such as one contg. Ba formate.

**Electrodeposition of palladium.** The Mond Nickel Co. Ltd. *Ger.* 587,807, Nov. 9, 1933 (*Cl.* 48a. 6.08). See *Fr.* 737,752 (*C. A.* 27, 1879).

**Chromium plating.** Henderik van der Horst. *Brit.* 401,933, Nov. 23, 1933. A hard wearing surface is provided on an internal-combustion engine cylinder bore, after it has been ground smooth, by electrolytically depositing thereon a coating of Cr of uniform thickness, a coaxial cylindrical anode of hard Pb or steel of diam. only slightly less than that of the bore being used and the flow of current being strictly confined to the cylinder bore and the part of the anode within it. With a plating bath

contg. 350 g.  $H_2CrO_4$  per l. and 1%  $H_2SO_4$ , the c. d. and pressure are 30-70 amp. per sq. decimeter and 3-5 v., the current being preferably reversed for the 1st min. to ensure cleaning and degassing of the bore. After deposition, the block is heated to 150-300° for 0.5-2 hrs. to eject occluded H.

**Coating silver to prevent tarnishing.** Blasius Bart (to Precious Metals Developing Co.). U. S. 1,947,180, Feb. 13. Silver articles such as tableware, prize cups, etc., are provided with successive electrodeposited coatings of Ni, Pd and Rh.

**Coating aluminum.** Pierre R. L. Hogner (to Aluminum Colors, Inc.). Brit. 401,579, Nov. 16, 1933. A hard, wear-resistant, adherent oxide coating is produced electrolytically on a printing plate formed of Al (alloy). The plate forms the anode in a cell contg. a 5-10%  $H_2SO_4$  or a 3-5%  $H_2CrO_4$  or oxalic acid soln., a c. d. of 10-20 amp. per sq. ft. being used for 30 min. at 20-30°.

**Protecting metal wires, etc.** Désiré Baudewyns. Fr. 756,505, Dec. 11, 1933. Wires, etc., are protected against oxidation by passing them in a continuous manner into successive electrolytic baths to deposit thereon successive layers of different inoxidizable metals. Washing baths are placed between each electrolytic bath to remove electrolyte.

**Electric condenser.** Samuel Ruben (to Ruben Condenser Co.). U. S. 1,947,112, Feb. 13. A dielectric spacer is used consisting of a homogeneous mixt. of a finely divided inorg. dielectric material such as S, MgO or mica, a water-insol. resinous binder such as a synthetic resin of the Bakelite type and an inorg. binder comprising a B compd. such as  $H_2BO_3$ .

**Electrolytic condenser.** Elektrizitäts-A.-G. Hydraulwerk. Fr. 756,845, Dec. 15, 1933.

**Electrolytic condensers with means, directly responsive to overheating, for releasing excess pressure within the container.** Joseph J. Barrett (to Magnavox (Great Britain) Ltd.). Brit. 401,989, Nov. 23, 1933.

**Electrolytic cells.** I. G. Faibend. A.-G. Fr. 757,119, Dec. 20, 1933. A cell having a Hg cathode is constructed of a material not attacked by Hg, e. g., Fe, and the part not covered by Hg has an insulating layer to protect it from the electrolyte and its decompn. products, while the part not protected and covered with Hg serves for leading in the current.

**Electrolytic recording.** Emil Glas. Austrian 135,822, Dec. 11, 1933 (Cl. 21e). Use is made of a support impregnated with a material which combines directly with metal ions derived from the anode to form an insol. colored substance. Thus, a support impregnated with dithiooxamide may be used with a Cu anode, or a support impregnated with nitrosonaphthol may be used with a Co anode. The cond. of the support may be raised by adding a salt, e. g., NaOAc, to the impregnating soln.

**Per-compounds by electrolysis.** Kali-Chemie A.-G. (Friedrich Nessler, inventor). Ger. 591,263, Jan. 18, 1934 (Cl. 12a. 16). In the manuf. of per-compds. by electrolyzing suitable acid solns. with the use of an anode comprising Pt supported on Al, corrosion of the Al is avoided by first subjecting it in known manner to anodic polarization, e. g., in a satd. soln. of  $NH_4HSO_4$ .

**Electrolytic production of embossing foils of gold or other metals.** Julius Fichtmueller. U. S. 1,945,142, Jan. 30. Electrodeposition is effected on a highly polished metal supporting band, a backing substance such as gelatin or shellac is applied and allowed to dry on the deposited metal, the metal and backing film are stripped from the support, a facing film such as one from "liquid cellulose" is applied and a portion of the backing film is dissolved and removed.

**Ductile electrolytic iron.** John R. Cain (one-half to Frederic A. Eustis). U. S. 1,945,107, Jan. 30. A soln. of a ferrous salt such as  $FeCl_2$  is subjected to electrolysis between a pair of electrodes, while the soln. surrounding the anode is maintained sep. from the soln. surrounding the cathode by a porous wall, and the  $pH$  of the soln. surrounding the cathode is controlled to maintain it at between 1.0 and 3.0. App. is described. Cf. C. A. 27, 4179.

**Metallic salts such as those formed from scrap metal alloys.** Wm. P. Heineken and Meyer L. Freed (to Rufert Chemical Co.). U. S. 1,947,006, Feb. 13. A metallic mass such as a Cu alloy which contains 2 known metals but the exact compn. of which is unknown is employed as anode and electrolyzed with a soln. of sol. salts of the metals (the cathode being segregated from the anode) and a flow of electrolyte is effected from the cathode toward the anode to prevent migration of ions from the anode to the cathode while migration of ions is permitted from the cathode to the anode, the electrolyte adjacent the cathode being maintained in a substantially pure state and in a condition compatible with the deposition of its metal; a supplementary cathode removed from the first-mentioned cathode is provided, adapted for unrestricted interchange of ions and the electrolyte adjacent this supplementary cathode is maintained in a condition permitting deposition

of the other of the known metals. App. is described.

**Low-carbon chromium alloys.** Ture R. Haglund. U. S. 1,946,161, Feb. 6. See Brit. 382,796 (C. A. 27, 4480).

**Manganous chloride.** Goshi Kaisha Sugibayashi Kokuken Mangan Seirenjo (Zyôji Han, inventor). Japan. 99,775, Feb. 24, 1933.  $MnCl_2$  is prepd. by electrolytic reduction of powd.  $MnO_2$  in dil. HCl, with a c. d. of 2 amp. per sq. cm. at 6 v.

**Calcium carbide.** Kenji Tazaki. Japan. 99,201, Jan. 26, 1933. In an elec. furnace for manuf. of  $CaC_2$ , a mixt. of  $CaO$  and C is placed around the electrode, and a mixt. of limestone and coal is placed outside of this first layer.

**Electric removal of arsenic from sulfuric acid.** M. A. Kolontsev. Russ. 1514, July 31, 1926. Crude  $H_2SO_4$  is passed through a number of heated containers charged with porous material where it is exposed to the action of elec. current.

**Treatment of ore slime containing lead sulfate.** Kyôritsu K. K. (Kyoku Nakada, inventor). Japan. 99,582, Feb. 16, 1933. Ore slime contg.  $PbSO_4$  is mixed with satd. NaCl soln., heated and electrolyzed without filtering; Pb is used as the anode. Pb is obtained in a spongy state. By mixing with lime, the soln. gives concd. NaCl soln. which is used in the first process.

**Apparatus for nitriding carbides.** Bayerische Stickstoffwerke A.-G. Ger. 591,194, Jan. 17, 1934 (Cl. 12a. 9). Addn. to 572,113 (C. A. 27, 2889).

**Decomposing liquids to gases.** Alfred Kilgus. Brit. 401,688, Nov. 43, 1933. The production of gases by the chem. or electrolytic decompn. of liquids is carried out in a magnetic field to increase the yield. Thus acidulated  $H_2O$  is decompd. with evolution of  $H_2$  by immersion of permanent magnets or electromagnets therein even when the Fe has been previously rendered passive. By electrolytic decompn. in a magnetic field a yield in excess of that detd. by Faraday's law may be obtained. Detailed examples of the electrolysis of a 30% KOH soln. are given.

**Formaldehyde from methane.** Gutehoffnungshütte Oberhausen A.-G. Ger. 506,516, Aug. 28, 1933 (Cl. 12a. 7.01). See U. S. 1,900,215 (C. A. 27, 3675).

**Hexamethylenetetramine from methane.** Gutehoffnungshütte Oberhausen A.-G. Ger. 508,005, Nov. 25, 1933 (Cl. 12a. 15). Addn. to 506,516 (preceding abstr.). See U. S. 1,930,210 (C. A. 28, 1809).

**Chlorobenzene and hydrogen.** W. Jeunehomme. Belg. 398,222, Sept. 30, 1933.  $C_6H_5Cl$  in MeOH soln. is treated with Cl; HCl is added and the soln. is electrolyzed to give  $H_2$  and PhCl.

**Electric resistance furnace.** Rudolf Schaur and Klemens Schumacher. Austrian 135,901, Dec. 27, 1933 (Cl. 40c). Addn. to 133,875 (C. A. 27, 4745).

**Continuous electric resistance furnace for heating metal strip, wire, etc.** Emil F. Russ. Brit. 401,584, Nov. 16, 1933.

**Electric furnace for dry distillation of hydrocarbons.** Rikagaku Kenkyûjo (Masatoshi Ôkouchi and Taizô Yoshikawa, inventors). Japan. 99,987, March 7, 1933. Diagrammatical.

**Electric salt bath furnace.** Siemens-Schuckertwerke

A.-G. (Ulrich Aschmann, inventor). Ger. 589,824, Dec. 15, 1933 (Cl. 21k. 15.01).

**Crucible for smelting metals electrolytically.** Allgemeine Elektrizitäts-Ges. (Hermann Blomberg, inventor). Ger. 588,437, Nov. 18, 1933 (Cl. 18c. 5.40). Addn. to 589,651 (C. A. 28, 1283\*).

**Heating process suitable for fusing metals.** Irving Langmuir (to General Elec. Co.). U. S. 1,947,267, Feb. 13, 1933. For effecting high-temp. heating, an elec. arc is used to heat mol. H and the H is passed directly from the arc to the body to be heated (the arc being maintained with such voltage and current as to cause substantial quantities of at. H to be formed which recombines in the neighborhood of the body to be heated). App. is described.

**Electrodes for electrolysis.** Asahi Denka Kōgyō K. K. (Masutaro Suzuki and Ryōzō Abe, inventors). Japan. 99,320, Feb. 3, 1933. The strength and durability of electrodes for electrolysis of NaCl soln., etc., are increased by filling small holes in the electrodes with solidified fats or fatty acids in fused state or in soln. in org. solvents.

**Electrodes for electrolysis.** Asahi Denka Kōgyō K. K. (Masutaro Suzuki and Teizō Abe, inventors). Japan. 99,321, Feb. 3, 1933. Small holes in electrodes (such as graphite) for electrolysis of NaCl, etc., are filled with fat or fatty acid, which is then solidified by treating with heat or Cl<sub>2</sub> or mineral acids. The strength and durability of the electrodes are increased.

**Nickel anodes for electrolysis.** The Mond Nickel Co., Ltd. Ger. 591,373, Jan. 20, 1934 (Cl. 48a. 4). Ni contg. up to 0.25% of combined O is mech. treated, e. g., by rolling or hammering, at a raised temp. below its m. p. A homogeneous Ni-NiO eutectic is obtained, which dissolves easily and uniformly in electrolytic baths.

**Electrode for lead cells.** Etsurō Ishii. Japan. 100,473, Apr. 7, 1933. Pure Pb foil perforated and painted with Pb powder or oxide is rolled around a Pb rod and the whole is inserted in a perforated ebonite tube. A series of such tubes is used as the electrode.

**Electrode device suitable for use with oil burners, etc.** Theodore Schmidt (to Winslow Boiler and Engineering Co.) U. S. 1,945,385, Jan. 30. Structural features.

**Binding material suitable for use in making carbon electrodes, etc.** Edmund O. Rhodes and Elmer H. Hyde (to American Tar Products Co.). U. S. 1,946,446, Feb. 6, 1933. A mixt. m. 85–110° is formed from pitch m. 100–150° and pitch oil obtained as a distillate in coking pitch.

**Semi-automatic machine for winding yarn around the dollies of carbon electrodes for dry cells previously wrapped with fabric.** Wilhelm Hasse. Brit. 401,983, Nov. 23, 1933. Addn. to 399,324 (C. A. 28, 1608\*).

**Electrofiltration of gases.** Siemens-Schuckertwerke A.-G. (Richard Heimich, inventor). Ger. 591,193, Jan. 17, 1934 (Cl. 12c. 5). The gases are fed to the electrofilter by a metallic fan coated with enamel, hard rubber, or acetone-sol. cellulose acetate or like material. The particles in the gases become charged with the frictional electricity induced by their contact with the fan.

**Electric gas cleaner.** Aloys Schirp. Ger. 589,609, Dec. 11, 1933 (Cl. 12c. 5).

**Electrical precipitation treatment of fresh hot coal-distillation or carbonization gases.** Stuart P. Miller (to Barrett Co.). U. S. 1,945,061, Jan. 30. The hot gases are sprayed with tar, and residual particles remaining from the resulting distn. of these particles are removed by an elec. pptn. treatment (various details of app. and operation being described).

**Electrical precipitation apparatus.** Alexander N. Crowder (to Research Corp.). Brit. 401,566, Nov. 16, 1933.

**Filtration of liquids by electroosmosis.** The Minister of Communications (Haruo Okuno, inventor). Japan. 100,571, Apr. 13, 1933. Liquids (such as water, glycerol,

acetone, alc.) contg. suspended impurities are purified by means of a special compound porous layer and electroosmosis with an applied e. m. f. of 10–120 v.

**Electric transmission of pictures, etc.** Viktor Bausch, Jr. Ger. 591,455, Jan. 22, 1934 (Cl. 15k. 7.05). Reagents which produce a color under the action of a current, but which can be decompd. or eliminated by a simple after-treatment, are incorporated in paper, fabric or like supports for use in picture telegraphy, etc., whereby darkening of the transmitted picture, etc., can be prevented. Thus, the color may be produced by anodic oxidation in known manner of a volatile amine, e. g., *o*-toluidine, and unchanged amine afterward removed by evapn. Alternatively, the support may contain a light-sensitive diazo compd., e. g., diazotized *p*-aminodiphenylamine, an electrolyte, e. g., NiCl<sub>2</sub>, and a coupling component, e. g., resorcinol. In this case, a dye is formed through the liberation of NH<sub>2</sub> at the cathode, and unused diazo compd. is afterward decompd. by strong illumination.

**Conductors.** Alexander F. Peckete. Brit. 401,368, Nov. 10, 1933. Divided on 396,453 (C. A. 28, 548\*). A conductor, preferably of Cu or Fe, is insulated with alternate coatings of Al and Al<sub>2</sub>O<sub>3</sub> or other insulating chem. compd. of Al. The oxide coatings may be formed by oxidizing the Al coatings and may include fillers, e. g., porcelain, steatite, sol. glass. They may be strengthened by treatment with superheated steam. The Al coatings may be applied electrolytically, an electrolyte of molten Al compds., e. g., cryolite, and auxiliary anodes of Pb being used; alternatively the conductor may be passed through vaporized Al at 1000–1200°.

**Electric system for detecting flaws in electrical conductors such as rails.** Harcourt C. Drake (to Sperry Products, Inc.). U. S. 1,941,930, Jan. 30.

**Electric system for detecting flaws in electrical conductors such as wires, cables or bars.** Elmer A. Sperry (to Sperry Products, Inc.). U. S. 1,944,954, Jan. 30.

**Electrical coils.** Harry W. Turner (to The British Thomson-Houston Co., Ltd.). Brit. 401,084, Nov. 9, 1933. See U. S. 1,874,722 (C. A. 26, 6037\*).

**Incandescent cathode rectifier filled with gas or vapor.** Telefunken Ges. für drahtlose Telegraphie m. b. H. Fr. 756,947, Dec. 18, 1933.

**Lamp for emitting both visible and ultra-violet light.** Thomas W. Rolph (to Holophane Co.). U. S. 1,945,567, Feb. 6. Structural features.

**Arc lamps.** Patent-Freihand Gesellschaft für elektrische Glühlampen m. b. H. (to The General Electric Co., Ltd.). Brit. 401,509, Nov. 16, 1933. An enclosed arc lamp electrode consists of a compacted or sintered body of Fe (compds.) and electron-emitting substances, e. g., Fe oxide 50 and BaO 50 parts or Fe dust 90 and CaO 10 parts. A tubular extension removes a quartz window from the neighborhood of the electrodes which may sputter onto the envelope.

**Electron lamps.** Telefunken Ges. für drahtlose Telegraphie m. b. H. Fr. 756,830, Dec. 15, 1933.

**Thermionic lamp.** Compagnie des lampes. Fr. 757,187, Dec. 21, 1933.

**Incandescent lamp.** Egyesült Izzólámpa és Villamos-ágyi R. T. Hung. 107,890, Jan. 2, 1934. To prevent blackening of the glass bulb a water-absorbing substance that is gaseous or that boils below 350° is used. Practically a reaction mixt. or complex compd. is introduced into the bulb from which (e. g., H<sub>2</sub>SnCl<sub>4</sub> or H<sub>2</sub>SiF<sub>6</sub> or their salts) on heating a gaseous or vaporous water-absorbing material is developed. The bulbs are then closed and heated.

**Cut-out for incandescent electric lamps, etc.** Ernst Friedrich and Günther Aschermann (to General Elec. Co.). U. S. 1,946,279, Feb. 6. A shunt resistor contg. a Cu compd. such as the iodide is used with plumbic surfaced terminal members.

## 5—PHOTOGRAPHY

R. P. WIGHTMAN

**Photography.** Ernst Mees. *Apoth. Ztg.* 49, *Deul. Apotheke* 2, 375-80 (1934); cf. *C. A.* 27, 5658.—A concise exposition of the art for beginners and more advanced amateurs. W. O. R.

The photographic summation law and the extent of its validity. A. van Kreveld. *Physica* 1, 60-77 (1933). — The relation between developable  $d$  of the photographic plate and spectral compn. and intensities was studied in connection with the "summation" law of v. K. (*Z. wiss. Phot.* in press). The app. used for longer exposure periods was similar to that of Toy (*C. A.* 16, 4161), essentially a monochromator with double slit; for shorter exposures was used a pair of 16 candle-power lamps with color filters and direct illumination. The  $d$  was detd. to 2-3% accuracy for small or large  $d$  by visual comparison of the illuminated plate with a pyrometer filament, standardized for intensity in an optical system.

The summation law  $\sum_i \frac{E_i}{E_s} = 1$ , in which  $E_s$  is the energy contributed by color ( $i$ ) to a composite developability by mixed ( $m$ ) light, and  $E_i$  the energy of color ( $i$ ) required to produce the same developed  $d$  alone, is independent of the  $d$ -log  $E$  function itself, the measurement of  $d$  and the choice of  $d$ - $E$  or  $d$ -log  $E$  curve. A no. of photographic plates were tested for this law; the deviation of the sum from unity was never more than 3-5%. The influence was investigated of the emulsion type (8 panchromatic ones, several non-sensitized ones), mixing ratio of the light components, wave length, either type of illumination,  $d$ . (from  $D = 0.1$  to  $2.0 = \log$  (incident/transmitted light)), exposure time (0.004-100 sec.), development conditions (1-25 mins., 6 developers),  $d$  measurement by pyrometer or by microphotometer. The law leads to additivity of  $D(E_s)$  from the  $D(E)$  functions of the component colors. If the characteristic curves of the components happen to be parallel,  $E_i/E_s = \text{const.}$ , a special case is obtained with  $E_m$  likewise parallel. This case is realized for non-sensitized Ilford Special Rapid plates and surface development. The general validity of the law is explained by its validity for each individual layer of the plate; for this reason the effect of superficial development (pyrocatechol- $K_2CO_3$  and AcOH arrester) was studied in several expts.; it developed the plates for  $1/4$  of its depth (0.005 mm.). From application of the Svedberg statistical laws (Hay, *Handbuch für Photographie*, Bd. V, 269 (1932)) it is found that the summation law can only be accounted for if the colors of a mixt. act independently of each other on the plate. It is furthermore indirectly proved that the Schwarzschild exponent  $p$  is independent of the color for all ds. This is confirmed from Webb's work (*C. A.* 27, 5659) and present measurements on Ilford Rapid Pan. plates: for red of 650  $m\mu$ , violet of 450  $m\mu$  and their mixt., exposures of 5 to 100 sec.  $p$  is only dependent on  $d$ ,  $D$ , varying from 0.84-0.82 for  $D = 0.3$  to 0.99-0.93 for  $D = 1.0$ . It is impossible to assign a phys. significance to the factor  $p$ .

B. J. C. van der Hoeven

Oxidation products of org. developers (Seyewetz, Symson) 10. Films, plates, etc. (Fr. pat. 756,422) 18.

**Color photography.** Léon J. Dassonville. U. S. 1,945,772, Feb. 6. See Brit. 377,411 (*C. A.* 27, 2892).

**Color photography.** Paul E. F. Lessertisseux. Fr. 756,344, Dec. 8, 1933. Pos. colored films are obtained from 3 selected monochrome negatives, 2 Ag images being obtained on the 2 faces of the film, and they are colored by mordanting. The 3rd image is superposed on one of the first 2 by sensitization by dichromate and dyeing by hydrotype. The process is only applicable if the dyes are carefully chosen to avoid harmful reactions and used in a certain order. The dyes are dissolved in an appropriate thick solvent.

**Light filter system for use in color photography.** Herbert Bertling (to Kurt Dicken). U. S. 1,945,768, Feb. 6.

**Photographic color screen.** Merrill W. Seymour (to The Eastman Kodak Co.). Can. 339,057, Jan. 30, 1934. Colloidal suspensions of certain dyes, especially the indophenols or dyes closely related to them, are particularly useful as filter layers on sensitive photographic elements. These suspensions may be made for example, by mixing a gelatin soln. of a nitroso deriv. of a tertiary aromatic amine with a gelatin soln. of a suitable phenol in which the position para to the hydroxy group is not substituted. The indophenol formed is pptd. in colloidal form in the gelatin.

**Photographic printing process.** Kenneth C. D. Hickman and Ludwig G. Staib, Jr. (to The Eastman Kodak Co.). Can. 339,055, Jan. 30, 1934. Certain brown or black heavy-metal sulfides, e. g., those of Pb, Cu, Bi, Ni, Hg and Ag, are oxidized to a white material, probably the corresponding sulfate, under the action of light, by trivalent Co salts, e. g.,  $Co(NH_3)_4Cl_3$ ,  $Co(NH_3)_5NOCl_2$ , and  $Co(NH_3)_6(NO_2)_3$ . The Co salts are added to, or coated over, layers contg. the sulfides. This is made the basis of a practical printing method; e. g., a photographic positive is made by coating a suitable support with a layer contg. PbS, applying a soln. contg. a light-sensitive trivalent Co salt, printing the layer with a light image, and washing the layer to fix the image.

**Photographic materials.** E. Mayer & Benedik. Ger. 591,443, Jan. 22, 1934 (Cl. 57b. 14.01). Photographic prints are toned with a weak acid soln. contg. phosphates (or arsenates) and molybdates, preferably an acid soln. contg. a phosphomolybdate (or arsenomolybdate) and a thiocyanate. A brown color is obtained if the print is aftertreated with  $NH_3$  or an alk. soln. Aftertreatment with a sol. sulfide or polysulfide colors the print green.

**Photographic emulsion.** Leslie G. S. Brooker (to The Eastman Kodak Co.). Can. 339,059, Jan. 30, 1934. A photographic emulsion contains a cyanine dye in which 2 naphthoxazole nuclei are linked together by a trimethenyl chain, the N atoms of which are each bound to dissimilar alkyl radicals, while one is also bound to a suitable acid radical. Cf. *C. A.* 28, 1611<sup>9</sup>.

**Photographic emulsion.** Syōgyoku Yamabata (Zin zaburō Nabeya, inventor), Japan. 99,058, Jan. 16, 1933. The emulsion is prepd. by mixing gelatin, agar-agar, Rochelle salt,  $NH_4Cl$ ,  $AgNO_3$ , and a citrate.

**Photographic film.** Carl J. Malm (to The Eastman Kodak Co.). Can. 339,060, Jan. 30, 1934. Sol. salts of dicarboxylic acid esters of cellulose are utilized as an antihalation backing for photographic films. Examples of the salts are cellulose Na phthalate and the Na, K and  $NH_4$  salts of cellulose acetate hydrogen phthalate and of cellulose acetate hydrogen succinate.

**Photographic films.** Jaroslav Karafiát and Jirí Černý. Fr. 756,352, Dec. 8, 1933. Photosensitive layers are formed on the surface only of sheets of regenerated cellulose by drying a clear soln. of sol. salts of Ag or Fe, without the use of pptg. agent, e. g., Cl salts for Ag, or developer, e. g., red salt from blood serum for Fe. The sheets are kept in the state of max. dilation in water, before or after sensitization.

**Photographic films.** Voigtländer & Sohn A.-G. Fr. 756,479, Dec. 11, 1933. See Ger. 576,416 (*C. A.* 27, 3677).

**Cockle-proofing photographic film containing cellulose acetate.** Charles Holzwarth (to Du Pont Film Mfg. Corp.). U. S. 1,947,160, Feb. 13. For cockle-proofing photographic film of cellulose acetate contg. moisture-repelling agents such as dibutyl phthalate or triphenyl phosphite so that the combustion-retarding properties of the film will not be materially diminished, the film is thoroughly and carefully dried and both sides are treated with a thin coating formed from a soln. contg. not more than 10% nitrocellulose, about 1% of camphor, about

10% each of acetone, BuOH and the mono-ethyl ether of ethylene glycol and about 80% MeOH, and the film is re-dried.

**Motion picture films.** Lawrence L. Steele (to Essenc Laboratories, Inc.). U. S. 1,946,004, Feb. 6. A polyglycol such as diethylene glycol is incorporated in the gelatin film of motion picture films, in order to prevent brittleness, etc. U. S. 1,946,005 relates to motion picture films with a protective coating including a cellulose ester such as nitrocellulose and a hygroscopic org. material of low volatility such as diethylene glycol.

**Apparatus for developing cinematograph films.** Alexander S. Henderson. Brit. 401,380, Nov. 16, 1933.

**Intensifying photographic images.** Kenneth C. D. Hickman and Walter J. Weyerts (to The Eastman Kodak Co.). Can. 339,050, Jan. 30, 1934. A photographic Ag image is bleached in a soln. contg. an oxidizing agent relatively poor in Ag precipitant. The bleached image is darkened in a soln. contg.  $\text{Na}_2\text{S}$  and a solvent for AgBr. The resulting  $\text{Ag}_2\text{S}$  image is intensified in a soln. contg.  $\text{Na}_2\text{SO}_3$ ,  $\text{NaHSO}_3$ ,  $\text{Na}_2\text{S}_2\text{O}_3$ , and a Ag salt.

**Wash-off relief images.** Merrill W. Seymour (to Eastman Kodak Co.). U. S. 1,946,640, Feb. 13. In making a relief image, a light image is printed from the emulsion side on a layer having sensitivity increasing away from such side, and from this there is produced an image of graded soly. which is least sol. where the sensitivity was greatest, and the more sol. portions of the layer are washed off.

**Photographic and etching process for preparing printing surfaces.** Herman C. Bodicker (to Photo-Cylinder Corp.). U. S. 1,945,676, Feb. 6. Numerous details of procedure are described.

**Photographic printing paper.** Dai Nippon Celluloid K. K. (Kisaburo Takeuchi and Gonnosuke Asai, inventors). Japan. 99,598, Feb. 16, 1933. Paper is coated with a mixt. of NaCl, KBr, KI, a sol. salt of Cu, Ni or Co, gelatin soln. and  $\text{AgNO}_3$ .

**Diazotype paper.** Frans van der Grinten. Dutch 30,636, Sept. 15, 1933. A soln. of a diazo compd. (with tertiary N in the para position) + an azo component + a salt of a strong alkali and weak acid ( $\text{AcONa}$ ) is spread

on paper and dried at a temp. (below  $50^\circ$ ) at which coupling does not take place. The diazo compd. is preferably substituted in the nucleus to retard the coupling tendency. The development takes place on heating the paper with a hot iron or passing it between heated rolls. An example is given of 5% dimethylamino-3,5-xylene-4-diazonium chlorostannate, 0.5% phloroglucinol and 3% NaOAc (or 5% malonate or 5% K succinate).

**Diazotype papers.** Frans van der Grinten. Dutch 30,637, Sept. 15, 1933. Yellowing of diazotype paper is prevented by the addn. of reducing substances such as hydroxylamine or semicarbazide to the mixt.

**Photographic copies.** Kodak-Pathé. Fr. 756,426, Dec. 9, 1933. A photographic product sensitive to light and suitable for making pos. copies comprises a coating contg. a heavy-metal sulfide, e. g., of Pb, Cu, Bi, Ni, Hg or Ag, and a photosensitive oxidizing salt of trivalent Co, e. g., hexamminocobaltic chloride, nitrosopentamminocobaltic chloride or trinitrotetramminocobaltic chloride. The coating may contain a hygroscopic substance such as glycerol. The Co salt may be applied in soln. on a layer of sulfide.

**Colored photographic pictures.** Georg Roessler (to Agfa Ansco Corp.). U. S. 1,945,658, Feb. 6. A photographic Ag picture is acted on with an aq. bleacher soln. contg. a per-compd. such as  $\text{NH}_4$  persulfate and a halide salt such as KBr in the presence of a water-sol. leuco-compd. of a vat dye.

**Coloring photographic pictures.** I. G. Farbenind. A.-G. Brit. 401,340, Nov. 6, 1933. Color pictures are made from Ag pictures by applying to the photographic material an azo dye which is reducible with  $\text{Na}_2\text{S}_2\text{O}_4$  to give reaction products with Ag which are sol. in  $\text{H}_2\text{O}$  or aq. solns. and do not readily regenerate the dye under the influence of O, treating the dyed picture with an acid soln. contg. a reducing agent, e. g.,  $\text{HI}$ ,  $\text{HBr}$ , that does not reduce the dye when used alone and an agent, e. g., thiourea, capable of forming a complex Ag compd., and treating the material in a fixing soln. A bleaching soln. of acidified  $\text{CuCl}_2$  may be used before fixing. A suitable soln. for the process comprises  $\text{I}$ ,  $\text{KI}$ ,  $\text{H}_2\text{SO}_4$ ,  $\text{Na}_2\text{SO}_3$  and thiourea. Suitable dyes are Congo sky blue, Sirius red-violet R, Sirius ruby B, Benzo light yellow, etc.

## 6—INORGANIC CHEMISTRY

A. R. MIDDLETON

The reactions of arsenic, antimony, tin and lead organic compounds with mercuric chloride in neutral and alkali media. A. N. Nesmeyanov and K. A. Kozeshkov. Ber. 67B, 317-24 (1934).—In EtOH,  $\text{HgCl}_2$  reacts according to these type equations: (1)  $\text{Ar}_3\text{M} + \text{HgCl}_2 = \text{Ar}_3\text{MCl} + \text{ArHgCl}$ ; (2)  $\text{Ar}_3\text{MCl} + \text{HgCl}_2 = \text{Ar}_2\text{MCl}_2 + \text{ArHgCl}$ ; (3)  $\text{Ar}_3\text{MCl}_2 + \text{HgCl}_2 = \text{ArMCl}_3 + \text{ArHgCl}$ ; (4)  $\text{ArMCl}_3 + \text{HgCl}_2 = \text{MCl}_4 + \text{ArHgCl}$ . In (1), (2), (3) and (4) M may be Sn; in (1) and (2) it may also be Pb. In alk. media the type reactions are: (5)  $\text{Ar}_3\text{SnO} + \text{HgO} + 2\text{NaOH} = \text{Ar}_2\text{Hg} + \text{Na}_2\text{SnO}_3 + \text{H}_2\text{O}$ ; (6)  $2\text{ArSbO} + \text{HgO} = \text{Ar}_2\text{Hg} + \text{Sb}_2\text{O}_3$ ; (7)  $2\text{PhAsO} + \text{HgO} = \text{Ph}_2\text{Hg} + \text{As}_2\text{O}_3$ ; (8)  $2\text{Ar}_3\text{PbOH} + \text{HgO} = \text{Ar}_2\text{Hg} + 2\text{Ar}_2\text{PbO} + \text{H}_2\text{O}$ ; (9)  $\text{Ph}_3\text{Hg} + \text{HgO} + \text{H}_2\text{O} = 2\text{PhHgOH}$ ; (10)  $\text{ArSbO} + 2\text{HgO} + 2\text{NaOH} = \text{ArSbO}_2\text{Na}_3 + \text{Hg}_2\text{O} + \text{H}_2\text{O}$ ; (11)  $(\text{ArSb})_2\text{O} + 4\text{HgO} + 2\text{NaOH} = 2\text{Ar}_2\text{SbO}_2\text{Na} + 2\text{Hg}_2\text{O} + \text{H}_2\text{O}$ ; (12)  $\text{PhHgOH} + \text{PhSbO} + \text{NaOH} = \text{Ph}_2\text{Hg} + \text{NaSbO}_3 + \text{H}_2\text{O}$ ; (13)  $\text{PhHgOH} + \text{PhAsO} + 2\text{NaOH} = \text{Ph}_2\text{Hg} + \text{NaAsO}_3 + \text{H}_2\text{O}$ ; (14)  $\text{Ph}_3\text{SnX}_{4-n} + n\text{PhHgX} + 6\text{NaOH} = n\text{Ph}_2\text{Hg} + \text{Na}_3\text{SnO}_3 + 4\text{NaX} + 3\text{H}_2\text{O}$ . Exptl. results are reported on the reaction of  $\text{HgCl}_2$  with  $\text{Ph}_3\text{Sn}$ ,  $\text{Ph}_3\text{Pb}$ ,  $\text{PhAsO}$ ,  $\text{PhSbCl}_2$ ,  $\text{PhSbO}$ ,  $o\text{-MeOC}_6\text{H}_4\text{SbCl}_2$  and  $p\text{-ClC}_6\text{H}_4\text{SbCl}_2$  and of interactions of various substances formed in these reactions.

**Investigations on bromine.** J. d'Ans and P. Höfer. Angew. Chem. 47, 71-4 (1934).—The compn. of Br hydrate was proved to be  $\text{Br}_3 \cdot 8\text{H}_2\text{O}$ . The transition point for  $\text{Br}_3 \cdot 8\text{H}_2\text{O} \rightarrow \text{liquid Br}_3 + \text{soln.}$  was established at  $+5.84^\circ$ . The system  $\text{Br}-\text{H}_2\text{O}$  was further examd. and

the results are presented in graphical form. Vapor pressures for Br were detd. in a soln. of the compn.  $\text{H}_2\text{O}$  100, NaCl 15, KCl 12,  $\text{MgCl}_2$  12 and  $\text{MgSO}_4$  9.2 g. The vapor pressures were measured for 0.1 and 0.27% Br and are reported over the temp. range  $20-80^\circ$ . The iodometric detn. of bromides by van der Meulen's method was also investigated and several improvements are reported. Numerical examples and 16 references are given.

**The composition and the heats of formation of the carbon fluoride mixtures obtained from Norite and from silicon carbide (heats of formation of carbon tetrafluoride and silicon carbide).** Otto Ruff and Otto Bretschneider. Z. anorg. allgem. Chem. 217, 19-21 (1934).

**Preparation and properties of gallium and gallium trichloride.** Wm. M. Craig and G. Wilson Drake. J. Am. Chem. Soc. 56, 584-5 (1934).—Pb dross from the redistn. of Zn is treated with molten  $\text{PbCl}_2$  and the product leached with dil. HCl. The crude Ga obtained by electrolyzing the KOH soln. of the  $\text{Ga}(\text{OH})_3$  from the leachings was heated *in vacuo* and converted to the chloride which was fractionally distd. Ga prepd. from this  $\text{GaCl}_3$  showed no traces of Zn, Cd or In and little tendency to supercool.  $\text{GaCl}_3$  b.  $199.6^\circ$  and m.  $76.65^\circ$ . Ga melts at  $29.755^\circ$ ; has  $d_{20}^{25}$ , 5.903; at. vol., 11.81. W. C. F.

**The reaction products of the various forms of carbon with fluorine. II. Carbon monofluoride.** Otto Ruff, Otto Bretschneider and Fritz Ebert. Z. anorg. allgem. Chem. 217, 1-19 (1934); cf. C. A. 24, 5741.—CF is

formed from Norite (free from O) and F at 280° and 25 mm. pressure, or from graphite and F at 420° and 760 mm. pressure. Its structure has been found from x-ray diagrams. Phys. and chem. properties are listed. At higher temps., Norite, graphite and CF give gaseous fluorides of C, such as  $CF_4$ ,  $C_2F_4$ ,  $C_3F_4$  or even higher homologs.

**The melting point of nitrogen trifluoride.** Otto Ruff and Walter Menzel. *Z. anorg. allgem. Chem.* 217, 93-4 (1934).— $NF_3$  melts at  $-208.5^\circ$ . There is a transformation point at  $-219^\circ$ .

**The oxygen fluorides  $O_2F_2$  and  $OF_2$ .** Otto Ruff and Walter Menzel. *Z. anorg. allgem. Chem.* 217, 85-92 (1934); cf. *C. A.* 27, 3889.—An app. for the production of O fluorides is described.  $O_2F_2$ , b.  $-57^\circ$ ,  $\log p = 7.515 - (1000/T)$  (below  $-100^\circ$ ), m.  $-163.5^\circ$ ,  $d = 2.074 - 0.00291T$ .  $OF_2$ , b.  $-185.4^\circ$ ,  $\log p = 6.897 - (352.7/T)$ , m. about  $-224^\circ$ ,  $d = 1.823 \times 0.0056T$ . The interactions between these compds. and several other compds. are listed.

**A very insoluble phosphate from Orissa monazite.** Chandra Bhusan Roy and Shashanka Bhusan Roy. *Z. anorg. allgem. Chem.* 216, 203-6 (1933).—Monazite from the black sands of Orissa (cf. *C. A.* 27, 5487) was repeatedly fused with the usual reagents, and supposedly every element but Zr, Hf and Ti removed. These latter were found present spectrographically. A preliminary at. wt. detn. gave 100.4 and 99.0, but the chem. properties do not correspond to those for Zr. The freshly pptd. hydroxide is practically completely sol. in  $NaHCO_3$  soln.; the chloride or oxychloride forms yellow crystals, and gives a yellow soln.; the oxide is pale yellow, and on heating becomes deeper yellow. Even if allowance is made for traces of Hf and Ti, these properties differ from those of Zr.

**Alkali iodobismuthates.** D. Motard. *Compt. rend.* 198, 655-7 (1934).—Freshly powd. Bi was added to concd. alc. I to which was added varying amts. of alc. or aq. KI, the mixt. agitated, allowed to stand and the cryst. mass extd. with  $Me_2CO$ , from which the iodobismuthate crystd. out on evapn. The only compds. obtained were: with alc. KI,  $KI \cdot 2BiI_3$  and  $4KI \cdot 2BiI_3$ ; with aq. KI,  $2KI \cdot 2BiI_3$ ,  $2H_2O$  and  $3KI \cdot 2BiI_3$ ,  $2H_2O$ , all well crystd. The methods described by Arrpe and Linau [*Pogg. Ann.* 64, 237 (1845); 111, 243 (1860)] yielded no others; the  $6KI \cdot 2BiI_3$  claimed by Astre [*Compt. rend.* 110, 1137 (1890)] seems to have contained  $BiOI$ . In similar fashion  $NaI \cdot BiI_3 \cdot nH_2O$  ( $n = 0, 1$  and  $2$ ) was prepd.

**The product obtained by the action of ammonia on phosphorus pentachloride.** Henri Moureu and Paul Rocquet. *Compt. rend.* 197, 1643 5 (1933).—On treatment of resublimed  $PCl_5$  with dry  $NH_3$  at  $-50^\circ$  in a special app., a white compd., corresponding to the diiminoamide  $P(NH_2)_2NH_3$ , was isolated. An intermediate compd. could not be isolated. On being heated *in vacuo* the diiminoamide begins to decomp. at  $50^\circ$ , and decompn. is complete after heating 100 hrs. at  $350-400^\circ$  to form the phospham,  $PN_2H$  and  $NH_3$ . This in turn decomp. at  $480^\circ$  to form  $P_2N_5$  and  $NH_3$ , and at  $700^\circ$  P and  $N_2$  result.

**Oxidation of arsenious sulfide with atmospheric oxygen in an alkaline medium, under pressure and high temperature.** G. A. Razuvayev, V. S. Malinovskii and E. P. Lopatina. *J. Applied Chem.* (U. S. S. R.) 6, 206-19 (1933).—Oxidation of  $As_2S_3$  in  $NaOH$  soln. under pressure probably takes place (a) at low temp. ( $100-110^\circ$ ) according to  $As_2S_3 + 4NaOH + 2\frac{1}{2}O_2 \rightarrow 2NaAsO_2 + Na_2S_2O_3 + S + 2H_2O$ ; (b) at  $150-300^\circ$ ,  $As_2S_3 + 10NaOH + 7O_2 \rightarrow 2Na_2HAsO_4 + 3Na_2SO_4 + 4H_2O$ . Insufficient  $O_2$  in the bomb retards the reaction, while an excess has no effect. The contact surface has much influence on the reaction velocities in the liquid and vapor phases. The oxidation in  $Na_2CO_3$  soln. is slower and requires higher temps. than oxidation in  $NaOH$  solns. The exptl. procedure is described in detail.

**Solubility of cupric chloride in water, and the transition points of its hydrates.** Hanna Benrath. *Z. anorg.*

*allgem. Chem.* 216, 207-8 (1933); cf. *C. A.* 26, 4233; Boye, *C. A.* 28, 984<sup>1</sup>.—Polemic. Only a dihydrate of  $CuCl_2$  exists between  $0^\circ$  and  $100^\circ$ . I. J. Patton

**Interaction of aqueous solution of cupric sulfate and cupric hydroxide.** O. Binder. *Compt. rend.* 198, 653-4 (1934).—Mixts. of 5 g. of  $Cu(OH)_2$  and 100 cc. of aq.  $CuSO_4$  of varying concns. were agitated at  $22^\circ$  until equil. was attained. The ratios  $CuO/SO_4$  and  $H_2O/SO_4$  were both invariably 4, and no other basic salt than  $(Cu_2O)_2SO_4 \cdot 4H_2O$  was found. If the amt. of  $Cu(OH)_2$  was relatively too small or too great this compd. was found together with  $CuSO_4 \cdot 5H_2O$  or  $Cu(OH)_2$  as the case might be. The nonexistence of any other basic salt was confirmed by x-ray investigation, which gave the characteristic diagrams of these 3 compds. only (cf. *C. A.* 20, 1184; 26, 1870).

**Basic nickel sulfate.** G. Gire. *Compt. rend.* 197, 1646 (1933).—When powd. Mg is added to  $NiSO_4$  solns. varying from 0.05 to 0.25 mol. per l., soln. occurs and  $H_2$  is liberated. Brilliant green crystals with 18 mols.  $H_2O$  are obtained. The color becomes dull and on drying at 100 the compd.  $NiSO_4 \cdot 4NiO \cdot 10H_2O$  is obtained. This compd. is nonmagnetic, insol. in  $H_2O$  and sol. in hot acids.

**The hydrates of nickel sulfate.** André Chrétien and Raymond Rohmer. *Compt. rend.* 198, 92-4 (1934).—The system  $NiSO_4-H_2O$  was studied at one atm. over the range  $-3.15^\circ$  to  $107.7^\circ$  (b. p. of the satd. soln.). The coexisting solids, temps. and g.  $NiSO_4/100$  g.  $H_2O$  were, resp.: ice- $NiSO_4 \cdot 7H_2O$   $-3.15^\circ$ , 26.2;  $NiSO_4 \cdot 7H_2O$ - $\alpha$ - $NiSO_4 \cdot 6H_2O$   $29.1^\circ$ , 43.7;  $\beta$ - $NiSO_4 \cdot 6H_2O$ - $\alpha$ - $NiSO_4 \cdot 6H_2O$   $60.3^\circ$ , 57.0;  $\beta$ - $NiSO_4 \cdot 6H_2O$ - $NiSO_4 \cdot 5H_2O$   $98^\circ$ , 79.2;  $\beta$ - $NiSO_4 \cdot 6H_2O$ - $NiSO_4 \cdot 4H_2O$   $97.2^\circ$ , 78.5;  $\beta$ - $NiSO_4 \cdot 6H_2O$ - $NiSO_4 \cdot 3H_2O$   $96.4^\circ$ , 78.0;  $\beta$ - $NiSO_4 \cdot 6H_2O$ - $NiSO_4 \cdot 2H_2O$   $90.3^\circ$ , 73.1;  $\beta$ - $NiSO_4 \cdot 6H_2O$ - $NiSO_4 \cdot H_2O$   $84.8^\circ$ , 69 (\*denotes metastable equil.). Above  $84.8^\circ$  only the monohydrate is stable. The metastable phases are very persistent.

**Decomposing sodium sulfate with hydrogen.** K. I. Losev and Yu. G. Naidis. *J. Applied Chem.* (U. S. S. R.) 6, 220-3 (1933).—At comparatively low temps., up to  $800^\circ$ , there is only a reduction of the sulfate with the  $H_2$ . There is more decompn. when the temp. is above  $800^\circ$  whereby  $H_2S$  and  $NaOH$  are formed in the boat. On further heating, the sepd. alkali as well as the remaining  $Na_2S$  is combined with the material of the boat (porcelain, magnesite, etc.) forming ultramarine of different colorings, such as yellow, green, blue and red. If  $H_2$  is passed in at  $1100^\circ$  for one hr. the alkali and  $Na_2S$  formed to about 80% are completely combined.

**The action of vanadium tetrachloride on some anhydrous chlorides.** André Morette. *Compt. rend.* 197, 1640-3 (1933).—Molten V was treated with a stream of  $Cl_2$  and the product passed over anhyd. Li, Na, K, Rb, Cs, Mg, Ca, Sr, Ba, Zn, Mn, Cr, Ag and Pb chlorides. Of these only K, Rb and Cs chlorides reacted with the vapors of V chlorides, as shown by an increase in wt.  $CsCl$  increased most, while  $KCl$  and  $RbCl$  retained essentially the same wts. of V chlorides and in each case the ratio  $Cl/V$  was about 3, indicating  $VCl_3$ ; for a ratio above 3,  $VCl_4$  seems to enter. The compd. or soln. of V chloride in the alkali chloride loses V when heated in a stream of  $Cl_2$ ; above  $400^\circ$  this loss occurs even in the presence of  $VCl_4$ . The reaction  $VCl_4 = VCl_3 + Cl$  seems to be supported by the alkali chloride. I. J. Patton

**Hydrolysis of carbides.** Norbert G. Schmahl. *Z. Elektrochem.* 40, 68-70 (1934).—S. discusses the hydrolysis products of various metallic carbides, particularly of the rare earth group. He concludes that the nature and amt. of the hydrocarbon products formed can be detd. from the formulas and energy content of the resulting metallic oxide and the original carbide.

**The existence of pyro- and meta-arsenic acids.** V. Auger. *Compt. rend.* 197, 1639-40 (1933).—On repeating Rosenheim and Antelmann's work on meta- and

pyro-arsenic acids (C. A. 24, 5250), and even analyzing a sample of the pyro acid furnished by R., Auger detd. that this acid corresponds to  $3As_2O_5 \cdot 5H_2O$ . The product claimed as  $HAsO_3$  is  $As_2O_5$ . Conclusion: The free ortho-, pyro- and meta-arsenic acids have not been isolated.

I. J. Patton  
**Hydrazoic acid.** Edward C. Franklin. *J. Am. Chem. Soc.* 56, 568-71 (1934).—The reaction  $KNO_3 + 3KNH_2 \rightarrow 3KOH + NH_3 + KN_3$  (75% yield; 80% with  $Pb(NO_3)_2$ ) takes place in liquid  $NH_3$  (90°) and is evidence that  $HN_3$  is ammononitric acid (cf. C. A. 6, 1410; 20, 1185). Aq.  $HN_3$  acts upon Zn, Fe, Mn, Ni and Cu in a fashion similar to  $HNO_3$ :  $Zn + 3HN_3 \rightarrow Zn(N_3)_2 + NH_3 + N_2$  (small amounts of  $H_2N_2$  also). A mixt. of  $HN_3$  and HCl dissolves Au and Pt. Aq.  $HN_3$  oxidizes (augments)  $Fe(N_3)_2$  to  $Fe(N_3)_3$  on warming and  $NaN_3$  oxidizes  $Sn^{++}$  to  $Sn^{4+}$  in molten  $NaNH_2$ . Several simple org. compds. are oxidized (nitridized) when heated with  $HN_3$  in aq. soln. or  $NH_4N_3$  in liquid  $NH_3$ .

W. C. Fernelius  
**A hexosephosphoric acid obtained from the hydrolysis of flour.** Theodore Posternak. *Compt. rend.* 198, 5103-7 (1934).—The biosemonophosphoric acid previously obtained from the hydrolyzate of flour (C. A. 28, 833<sup>9</sup>) was hydrolyzed by boiling with 2%  $H_2SO_4$  and from the soln. was obtained a Ba hexosemonophosphate  $CaH_{11}O_{11}PBa$ ,  $[\alpha]_{D_{20}}^{20}$  (1% soln.) 20.8°; the free acid has  $[\alpha]_{D_{20}}^{20}$  40.9°; the phenylhydrazide of the osazone m. 152-3°. From these properties and from the change of rotation in mixts. of alc. and pyridine the acid is identical with Robison's ester, dextrose-6-phosphoric acid. K. V. Thimann

The amphoteric behavior of metal hydroxides. III. Cuprites. R. Scholder, R. Felsenstein and A. Appl. *Z. anorg. allgem. Chem.* 216, 138-44 (1933); cf. C. A. 27, 5018; 28, 1617<sup>8</sup>. Na tetrahydroxocuprite  $[Cu(OH)_4]Na_2$  is prepd. by gradually adding a warm soln. of 40 g.  $Cu(NO_3)_2 \cdot 3H_2O$  in 25 ml. water to 240 cc. of a soln. of NaOH (sp. gr. 1.535) at 5°, and kept at this temp. in an ice bath. After addn. is complete, the soln. is warmed to 80° on a water bath, filtered by suction, and the filtrate rapidly cooled to room temp. After an hr. a fine, deep-blue ppt. of the Na cuprite forms (sq. plates under a microscope). Analysis led to the above formula. No K salt could be prepd. in this way. Double decompn. reactions for the prepn. of Li, Mg, Ca, Ti and heavy metals from the Na salt failed. Ba and Sr compds. (hydroxides or chlorides) were prepd. Two Sr salts,  $[Cu(OH)_4]Sr \cdot H_2O$ , and  $[Cu(OH)_4]Sr_2$ , were prepd., the former violet, the latter light blue in color.  $[Cu(OH)_4]Ba_2$  was also prepd. Dehydration expts. prove the structure. IV. Cobaltites. R. Scholder and H. Weber. *Ibid.* 159-64. True solns. of  $Co^{II}$  salts in very concd. NaOH solns. give  $[Co(OH)_4]Na_2$ , wine-red;  $[Co(OH)_4]Ba_2$ , violet-red;  $[Co(OH)_4]Sr_2$ , violet red. V. Stannites. R. Scholder and R. Kutsch. *Ibid.* 176-84. From alk. stannite solns., the following cryst. stannites were isolated: (a) white hydroxostannites  $[Sn(OH)_4]Na_2$ ;  $[Sn(OH)_4]Ba_2 \cdot 2H_2O$ ;  $[Sn(OH)_4]Sr \cdot 2H_2O$ ;  $[Sn(OH)_4]Ba$ ; (b) the yellow oxyhydroxostannites:  $[(HO)_2Sn-O-Sn(OH)_4]Ba$ ; and the corresponding Sr salt. At 100-110° the trihydroxo-Ba and Sr compds. change to the yellow oxyhydroxostannites; at 200-400° these go to the pure oxostannites,  $SnO_2 \cdot Ba$  or  $SnO_2 \cdot Sr$ . The Na salt decomposes at room temp. with sepn. of Sn. I. J. P.

Amphoteric oxide hydrates, their higher molecular compounds and solutions thereof. XIX. Hetero- and isopolytungstic acids, particularly the periodotungstic acids. Gerhart Jander and Hans Witzmann. *Z. anorg. allgem. Chem.* 214, 145-57 (1933); cf. C. A. 27, 4187. To investigate the formation and mol. state of heteropoly compds. thoroughly the systems of 1-periodo-6-tungstic acid, 1-telluro-6-tungstic acid, 1 phospho-12-molybdic acid and x-phospho-y-vanadic acids are to be investigated in detail and the systems referred to the theories of Miotati, Copaux and Rosenheim (cf. C. A. 2, 2346; 3, 2008; 12, 1264). These theories are reviewed and the prepn. and properties of periodotungstic acids and their salts are described. XX. Iso- and heteropolytungstic acids,

particularly the optical absorption powers of 1-telluro-1-hexatungstic acid. *Ibid.* 275-80. XXI. Iso- and heteropoly-molybdic acids, particularly the phosphor-molybdic acids. *Ibid.* 215, 310-20.—Diffusion tests were made to investigate the formation, behavior and structure of 1 phosphorus-12-molybdenum acid with solns. of 0.1 M  $Na_2MoO_4 \cdot 2H_2O$ , 0.1 M  $Na_2HPO_4 \cdot 12H_2O$  and 1 M  $NaClO_4$ . To obtain different H-ion concns. the solns. were mixed with various amts. of perchloric acid. Tabulated data show the mol. condition of the Mo-contg. ions for different H-ion concns. Curves are given showing the optical absorption properties of solns. of phosphor-molybdic acids. M. McMahon

The ternary system  $KI-PbI_2-H_2O$  at 0° and 25°. Henry S. van Klooster and Paul A. Balon. *J. Am. Chem. Soc.* 56, 591-2 (1934).—Equilibria conditions in the system  $KI-PbI_2-H_2O$  at 0° and 25° were studied and the existence at both temps. of one double salt,  $KPbI_3 \cdot 2H_2O$ , was established. H. S. v. K.

Ternary systems of urea and acids. I. Urea, nitric acid and water. II. Urea, sulfuric acid and water. III. Urea, oxalic acid and water. Lawrence H. Dalman. *J. Am. Chem. Soc.* 56, 549-53 (1934). The system urea- $HNO_3$ - $H_2O$  was studied at 10°, 25° and 40°. One salt was found:  $CO(NH_2)_2 \cdot HNO_3$ . In the system urea- $H_2SO_4$ - $H_2O$ , studied at 10° and 25° 2 salts exist:  $[CO(NH_2)_2]_2 \cdot H_2SO_4$  and  $CO(NH_2)_2 \cdot H_2SO_4$ . The system urea-oxalic acid- $H_2O$  examd. at 10°, 25° and 40° shows the existence of a mono- and a di-urea oxalate, both anhyd. The mono-urea oxalate is stable only above 21.2°. H. S. v. K.

A class of tartaric compounds. J. P. Mathieu. *Compt. rend.* 198, 251-3 (1934).—Metallic tartrates ( $TM_2$ ) of a unique type have been prepd. by the reaction of equimol. amts. of  $MSO_4$  and  $TNa_2$ . The complex  $TM(OH)_2$  (I), formed in acid soln., undergoes hydrolysis to  $TM(OH)_2H_2$  (II). I and II then react to give  $[TM(OH)_2]M$  (III). I with 1 equiv. of NaOH gives III, but with 2 equivs. gives  $[TM(OH)_2]Na_2$ . W. J. Peterson

New combinations of hexamethylenetetramine. L. Debucquet and L. Velluz. *Bull. soc. chim.* 53, 1288-91 (1933). The feebly basic character of hexamethylenetetramine (I) confers on it the property of giving cryst. compds. with mineral salts and certain complex salts. A soln. of 10 g.  $K_2CrO_4$  and 12.5 g.  $MgSO_4 \cdot 7H_2O$  in 100 cc.  $H_2O$  was mixed with 70 g. I in 150 cc.  $H_2O$ . Crystn. on standing 21 hrs. gave 20 g. of  $(MgCrO_4)_2 \cdot 3I \cdot 15H_2O$ . Similarly were prepd.  $MgCr_2O_7 \cdot 2I \cdot 5H_2O$  and  $CaCr_2O_7 \cdot 2I \cdot 7H_2O$ . Ferro- and ferricyanides were formed by using the Ca compds.  $KCaFe(CN)_6 \cdot 2I \cdot 6H_2O$  and  $K_2CaFe(CN)_6 \cdot I \cdot 6H_2O$  described by Barbieri (C. A. 24, 3724) as starting material. From a mixt. of solns. of I said. with 1 or the other of these compds. and a soln. of  $MgSO_4 \cdot 7H_2O$  were obtained the following new Ca and Mg complexes, insol. in 10-20% aq. I:  $CaMg_2[Fe(CN)_6]_2 \cdot 4I \cdot 24H_2O$  and  $[CaMgFe(CN)_6]_2 \cdot 4I \cdot 40H_2O$ . The above 5 compds. are lemon-yellow, orange-red, brick-red, yellow and almost white, resp. The analysis of the Cr compds. was carried out directly. The ferro- and ferricyanides were calcined and the analyses were made on HCl solns. of the ashes. In all cases classical methods of sepn. were used in the isolation of the metals. C. R. Addinall

Apparent atomic volumes and coordination centers of insoluble internal complexes. G. Gutzzeit. *Arch. sci. phys. nat.* 15, 409-17 (1933).—A simple relationship between the at. vol. of the cation and the centers of coordination of the org. mols. is not applicable to org. monosubstituted compds. I. J. Patton

Trivalent iron combined as alcoholate inner complexes. Bruno Emmert and Eugen Jacob. *Ber.* 67B, 286-9 (1934); cf. C. A. 25, 3580. Reactions were similar to those for ferrous iron except that instead of acetylacetonate ferric butylate the product was acetylacetonate-iron<sup>III</sup>. Acetylacetonate-iron<sup>III</sup> + 2 pyridine in soln. in alc. on oxidation with air gives on evapn. diacetylacetonate ferric ethylate, m. 159.5°; acetylacetonate ferric dimethylate; acetylacetonate-iron<sup>III</sup> +  $2C_2H_5OH$ , m. 109° after 4 crystns.;

## 7—ANALYTICAL CHEMISTRY

W. T. HALL

**Nitrazine yellow, a new indicator.** Henry Wenker. *Ind. Eng. Chem.* 26, 350(1934).—Nitrazine yellow, or 2,4-dinitrobenzeneazo-1-naphthol-3,6-disulfonic acid, shows a yellow color in solns. of  $pH = 6.4$  or lower and a blue color at  $pH = 6.8$  or higher. A test paper can be prepd. by adding a little phenolphthalein to the dye soln. which serves to reduce the porosity of filter paper so that drops do not run out readily. A drop of  $10^{-4} N$  HCl or of NaOH will cause color change with this paper.

**Use of dithizone (diphenylthiocarbazon) in chemical analysis.** W. Fresenius. *Z. anal. Chem.* 96, 128-31 (1934).—A review.

**Analyzing industrial solvents.** VI. F. Hauck. *Chem.-Ztg.* 58, 75-6(1934); cf. *C. A.* 28, 727<sup>7</sup>.—A quant. study of solvent mixts., *turpentine oil* and its substitutes, contg benzene and aromatic compds. The  $n$  is detd. and the mixt. then nitrated according to Marcusson's method. The formulas for calcg. results are given, also data for *pine oil*, *camphor oil* and *hydnorpin*.

**Turbidity and color measurements.** I. A photoelectric cell arrangement for measuring small quantities of certain impurities in reagent chemicals. R. A. Osborn. *J. Assoc. Official Agr. Chem.* 17, 135-41(1934).—A photoelectric cell arrangement for measuring small quantities of certain impurities in reagent chemicals is described. Measurements for Fe, Pb, chloride and sulfate are presented. Satisfactory measurements were obtained for Fe and Pb as sulfides; but difficulties were encountered in the measurement of sulfate and chloride.

**Studies in colorimetry with the photoelectric tube.** I. Kemelchi Yamamoto and Mochiyuki Abe. *Bull. Waseda Applied Chem. Soc.* 21, 1-16(1933)(English abstract 13A). The results of colorimetric studies with solns. of methylene blue, quinoline yellow and eosin red are described.

**Microscope tests on papers.** A. R. Matthis. *Ann. chim. anal. chim. appl.* 16, 1-14, 49-57(1934).—A review of methods used for identifying fibers under the microscope.

**Methods of photoelectric titration.** Friedrich Müller. *Elektrochem.* 40, 40-51(1934). Various methods and types of app. are compared.

**Double-bond titration.** R. Prognier and F. Van Goetsenhoven. *Bull. soc. chim. Belg.* 42, 391-409(1933). Exptl. details are given for the titration of the double bond of an ethylenic compd. in  $CCl_4$  soln., by means of an aq. soln. of Br, a mixt. of KBr and  $KBrO_3$  or a  $CCl_4$  soln. of Br. Accuracy is about 0.5%.

**Volumetric methods for the determination of the metals in the platinum group.** A. A. Grinberg and B. V. Ptitzin. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1933, 284-6 (in French 286-90).—A review of the existing potentiometric methods for the titration of these metals in various complexes. The visual titration of 10 Pt complexes with  $KMnO_4$  is also described.

**Drawing off and determination of very small quantities of gas.** R. A. Kolliker. *Chem. Fabrik* 6, 299-302(1933).—A review.

**Kinematic method of quantitative spectral analysis.** A. Betim. *Compt. rend.* 198, 568-9(1934).—A selected spectral line of the substance to be detd. is photographed at fixed intervals (on a plate moved vertically at a fixed rate), while the mineral in which it occurs is heated electrically. The quantity is deduced from the length, and rate of diminution in breadth and intensity of the line, the arrangement having been suitably calibrated.

**Effect of sulfated fatty alcohols in the colorimetric determination of  $pH$ .** J. Edward Smith and Harold L. Jones. *J. Phys. Chem.* 38, 243-4(1934).—Neville and Jeanson (*C. A.* 27, 5986) have used indicators to det. the  $pH$  values of solns. contg. gardinol. Gardinol C. A. is

the Na salt of sulfated oleyl alc. and gardinol W. A. is the corresponding deriv. of lauryl alc. Expts. with buffer solns. show that the  $pH$  detd. colorimetrically may be as much as one whole unit wrong when a salt of a sulfated aliphatic alc. is present. This error is on the acid side and is not caused by the  $pH$  of the sulfated fatty acid itself.

**Qualitative analysis with small quantities of minerals.** IV. 1. Gunther Rieckacker and Werner Schiff. *Centr. Mineral Geol.* 1934A, 56-60; cf. *C. A.* 28, 68<sup>1</sup>.—To test for Ti, take a small fragment of the mineral and digest it with 1 drop of  $HNO_3$ . Remove the clear soln. from the residue by means of a capillary tube, and make it slightly

anioniacal on a watch glass. Evap. nearly to dryness, add 1 drop of 10% KI soln. and 1 drop of satd.  $Na_2S_2O_3$  soln. If 1  $\gamma$  of Ti is present, a yellow ppt. of TiI will be seen. To test for Bi, digest the mineral with a few drops of  $HNO_3$ , evap. the soln. with HCl and to the clear soln. add 1 drop of a soln. contg. 5 g.  $SnCl_4$ , 5 cc. of concd. HCl and water to make 100 cc. Filter and add 1-2 drops of stannite soln. (mixt. of the above  $SnCl_4$  soln. with an equal vol. of 25%  $NaOH$ ). A black ppt. will form if 1-2  $\gamma$  of Bi is present. To test for Mo, fuse a little of the mineral in a small crucible with a pellet of NaOH. Treat the fusion product with a little water and filter. Nearly neutralize with HCl. Add a drop of the soln. to filter paper and add to the border of the spot 1 drop of KCNS and 1 drop of  $SnCl_4$  soln. A red color will result if 1  $\gamma$  of Mo is present. To test for W fuse and treat as just described but use as reagents 1 drop of concd. HCl and 1 drop of  $SnCl_4$  soln.; a blue color results if 10  $\gamma$  of W is present. To test for V, fuse with NaOH as in the last 2 tests and make acid with concd.  $HNO_3$ . If Cr or Mn is present it may be necessary to reduce  $Cr_2O_7^{2-}$  and  $MnO_4^{2-}$  or  $MnO_4^{2-}$  by heating with concd. HCl and then evap. with  $HNO_3$ . As reagent use 1 drop of aniline chloride in concd. HCl. A blue-green color results if 10  $\gamma$  of V is present.

**Tabular method for reading arsenic strips.** Bertrian D. Thomas. *Ind. Eng. Chem.* 26, 356(1934).—In the Gutzzeit test, the lengths of a given standard vary widely from set to set but the relative lengths of the various standards in the set are quite const. Thus with a single set of standards contg. 0.01, 0.02, 0.03 and 0.04 mg. of As, the lengths of the stain may be 8.5, 13.5, 17.0 and 20 mm. with a total length of 59 mm. From these results a graph can be drawn from which the As content can be read. About 25 such graphs suffice to cover a range of 45-70 mm. in length of the stain.

**Correct preparation and use of the Bunsen valve on burets.** Paul Fuchs. *Z. anal. Chem.* 96, 101-3(1934).—Use black rubber tubing of about 3 mm. diam. and at least 1.5 mm. thickness. Use a piece of glass rod with no ridges on the surface. Round one end in the flame of a blast lamp, heating until the end thickens a little. Cut off 8 mm., break it off with the rod held in the head of a cork borer in which the rod fits. Smooth the cut end with a file. In using the valve, make sure that there is no air bubble in the rubber tubing and press from above. Keep the buret filled with liquid to prevent hardening of the rubber.

**Colorimetric determination of aluminum with eriochromocyanin.** F. Alten, H. Weiland and E. Knippenberg. *Z. anal. Chem.* 96, 91-8(1934).—The colorimetric test for Al with eriochromocyanin can be used for the colorimetric detn. of 0.005-0.1 mg. of Al. Reagents.—(1) A 0.1% soln. of eriochromocyanin R conc. G. (G. Grüber & Co. Leipsig), prepd. daily; (2) 2 N NaOH free from Al (*Natrium hydroxidum in rotulis* (Merck) is approx. Al-free but must be preserved in paraffined bottles); (3) 0.2 N AcOH; (4) 7 g. of  $KH_2PO_4$  in a l. of water; (5) 10% LiCl soln.; (6) K or  $NH_4$  alum contg. 0.001, 0.003, 0.005 and 0.080 mg. Al in 5 cc.; (7) buffer soln.

contg. 400 cc. of 5 N  $\text{NH}_4\text{OAc}$ , 200 cc. of 4 N  $\text{NaOAc}$ , 25 cc. of 4 N  $\text{HOAc}$  and water to make 1 l. (by dilg. this buffer mixt. with 9 times as much water, the  $\text{pH}$  = 6.0). *Seprn. of Al from  $\text{P}_2\text{O}_5$  and interfering cations.*—Take 5 cc. of the soln. to be tested and 5 cc. of purest water in a 25 cc. quartz test tube. Add 2 cc. of reagent (4) and 1 g. of pure  $\text{NaOH}$ . Boil 1 min. and add to the hot soln. 2 cc. of reagent (5) and boil 1 min. or until the odor of  $\text{NH}_3$  disappears. Cool, centrifuge and decant off the clear centrifugate into a 100-cc. measuring flask contg. sufficient 10%  $\text{HCl}$  to make the soln. remain acid after the alk. centrifugate has been added. Wash the residue in the centrifuge tube with 2 cc. of water and add the clear washing to the main soln. *Colorimetric test.*—Take 10 cc. of reagent (1), add reagent (2) dropwise until the color is blue-violet and add dropwise, while shaking, sufficient of reagent (3) to make the color change to yellow and then toward a red-violet shade. Then add 10 cc. of reagent (7), make up to the 100-cc. mark, mix and after 30 min. measure the extinction of the test soln. against the blank soln. in the yellow-green (531  $\text{m}\mu$ ). The measured extinction  $\times 50$  gives the approx. Al content in  $\gamma$ . For the accurate detn. follow the same procedure but use instead of 10 cc. of reagent (1) 5 cc. for 0.005–0.015 mg. Al, 10 cc. for 0.015–0.050 mg. Al and 15 cc. 0.05–0.1 mg. of Al. W. T. H.

*The separation of arsenic and antimony from tin.* P. Ed. Winkler. *Bull. soc. chim. Belg.* 42, 503–18 (1933).—The titration of Sn proposed in C. A. 26, 4768 is slightly modified: the oxidation of the S in the thioacetanamide, which was done with  $\text{H}_2\text{O}_2$ , is now performed with  $\text{H}_2\text{O}_2$  first, and then brought to completion with permanganate in acid soln. The pptn. of As and Sb by  $\text{H}_2\text{S}$  from a soln. contg. As, Sb and Sn should be carried out in the presence of 10 g. oxalic acid and 10 cc. of concd.  $\text{HCl}$  per 100 cc. of soln.; adsorption of the Sn salt on the ppt. is thus minimized. A. L. Henne

*Spectrographic determination of some secondary constituents in copper.* Raymond Breckpot. *Ann. soc. sci. Bruxelles* B53, 219–47 (1933).—The behavior, intensities and characteristics of the lines due to 1 to 0.001% of Pb, Bi, Ag, Sb and As in Cu were studied. The most persistent lines were: Pb 2833, Bi 3068, Ag 3383, Sb 2312, 2529 and 2598, and As 2350 and 2288. L. P. Hall

*A rapid and accurate photometric method for determination of lead in small quantities, especially applicable to determination of lead in spray residues and in food products.* Boyd L. Samuel and Howard H. Shockey. *J. Assoc. Official Agr. Chem.* 17, 141–6 (1934).—To det. Pb in apple peelings treat a suitable sample with  $\text{HNO}_3 + \text{H}_2\text{SO}_4$  to destroy org. matter, evap. with  $\text{H}_2\text{O}$  to remove excess  $\text{HNO}_3$  and distil off  $\text{AsCl}_3$  by either the bromate or Gutzeit method. Ext.  $\text{FeCl}_3$  from the residual  $\text{HCl}$  soln. with  $\text{NH}_4\text{CNS}$  and  $\text{Et}_2\text{O}$ , make ammoniacal and add KCN and some  $\text{NH}_4$  citrate. Transfer to the Nessler tube of the photoelec. colorimeter and add  $\text{Na}_2\text{S}$ . Compare the results with those obtained similarly with known quantities of Pb. The original paper should be consulted. A. Papineau-Couture

*Colorimetric determination of lead and copper with dithizone (diphenylthiocarbazon).* Hellmut Fischer and Grete Leopoldi. *Angew. Chem.* 47, 90–2 (1934); cf. C. A. 27, 3418.—The microdetn. of Pb consists of the extn. of Pb with a green soln. of dithizone in  $\text{CCl}_4$  and removal of excess reagent by washing the red lead soln. with a 1% KCN soln. Washing with mineral acid gives a green soln. which is examd. colorimetrically. Details are given for overcoming difficulties due to the presence of other ions. Karl Kammermeyer

*Note on the accuracy of lead analyses.* Lawrence T. Fairhall. *J. Ind. Hyg.* 15, 289 (1933).—Polemical with Kehoe et al. (C. A. 28, 2376). K. has been using the method described in C. A. 16, 2160 and later discarded (cf. C. A. 18, 3400) but some of K.'s criticism is accepted. E. G. Meiter

*Determination of manganese contained in iron and steel or in ores.* Motojiro Sekino. *Bull. Inst. Phys.-Chem.*

Research (Tokyo) 12, 927–34 (Abstracts 61 (in English) published with *Sci. Papers Inst. Phys.-Chem. Research* (Tokyo) 23, Nos. 468–77).—In detg. Mn by the bismuthate method, the soln. must not be above 30° after adding the reagent. K. Konda

*Electroanalysis of molybdenum.* Chujiro Nenoto and Yoshio Tanabe. *J. Electrochem. Assoc. (Japan)* 2, 53 (1934).—Add 0.5 g.  $\text{NH}_4\text{OAc}$  to the aq. soln. contg. 0.1 g.  $\text{MoO}_3$  as  $\text{NH}_4$  molybdate, dil. to 150 cc., heat to about 70° and electrolyze with a current of 0.2 amp. for 5 hrs. and with a cathode of Pt gauze plated with Cu. Add 1 cc. of 50%  $\text{AcOH}$  at the middle of the electrolysis. After complete pptn., wash the deposit with hot water without breaking the circuit, rinse with alc., dry and weigh. K. Konda

*A rapid method for the determination of potassium in the form of potassium bitartrate.* Yu. I. Chernyaeva and R. V. Krasnovskaya. *J. Chem. Ind. (Moscow)* 1933, No. 10, 57–9.—The K sample is mixed with 0.33 N Na bitartrate and stirred for 12 min. The ppt. is filtered and the filtrate titrated with  $\text{NaOH}$ . The method is accurate to 0.6–0.9%, only when large aints. of Na are absent. H. M. Leicester

*A qualitative reaction for radium.* B. A. Nikitin. *Compt. rend. acad. sci. U. R. S. S. [N. S.]* 1, 19–20 (in German 20 1) (1934).—Ra is sepd. from Ba by pptn. with 10%  $\text{K}_2\text{CrO}_4$  in the presence of 1.5% trichloroacetic acid. The method is applicable only in narrow limits. F. H. Rathmann

*Testing tin coating on soft sheet.* Fritz Eisenkolb. *Stahl u. Eisen* 54, 109–10 (1934).—The thickness of the layer is detd. by dissolving a weighed section in  $\text{HCl}$  and titrating with  $\text{FeCl}_3$ . Pb is detd. by electrolysis. Porosity is revealed by allowing pieces to stand in hot water for 21 hrs., and testing for rust spots with  $\text{K}_3\text{Fe}(\text{CN})_6$ . Curtis L. Wilkon

*The detection of fluorine in glass tubes.* K. Baroni. *Giorn. farm. chim.* 82, 277–89 (1933). Lewis W. But

*Determination of the composition of small amounts of a neon-argon mixture.* P. Clausen. *Physica* 13, 320 3. (1933).—A method was worked out for analysis of 1 mg. of a Ne-A mixt. The gas mixt. is measured at room temp. and 100 atm. in a glass reservoir with attached closed capillary (area  $4.8 \cdot 10^{-3}$  sq. cm. and narrowed down 1 cm. from end to  $0.4 \cdot 10^{-3}$  sq. cm.); the latter protrudes from a pressure vessel which surrounds the reservoir. The A is then condensed in the capillary by means of liquid  $\text{O}_2$  (90° abs.) and its vol. read. The various errors, deviation from gas law, increased A vapor pressure (foreign gas), thermal diffusion effects, etc., are discussed and proper corrections given. Tests on known mixts. show the accuracy to be around 5%. B. J. C. van der Hoeven

*The determination of nitrogen in cyanides by the Kjeldahl method.* Angelo Tettamanzi. *Atti accad. sci. Torino, Classe sci. fis., mat. nat.* 68, 153–60 (1933). The Kjeldahl method for N is found to be applicable, without any modifications, to the detn. of N in cyanides. The method is applicable when the more rapid titration methods of Volhard and Liebig fail, as well as for all insol. complex, and nonelectrolyte cyanides. A. W. C.

*Determination of oxygen in alloy steels and its effect upon tube piercing.* Newell Hamilton. *Am. Inst. Mining Met. Engrs. Tech. Pub. No. 540*, 12 pp. (1934).—The app. and procedure used in detg. O, H and N in steel are described. Total O in 2 steels (Cr 18, Ni 8, C 0.07%, Cr 5, Mo 0.50%) showed a direct relationship to the elevated temp. ductility of these steels as detd. by seamless tube piercing. Probably O is combined with the Cr. Inclusions at room temp. are not excessive. Heats of 18–8 alloys deoxidized with Al or Zr have been pierced successfully even though the total O content was above the max. for good piercing quality, probably because the O is fixed to a more stable form with Al or Zr. However, the resulting inclusions interfere with other working of the alloy. Max. O content should be < 0.01%. Alden H. Emery

**The determination of alkali metals as fluosilicates.** W. D. Treadwell and W. König. *Helv. Chim. Acta* 16, 1201-8 (1933).—The alkali metals should be present as chlorides or nitrates, and all other metals (including Mg) should be previously eliminated. Evap. the salt soln. to dryness in a Pt crucible. Add a 200% excess of freshly prepd. hydrated silica, together with some distd. 40% HF soln. (1-2 cc. of acid per 0.1 g. of silica). Evap. on the water bath, dry for 2 hrs. at 120°, and weigh. The alkali metal is present as  $M_2[SiF_6]$ . By subsequent titration it is possible to check the analysis or to det. the ratio of a binary mixt. of alkali metals. A. L. Henne

**Potentiometric determination of arsenates.** W. E. Hanson, S. B. Sweetser and H. B. Feldman. *J. Am. Chem. Soc.* 56, 577-9 (1934).—The method is similar to the one described by Bedford, Lamb and Spicer (*C. A.* 25, 1595) except that 10 times as much NaOAc as required to react with the acid liberated by the pptn. of  $Ag_3AsO_4$  from a soln. of acid arsenate is added to buffer the soln. and the solvent is 50% EtOH. The procedure can be used for detg. As in com. Ca arsenate.

**Microscopic determination of perchlorate.** (1) S. Fedorova. *J. Gen. Chem.* (U. S. S. R.) 3, 377-84 (1933), cf. *C. A.* 22, 1746, 2723; 24, 39.—The method of Kruger and Tschirch (*C. A.* 25, 5642) was studied. The microscopic method for the detn. of pure  $NaClO_4$  is more sensitive and quicker than the colorimetric method, but is inferior to the latter for detg.  $NaClO_4$  contaminated with  $NaNO_3$ ; it is not suited for a mixt. of  $NaClO_4$  and  $NaClO_3$ . Chas. Blanc

**Titration of iodides by the method of Andrews.** L. Michiels and B. Tougarinoff. *J. pharm. Belg.* 15, 845-8 (1933).—The method of Andrews (*J. Am. Chem. Soc.* 25, 756 (1903)) for the titration of iodides has been found to be specific in the presence of bromides, chlorides and other ions. S. W. Goldstein

**Detection of hyposulfites (and sulfoxylates), ferrous salts, hypochlorites and dichromates by means of resorufin.** Hermann Eichler. *Z. anal. Chem.* 96, 98-9 (1934).—An alk. soln. of resorufin (I) shows a yellow-red fluorescence but by reduction hydioresorufin (II) is formed which shows no fluorescence in alk. soln. On the other hand I is easily destroyed by oxidizing agents. To detect  $S_2O_4^{--}$ , add dropwise to the soln. which has been made alk. with  $Na_2CO_3$ , a soln. of 0.2 g. I and 0.2 g.  $Na_2CO_3$  in 100 cc. of air-free water. If  $S_2O_4^{--}$  or  $Fe^{++}$  is present there is no fluorescence until an excess of I has been added but in the absence of these anions an intense fluorescence is apparent on the addn. of the first drop of the reagent. The soln. of II is gradually oxidized by standing in the air. Since  $S_2O_4^{--}$  is hydrolyzed into  $SO_3^{--}$  and  $SO_2^{--}$  and  $SO_2^{--}$  does not give the test, it is apparent that the test is due to the sulfoxylate anion. Dichromates oxidize I in hot dil.  $H_2SO_4$  solns. and hypochlorites do in the cold. After making alk. the soln. shows no fluorescence.  $KMnO_4$  oxidizes I in both acid and alk. solns.  $SO_3^{--}$ ,  $AsO_3^{--}$ ,  $S_2O_3^{--}$  and formaldehyde do not interfere in the above test for  $S_2O_4^{--}$ .  $S^{--}$  does not cause reduction of (I) in the cold. The above tests are useful for detecting  $S_2O_4^{--}$  in vats.  $Cr_2O_7$  in after-chroming liquors,  $ClO^-$  in bleach liquors and for the control of the reducing power of vitriol vats. W. T. H.

**Detection of nitrite with Magdala red** Hermann Eichler. *Z. anal. Chem.* 96, 99-100 (1934); cf. *C. A.* 28, 1949<sup>1</sup>.—Magdala red is yellow in 2 N mineral acid, pink in N mineral acid, red with reddish fluorescence at  $pH = 4$  and lilac at  $pH = 15$ . By treatment with a hot soln. of nitrite it is changed to a non-fluorescent compd. A reagent dissolve 0.1 g. of Magdala red (Durand and Huguenin, Basel) in 100 cc. of water and a little AcOH. Take 5-10 cc. of water, add as little as possible of the dye soln., add HCl in the cold until the fluorescence ceases and a violet color appears. On heating an intense yellow-red fluorescence appears (if not, dil. with water). Add the soln. to be tested which should be neutral or slightly alk. If nitrite is present, the fluorescence will disappear at once and a blue color will result.  $Cu^{++}$  and  $Fe^{++}$

help the test. Nitrates do not cause loss of fluorescence even after long boiling. The method, therefore, is useful for detecting nitrite in the presence of nitrate. Sulfites, thiosulfates, hypochlorites, dichromates and permanganates interfere. W. T. H.

**Determination of inorganic phosphate in the presence of arsenic.** Lionel B. Pett. *Biochem. J.* 27, 1672-76 (1933).—The arsenate is reduced to arsenite, which does not interfere with colorimetric phosphate detns. B. H.

**New method for the potentiometric determination of mercuric salts.** G. Spacu and I. G. Murgulescu. *Z. anal. Chem.* 96, 109-14 (1934).—The method is suitable for detg.  $Hg^{++}$  in its sol. compds. and in  $HgI_2$ . It depends upon the formation of a difficultly sol. complex compd. by the reaction  $[HgI_4]^- + [Cu en_2]^{++} = [HgI_4][Cu en_2]$  in which  $en = H_2N.CH_2.CH_2.NH_2$ . As reagent a 0.1 molal soln. of  $[Cu en_2](NO_3)_2 \cdot 2H_2O$  or the corresponding sulfate is used. To the soln. to be analyzed add sufficient KI soln. to transform all Hg into  $[HgI_4]^-$ . Place a Pt wire coated with Hg in the soln. as indicator electrode and measure the initial potential against the normal calomel electrode. Add sufficient KI soln. to make this p. d. 0.250-0.300 v. Titrate in the usual way with the reagent. At the end point a sharp increase in the p. d. is obtained. It is necessary to wait 2-3 min. after each addn. of reagent. The results of 8 titrations are given and the agreement is satisfactory. W. T. H.

**Methods for determining lead peroxide.** V. A. V. Pamfilov and E. G. Ivancheva. *J. Gen. Chem.* (U. S. S. R.) 3, 262-8 (1933); cf. *C. A.* 26, 3456.—The most convenient and sufficiently accurate method was found to be the following: Digest  $PbO$  or  $Pb_2O_4$  with 25 cc.  $HNO_3$  (d. 1.2), add 75 cc.  $H_2O$  and 5-10 cc. of standard 1-2%  $H_2O_2$  and titrate the excess  $H_2O_2$  with  $KMnO_4$  (cf. Ebell, *Chem.-Ztg.* 10, Repet. No. 10, 70 (1886); Busvold, *C. A.* 26, 2140). Chas. Blanc

**Analyses of inclusions in high-carbon tool steels.** Haakon Styri. *Trans. Am. Inst. Mining Met. Engrs.* 105, 185-97 (1933).—The electrolytic method for sepn. of inclusions in steel has given satisfactory results when there is a membrane around the anode to collect the undissolved particles. Suitable dense filter paper attached to the bottom of a glass tube may serve better for many purposes than collodion bags, because it permits direct filtration. A variety of electrolytes may be used provided (1) the cathode chamber is kept slightly acid (0.1% or less) so that hydroxides are not formed on the membrane and (2) the anode chamber does not get too acid so that pptd. particles will be attacked. When carbides must be kept from the residue, the steel should be quenched from high enough temp. to bring the cementite into solid soln. S is present as sulfide, probably  $(MnFe)S$ . Brief treatment of the residue with weak acids does not affect the sulfides of Mn seriously, but does attack the Fe. Digestion with 25% NaOH for 72 hrs. dissolves all  $SiO_2$ , but attacks the sulfide; with 10 and 20% Na citrate, a large amt. of Fe but smaller amts. of  $SiO_2$ , S or Mn are dissolved, indicating that Mn is present largely as silicate. The amt. of Fe in the residue from heat-treated samples is rather const. and probably largely is bound to slag particles. The total proportion of  $SiO_2$  is very const. Apparently only a small amt. is present as colloidal  $SiO_2$ , as treatment with hot 3%  $Na_2CO_3$  takes some in soln. Alden H. Emery

**The determination of opaque minerals in sands.** E. V. Rozhkova and T. L. Pokrovskaya. *Centr. Mineral. Geol.* 1934A, No. 1, 16-21.—Methods (not new) that have been found most reliable and convenient for field use, including spot tests and microchem. reactions, are described for the identification of hematite, tourmaline, rutile, cassiterite, tantalite, columbite, ilmenite, thorianite and wolframite. Michael Fleischer

**Conductometric determination of ash.** T. Pietrzykowski. *Gaz. Chemiczna* 72, 172-82 (1933).—A critical review with numerous references. J. Wiertelak

**Determination of boron and boric acid.** M. Prommes. *Z. anal. Chem.* 96, 131-5 (1934).—A review. W. T. H.

Determination of sugar. W. Dehio. *Z. anal. Chem.* 196, 51-6, 138-51 (1934).—A review. W. T. H.

Analysis of plant materials. K. Fresenius. *Z. anal. Chem.* 96, 151-5 (1934).—A review. W. T. H.

A critical review of the methods for the detection of the blood in forensic hematology. Amedeo Dalla Volta. *Diagnostica tec. lab. (Napoli) Riv. mensile* 4, 507-18 (1933).—Spectroscopic and spectrographic methods are considered the best. Lewis W. Butz

Lead poisoning as cause of death. Detection in cadaver ash. H. Jesser. *Sudder. Apoth.-Ztg.* 74, 65-6 (1934).—The ash from the cremation of a worker in Pb was examd. in an attempt to det. whether chronic Pb poisoning was the cause of death. The results were indecisive. W. O. E.

Microchemical color reaction of *m*-dinitrobenzene for the forensic detection of benzene. F. Kirchhof. *Chem.-Ztg.* 57, 425-6 (1933). If Peltzer's reaction (*C. A.* 27, 5030; Weber, *C. A.* 25, 2866) is carried out by adding to a mixt. of equal vols. of a soln. of the  $\text{NO}_2$  compd. and 96% EtOH (instead of  $\text{COMe}_2$ ) 1 drop of KOH in EtOH, a color stable for 3-4 hrs. is obtained. The reaction is also obtained with tech.  $\text{PhNO}_2$ , presumably because of the presence of  $m\text{-C}_6\text{H}_4(\text{NO}_2)_2$ . The chemistry of the reaction is discussed. B. C. A.

Modification of a new catalytic method for the determination of carbon and hydrogen in organic compounds. Angelo Contardi and Cesare Ferri. *Atti accad. sci. Torino, classe sci. fis., mat. nat.* 68, 181-9 (1933).—The catalytic method of Ter Meulen and Heslinga (*C. A.* 26, 2144), for detg. C and H by oxidation of the compd. with  $\text{PbO}_2$  and  $\text{MnO}_2$  as catalysts, has been improved by placing these catalysts in different parts of the heating tube. This makes it possible to heat the  $\text{MnO}_2$  sufficiently to cause complete oxidation, while the  $\text{PbO}_2$  is kept below the temp. at which it loses O when its efficiency is lost. In addn., a spiral of Ag is placed in the cool part of the app. beyond the heated part, to condense any Hg present, which has been volatilized, and det. the amt. present. A. W. Contieri

Determination of silver in organic compounds. Carl Stainier and Leon Leclercq. *J. pharm. Belg.* 15, 693-7 (1933).—The error in the detn. of Ag in org. compds. is due mainly to chloride present, which forms  $\text{AgCl}$  and is not taken up in the procedures now used. The use of concd.  $\text{H}_2\text{SO}_4$  and powd.  $\text{KMnO}_4$  in the destruction of the org. part of the mol. is suggested to remove this error. The remainder of the procedure is unchanged. S. W. Goldstein

Determination of formic acid in presence of acetic acid. Carl Stainier and Jean Massart. *J. pharm. Belg.* 15, 869-72, 891-3 (1933).—Ten cc. of soln. contg. about 5% of total acid is titrated with *N* NaOH, with phenolphthalein as indicator. Ten cc. of the same soln. is refluxed with 60 cc.  $\text{H}_2\text{O}$  and 5 g.  $\text{HgO}$  for 2 hrs. with shaking, then titrated with *N* NaOH; in this case only the AcOH is titrated. S. W. Goldstein

Determination of pyruvic acid. G. Carpeniscanu. (*compt. rend.* 198, 272-4 (1934).—A procedure is given for the detg. 1 pt. of  $\text{MeCOCO}_2\text{H}$  in 50,000. The greater sensitivity is obtained by using more dil. solns. and standards covering a wider range. W. J. Peterson

A new procedure for the determination of glycerol. Hiei Kataoka. *J. Biochem. (Japan)* 19, 15-24 (1934).—Principle of method: Acrolein formed in the heating of glycerol with  $\text{KHSO}_4$  is distd. into a mixt. of equal parts of Bertrand's sugar reagents I and II, and the  $\text{Cu}_2\text{O}$  is titrated by the usual Bertrand procedure. To an exactly weighed amt. of glycerol add 20 times the quantity of  $\text{KHSO}_4$  in a test tube, which is connected through a long glass tube to the receiving flask. Pass a current of  $\text{CO}$  through the app. and heat 30 min. with a Bunsen burner under a wire gauze screen. The relation between the amt. of Cu (y) and that of glycerol (x) is given by the formula:  $y = 0.42x - 2.2$ , or once a series of detns. has been made,  $x = 2.380y + 5.238$ . The detn. is also applicable to the study of glycerides. In expts. with  $\beta$ -stearodipalmitin the relation between the values of x and y is given by the formula:  $y = 0.633x + 1$ , and  $x = 1.58y - 1.58$ . S. Morgulis

Detection of the methylenedioxybenzene group. J. A. Lahat. *Bull. soc. chim. biol.* 15, 1344-5 (1933).—To 2 cc. concd.  $\text{H}_2\text{SO}_4$  add 0.1 cc. of an alc. soln. of the substance to be tested and 0.1 cc. of a 5% alc. soln. of gallic acid. Heat on a water bath. A green color changing to deep blue indicates the methylenedioxybenzene group. The reaction is obtained with 0.005 mg. nafcotine. It is also obtained with hydrastine, hydrastinine, berberrine, piperine, heliotropin, apiole, saffrole and isosaffrole. L. E. Gilson

Detection of small quantities of pyridine, particularly in charred wood. A. Brünig and M. Schmetka. *Chem.-Ztg.* 58, 156-7 (1934).—The method of Goris and Larssonneau (*C. A.* 16, 886), which depends upon the formation of a red dye by the action of  $\text{BrCN}$  and aniline, is suitable for detecting traces of pyridine except for the fact that furfuraldehyde gives the same reaction that pyridine does. If, however, benzidine or o-tolidine is substituted for the aniline the test becomes more specific, although nicotine gives the test. In applying the test to the steam distillate from charred wood, it is well to remember that pyridine is often formed by the incomplete combustion of certain org. substance. Details for applying the test are given. W. T. H.

Determination of nicotine. R. Dubrisay. *Mem. manuf. état tabacs* 6, 253 (1930); cf. *C. A.* 21, 2445. Solns. contg. equiv. proportions of nicotine and  $\text{H}_2\text{SO}_4$  have  $p_H$  5.6. Titration methods for detg. nicotine are satisfactory if a bromocresol indicator having a color change at  $p_H$  5.6 is used, and the end-point color is standardized by comparison with suitable buffer solns. B. C. A.

Sensitivity of the Debye-Scherrer method and its application in quant. analysis (Pač) 2. 3,6-Dinitro-2,7-dihydroxyfluoran as a reagent for the detection of reducing sugars (Dominkiewicz) 10. The soly of  $\text{PbCrO}_4$ . Application to titration of Pb (Huybrechts, Degard) 2.

Katow, G.-A. de: *Traité élémentaire d'analyse chimique*. Paris: J. B. Baillière & Fils. 132 pp. F.10

## 8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND I. F. SCHAIRER

Forms in which platinum and allied metals occur in nature. O. E. Zvyagintzev. *Ann. inst. platino* No. 10, 14-33 (1932); cf. *C. A.* 27, 5687.—A discussion. B. C. A.

The crystal form and chemical composition of polybasite. B. Gossner and O. Kraus. *Contr. Mineral. Geol.* 1934A, No. 1, 1-6.—X-ray examn. gave  $a = 7.50$ ,  $b = 12.99$ ,  $c = 11.95$  Å. The unit cell contains 2 mols. of  $8(\text{Ag}, \text{Cu})_2\text{S}_2\text{Sb}_2\text{S}_4$ . It is shown to be pseudohexagonal by lamellar twinning, and may be orthorhombic, in which

case space group  $V_2^2$  fits the reflections observed, or monoclinic with  $\beta$  very nearly  $90^\circ$ , or even possibly triclinic. Michael Fleischer

Realgar and benitoite. H. Buttgenbach. *Bull. sci. acad. roy. Belg.* 19, 1019-33 (1933); cf. Ungemach, *Bull. soc. franç. mineral.* 53, 394-416 (1930).—On the realgar found at Matra, Corsica, 6 new forms have been discovered, bringing the total for the mineral to 80. Crystallographic and optical data are given for benitoite from this district. A. W. Furbank

The chemical composition of matlockite. W. Nieuwenkamp. *Z. Krist.* 86, 470-1 (1933).—Powder photographs of matlockite are identical with those of artificial  $\text{PbFCl}$ . Analysis of matlockite from Matlock, Derbyshire, gave 6.5% F (theoretical 7.3). The true formula is not  $\text{Pb}_2\text{OCl}_2$ , but  $\text{PbFCl}$ . The structure is tetragonal, with  $a = 4.09$  and  $c = 7.21$  Å. L. S. Ramsdell

The behavior of calcite in ultra-violet light. A. Köhler and H. Leitmeier. *Centr. Mineral. Geol.* 1933A, 401-11; cf. Witteborg, *C. A.* 27, 1297.—About 300 specimens were examined. The luminescence phenomena observed are characteristic for each locality, and specimens of different age from the same locality can usually be distinguished. However, no general rule holds, as impurities such as Fe and Mn appear to be an important factor. M. F.

Composition of a robe mineral found in serpentine from Bou Oufroh, Morocco. Robert Frey and Jean Burghelle. *Ann. chim. anal. chim. appl.* 15, 61-2 (1934).—Chem. analysis indicates the compn.  $(\text{Fe}, \text{Cr})_2\text{O}_3 \cdot 9\text{MgO} \cdot 2\text{CO}_2 \cdot 14\text{H}_2\text{O}$ . W. T. H.

Minerals from Topaz Mt., Utah. Charles Palache. *Am. Mineral.* 19, 14-15 (1934); cf. *C. A.* 28, 1631.—Beryl, topaz and pseudobrookite are briefly described. A. M. Brant

Sodalite from Bolivia. Wolfgang Brendler. *Am. Mineral.* 19, 28-31 (1934).—The mineral occurs in a large dike accompanying a small stock of nephelite syenite. The color is dark ultramarine blue; sp. gr. = 2.295 at 14.5°;  $n = 1.4837$ . Chem. analyses of fresh material check the accepted formula closely. Weathered sodalite was found to be lower in alkalis and Cl and to have a greater  $\text{H}_2\text{O}$  content. A. M. Brant

Optical and thermal properties of cancrinite from Dôdô, Korea. Shukusuké Kôzu, Junichi Ueda and Shizuo Isurumi. *Proc. Imp. Acad. (Tokyo)* 9, 13-16 (1933); cf. *C. A.* 27, 3684.—Refractive indexes are  $n = 1.5238$ ,  $n_z = 1.5015$ . The linear thermal expansion is about twice as great along the  $c$  axis as in a direction perpendicular thereto. The expansion curves show irregularities at about 900°, corresponding with the decompn. of the mineral. The heating curve shows only one distinct break at 920°. The curve plotting changes in wt. on heating shows breaks at 300°, 460°, 800° and 910°, corresponding with the loss of  $\text{H}_2\text{O}$  and  $\text{CO}_2$  and the decompn. of the mineral. B. C. A.

Constitution and origin of leverrierite. J. de Laparent. *Compt. rend.* 198, 669-71 (1934); cf. *C. A.* 24, 1919; 25, 2614.—Leverrierite is an assocn. of muscovite and kaolin in varying relative amts., probably resulting from decompn. of biotite under humid conditions. The crystals of the two minerals appear to be in definite orientation (epitaxy). C. A. Silberrad

New microscopic-chemical analyses of phosphorites from the neighborhood of Grodno, Poland. J. Tokarski. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1932A, 300-17 (in German).—Microscopical, optical and chem. analysis of phosphorites from the Grodno strata reveals that they contain F in amts. sufficient not only to sep. apatite mols. but also to form excess mols. of  $\text{CaF}_2$ . The main constituent of the phosphorites is a mineral similar to francolite of the formula  $2[\text{3Ca}_3(\text{PO}_4)_2 \cdot \text{CaF}_2] \cdot 3\text{CaCO}_3$ . This mineral is distinctly cryst., optically uniaxial —, with sp. gr. 2.811-855. J. Wiertelak

The tectite from Paucartambo. G. Linck. *Centr. Mineral. Geol.* 1934A, 13-15.—L. reaffirms the tectite nature of the glassy material from Paucartambo, which was doubted by Dittler (*C. A.* 27, 4756), and suggests that the tectites are of extra-terrestrial, possibly of lunar, origin. Michael Fleischer

Clarification of some problems concerning the formation of the Mansfeld copper schist. F. Krull. *Centr. Mineral. Geol.* 1933A, 411-21.—The occurrence of the ores in alternately enriched and impoverished layers is ascribed to a rhythmic pptn. of sulfides due to interdiffusion of sulfide soln. and a soln. contg. metal salts. The lack of bivalent Cu compds. is ascribed to the presence of reducing gases formed by the decompn. of org. matter. M. F.

Barite in the ceded districts of the Madras Presidency;

with notes on its occurrence in other parts of India. A. L. Coulson. *Mem. Geol. Survey India* 64, Pt. 1, 142 pp. (1933).—Theories of barite formation are reviewed. In the ceded districts, Ba-contg. solns. were derived from magma and pptd. by  $\text{H}_2\text{SO}_4$ . Alden H. Emery

The geology of sapromyxite coals in the Barzass River basin. N. M. Karavaev and P. Dorofeev. *Sapromyxites from Barzass* (Goskhimizdat-Petrograd) 1933, 19-35.—A historical review of the geology of sapromyxite coals, with 15 references. A. A. Bochtlingk

Some data on the petrographic character of the Barzass coals. N. M. Karavaev and Z. V. Ergolskaya. *Sapromyxites from Barzass* (Goskhimizdat-Petrograd) 1933, 35-44.—Barzass coals are separable into a platelike variety, a dense massive coal and Kamzhal coal, which is found in thin weathered plates. The geological distribution is discussed and the typical coals are photographically reproduced. A. A. Bochtlingk

Deposits of lignite. Jacques Dumas. *Génie civil* 104, 53-8 (1934).—A description of the mines near Hostens, Gironde, the equipment used to mine and store the lignite, and the power house. Ann Nicholson Hird

The geological position of metaxylite [metallignite]. Hans Bode. *Braunkohle* 32, 793-7 (1933); cf. *C. A.* 27, 5934. F. W. Jung

The problem of the genesis of Central-Asiatic petroleum deposits. V. B. Porfir'ev and V. A. Vasil'ev. *Neftyanoe Khozaystvo* 25, No. 10, 18-22 (1933).—The genesis of the petroleum deposits in the Caspian Valley, Chelekenui, Pitnyak and Gaudak districts is discussed. A. A. Bochtlingk

Some problems concerning oil-bearing deposits in Sakhalin and their connection with its paleogeography. N. Gedroitz. *Neftyanoe Khozaystvo* 25, No. 10, 23-6 (1933). A. A. Bochtlingk

Conclusions derived from the gravitation measurements carried out in the Emba district. V. P. Skvortzov. *Neftyanoe Khozaystvo* 25, No. 10, 14-17 (1933).—Geological formations and their relation to crude-oil deposits in the Emba district are discussed. A. A. Bochtlingk

Source of various salts recovered in the Texas Company's refinery explained by geologist. J. Terry Duce. *Oil and Gas J.* 32, No. 28, 18, 40 (1933). J. R. S.

Volcanic rocks west of Lake Rudolph. Mmc. E. Jérôme. *Compt. rend.* 198, 673-5 (1934).—The volcanic rocks to the west of Lake Rudolph, Kenya, consist of: rhyolites, including comendites and pantellerites (a); phonolites with phenocrysts of sanidine, and much egirite (a); nephelinitic microsyenites contg. solvstergites and some tinguaites; and basaltic rocks often rich in analcite (a), and including ankaramites (a) and doleritic basalts, while some flows contain large (5-6 cm.) phenocrysts of plagioclase (a). An ordanclite-like basanitoid basalt (a) occurs at Lodwar. Holocryst. rocks are found only in dikes or as rounded blocks; they include a herondrite-like essexite, and shonkinite rich in egirite and arfvedsonite (a). Chalcedony, calcite, analcite, stilbite, heulandite and mesolite are found in cavities. Eight complete analyses are given of the rocks marked (a). C. A. S.

Granite from Valle Staffora. (Pavese Apennines). Luigi Peretti. *Atti accad. sci. Torino, Classe sci. fis., mat. nat.* 68, 273-87 (1933).—Petrographic studies of the granite in the shales of the Pavese Apennines have been made. The important constituents are enumerated. The structure is typically intrusive. A. W. Contieri

Nephelite syenite from Solwezi, Northern Rhodesia. Frank D. Adams and F. Fitz Osborne. *Am. J. Sci.* 27, 135-45 (1934); cf. *C. A.* 27, 2115.—The mineralogical compn. of nephelite syenite from Solwezi, N. Rhodesia, is compared with its chem. compn. and calcd. norm, and its origin discussed. Alden H. Emery

Intrusive igneous rocks of the Muswellbrook-Singleton district. H. Savoy Sill. H. G. Ruggatt and H. F. Whitworth. *J. Proc. Roy. Soc. N. S. Wales* 66, 194-233 (1933).—The Savoy intrusion is partly of the simple sill type and partly phacoidal, and is of Tertiary age. Analyses of the constituent dolerite and syenite are given. B. C. A.

**Spillite and the average metabasalt.** H. W. Fairbairn. *Am. J. Sci.* 27, 92-7 (1934).—Spillite is transitional chemically to low-soda metabasalt and the conception of a special spilitic magma is not justified. Comparison of an av. of 135 metabasalt analyses with the av. of 198 analyses of basalt and 43 of plateau basalt shows that the alteration was accompanied by loss of total Fe, gain of Na<sub>2</sub>O and constancy of SiO<sub>2</sub>, MgO and CaO.

**Distribution of the diabase amphibolites in the diamond-bearing region of northern Minas Geraes.** Luciano Jacques de Moraes. *Ann. acad. brasil. sci.* 5, 235-6 (1933).

**The amphibolites of the diamond-bearing region of northern Minas Geraes.** Djalma Guimares. *Ann. acad. brasil. sci.* 5, 237-58 (1933).—Descriptions and chemical constitutions of these rocks are given. John M. Ladino

**Correlation studies of the central and south central Pennsylvania bentonite occurrences.** R. R. Rosenkrans. *Am. J. Sci.* 27, 113-34 (1934).—Chemically the Pa. bentonites resemble one another closely but are distinguished from the younger western material by consistently higher alkali metal content and preponderance of K<sub>2</sub>O over Na<sub>2</sub>O. The alkalis probably exist partly in undecomposed feldspars, partly in clay-like minerals and partly as adsorbed salts. The much lower SiO<sub>2</sub> content is due to age and stage of alteration. Leaching of SiO<sub>2</sub> from the original ash and passage into subjacent strata probably explains the cherty layer underlying bentonite.

**Soil processes in volcanic ash beds.** N. H. Taylor. *New Zealand J. Sci. Tech.* 14, 338-52 (1933); cf. C. A. 27, 2914.—Analyses are given of the secondary alumina minerals occurring throughout the ash beds of northern King country. The results show that kaolin minerals have been deposited in the rhyolitic beds, whereas Al-rich minerals, such as allophane and gibbsite, have formed in the andesitic beds. From observations of profiles it appears that the predominating soil-forming process is podsolization on the rhyolitic beds and laterization on the more basic ones.

**Chemical studies of the orbicular rock from Minedera-yama.** Yoshinori Kawano. *Proc. Imp. Acad. (Tokyo)* 9, 613-16 (1933).—The rock consists of balls of metamorphosed clay-slate in a granite matrix. Chem. analyses are given for the kernel of the balls and its component minerals biotite and oligoclase, the cordierite shell, the matrix and the country rocks. Calcns. from these indicate that the clay-slate furnished material for the component minerals of the balls, and the excess SiO<sub>2</sub> was absorbed by the granite matrix.

**Egriite-augite-bearing riebeckite quartz schist from Kamukotan and some other localities in Hokkaido, Japan.** Jun Suzuki. *Proc. Imp. Acad. (Tokyo)* 9, 617-20 (1933).—Chem. compn. and mode of occurrence indicate that these schists were derived from a highly siliceous sedimentary rock by contact action of ultra-basic magmas intruded in connection with regional metamorphism. The egriite-augite occurs in short prisms, with frequent zonal structure and undulatory extinction. The max. extinction angle is variable, 14° and 32° being observed in that from different localities. It is pleochroic in green and brown.

**Polyhedral concretions of dolomitic composition.** Fritz E. Klingner. *Centr. Mineral. Geol.* 1934A, 6-13; cf. Rodolico, C. A. 25, 5879.—The distorted shapes are ascribed to the action of pressure on the mineral, which was present as a colloidal gel, before crystn.

**Occurrence of indium in Japan.** Yoshio Imaizumi. *J. Chem. Soc. Japan* 54, 771-2 (1933); cf. C. A. 28, 5831.—Arc spectrum analysis shows In in Zn blends from various districts.

**Geochemistry of beryllium.** V. M. Goldschmidt and C. Peters. *Nachr. Ges. Wiss. Göttingen, Math.-physik. Klasse* 1932, 360-76.—Probably the quantities of Li and Be in accessible rocks are not less than the av. values for the whole earth. Spectrographic detns. show that Be is markedly concd. in granites and nephelitic syenites (av. 0.001, 0.01% BeO, resp.). Be was not found in olivine and olivine rocks, but is present in alkali feldspar, nephelite, pyroxene, amphibole and mica. The av. BeO content of rocks is detd. as 0.0005%, and the av. value for meteorites is about the same; hence the Be content is held to be about 0.0002% and in no case more than 0.0004%.

**Geochemistry of noble metals.** V. M. Goldschmidt and C. Peters. *Nachr. Ges. Wiss. Göttingen, Math.-physik. Klasse* 1932, 377-401.—The concn. of Os, Ir, Pt and Rh in rocks is too small to permit the use of a spectrographic method on the original material. The limits with an arc spectrum (admixt. with SiO<sub>2</sub> or Al<sub>2</sub>O<sub>3</sub>) are: Ag 0.0001; Au, Ru, Rh, Pd 0.001; Pt 0.005; Ir, Os 0.01%. A concn. method employing Pb was therefore used; 0.5 g. of original materials could then be employed, and the following quantities ( $\times 10^{-4}$  g.) could be detected: Ag < 0.1; Rh, Pd, Pt, Au 0.1; Ru 0.25; Os 2.5, Ir 0.5. Fe meteorites were examd.; all contained Pt metals and Au. Ni-rich Fe meteorites are frequently particularly rich in noble metals. Basaltic Fe, chromite, Mo and Sn minerals were examd. Pt metals and Au are: siderophile > chalcophile > lithophile; Ag is: chalcophile > siderophile. The distribution of noble metals in arsenides, antimonides and sulfides, and their occurrence in Co and Ni minerals contg. As and Sb, were studied.

**Oceanography and geochemistry.** V. I. Vernadskii. *Mineralog. petrog. Mitt.* 44, 168-92 (1933).—A lecture.

**Portuguese uranium-uranium minerals.** Charles Laperre. *Bull. soc. chim.* 53, 72-80 (1933).—The only U minerals found in Portugal are black mineral, a product of alteration of UO<sub>2</sub> and U<sub>3</sub>O<sub>8</sub> and always accompanied by phosphate, sulfide and sulfate, and the products of alteration of this mineral, autunite and torbernite. Analyses of 2 samples of black mineral from 15 m. and 2 from 95 m. depth are given. All except one of the latter have the normal Ra/U ratio,  $3.2 - 3.3 \times 10^{-7}$ . For the exception it is  $2.80 \times 10^{-7}$ , a fall in the value being characteristic of an altered mineral. There is no const. ratio between Pb and U. The alteration process is discussed and the view advanced that H<sub>2</sub>SO<sub>4</sub> formed by the oxidation of pyrite is an important factor.

**Five-fold check of uraninite age?** Alfred C. Lam. *Am. Mineral.* 19, 1-13 (1934).—Five major lines of attack in the detn. of the age of a disintegrating mineral are discussed: (1) detn. of U<sub>238</sub> content, (2) detn. of Th Pb (Th D + Pb<sup>206</sup>) content, (3) detn. of the change from U<sub>238</sub> to Act D (Pb<sup>206</sup>), (4) O method, (5) detn. of He content; minor methods are based on the proportion of isotopes of Pb and the sp. gr. Wilberforce uraninite is used as an example.

**Goldfield of the Eastern Alps** (Canaval, Imhof) 9. Detn. of sp. gr. of minerals by use of index liquids (Meen) 2. Optical properties of ideal soln. immersion liquids (Buerger) 2. Immersion liquids of intermediate refraction (Butler) 2. Tests and properties of oil and gas sands (Fancher, et al.) 22.

**Munk, Rudolf:** Deposit of Manganese Ore in Kišovec in Slovakia and Its Genesis. Prague: Prometheus. 78 pp.

**Ortiz Mena, Rafael:** Estudio de un mineral mixto de plomo y zinc. Mexico, D. F.: Imp. Universal. 30 pp.

## 9—METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, OSCAR K. HARDER AND RICHARD RIMBACH

Standards and specifications for metals and metal products. G. A. Wardlaw. Bureau of Standards, *Miscellaneous Pub.* No. 120, 1359 pp. (1933). E. J. C.

The flotative separation of a mixture of barite and dolomite—the differential flotation of earth alkali minerals. E. Ringe and E. Bierbrauer. *Berg- und Hüttenmannisches Jahrb.* 81, 139–46 (1933).—A new method was developed in which, by the action of  $\text{ZnSO}_4$ , dolomite in the flotation slime goes into the foam after addn. of  $\text{K}$  amylxanthate. The effects of grain size of barite, amt. of  $\text{ZnSO}_4$ , and of xanthate on the efficiency of the sepn. are studied; increasing the addns. of  $\text{ZnSO}_4$  improves the sepn.; increasing xanthate impairs it; the slime should be kept about neutral. The grain size of the barite should not be too fine as the sepn. is impaired by it. Six references. M. Hartenheim

The flotation of Alabama graphite ores. B. W. Gaudrud, G. D. Coc, C. S. Benefield and I. N. Skelton. *Bur. Mines, Rept. of Investigations* 3225, 20 pp. (1934).—The  $p_H$  value of the flotation pulps is the most important single factor affecting flotation results. Production of com.-grade concentrate is facilitated greatly by adding enough  $\text{H}_2\text{SO}_4$  to give  $p_H$  3.0–5.0. The unoxidized ores are naturally acid and give results much in line with the conditioned oxidized ores. Steam-distd. pine oil was one of the most satisfactory frothing and collecting reagents.  $\text{NaCN}$  depresses the pyrite, and in the unoxidized ores increases recovery and C content. Com.-grade concentrates with reasonably good recoveries were obtained by grinding the primary concentrates and retreating in a second stage flotation. Pneumatic and mech. agitation machines gave comparable results with neutral or alk. pulps; pneumatic machines failed to give a productive froth from an acid pulp. Alden H. Emery

A study of slime coatings in flotation. Guido R. M. del Giudice. *Am. Inst. Mining Met. Engrs. Tech. Pub.* No. 528, 15 pp. (1934).—Calcite slime coatings on galena are due to metathesis between anchored  $\text{Pb}$  ions on the galena and anchored carbonate ions on the calcite. This produces the almost insol.  $\text{PbCO}_3$  which acts as a cement between the galena surface and the slime particle. It is postulated that those reagents which inhibit calcite slime coatings on galena operate by reacting with the sulfide mineral surface, or with the calcite surface, or with both, to form thereon compds. which are less sol. than  $\text{PbCO}_3$ . Na silicate is an excellent reagent for inhibiting slime coatings on galena. It functions by forming relatively insol.  $\text{Pb}$  silicates on the galena surface. A. H. E.

Differential flotation of pyrite copper ores (Solo mine, Java). Gaichi Yamada and Shin-ichi Sato. *Suifokubunshi* 8, 307–23 (1933).—One ore contains Cu 5.89, Fe 20.19, Si 22.37, insol. 47.23% and the other Cu 2.21, Fe 16.93, Si 18.41, insol. 56.05%. The Cu occurs as chalcopyrite and a small amt. of chalcite and bornites. Flotation of finely ground ores (80–85% of the ore, through 200-mesh) gave good results; the recovery was 96–100% Cu and the compn. of the Cu concentrate was 28–30% Cu. The mineralogical compn. of the ore, details of the flotation methods, reagent used, etc., are described. Hideo Nishimura

Measurement of crushing resistance of minerals by the scleroscope. R. S. Dean, John Gross and C. E. Wood. *Progress Repts. Metallurgical Division. I. Mineral Physics Studies. Bur. Mines, Rept. of Investigations* 3223, 33–5 (1934).—Energy absorbed (difference between height of drop and rebound in a scleroscope) was directly proportional to the wt. of material crushed per unit of work. The effect of various variables on the results is described. Alden H. Emery

Progress in explosive shattering of minerals. John Gross. *Progress Repts. Metallurgical Division. I. Mineral Physics Studies. Bur. Mines, Rept. of Investigations* 3223, 19–32 (1934).—Increased pressures cause small increases in shattering. With increasing wt. of

charge, the shattering per g. of  $\text{H}_2\text{O}$  increases. Impact of particles against a solid barrier results in considerable shattering. Material from one explosion is nearly as susceptible to subsequent explosive shattering as the original. Less fines are made by explosive shattering than by ordinary crushing. There is a differential shattering with many ores which concentrates the values more than mech. crushing. A machine for explosion shattering is described. Alden H. Emery

Magnetic separation of minerals. R. S. Dean, V. H. Gottschalk and C. W. Davis. *Progress Repts. Metallurgical Division. I. Mineral Physics Studies. Bur. Mines, Rept. of Investigations* 3223, 3–13 (1934).—After magnetic properties are discussed in general, data are given on the d.-c. susceptibility and a.-c. activity before and after various kinds of heat treatment for many minerals. A separator is described briefly in which magnetized mineral particles on a tilted nonmagnetic belt pass over an a.-c. magnetic field. The slight repulsion of the particles having high coercive force overcomes the friction on the belt and the particles fall off. A. H. E.

A study of the homogeneity limits of wüstite ( $\text{FeO}$ ) by x-ray methods. Eric R. Jette and Frank Foote. *Trans. Am. Inst. Mining Met. Engrs.* 105, 276–89 (1933).—See C. A. 27, 2920. Alden H. Emery

The gold field of the Eastern Alps and its importance for the present. R. Canaval and Karl Imhof. *Berg- und Hüttenmannisches Jahrb.* 81, 146–56 (1933).—Brief historical data are given and the geological conditions discussed. The mineral contains about 8.35 g. Au and 69.3 g. Ag per ton, 3.2% As, 4.8% S and 0.4% Pb. M. H.

Effect of variations in coke ash on pig-iron analyses. H. W. Johnson. *Trans. Am. Inst. Mining Met. Engrs.* 105, 28–6 (1933).—As the amt. of coke ash varies, Si and S in the pig Fe tend to vary correspondingly. Max. blast-furnace efficiency is attained when variations are a min. Alden H. Emery

Metallurgical treatment of brass wastes containing iron. Werner Frölich. *Metallborse* 23, 1406–7 (1933).—Large particles of Fe mechanically attached to the brass turnings, filings, etc., can be sepd. by magnetic methods. Some Fe particles may become coated over with the brass and will not be removed by this means. This Fe and other residual, mechanically attached Fe can be sepd. by cautious melting and removal of the unmelted iron. Fe is especially harmful if it comes in contact with C or carbonaceous compds. to form Fe carbide. In the usual brass the Fe carbide is not decompd.; on casting it collects under the surface as hard inclusions. Control to prevent the C entrance in the metal bath during melting reduces the ill effect of the presence of Fe. Small addn. of Al may be made to destroy the formed Fe carbide. The Fe carbide can be destroyed and the chief part of the alloyed Fe removed by treatment with appropriate slags. An important constituent of the oxidizing slags is  $\text{CaSO}_4$ . Another slag used contains equal parts of sand and calcined soda as fluxing mixt. with about 20% Cu for forging scale for oxidation agent. Other slags are mentioned but they yield poisonous gases and are difficult to use. C. B. J.

Milling methods at the lead-zinc concentrator of the International Smelting Co., Tooele, Utah. W. J. McKenna. *Bur. Mines, Information Circ.* 6758, 13 pp. (1933).—About 1150 tons of  $\text{Pb}$ - $\text{Zn}$  ore is treated daily by flotation. A typical ore assays Pb 8.62, Cu 0.42, Zn 11.23, Fe 9.75%, Au 0.137 and Ag 7.10 oz. per ton. The Pb concentrate assays Pb 64.02, Cu 2.00, Zn 7.67, Fe 3.83, insol. 3.33%, Au 0.539 oz. and Ag 44.65 oz. and accounts for 93.62% of the Pb, 49.71% of the Au and 79.26% of the Ag. The Zn concentrate assays Pb 1.19, Cu 0.05, Zn 58.44, Fe 3.28, insol. 2.50%, Au 0.116 oz. and Ag 3.67 oz. and accounts for 85.44% of the Zn, 13.86% of the Au and 8.49% of the Ag. The Fe concentrate assays Pb 0.80, Cu 0.18, Zn 2.71, Fe 41.50, insol. 5.37%, Au 0.188 oz. and Ag 2.85 oz. and accounts for 67.00% of the

Fe, 21.64% of the Au and 6.31% of the Ag. The tailing assays Pb 0.41, Cu 0.05, Zn 0.44, Fe 3.98%, Au 0.037 oz. and Ag 0.76 oz. The flow sheet is described in detail. The consumption of flotation reagents in Feb. 1931 was soda ash 1.85, Na aerofloat 0.065, NaCN 0.217, ZnSO<sub>4</sub> 0.738, CuSO<sub>4</sub> 1.379, Aerofloat No. 15 0.100, K ethyl-xanthate 0.314 and K amylxanthate 0.115 lb. per ton of ore.

Heat transfer to the open-hearth bath. Wm. C. Buell, Jr. *Iron Steel Eng.* 11, 52-67 (1934).—A paper presenting a line of reasoning that if brought to a successful conclusion may be instrumental in establishing a more efficient process. Tables and curves and an extensive discussion are included. W. H. Roynton

Operation records of the blast furnaces Nos. 1 and 2 of the Magnitogorsk plant. C. Ilduim and V. Sorokin. *Steel* (U. S. S. R.) 1933, No. 3, 13-25.—Premature burning out of the lining of furnace No. 1 is attributed to the facts that: (1) the level of the charge varied from 0 to 7 m. from the top; (2) the charging bell was designed for fine rather than lumpy ores; (3) ore and coke were charged together. The furnace, of American design, produced 1100 tons pig iron daily contg. 4% Si with a ratio of coke to pig iron of 1.2. The top gases were at a temp. of 400-600° and contained 9% CO<sub>2</sub> by vol. The production of 1% Si pig iron is recommended to give normal life of lining.

H. W. Rathmann  
Remelting aluminum in a reverberatory furnace. E. T. Richards. *Chem.-Ztg.* 58, 135-6 (1934).—Reverberatory furnaces are best used for remelting large amts. of scrap. Al scrap is divided into 3 classes: (1) first quality (pure and purified scrap); (2) av. quality (both coarse and fine pieces); (3) poor quality (old, partly oxidized, thin chips). Classes 2 and 3 are best remelted in the reverberatory furnace. A deep hearth is essential. Basic fireclay contg. little free SiO<sub>2</sub> or bauxite is used for refractories. Furnace control is best with oil or producer gas as a fuel. The temp. should not exceed 750°, as oxidation of Al and absorption of N and hydrocarbons are rapid above this temp. Al oxide layer is not considered sufficient protection to the molten metal against oxidation and harmful gas absorption. Flux may act mechanically by the formation of a slag blanket or may have chem. purification action as well. ZnCl<sub>2</sub> and NH<sub>4</sub>Cl mixt. may be used for flux. NaCl-CaF<sub>2</sub> is also used. A mixt. made up of 10 parts calcined soda, 2 parts calcined CaCO<sub>3</sub>, 1 part borax and 2 parts cryolite has a low m. p. and forms a fluid slag. Oxidizing fluxes used directly before casting remove absorbed gases and purify the Al. Dichromates of Ca, Na and NH<sub>4</sub> nitrates, permanganates and chlorates are used. A final ZnCl<sub>2</sub> treatment is given to decrease the Al<sub>2</sub>O<sub>3</sub> content. C. B. Jenni

Cupola furnaces and casting. G. Itam. *Rev. sonderie moderne* 28, 1-5 (1934).—Previous results of studies of influence of size of tuyères on the melting process (see C. A. 28, 731<sup>a</sup>) are discussed; after more recent tests it has been confirmed that max. temps. can be obtained in a cupola furnace equipped with properly arranged small tuyères without having to resort to recuperating systems as before. Crystal structure and ferromagnetism of copper manganese-aluminum alloys. Otto Heusler. *Ann. Physik* 19, 155-201 (1934); cf. C. A. 27, 5638.—The compd. Cu<sub>2</sub>MnAl after prolonged heating at 110° has the ideal structure: cubic, O<sub>h</sub>, *a* = 5.935, *d* = 0.60, 4 formula units per cell; face-centered lattices begin in the points Cu = (1/4, 1/4, 1/4), Mn (000), Al (1/2, 1/2, 1/2), as shown by quant. blackening measurements of Debye photographs. The crystal lattice, elec. cond. and ferromagnetism of the β-phase of the system Cu-Mn-Al vary with compn. and heat treatment. In this phase the compd. Cu<sub>2</sub>MnAl has the max. cube edge, temp. coeff. of cond., intensity of magnetization and Curie point; it is thus responsible for the ferromagnetism of these alloys. C. D. West

Protection from corrosion of aluminum and its alloys. N. D. Pullen. *Metal Ind.* (London) 44, 133-6, 187-9 (1934).—A review. E. H.

Intercrystalline corrosion in rustless steels. Schalmeyer. *Oberflächentechnik* 10, 281-2 (1933).—Intercrystalline attack follows the grain boundaries and can be observed in Pb, Sn, Al, brass, mild steel and rustless steels, dezincing and season-cracking of brasses, lye-brittleness of mild steel and the intercrystalline disintegration of austenitic rustless steel are most frequently observed phenomena. The conditions under which these materials are attacked are studied. Grain boundary corrosion is an electrochem. process. Macrotensile stresses are proper (interior) stresses due to deformation, cooling, temperature differences, microtensile stresses cannot be experimentally demonstrated; they are in equilibrium (dislocation of the lattice). Greater irregular plastic deformation (tensile stress) favors corrosion. Austenitic steels can be improved by preventing segregation of carbide by addn. of Ti in the ratio of about 4:1; 0.14 C and 0.47 Ti gave very good results. Disintegration of grain boundaries can also be prevented or retarded by increasing Cr and

decreasing Ni, or addn. of Ti, Si, etc., which form mixed structures that are more difficultly attacked. M. H.

**A practical method of electrical protection for pipe lines against soil corrosion.** Starr Thayer. *Natural Gas* 14, No. 11, 6-12 (1933).—A line laid in 1927 protected with one coat of coal tar enamel was examined in 1932 and found to have corroded seriously. Methods and results are described of the elec. protection system that was then put into operation. Conclusions: A current of 0.6 volts is sufficient to give complete protection; it would not be economical to attempt the protection of a bare line by this method. Also in *Proc. Am. Petroleum Inst. 14th Ann. Meeting, Sect. IV*, 143 52 (1933).

**Jig for ore concentration.** Christopher Livingood. U. S. 1,946,219, Feb. 6. Mech. features.

**Metals from ores.** "Berzelius" Metallhütten-G. m. b. H. (Max G. Freise, inventor). Ger. 587,458, Nov. 3, 1933 (Cl. 40a. 11.40). Addn. to 585,628 (C. A. 28, 1321<sup>o</sup>). The method of 585,628 for obtaining readily reducible low-melting metals such as Sn, Pb, Bi, Sb or their alloys by reducing sulfidic ores or foundry products, is modified by charging the reducing furnace with the ores, etc., and Fe or oxygen compds. of alk. earth metals

or metals of the Fe group, so that the S is driven off or combined with the metals from a slag.

**Metals from bituminous ores.** Carl Goetz. Ger. 587,290, Nov. 1, 1933 (Cl. 1a. 36). Addn. to 551,024 (C. A. 26, 4787). In extg. metal from bituminous ores by heating in exclusion of air to drive off the bitumen by the method of 551,024, temps. of 900° 1000° are used. Cf. C. A. 27, 695.

**Apparatus for pretreating ores, crude cement, etc., with waste gases from rotating furnaces.** Arno Andreas. Ger. 589,715, Dec. 13, 1933 (Cl. 80c. 14.10).

**Treating ores.** Neunkircher Eisenwerk A.-G. vorm. Gebrüder Stumm. Ger. 589,737, Dec. 13, 1933 (Cl. 40a. 2.30). Fine ores are agglomerated or sintered by using smoke dust especially from locomotive fires, as fuel.

**Treating vanadium ores.** Charles Knight and Arden M. Wilson. U. S. 1,945,611, Feb. 6. The crushed and furnace ore is treated with an alk. soln. such as Na<sub>2</sub>CO<sub>3</sub>, and the alk. filtrate is removed, the residue is treated with an acid soln. such as HCl and the acid filtrate is removed. U is removed from the alk. filtrate (suitably by adding HCl and then NaOH) and Ra is removed from the acid filtrate (suitably by use of BaCl<sub>2</sub> and H<sub>2</sub>SO<sub>4</sub>) and the remaining alk. and acid filtrates are then mixed in the presence of iron and in such proportions as to give a neutral soln. to ppt. V. An arrangement of app. is described.

**Reducing iron ore.** Herman A. Brassert (to H. A. Brassert & Co.). U. S. 1,944,874, Jan. 30. In reducing Fe ore by finely divided C, the ore is preheated with waste heat derived from complete combustion of fuel such as oil, gas, coke or coal injected into the melting zone, reduced iron and gang are melted, and the molten metal is refined by an oxidizing flame in the same unit (of a described app.).

**Reducing iron ores.** Trent Process Corp. Ger. 591,485, Jan. 22, 1934 (Cl. 18a. 18.03). See Brit. 378,940 (C. A. 27, 2413).

**Apparatus for mixing iron ore with carbon.** Sandvikens Jernverks Aktiebolag. Ger. 589,927, Dec. 18, 1933 (Cl. 40a. 6.50).

**Smelting iron ores in a shaft furnace.** Herman A. Brassert (to H. A. Brassert & Co.). U. S. 1,945,341, Jan. 30. A metal low in C is produced from Fe ore in a shaft furnace by sepg. the ore into coarser and finer ore portions, charging small fuel mixed with the finer portion of the ore separately into the vertically extending portion of the furnace adjacent the walls, charging the coarser ore substantially free from fuel into the vertically extending central portion of the furnace and smelting the materials in a single furnace operation. App. is described.

**Working up copper and nickel ores.** Edgar Arthur Ashcroft. Ger. 585,697, Oct. 10, 1933 (Cl. 40a. 2.50). See Brit. 338,556 (C. A. 25, 2406).

**Manganese recovery from ores, etc.** Wilson Bradley (to Bradley-Fitch Co.). U. S. 1,947,457, Feb. 20. Material such as ore which has been subjected to partial reduction and contains MnO is treated with a soln. of an NH<sub>4</sub> salt such as (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> to form a sol. manganous salt and NH<sub>3</sub>, and a sufficiently low content of NH<sub>3</sub> is maintained in the digestion to permit the digestion to proceed; an O-contg. gas such as air is injected into the digestion liquid to aid in the removal of NH<sub>3</sub> and to oxidize ferrous impurities, and the resulting manganous salt soln. is recovered. Cf. C. A. 27, 486.

**Selenium recovery from copper sulfide ores.** Oliver C. Ralston and Leonard Klein (to United Verde Copper Co.). U. S. 1,945,074, Jan. 30. A Cu sulfide ore contg. Se is smelted to produce a mat, the mat is treated (as by blowing in a converter) to eliminate S, and the resulting product, in the form of a molten bath, is subjected to the action of a slag contg. one or more alkali metal compds. such as a slag formed from "irona" under reducing conditions, in order to form alkali metal selenide which can be leached out with water.

**Chlorinating materials containing tin.** Edgar A. Ashcroft. Ger. 585,769, Oct. 14, 1933 (Cl. 40a. 44.01). See Brit. 302,851 (C. A. 23, 4181).

- Ball mill suitable for treating gold and silver ores, etc.** Elmer L. Van Pelt (to American Ball-Mill Co.). U. S. 1,946,511, Feb. 13.
- Conveyor apparatus for sintering or roasting ores.** Metallgesellschaft A.-G. (Jakob Schwalb, inventor). Ger. 589,984, Dec. 22, 1933 (Cl. 40a. 3.60).
- Preparing hollow ingots such as those of ferrous metal for subsequent working.** Jacob C. Siegle (to Youngstown Sheet and Tube Co.). U. S. 1,945,087, Jan. 30. The ingot is heated to a working temp., and during the heating there is introduced into its interior a gaseous oxidizing fluid such as air or O which forms a scale, and the ingot is subsequently worked to remove the scale from the bore. App. is described.
- Siemens-Martin furnaces.** C. Ott & Co. G. m. b. H. Fr. 756,648, Dec. 13, 1933. Masonry construction.
- Tunnel furnace and method for carrying out the reduction of oxidic zinc ores containing volatilizable detrimental constituents.** e. g., Pb, Cd, Sb, As. Andrew Pearson. Brit. 401,588, Nov. 16, 1933.
- Metallurgical furnace with a hearth and a superposed shaft portion suitable for producing low carbon metal from ores and scrap.** Herman A. Brassert (to H. A. Brassert & Co.). U. S. 1,945,342, Jan. 30. Structural features.
- Metallurgical furnace operation.** Harry O. Breaker (to Industrial Furnace Corp.). U. S. 1,940,270, Feb. 6. In the operation of furnaces such as those used for heat-treating cast iron, interchange of furnace gases with the atm. is prevented by interposing a layer of Fe oxide of av. particle size, 40 mesh or smaller, between the gases and the atm. Various app. features are described.
- Means for gripping and transporting blast-furnace feed buckets.** Demag A.-G. Ger. 591,159, Jan. 17, 1934 (Cl. 18c. 6.05).
- Furnace suitable for heat-treating metal rods, tubes sheets, etc.** Isaac Harter (to Babcock & Wilcox Tube Co.). U. S. 1,946,971, Feb. 13.
- Furnace for annealing metal sheets.** Evelyn E. Griffiths. U. S. 1,944,975, Jan. 30. Structural, mech. and operative details.
- Furnace for annealing metal sheets by a continuous process.** Ernest Griffiths. U. S. 1,941,974, Jan. 30. Various structural, mech. and operative details are described.
- Furnace for annealing blanks.** Akt.-Ges. Brown, Boveri & Cie. Ger. 589,020, Dec. 12, 1933 (Cl. 18c. 8.80).
- Mold materials.** Société l'Avébec. Brit. 401,217, Nov. 9, 1933. A compn. for addn. to molding-sand is made by mixing coal dust with a dry, powd., combustible binder, e. g., sulfite lye, dextrin, farina, linseed.
- Centrifugal apparatus for separating metals of different fusion points.** Louis Renault. Fr. 756,933, Dec. 18, 1933.
- Separation of platinum from solution containing much inorganic salt.** The Minister of War (Tetsuzōrō Matō and Hyōi Watanabe, inventors). Japan. 100,088, March 13, 1933. The soln. is mixed with a glue soln. and reduced with Mg and an acid, by which Pt and other metals are pptd. Pt is sepd. from the ppt. by treating with HCl.
- Metal objects.** Vereinigte Glühlampen und Electricitäts A.-G. Ger. 589,928, Dec. 20, 1933 (Cl. 40d. 1.30). Objects with a large-crystal structure are made by heating to recryst. temp. pressed objects of high-melting metals such as W or Mo, or alloys of these, and substances forming large crystals with them. Thus, H<sub>2</sub>WO<sub>4</sub> hydrate is mixed to a paste with water. A soln. contg. BaCl<sub>2</sub> and NaF is added to the paste. The paste is dehydrated and reduced in a current of H<sub>2</sub>. The resulting metallic powder is then pressed into desired shape and heated to 1100° in a current of H<sub>2</sub>. Cf. C. A. 28, 1011.
- Refining metals.** Karl Schmidt G. m. b. H. (Roland Sterner-Rainer, inventor). Ger. 589,988, Dec. 19, 1933 (Cl. 40b. 1). Metals or alloys, especially Al and its alloys, are refined by fusing and treating with PCl<sub>5</sub>. Cf. C. A. 27, 4764.
- Metal working such as deoxidizing aluminum, etc.** John Schmeller, Sr. (to Schmeller Holding Co.). U. S. 1,947,114, Feb. 13. Various details of app. and operation are described, one feature of operation being the subjection of the molten metal to friction and impact to disrupt oxide coatings on particles of the metal for effecting deoxidation.
- Uniting metals.** Bert Louis Quarnstrom (to Bundy Tubing Co.). Brit. 401,676, Nov. 6, 1933. A strong union between ferrous and cupriferous metals is effected by bringing them into intimate contact and heating so that solid diffusion takes place, the temp. and time being so controlled that the amt. of Cu which diffuses into the ferrous metal does not exceed at any point the soly. of Cu in Fe at the point at which the  $\alpha$ - $\gamma$  transformation begins. The heating is preferably in a neutral or reducing atm., e. g., illuminating gas, H<sub>2</sub>, CO.
- Uniting by fusion.** Michael Zack. Brit. 401,487, Nov. 16, 1933. In elec. arc welding Al (alloys), arcs are struck between the work and at least 2 electrodes of nonmetallic material, e. g., C, the work being covered by a flux, suitably KF 30, cryolite 30 and hydrated Al silicate 40% Cf. C. A. 27, 1856.
- Lining metal articles with metals.** Frederick T. Bersey, Ernest A. Hardy, Sidney C. Newton and The Laystall Motor Engineering Works Ltd. Ger. 591,247, Jan. 18, 1934 (Cl. 49l. 12). See Brit. 372,401 (C. A. 27, 2927).
- Bearing bushings.** Robert D. Pike, Hugo J. Stevenson and Otto M. Eash (to Kalif Corp.). U. S. 1,945,291, Jan. 30. A layer of Cu-Pb bearing metal is cast-welded onto the inside of an iron or steel cylinder, the composite article thus formed is cooled and is rolled between rollers pressing against the exterior iron or steel face to relieve differential stresses. App. is described.
- Finishing ferrous sheet material.** Albert H. Shonkwiler and Donald M. Shanafelt. U. S. 1,946,766, Feb. 13. Material such as strip steel is first hot-rolled, then cold-rolled and then finished by etching the cold-rolled material by treatment with a soln. contg. the HNO<sub>3</sub> radical in active form, such as a soln. formed of H<sub>2</sub>SO<sub>4</sub> and NaNO<sub>2</sub>, and the etched material is annealed. An arrangement of app. is described.
- Case hardening.** Ewald Hanus. Ger. 589,917, Dec. 18, 1933 (Cl. 18c. 3.15). In case-hardening metals, the hardening material is given an addn. of a mixt. of fire-resisting metal filings, asbestos fiber and water glass, to prevent the hardening material from collapsing or falling, in the furnace.
- Nitriding tungsten.** Richard Walter. Ger. 589,906, Dec. 18, 1933 (Cl. 48d. 5). W is nitrided by treatment with substances yielding N, e. g., NH<sub>3</sub>, at high temps. in the presence of C or gases contg. C.
- Heat treatment of metals.** Nobuta Matsunawa, Husatoshi Nozawa and Masuhiro Suzuki. Japan. 100,008, March 9, 1933. As a heat-treating medium, a mixt. of water and mineral oil contg. 0.5-10% petroleum is used.
- Heat treatments such as in tempering steel rolls.** Edwin F. Northrup (to Ajax Electrothermic Co.). U. S. 1,946,876, Feb. 13. For controlling the heat gradient preparatory to tempering a steel roll or the like to give a max. hardness at a surface with max. strength in the adjoining supporting body structure, the surface is heated rapidly with respect to inward conduction of heat, and the charge is quenched when the heat generated at and near the surface has had time to travel by conduction to the desired extent. App. is described for heating by elec. induction.
- Heat-treating duralumin and similar alloys.** Leopold Pessel. U. S. 1,946,545, Feb. 13. For increasing the elongation and resistance against intergranular corrosion embrittlement, alloys of this type, during an aging period of not less than 9 hrs. are subjected to a static pressure which will not effect any essential change in shape but is at least 600 lb. per sq. in. and may be applied by a screw press.
- Annealing and pickling apparatus for metal bands**

Fried. Krupp Grusonwerk A.-G. Fr. 756,762, Dec. 15, 1933.

**Aluminum cooking vessels.** Harry V. Churchill (to Aluminum Co. of America). U. S. 1,946,149, Feb. 6. A coating resistant to long and repeated exposure to the action of corrosive foods such as salted hams comprises an adherent adsorptive oxide coating in which is adsorbed a substantial amt. of a corrosion-inhibiting sol. Na silicate having a ratio of  $\text{SiO}_2$  to  $\text{Na}_2\text{O}$  of at least about 3.25.

**Chromium.** I. G. Farbenind. A.-G. (Ernst Pokorny and Kurt Schneider, inventors). Ger. 589,987, Dec. 19, 1933 (Cl. 40a. 46.01). Powd. metallic Cr is obtained by treating  $\text{CrCl}_3$  with Mg, preferably in the presence of alkali chlorides. The process is carried out at temps. above the m. p. of the chlorides so that the Cr can be filtered from the fused  $\text{MgCl}_2$ . Cf. C. A. 28, 1008<sup>a</sup>.

**Copper.** Keynertstolins Gamla Industri Aktiebolag. Ger. 585,544, Oct. 11, 1933 (Cl. 40a. 13.50). See Brit. 260,294 (C. A. 21, 3428).

**Gold and silver metallurgy.** Baxeres de Alzugaray. Can. 338,900, Jan. 30, 1934. To assist the oxidation of Au and Ag in the extn. of the metals from their ores, salts and compds. of Co, Fe and V or mixts. thereof in an alk. earth and in an alkali cyanide soln. are used. The oxidation is rendered more energetic and is effected with a saving of a considerable amt. of cyanide solvent.

**Lead, antimony and bismuth.** "Berzelius" Metallhitten-G. m. b. H. Ger. 589,738, Dec. 13, 1933 (Cl. 40a. 18.01). Pb, Sb or Bi are smelted by heating their compds. contg. S and O in a furnace directly heated by combustion gas, e. g., in a rotating furnace, till a slag contg. a high percentage of metal and practically no S is obtained. The S-contg. constituent is present as a flotation concentrate. The slag is then reduced in a shaft furnace.

**Centrifuge for separating mercury and heavier metals from amalgamation sludges, etc.** Paul A. Neumann. Ger. 588,280, Jan. 17, 1934 (Cl. 1a. 8).

**Recovery of zinc from zinc dust.** Soc. anon. la nouvelle montagn. Belg. 398,234, Sept. 30, 1933. Excess  $\text{NH}_4\text{Cl}$  is added and the mixt. is heated to slightly above the m. p. of Zn, so that the droplets of Zn liberated from the  $\text{ZnO}$  gather together as liquid Zn.

**Cemented columbium carbide.** Floyd C. Kelley (to General Elec. Co.). U. S. 1,947,206, Feb. 13. A sintered compn. which is suitable for cutting hard rubber or "Mycalex" contains about 3-25% of a metallic binder such as a mixt. of Fe and Mo together with Cb carbide.

**Iron.** Bamaq-Meguín A.-G. (Wilhelm Bannenberg, inventor). Ger. 589,808, Dec. 14, 1933 (Cl. 18b. 20). An acid-resisting Fe alloy contg. at least 12% Si is produced by pouring molten steel into a container filled with Fe-Si.

**Iron.** Adolf Wirtz. Ger. 591,197, Jan. 17, 1934 (Cl. 18b. 1.03). See Fr. 721,975 (C. A. 26, 4025).

**Composition for refining molten metals such as iron and steel.** Alfred H. Davies. U. S. 1,945,260, Jan. 30. An alkali metal chlorate such as  $\text{KClO}_3$ , 3-5, a B compd. such as borax or  $\text{H}_2\text{PO}_4$ , 0.25-1.0,  $\text{Na}_2\text{CO}_3$  or  $\text{NaF}$  0.5-1.0, and  $\text{MnO}_2$  0.25-1.0 parts are used together.

**Hot-rolling steel strips from billets or the like.** Wilhelm Rohm. U. S. 1,946,240, Feb. 6. Various details of operation are described.

**Abrading hardened steel surfaces.** Robert C. Angell (to S. S. White Dental Mfg. Co.). U. S. 1,945,510, Feb. 6. Various details of app. and operation are described suitable for use of a jet of oil and abrasive in grinding articles such as dental burrs.

**Brake drums.** Raymond J. Norton (to Bendix Brake Co.). U. S. 1,946,103, Feb. 6. A brake drum formed of low-C steel has a welded frictional engaging surface of steel of about the same C content but of greater hardness. Cf. C. A. 27, 2927.

**Apparatus for effecting reactions such as steel production from ore dusts, etc.** Sydney T. Wiles (to Buffalo Elec. Furnace Corp.). U. S. 1,946,252, Feb. 6. Various details are described of an app. with an elongated hori-

zontal reaction tube which may be formed of carbonaceous material and is electrically heated.

**Hollow drill steels, etc.** Reginald A. Bedford. Brit. 401,381, Nov. 16, 1933. Hollow bars are made by providing a pre-formed hollow billet with a tubular lining of rustless or stainless steel or other metal or alloy as a close sliding fit in the bore of the billet, rolling, forging or otherwise reducing the compd. blank on a core of a ductile metal or alloy, e. g., Cu (alloy), with a coeff. of expansion higher than that of the blank and then removing the core, the lining remaining as a tight fit in but not welded, soldered or intimately alloyed to the hollow bar.

**Stainless steel.** Heinrich Neuhauss (to Ajax Metal Co.). U. S. 1,946,873, Feb. 13. A blast-furnace iron having a high Cr content is electromagnetically superheated and stirred in vertical planes rapidly, to produce a rapid change of metal at the surface of the bath, and preheated air is coincidentally applied to the surface of the bath while the treated surface is kept free from slag covering, this oxidizing C without excessive loss of Cr. App. is described.

**Manganese nickel steel.** Hurl II. Payne (to Stulz-Sickles Co.). U. S. 1,947,167, Feb. 13. A Mn Ni steel for parent metal in welding operations contains Fe together with C 0.60-0.85, Ni 2.5-3.5, Mn 11-13.5 and Si 0.60-0.95%.

**Steel alloy.** George Charlton (to Wilcox-Rich Corp.). U. S. 1,946,522, Feb. 13. An alloy which is suitable for internal-combustion engine exhaust valves, etc., contains Fe together with Cr about 20, Zr 2, C 1.25, Mn 0.8, Si 0.8%, and a "minimum" of P and S.

**Alloy.** Nippon Tokusyu Kinzoku Kôgyô K. K. (Takeo Kitazawa, inventor). Japan. 100,410, Apr. 4, 1933. An alloy contg. Cu 25-88, Fe 11-50, Cr 0.1-15 and Al 0.1-10% is magnetic, hard and resistant to friction, sea water, etc.

**Alloy.** Nippon Tokusyu Kinzoku Kôgyô K. K. (Takeo Kitazawa, inventor). Japan. 100,411, Apr. 4, 1933. An alloy of Cu 47-89.99, Fe 10-50 and B 0.01-3% is magnetic and resistant to friction, etc.

**Alloys.** Firma Jacob Neuraath. Austrian 135,895, Dec. 11, 1933 (Cl. 40b). Bearing alloys contain Pb 65-77, Sn 3-14, Sb 10-27 and As 0.7-2.5%. Specific alloys are described.

**Alloys.** Heraeus Vacuumschmelze A.-G. Fr. 757,133, Dec. 20, 1933. The hardness of Cr-Ni alloys at high working temps. (500-1200°) is increased by the addn. of alk. earth metals, e. g., Be 0.05-0.8, Mg 0.05-0.5, Ca 0.05-2, Ba 0.05-2 or Sr 0.05-2%, or more than one of these, the total not being above 2%.

**Alloys; annealing.** Henry W. Brownson and Imperial Chemical Industries Ltd. Brit. 401,313, Nov. 3, 1933. Articles the surfaces of which contain designs and (or) lettering, e. g., coins, medals, are stamped from a soft Cu-Ni-Al alloy contg. 0.5-5% Al and about 3-4 times as much Ni, the stamped article being hardened by heating to 300-600°. The initial alloy may be softened by heating to 800-900° and cooling rapidly. The alloy may contain to 37% Zn. In 401,314, Nov. 3, 1933, metal tubes are formed from such alloys.

**Light alloy.** The Head of the Kôkû Kenkyûzyo (Masa-haru Gotô and Shin Nitô, inventors). Japan. 100,469, Apr. 7, 1933. A Mg alloy contg. Cd 3-25, Zn 1-6 and Mn 0.1-2% is resistant to corrosion and has good mechanical properties.

**Hard alloys.** Fried. Krupp A.-G. (Karl Schröter and Hans Wolff, inventor). Ger. 589,597, Dec. 11, 1933 (Cl. 40b. 17). A sintered hard alloy for tools, etc., consists of equal parts of carbide of V and Cb and an addn. of a lower-m. metal, not exceeding 25%, such as Fe, Co or Ni. The Cb carbide may be partly or wholly replaced by Ta carbide.

**Hard alloys.** Compagnie Lorraine de charbons pour l'électricité. Fr. 756,523, Dec. 11, 1933. Alloys of which at least 80% is formed by one or more chem. compds. which are very hard in themselves and the rest by an alloy of 2 or more metals, practically free from metalloids,

are hardened by heating to a high temp. and heating again to a lower temp. Thus, an alloy contains WC 36, TiC 7 and a hardenable alloy (Fe-W, Co-W or Fe-Co-W) 57%.

**Hard alloys.** Gustav Boecker. Fr. 756,992, Dec. 18, 1933. Tools are made from alloys contg. Ti 40-80, Si 10-50 and Co up to 15%, or Ti 15-50, B 40-80 and Co up to 15%. Mg, Al, V or Be may be used up to 15%, and Fe 2% may be present. The starting materials are reduced to easily oxidized metal powders, finely ground and moistened, compressed to the desired shape and heated.

**A hard magnetic alloy.** Nippon Tokusyu Kinzoku Kōgyō K. K. (Takeo Kitazawa, inventor). Japan. 99,549, Feb. 16, 1933. The alloy contains Cu 40-85, Fe 1-50, Ni 0.1-35, Cr 0.1-5 and Al 0.1-7%.

**Magnetic alloys.** Telefonaktiebolaget L. M. Ericsson. Brit. 401,352, Nov. 13, 1933. An Fe-free alloy in powd. form is heat-treated and has substantially the same magnetic properties as powd. Fe used, *e. g.*, in cores for loading coils. For an example cf. Fr. 736,964 (C. A. 27, 1465).

**Magnetic alloys.** Westinghouse Electric and Manufacturing Co. Ger. 591,160, Jan. 17, 1934 (Cl. 18d. 2.10). See U. S. 1,845,493 (C. A. 26, 2164).

**Corrosion-resistant alloys suitable for springs.** Michael G. Corson (to Metal & Thermit Corp.). U. S. 1,945,679, Feb. 6, 1934. An alloy of Ni together with Fe 1-20, at least one metal of the Cr group such as Cr or Mo 10-20, Cu 5-12 and Be 0.5-1.5% is given a desired hardness and elasticity by heating for about 0.5 hr. above 900° but below the m. p. of the alloy, this being followed by quenching and age-hardening at 250-400°.

**Alloy resistant to acids, to alloys and to corrosion.** K. K. Kōbe Seikōzyō (Kōjirō Kochi, inventor). Japan. 100,399, Apr. 4, 1933. The alloy contains Cu 18-60, Ni 21.5-80.3, Cr 0.2-10, Al 0.3-2, Mn 0.5-2, Fe 0.5-2, Co 0.1-1 and Mo 0.1-1.5%.

**Alkaline earth metal alloys.** Calloy Ltd. Fr. 756,766, Dec. 15, 1933. Alloys of alk. earth metals with Pb or Cd or other metals which do not alloy easily with Al are made by reducing a compd. of an alk. earth metal (oxides or silicates) in molten Al and adding fused Pb, Cd, etc., to the Al alloy also molten. The alk. earth metal leaves the Al and alloys with the Pb or other metal.

**Aluminum alloys.** Roland Sterner-Rainer (to American Lurgi Corp.). U. S. 1,945,297, Jan. 30, 1934. Alloys substantially devoid of Cu contain Al together with Mg 0.8-6.0, Si 0.6-6.0% and from 0.2 to 5% of Mn, Ni, Co, Cr or Ti and are given improved strength and resistance to corrosion by heating to near the solidification point, quenching and aging at room temp. for several days.

**Aluminum alloys.** Durener Metallwerke A.-G. and Karl L. Meissner. Brit. 390,121, Mar. 30, 1933. Divided on 392,388 (C. A. 27, 5302). See Fr. 741,667 (C. A. 27, 2666).

**Aluminum alloys.** Karl Schmidt G. m. b. H. Brit. 401,246, Nov. 9, 1933. Alloys for pistons, bearings, cylinders, parts of briquetting presses, etc., consist of Al with Si 5-40 and P 0.001-0.1%, with or without minor addns. of Mg, Ni, Cr, Mn, Co or Cu. In making the alloys P may be added to Al-Si alloy as such or preferably as  $\text{PCl}_3$ , the liberated Cl having a refining effect.

**Aluminum alloys.** Hans Vogt. Ger. 589,857, Dec. 15, 1933 (Cl. 40b. 18). See Fr. 734,920 (C. A. 27, 945).

**Aluminum alloys.** Durener Metallwerke A.-G. Ger. 591,203, Jan. 18, 1934 (Cl. 48b. 9). A corrodible duralumin alloy is plated on one or both sides with another duralumin alloy which is as resistant to corrosion as Al but has better mech. properties.

**Aluminum alloy.** Furukawa Denki Kōgyō K. K. (Tutomu Shiomi and Kenji Ono, inventors). Japan. 99,302, Feb. 1, 1933. An Al alloy contg. Mg 0.3-6 and Cd 0.3-1.3% is strong and is resistant to sea water or acids.

**Aluminum alloy.** Mitsubishi Kōgyō K. K. (Seichi Tamura and Yūzō Mutō, inventors). Japan. 99,821, Feb. 28, 1933. An Al alloy contains Zn 4-15, Mg 1-6, Fe 0.2-2, and Co 0.1-1.5%.

**Hard aluminum alloy.** Kumakichi Koide, Zenzō Sirai, Kyōkichi Taguchi and Eiichi Satomi. Japan. 100,227, March 23, 1933. An Al alloy contg. Si 10-13, Mn 8-10, Sn 5-10 and Cr 2-3% is hard and non-corrosive.

**Aluminum-base alloys.** Walter Bonsack (to National Smelting Co.). U. S. 1,947,121, Feb. 13, 1934. Alloys which have a low thermal coeff. of expansion and good mech. and phys. properties contain Al together with Si 7-20, Mg 0.2-6.0 and Mn 0.1-5.0% (the alloy being comparatively free from other elements having a higher  $\sigma_f$  gr. than Al).

**Aluminum and magnesium alloys.** Georges Chaudron and Eugène Herzog. Fr. 756,714, Dec. 14, 1933. Alloy of high mech. properties and not affected by sea water are made by incorporating with Al, poor in Si and Ni, free from chlorides and dissolved or occluded gases, complex addns. of 2 metals chosen from the Mg family, *e. g.* Mo and Mn, Mo and Ti, or Mo and Ni, the addn. being of the order of 1%. One example contains Al 89.9, Mg 9.5, Mn 0.3, Mo 0.2 and Si 0.1%.

**Heat treatment of aluminum-magnesium alloys.** Edgar H. Dix, Jr. and Louis W. Kempf (to Aluminum Co. of America). U. S. 1,945,737, Feb. 6, 1934. Al alloys contg. Mg 5-20% are improved as to their strength and hardness by heating for about 5-20 hrs. at 250-450° and then cooling rapidly enough to preserve the benefits of the heating. Cf. C. A. 27, 5711.

**Cadmium-nickel alloys.** Carl E. Swartz and Albert J. Phillips. Brit. 401,229, Nov. 9, 1933. See U. S. 1,901,175 (C. A. 27, 3190).

**Alloys of metals such as chromium.** Heraeus-Vacuum-schmelze A.-G. and Wilhelm Rohn. Ger. 589,986, Dec. 20, 1933 (Cl. 40a. 46.01). Addn. to 575,048 (C. A. 27, 3439). The process of Ger. 575,048 is accelerated by adding a compd. of C to the com. II used as reducing agent. Alloys free from C are obtained, provided that the proportion of C compd. does not exceed a certain max., which varies according to the conditions. Addn. of up to 50 g. of  $\text{C}_2\text{H}_2$ ,  $\text{CH}_4$ , benzene or like hydrocarbon to 1 cm. of II is generally suitable. Cf. C. A. 28, 1012<sup>2</sup>.

**Copper alloys.** Siemens & Halske A.-G. (Karl Dorsch, inventor). Ger. 589,985, Dec. 19, 1933 (Cl. 40a. 14). Addn. to 578,675 (C. A. 28, 735<sup>2</sup>). A drum for carrying out the process of 578,675, whereby Cu alloys are stirred with acid solns. of  $\text{CuCl}_2$  or  $\text{CuCl}$ , is described.

**Copper-lead alloy.** Robert D. Pike (to The Kahl Corporation). Can. 339,080, Jan. 30, 1934. To oxidize contg. lead, heated above the m. p. of Cu, is added Cu in amt. equiv. to about 1.5 g. for each lb. of metal in the final product. The molten mass is covered with a protective flux of borax and siliceous earthy material. Cu pig and any previously made Cu-Pb scrap are added, the Cu and scrap melted, and the metal heated to 2100-2200° F. The flux is thickened with sand and most of it removed with a rod and the metal is poured from beneath the remaining thin layer of thickened flux. Cf. C. A. 27, 3906.

**Gold alloys.** Leopold Nowack (to Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler). U. S. 1,946,231, Feb. 6, 1934. Alloys which can be annealed or hardened by heat treatment contain Au 70-95, Pt 1-25 and Fe, Ni or Co 0.05-5.0%.

**Ferrous alloys.** Gregory J. Comstock (to Firth-Sterling Steel Co.). U. S. 1,946,130, Feb. 6, 1934. Carbides of metals such as W, Cr, Mo, V, Ti, Ta, Zr, Th, U or Cb are dissolved in a ferrous alloy bath maintained under substantially non-oxidizing conditions (the addn. being made shortly before teeming and without opportunity for thorough dissemination of the carbide, this producing areas locally enriched in carbide which act as nuclei for the reprecipitation of hard carbides on cooling) and the material is cast to reprecipitate a hard carbide. Metal products may be thus obtained which are suitable for cutting tools, dies, punches, etc.

**Ferro-titanium alloy.** George F. Comstock (to Titanium Alloy Mfg. Co.). U. S. 1,946,670, Feb. 13, 1934. Alloys which are suitable for treating gray cast iron contain Fe together with Ti 15-25, Si about 20 and C less than 1%.

**Iron alloy.** Sumitomo Shindō Kōkan K. K. (Muraji Kinukawa, inventor). Japan. 100,516, Apr. 11, 1933. An Fe alloy contg. C 1.7-4, Mo 6-30, Cr 2-8% is very hard and is used for mfg. tools.

**Iron-beryllium alloys.** Ernst Pokorny and Kurt Schneider (to I. G. Farbenind. A.-G.). U. S. 1,945,535, Feb. 6. An alloy of Fe which may contain about 10% Be is produced by causing a Be compd. such as Be oxide to react with an alloy of Mg with about 40-60% Ca in the presence of an Fe compd. such as  $Fe_2O_3$  which effects reduction of the Be and Fe compds. and alloying of the reduced metals.

**Alloys of iron with chromium, nickel and beryllium.** Georg Masing and Wilhelm Kroll (to Metal & Thermit Corp.). U. S. 1,945,653, Feb. 6. Alloys which can be easily rolled and which have good heat resistance contain Fe together with Cr up to 25, Ni 5-10 and Be 0.5-1.5%.

**Lead-tin-cadmium-zinc alloys.** Alvin P. Bixler (to Advance Engineering Corp.). U. S. 1,946,609, Feb. 13. Alloys for wiping joints, fusible plugs, etc., contain Pb 40-75, Sn 15-30, Cd 5-20 and Zn about 1-3%.

**Magnesium alloys.** Leo B. Grant and Otis E. Grant (to Dow Chemical Co.). U. S. 1,946,009, Feb. 6; Brit. 401,244, Nov. 9, 1933. Alloys suitable for die casting contain Mg together with Al 8-15, Mn 0.1-0.5 and Si 0.35-1.0%.

**Silicon alloys.** Soc. électro-métallurgique de Saint-Beron. Fr. 756,537, Dec. 11, 1933. In making Si alloys of low C content, the formation of SiC is prevented by adding Mn, preferably as ore, to the alloy.

**Silver alloy.** Tadashi Tanabe. Japan. 99,246, Jan. 30, 1933. An alloy contg. Cd 4-20, Sn 4-20 and Ag 60-92% is not discolored by air, sulfides, sea water, etc.

**Zinc alloys.** Pascal J. Morell (to American Brass Co.). U. S. 1,945,288, Jan. 30. Alloys which are suitable for die casting contain Zn together with Al 15-35 and Mg 0.01-0.2%. Cf. C. A. 28, 924.

**Zinc alloy.** Leland E. Wemple and Floyd A. Warren. Can. 339,127, Feb. 6, 1934. An alloy consists of Zn 100.0, Cu 0.1-2.25 and Sb 0.01-2.0 parts. Cf. C. A. 28, 1654<sup>2</sup>.

**Zinc-copper alloy.** Compagnie Royale Asturienne des Mines. Brit. 401,147, Nov. 9, 1933. An alloy of Zn 99.5 and Cu 0.5% is described for making ammunition cartridge cases.

**Armor plate.** Fried. Krupp A.-G. Brit. 401,364, Nov. 13, 1933. Armor plate hardened on one side is made from a steel alloy contg. approx. °C 0.2-0.45, Ni 0.5-3.5, Cr 2-4.5 and Mo 0.2-1.5, the Mo being (partly) replaceable by about 1.5-3 times as much W. The plates are toughened by hardening above the  $A_c1$  point and reheating to close below the  $A_c1$  point. They are then heated on 1 side to the hardening temp. and hardened on this side by quick cooling. Cf. C. A. 28, 1323<sup>3</sup>.

**Type metal.** Metallgesellschaft A.-G. (Kurt Paarmann and Ernst Koch, inventors). Ger. 589,679, Dec. 15, 1933 (Cl. 40b. 10). An alloy suitable for type metal contains Pb 50-70, Sb 20-30, Sn 5-12, Zn 0.5-3, Cu 0.5-2, Cd 0.5-3, As 0.1-0.5 and Al 0.01-0.2%. An addn. of 0.01-0.06% of Si may be given and the Cu may be partly replaced by Ni.

**Permanent magnet.** Wm. E. Ruder (to General Elec. Co.). U. S. 1,947,274, Feb. 13. Age-hardened magnets are formed of an alloy of Fe together with Al 6-15 and Ni about 20-30%.

**Bi-metallic thermostat.** Howard Scott (to Westinghouse Elec. & Mfg. Co.). U. S. 1,937,065, Feb. 13. The member of higher temp. coeff. of expansion is an alloy contg. Ni 20-40, Cu 60-25 and Zn 20-35% and the member of lower temp. coeff. of expansion is an Fe alloy contg. Ni 30-39% and Co 2-10% and also traces of Mn and C. Cf. C. A. 28, 1326<sup>4</sup>.

**Decorating metal articles.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler (Oskar Ehrhart, inventor). Ger. 590,893, Jan. 12, 1934 (Cl. 75c. 5.09). Addn. to 508,395 (C. A. 27, 2008). See Brit. 335,789 (C. A. 25, 1651).

**Galvanizing metal sheets.** Ralph O. Griffis (to American Rolling Mill Co.). U. S. 1,940,936, Feb. 13. While in a substantially continuous travel, sheets are coated with molten galvanizing metal, promptly cooled to about 50° and then roller-leveled.

**Coating metal sheets such as ferrous metals with other metals such as tin.** Willard O. Cook, Oscar O. Miller and Joshua C. Whetzel (to American Sheet and Tin Plate Co.). U. S. 1,945,884, Feb. 6. The coated sheets are discharged into the atm. with the coating metal on the sheets at such a temp. above the solidifying point of the coating metal that the sheets so produced will have no discoloring film visible to the naked eye in ordinary white light and the amount of invisible film is reduced to such a min. that the sheets may be given several 8-10 min. treatments in an oven at a temp. of about 5-40° below the m. p. of the coating metal without causing a growth of the film sufficient to be objectionable from the standpoint of appearance or soldering.

**Coating iron and steel.** Leo P. Curtin and Bernard L. Kline (to Curtin-Howe Corp.). Brit. 401,908, Nov. 23, 1933. See U. S. 1,895,568-9 (C. A. 27, 2418).

**Treatment of surface of iron or its alloys.** Kenzyu Shiota. Japan. 99,675, Feb. 21, 1933. A pasty mixt. of powd. alloy of Cr, Ni, Fe and Al,  $NH_4Cl$ ,  $CoCl_2$  and water is applied to Fe or its alloys. When dried the material is heated at 800-1000° in  $NH_3$  under pressure. The alloy penetrates into the iron and makes it resistant to heat, to acid and to abrasion.

**Metal plating.** Metalligator Berlin A.-G. (Robert Hopfelt, inventor). Ger. 589,535, Dec. 8, 1933 (Cl. 48b. 10). Coatings of atomized liquid metal or condensed vaporized metal such as Zn, on metals such as Fe, are consolidated by treatment with Hg or an amalgam.

**Lead-plating of metallic wires.** Kenjiro Muchida. Japan. 100,079, March 13, 1933. Diagrammatical.

**Tin-plating machine.** Eisenwerke A.-G. Rothau-Neudeck and Fritz Peter. Ger. 589,746, Dec. 13, 1933 (Cl. 48b. 2).

**Apparatus for tinning metal objects.** Josef Janko. Ger. 589,933, Dec. 18, 1933 (Cl. 48b. 8).

**Apparatus for zinc plating.** Saburo Sasaki. Japan. 99,702, Feb. 22, 1933. Diagrammatical.

**Coating aluminum.** Martin Tosterud (to Aluminum Co. of America). U. S. 1,946,148, Feb. 6. An adsorbent amorphous oxide coating is produced on the metal by anodic oxidation, substances such as coloring material are adsorbed on this coating and the permeability of the oxide coating is then reduced by treating in water at a temp. of 80-100°. U. S. 1,946,150 relates to producing white coatings on Al or its alloys by forming on the metal surface an adherent oxide coating and subjecting this coating to a nonelectrolytic treatment with a soln. of an acid such as  $HNO_3$ ,  $H_2SO_4$  or HF. Cf. C. A. 27, 4763; 28, 1328<sup>4</sup>.

**Coating aluminum and its alloys.** Helmer Bengtson (to Aluminum Colors, Inc.). U. S. 1,946,147, Feb. 6. A pervious and adsorbent oxide coating is formed on the surface, composed in substantial part of amorphous Al oxide, and the coated metal is treated in water at a temp. of 80-100° in order to convert the coating into impervious hard cryst. form. Cf. C. A. 28, 1014<sup>4</sup>.

**Producing colored coatings on aluminum (alloys).** Aluminum Colors, Inc. Brit. 401,270, Oct. 30, 1933. See Fr. 750,391 (C. A. 28, 730<sup>5</sup>).

**Protecting or decorating aluminum surfaces.** Émile Apart. Fr. 757,147, Dec. 20, 1933. A deposit is obtained on Al by solns. of halides of Zn and Sn acidulated with HF, the solns. being about 3° Baumé.

**Protecting aluminum from corrosion.** Junius D. Edwards (to Aluminum Co. of America). U. S. 1,946,151-2, Feb. 6. See Can. 335,209 (C. A. 27, 5303). U. S. 1,946,153 relates to a process in which an adsorbent oxide coating is treated with a silicate soln. such as a Na silicate.

**Prevention of corrosion of aluminum and its alloys.** The Minister of Navy (Masahiro Tazaki, inventor).

Japan. 100,100, March 14, 1933. Al or its alloys are made corrosion-proof by passing a. c. or d. c. into a fused alkali nitrate with the metal as the anode (if d. c. is used) or the two poles (if a. c. is used).

**Protecting iron against rust.** Chemieprodukte G. m. b. H. Ger. 591,281, Jan. 19, 1934 (Cl. 22g. 7.02). In the manuf. of rust-proofing compns. comprising subdivided Pb and a metal oxide suspended in an oil, an aq. sludge of PbO and a metallic reducing agent, e. g., Zn or Al, is first treated with a small amt. of an acid or a salt capable of converting the PbO and the reducing agent into sol. salts. Addn. of a little AcOH is suitable. An aq. paste of Pb and ZnO (or  $Al_2O_3$ ) is obtained, which may be kneaded with an oil to displace the water. Alternatively, the paste may be treated with powd. Al, whereby heat is evolved and the water is evapd. In either case, the product is finally worked up with a drying or nondrying oil.

**Welding electrodes.** Michael Zack. Brit. 401,186, Nov. 9, 1933. The metal core of an arc-welding electrode is provided with a helical winding of 1 or more wires of difficultly oxidizable metal or alloy, e. g., Ni, Ni-Mn, Ag, Cu, bronze, Cr-Ni, monel metal, which are sepd. by insulation, e. g., asbestos, from the core throughout or are bared at the inner end where they are connected to the core.

**Welding electrodes.** The Babcock & Wilcox Co. Fr. 756,460, Dec. 11, 1933. Metal electrodes are coated with a compn. which contains substances forming an acid slag (some of these substances liberating O at the temp. of welding and others being reducing agents) in amt. at least equal to the theoretical amt. necessary for combination with the O liberated by the other sub-

stances. An example contains flint 150,  $MnO_2$  75, asbestos 30, Fe-Mn 60 g. and  $Na_2SiO_3$  200 cc.

**Electrode for arc welding.** Loulis G. Anastasiadis (to Una Welding, Inc.). U. S. 1,946,958, Feb. 13. A bare rod consisting predominantly of Al is provided with a flux or coating the same as that of Can. 337,746 (C. A. 28, 1650<sup>1</sup>) except that no dichromate is used.

**Electric arc welding.** James T. Catlett (to General Elec. Co.). U. S. 1,946,305, Feb. 6. An app. is described adapted to produce a curtain of gas spaced from and surrounding portions of the electrodes extending from their holders. U. S. 1,946,306 also relates to a welding-torch construction.

**Soldering and brazing.** Ludwig Meurer. Brit. 401,441, Nov. 16, 1933. In effecting a heat-conductive joint between the tire and rim of a railway vehicle wheel the tire and rim are heated in a reducing atm. and a metal alloyable therewith, e. g., Cu, Ni or alloys thereof, introduced between the surfaces of contact while the reducing atm. is maintained. App. is described.

**Soldering aluminum and its alloys.** Carl Banschier. Fr. 757,200, Dec. 21, 1933. The metal is heated to the same temp. as the solder, the film of oxide which is formed being removed by brushing with the liquefied solder. The solder may contain Sn 160, Al 5 and Zn 35 g., or Zn 120, Sn 75, brass 4 and Pb 1 g., or Zn 192 and Al 8 g.

**Soldering alloys of copper, silicon and zinc.** Aichi Tokai Denki K. K. (Etsuji Takahashi and Akihisa Ida, inventors). Japan. 100,360, Apr. 1, 1933. Alloys of Cu, Si and Zn are soldered to each other or with other metals by using  $Zn(NH_4)_2Cl_2$  as a solvent instead of  $ZnCl_2$  and a solder contg. a few percent of Cu (e. g., a solder composed of 40% Sn, 60% Pb and 3% Cu).

## 10—ORGANIC CHEMISTRY

CHAS. A. ROULLIER AND CLARENCE J. WEST

**A new class of free radicals.** A. Schönberg. *Trans. Faraday Soc.* 30, 17 18(1934); cf. C. A. 28, 126<sup>1</sup>.

E. R. Rushton

**Decomposition of organic compounds into free radicals.** F. O. Rice. *Trans. Faraday Soc.* 30, 152 69(1934); cf. C. A. 27, 5713 14.—Org. compds., when heated in the range 700–1100°, decompose into free radicals which can be detected by the Paneth effect on metallic mirrors. The Me group is the chief product of such decompn.; 10–30% of some other fragments are formed which x-ray photographs indicate consist chiefly of the Et radical. Higher radicals probably decompose into unsatd. compds. and smaller free radicals. When the strength of bonds in org. mols. is known, a plausible mechanism can be worked out for a variety of org. decomps., by means of which the products can be predicted, both qualitatively and quantitatively.

E. R. Rushton

**Relation between chemical and physical theories of the source of the stability of the organic free radicals.** C. K. Ingold. *Trans. Faraday Soc.* 30, 52 60(1934); cf. C. A. 27, 5713.—The stability of radicals such as  $Ph_3C$  is due to a special form of wave-mechanic "degeneracy" and a corresponding loss of energy through resonance. This is considered the driving force of all tautomeric changes. Aryl groups permit conductance of electrons in both directions, which is necessary for the degeneracy of the neutral radical. Qual. predictions of the relative stabilizing effect of the different aryl groups in triarylmethyl hydrocarbon radicals were confirmed by the work of Gomberg and Schlenk. This chem. theory is closely related to the phys. theory of Huckel and Pauling, but it is not confined to the hydrocarbons; also, it brings out the relation between radicals and their ions; chiefly, however, it brings the phenomena of the stable free radicals into relationship with the general theory of org. chem. reactivity.

E. R. Rushton

**Free radicals in the thermal decomposition and combustion of hydrocarbons.** Wm. A. Bone. *Trans. Faraday Soc.* 30, 148 52(1934).—The presence of any

free radicals in hydrocarbon flames, as derived from spectroscopic evidence, is probably due to the thermal decompn. of oxygenated mols. such as alcs., aldehydes, etc., as the affinity of hydrocarbons for O is great, and no thermal decompn. is apt to precede oxidation. Spectroscopic evidence does not enable us to distinguish between the main course of events, including primary changes, and mere side reactions and secondary effects in flames. The primary decompn. of  $CH_4$  is probably  $CH_4 \rightarrow \cdot CH_3 + H_2$ .

E. R. Rushton

**Use of free methyl and ethyl in chemical synthesis** F. A. Paneth. *Trans. Faraday Soc.* 30, 179–81(1934).

The method of Paneth (C. A. 26, 1232 3) was used to cause free radicals to produce Me and Et compds. of As, Sb and Bi. Antimony cacodyl,  $[SbMe_2]_2$ , a red solid which m. 17.5° to give a light yellow liquid, and  $[SbEt_2]_2$  were among the compds. formed. The m. ps., vapor pressure and characteristic reactions of the compds. were detd.

E. R. Rushton

**Creation of free radicals in highly diluted gas reactions** Hanns v. Hartel. *Trans. Faraday Soc.* 30, 187 9(1934).

The vapor of an alkali metal in a highly dil. state brought into contact with an org. halogen compd., setting free the org. residue. The products of the reaction are frozen out with liquid air. A 90% yield of  $Ph_2$  can be obtained from  $PhCl$  and Na, and  $Bz_2$  is made from  $BzCl$ . Cyanogen radical is produced by treating  $(CN)_2$  or halogen cyanide with Na.

E. R. Rushton

**Chemistry of radicals with trivalent carbon.** Karl Ziegler. *Trans. Faraday Soc.* 30, 10–17(1934).—A discussion of the stability of hexaphenylethane and analogous substances. The tendency to disoc. depends not only on the unsatd. character of the ethane substituents, but also on their vols. An exact kinetic study of the reaction between radicals and O shows that peroxides of the type R.O.O.R are secondary products. There are primary peroxides of the formula  $R O O \rightarrow$  which are strongly reactive but short-lived. Under suitable conditions

they can give off their O to acceptors and again form radicals, causing reactions.

**Thermal catalytic decomposition of methane.** Leonard Belchetz. *Trans. Faraday Soc.* 30, 170-9(1934).—The method of Paneth (*C. A.* 26, 1232-3) for the detection of Me radicals was used.  $\text{CH}_4$  and not Me proved to be the primary product of the decompn. on Pt.  $\text{CH}_4$  radicals produced compds. with I and Te, and, on a cooled glass surface, 2  $\text{CH}_4$  radicals react to form  $\text{C}_2\text{H}_6$ . At about 1700°,  $\text{CH}_4$  begins to decomp. to form H.

**Synthesis of hexane from propyl bromide by Würtz' method.** E. Erdheim. *Koczniki Chem.* 12, 631-4(1932).—Hexane is obtained in 47.6% yield by the action of Na on PrBr in the presence of MeCN. 2,3-Dimethylbutane cannot be prepd. analogously from iso-PrBr.

**The characterization of double bonds by antimony trichloride.** R. Delaby, S. Sabetay and M. Janot. *Compt. rend.* 198, 276-8(1934).  $\text{SbCl}_3$  (21-22 g.) in  $\text{CHCl}_3$  (100 g.) is a sensitive reagent for the detection of double bonds in unsatd. compds. The sensitivity increases with the no. of double bonds. The reaction is neg. with  $\text{C}_2\text{H}_4$ ,  $\text{C}_2\text{H}_2$ , and coumarin; pos. with phloroglucinol and phenanthrenequinone. A table of colors typical of a no. of unsatd. compds. is included.

**Interesting by-products in large-scale synthesis of aliphatic compounds from acetylene.** G. Benson and A. F. G. Cadenhead. *J. Soc. Chem. Ind.* 53, 40-31(1934).—In the synthesis of AcOH from  $\text{C}_2\text{H}_2$  through AcH, the following by-products heretofore not described have been identified:  $\text{AcCH(OH)Me}$ ,  $\text{Ac}_2\text{CHCH(OH)Me}$ ,  $\text{AcCH(OH)CH}_2\text{CO}_2\text{Et}$ , 4,2,3- and 5,2,3-

$\text{Me(HO)}_2\text{C}_6\text{H}_5\text{CHO}$ .

**The preparation of butene by the method of Lebeau and Picon.** Tschao Yin Lai. *Bull. soc. chim.* 53, 687-92(1933).— $\text{EtI}$  and  $\text{NaC}\equiv\text{CH}$  in liquid  $\text{NH}_3$  at -45° give 78% of 1-butene.

**Oxidation of iodoform solutions.** René Dubrisay and Guy Emschwiller. *Compt. rend.* 198, 263-5(1931); cf. *C. A.* 27, 700. Oxidation of  $\text{CHI}_3$  in specially purified  $\text{C}_6\text{H}_6$  takes place readily without addn. of  $\text{I}_2$  or acid. The rate of decompn. is independent of the  $\text{CHI}_3$  concn. At 10° and a  $\text{CHI}_3$  concn. of 1% the oxidation is retarded by the addn. of 1:1,000,000 parts of the following: phenol, hydroquinone, aniline and pyrrole.  $\text{H}_2\text{O}$  exercises a light retarding action.

**The question of ethyl alcohol production by hydration of ethylene.** N. I. Burda. *Coke and Chem.* (U. S. S. R.) 1932, No. 12, 50-3.—A report on the lab. research work on the hydration of  $\text{C}_2\text{H}_4$  according to the equation:

Eight catalysts were prepd. and tested by their ability to promote the decompn. of EtOH as indicated by the reverse of the above equation, if it is assumed that the catalytic action of any catalyst in the reaction proceeding in the direction *b* to be proportional to the catalytic action in the direction *a*. A catalyst prepd. from  $\text{Al}_2(\text{SO}_4)_3$  ( $\text{NH}_4$ )<sub>2</sub> $\text{SO}_4$  soln. gave the best results. Decompn. of 99.5% EtOH was obtained with this catalyst. The  $\text{Al}_2\text{O}_3$  was pptd. from alum soln. by  $\text{NH}_3$  and the ppt. washed twice in hot  $\text{H}_2\text{O}$  and dissolved in an alkali; the soln. was filtered and  $\text{Al}_2\text{O}_3$  pptd. by addn. of weak  $\text{H}_2\text{SO}_4$  until neutral; the ppt. was filtered, washed in hot  $\text{H}_2\text{O}$ , and dried for 11 hrs. in an oven at 110°. Some EtOH was obtained by hydration when  $\text{C}_2\text{H}_4$  was pumped into a bomb contg. this catalyst under a pressure of 40 atms. and the temp. was raised to 300°, increasing the pressure to 140 atms.

**Preparation of unsymmetric  $\gamma$ -glycols of the acetylene series.** I. Yu. S. Zalkind and V. K. Teterin. *J. Gen. Chem.* (U. S. S. R.) 3, 369-72(1933).—See *C. A.* 27, 2679.

**Addition of hydrogen to acetylene derivatives. XIX.**

Yu. S. Zalkind, V. K. Teterin and A. Ivanova. *J. Gen. Chem.* (U. S. S. R.) 3, 373-9(1933); cf. *C. A.* 27, 2679; 28, 1669<sup>1</sup>.

**Selecting a catalyst for the production of butanol from ethanol.** B. N. Dolgov and Yu. N. Volnov. *J. Gen. Chem.* (U. S. S. R.) 3, 313-18(1933).—Lab. expts. were undertaken for the production of BuOH by thermal decompn. of EtOH in the presence of the catalyst  $\text{Fe}_2\text{O}_3$ .  $\text{Al}_2\text{O}_3$  pptd. on powd. animal C. The results indicate the possibility of the process. The condensation to BuOH is accelerated with an increase in the temp. of the reaction. The excessive formation of gaseous by-products can be checked by activating the catalyst with the addn. of La.

**A convenient method of preparing  $\alpha$ -acetylenic primary alcohols.** Tschao Yin Lai. *Bull. soc. chim.* 53, 682-7(1933).—The following substituted propargyl alcs. were prepd. in 70-95% yield by passing the theoretical amt. of  $\text{CH}_2\text{O}$  gas into a 30% soln. of the proper acetylenic  $\text{RMgX}$  compd. in 20-30 min.: *Et*  $b_{16}$  81 2°,  $d_4^{20}$  0.91,  $n_D^{20}$  1.4535; *nonyl* m. 29.5-30.0°; *decyl* m. 34.5°; *amyl*  $b_{16}$  98 9°,  $n_D^{20}$  1.4585,  $d_4^{20}$  0.884; *hexyl*  $b_{16}$  118 20°,  $n_D^{20}$  1.4558,  $d_4^{20}$  0.875; *Ph*  $b_{16}$  137 8°,  $n_D^{20}$  1.5873,  $d_4^{20}$  1.07.

**Contact isomerization of linalol.** Yasuji Fujita. *J. Chem. Soc. Japan* 55, 6-10(1934).—Linalol (I) and water vapor are passed through a Cu tube contg. active C and heated at 320-40°. A terpene,  $\text{C}_{10}\text{H}_{16}$  (II), is obtained from the dehydration of I during this process. II has 2 double bonds,  $b_{170}$  170°,  $d_4^{20}$  0.7973,  $n_D^{20}$  1.4602,  $[\alpha]_D^{20}$  -1.52°, gives no cryst. tetrahydrate or nitrosate, is not reduced by EtOH and Na, does not condense on heating or with maleic anhydride but it is entirely different from myrcene. The other dehydration product of I is a terpene (III),  $b_{160}$  160°,  $d_4^{20}$  0.7832,  $n_D^{20}$  1.4448,  $[\alpha]_D^{20}$  -5.80°, and a small amt. of a sesquiterpene  $\text{C}_{15}\text{H}_{24}$ ,  $b_{200}$  200°,  $d_4^{20}$  0.9269,  $n_D^{20}$  1.5094,  $[\alpha]_D^{20}$   $\approx$  0.0°. The structures of II and III are unknown, but, since they showed the same optical property as I, there must have been no change in the asym. C in I and since in the dehydration there is no formation of a double bond, there must have been a formation of a ring by the removal of the tertiary OH group thus:

**Decomposition of aliphatic ethers through heterogeneous catalysis.** W. Marx. *Z. physik. Chem.* B23, 33-57(1933).—The kinetics of the decompn. of di-Et, di-Pr and di(iso-Pr) ether vapor on bauxite into olefin and  $\text{H}_2\text{O}$  were studied for different surface concns. At higher concns., the resulting  $\text{H}_2\text{O}$  inhibited the progress of the reaction. This effect could be reduced by passing the gases over BaO. The reaction took place in 3 stages:

(1) short adsorption period; (2) renewal of used ether on the catalyst from the vapor phase (reaction order: 0.35); (3) removal of remaining adsorbed ether (reaction order: 3). At lower surface concns. the entire ether supply was adsorbed at the start, the resulting  $\text{H}_2\text{O}$  remained on the catalyst and the olefin was desorbed. Here, the reaction took place in 4 stages: (1) adsorption period; (2) renewal from gas phase (reaction order: 0); (3) renewal from inactive surface (reaction order: 1 to 2); (4) removal of remaining adsorbed ether (reaction order: 3). The kinetic equations for the various stages were given. The no. of active spots were calcd. to be between  $2 \times 10^{10}$  and  $1 \times 10^{20}$  for 1 g. of catalyst (7-144-289°). The heat of activation was calcd. for Et<sub>2</sub>O 31 kg. cal. per mol., for Pr<sub>2</sub>O 26 kg. cal. per mol. (iso-Pr)<sub>2</sub>O decomposes in 2 steps: (1) C<sub>2</sub>

$C_2H_4$ , heat of activation: 13 kg. cal. per mol.; (2)  $C_2H_5OH \rightarrow C_2H_4 + H_2O$ , heat of activation: 26 kg.-cal. per mol. Inhibited and uninhibited reactions for all 3 ethers gave the same heat of activation. H. H. Rowley

**Hydrolysis of ethyl ether.** A. Vansheldt and M. Lozovakil. *J. Gen. Chem.* (U. S. S. R.) 3, 329-36(1933); cf. Balandin, *et al.*, *C. A.* 27, 223; Ipat'ev, *Ber.* 1904, 2994; Pease and Jung, *C. A.* 18, 1978; 19, 432.—The hydrolysis of c. p.  $Et_2O$  was carried on at atm. pressure in the presence of solid catalysts and by passing  $H_2O$ -moistened  $Et_2O$  vapors over  $H_2SO_4$ , and at high pressure in a rocking autoclave in the presence of dil.  $H_2SO_4$ . The hydrolysis of  $Et_2O$  took place in all 3 cases, the best yield of  $EtOH$  being produced with dil.  $H_2SO_4$  under pressure. Silica gel and  $ThO_2$  showed poor catalytic action, while  $Al_2O_3$ , prep'd. by the method of Willstätter (*C. A.* 17, 3513), gave a good yield of  $EtOH$ , which is ascribed to a high degree of catalytic decompn. of  $Et_2O$  into  $EtOH$  and  $C_2H_4$ . By passing  $Et_2O$  moistened with  $H_2O$  into dil.  $H_2SO_4$  (70% and over) heated to 160° and higher, 5-10%  $Et_2O$  was hydrolyzed with resinification.  $H_2PO_4$  under these conditions failed to hydrolyze  $Et_2O$ . By heating  $Et_2O$  with 5-25%  $H_2SO_4$  at 200° in an autoclave 36%  $Et_2O$  was hydrolyzed without resinification or excessive gas formation. With 1%  $H_2SO_4$  the yield of  $EtOH$  was sharply reduced, while the use of 50%  $H_2SO_4$  and a temp. of 230° and higher caused dark discoloration of the product and excessive formation of gases and oily products. Chas. Blanc

**Successive reactions on the surface of a single catalyst.** II. Hydration of ethyl ether with the subsequent conversion to acetone. M. Yu. Kagan, I. M. Rossinskaya and S. M. Chernizov. *J. Gen. Chem.* (U. S. S. R.) 3, 337-44(1933); cf. K. and Klimenko, *C. A.* 27, 223. —The  $Al_2O_3$  catalyst obtained by pptg.  $Al(OH)_3$  from  $Al_2(SO_4)_3$  with  $NH_3$  (Willstätter, *C. A.* 17, 3513) and from  $Al(ONa)_3$  with  $HNO_3$  proved to be poorly active in hydrolyzing  $Et_2O$ . The  $Al_2O_3$  catalyst was prep'd. by dissolving 100 g. of metallic Al in aq. NaOH, the soln., dild. to 2 l., was filtered and carefully neutralized with dil.  $HNO_3$ , the  $Al(OH)_3$  was washed free from NaOH, by decanting with some addn. of a little weak  $NH_3$  and dissolved in 5%  $HNO_3$  by heating, then it was neutralized with weak  $NH_3$ , washed free from  $NO_3$  ions, filtered and dried at 110°; the  $Al_2O_3$  was activated by passing  $EtOH$  at 325° for 12-48 hrs. until the resulting condensate was colorless. The catalyst produced 22.5%  $EtOH$ , 6%  $C_2H_4$  and unchanged  $Et_2O$  by passing a mixt. of  $Et_2O$  and 2.5 parts of  $H_2O$  at a speed of 16 g.  $Et_2O$  per hr. At the temp. of the formation of  $Me_2CO$  (450-500°) all prepn. of  $Al_2O_3$  led to dehydration of  $Et_2O$  with the formation of  $C_2H_4$ . By addn. of 100 g. of finely powd.  $Fe_2O_3$  and 12 g.  $MgO$  to the above catalyst in the process of prep'n. was obtained a contact mass capable of catalyzing the hydrolysis of  $Et_2O$  with 3 parts of  $H_2O$  to  $EtOH$  at 400-500° and its direct conversion to  $Me_2CO$ . At a speed of 20 cc.  $Et_2O$  per hr. and 495° the reaction mixt. contained 40%  $Me_2CO$ , 7.4%  $EtOH$  and the gases 9%  $C_2H_4$  and 18%  $CO_2$ . The variations in the method of prep'n. of the catalyst or in the proportions of its constituents produced inferior results. Chas. Blanc

**Polymerization of unsaturated mercaptans.** Julius v. Braun and Theodor Plate. *Ber.* 67B, 281 5(1934).—Allyl mercaptan cannot be obtained in pure form from the iodide and KSH because of the ease with which it polymerizes (*C. A.* 20, 2991), and cinnamyl and furfuryl mercaptans behave in the same way.  $MeCH:CH:CH_2SH$  (I),  $Me_2C:CHCH_2SH$  (II),  $CH_2:CHCH_2CH_2SH$  (III),  $CH_2:CHCH_2CH_2CH_2SH$  (IV) and 1-cyclopentenyl mercaptan (V) have been prep'd. to det., if possible, what constitutional factors in an unsat'd. mercaptan condition its tendency to polymerize. Only I and III proved to be similar to the allyl comp'd. in this respect; II, IV and V are much more stable. The mercaptans were prep'd. from the corresponding chloride and bromide and  $H_2NCS_2NH_4$ . Crotyl mercaptan (I), obtained in 37% yield, b. 99-101°,  $d_4^{25}$  0.8830 immediately after distn., increasing

to 0.9285 in 2.5 days at room temp.; if it is now distd., about 80% does not distil over below 101° and there is obtained a fraction b. 101-80° with d. 0.9483.  $\gamma,\gamma$ -Dimethylallyl mercaptan (II), b. 125-7° (*Bs deriv.*, b. 122°),  $d_{15}$  0.8953 immediately after distn., changing to 0.8987 after 3.5 hrs. at 100° and 0.9012 after 45 hrs.; most of it now still b. 125-7°, only about 20% passing over at 127-50°. 1-Butene-4-thiol (III), b. 98-103° (only about 1/3 of the crude product boils at this temp.),  $d_{15}$  0.9087, increasing in 12 hrs. at room temp. to 0.9198, when none of it boils below 104°, about 10% boils up to 115° and most of it up to 250°, leaving a considerable dark viscous residue. 1-Pentene-5-thiol (IV), b. 135-7°,  $d_{15}$  1.0748, changing but slightly at room temp. and only to 1.0812 in 3.5 hrs. at 100° and to 1.0830 in 48 hrs.; on distn., about 80% still b. around 135° and hardly any residue is left at 145°. V, b. 116°,  $d_{15}$  0.8947, increasing to 0.9008 in 3.5 hrs. at 100° and 0.9108 in 48 hrs.; not quite 80% now b. up to 116° and almost all the rest below 130°; the corresponding sulfide, from the chloride in PhMe with  $Na_2S$  in alc., b. 112°, sulfonium iodide, obtained with  $MeI$ , yellow ppt., decomp. 204°. C. A. R

**The mobilities of organic radicals in their promosulfites.** P. Carré. *Compt. rend.* 198, 181 2(1931), cf. *C. A.* 26, 4301; 28, 1658\*. —The decompn. temps. of a no. of bromosulfites,  $ROSOBr$ , in the presence of pyridine, into  $SO_2$  and  $RBr$  (with the alkyl bromosulfites) were det'd. As with the chlorosulfites, the order of decreasing mobility of the radicals, R (or increasing decompn. temp. of  $ROSOBr$ ), is: Et and iso-Pr,  $Pr$ ,  $C_6H_{11}$ , Bu and  $CH_2ClCH_2$ ,  $C_7H_{15}$  and Ph. R. Roseman

**$\beta$ -Chloroethyl esters of sulfurous acid.** Ya. R. Komissarov. *J. Gen. Chem.* (U. S. S. R.) 3, 309-12(1933). —By the interaction of  $SOCl_2$  and an excess of  $HOCH_2CH_2Cl$  (I) at an elevated temp. is formed only  $OS(OCH_2CH_2Cl)_2$  (II) (Levillant, *C. A.* 24, 824). By working in the cold with a small excess of  $SOCl_2$  was obtained  $OS(Cl)OCH_2CH_2Cl$  (III). III, treated with an excess of I, gave II, which, with an excess of  $SOCl_2$ , was reconverted into III. III was also obtained from II with  $PCl_5$ :  $II + PCl_5 = (CH_2Cl)_2 + POCl_3 + III$ .  $O:NOCH_2CH_2Cl$  (IV), treated with  $SOCl_2$  split off 1 or 2 mols. of  $NOCl$ , giving II or III, depending on the conditions of the reaction. One mol. (80.5 g.) I was dropped into 125 g. (5% excess over 1 mol.) of  $SOCl_2$  in the cold, and the product was then refluxed at 50-60° and 100 mm. pressure until  $HCl$  and  $SOCl_2$  were expelled, and then fractionated *in vacuo*, giving 136 g. (83% yield) of III,  $b_{10}$  93-5°,  $b_{20}$  84-5°,  $d_4^{25}$  1.5010. A mixt. of 70 g. III and 60 g. I was refluxed 3 hrs. at 50-60° until the evolution of  $HCl$  had ceased; the product was washed with  $H_2O$ , dried with anhyd.  $Na_2SO_4$  and vacuum-distd., giving 73% (65 g.) II,  $b_{10}$  147-50°,  $b_4$  117.5 18°,  $d_4$  1.4255, mol. refr. 41.25 (found), 41.50 (calcd.). A mixt. of 60 g.  $SOCl_2$  and 50 g. IV was refluxed 1 hr. at 40-50°, and then vacuum-fractionated, giving 54 g. (74%) III and 14 g. II mixed with some III. A mixt. of 60 g.  $SOCl_2$  and 125 g. IV, refluxed 2 hrs. at 70° and treated as above, produced 65 g. of pure II. A mixt. of 30 g. II and 20 g.  $SOCl_2$  was allowed to stand overnight at room temp., the excess of  $SOCl_2$  was expelled, and the product vacuum-distd., giving 65% III and 11 g. of unreacted II. II (30 g.) in 100 cc.  $CCl_4$  mixed with 35 g.  $PCl_5$  was refluxed 1 hr., the  $CCl_4$  was expelled first in the water bath and then *in vacuo* at 50°, and the residue fractionated *in vacuo*, producing 21 g. (90%) III. Chas. Blanc

**The catalytic preparation of nitriles from esters in the presence of Japanese acid clay.** Jiro Abe. *Bull. Waseda Applied Chem. Soc.* 21, 27-31(1933) (English abstract 5A); cf. *C. A.* 27, 3193. —Japanese acid clay is an effective catalytic dehydrating agent for the prep'n. of  $MeCN$  and  $PhCN$  from the corresponding Et ester and  $NH_3$ ; it keeps its activity for several operations at the optimum temp., 350-400°. Yield is 85%. K. K.

**Dynamics and mechanism of aliphatic substitutions.** E. D. Hughes and C. K. Ingold. *Nature* 132, 933-4

(1933).—The authors cite exptl. evidence in support of their views (cf. *C. A.* 27, 3455) regarding the mechanism assumed by them for reactions of certain types, e. g., the hydrolysis of  $\text{NH}_4$  cations. Louise Kelley

**The isolation of chlorodiborane; some additions to the high-vacuum technic of chemical work with volatile substances.** Anton B. Burg. *J. Am. Chem. Soc.* 56, 199 501 (1934).— $\text{B}_2\text{H}_4\text{Cl}$ , m.  $-142^\circ$ ,  $b_{18} -78.6^\circ$ , is extremely unstable. Improved equipment is proposed. A. L. Henne

**Improvement of the method of determination of active hydrogen atoms.** O. Schmitz-Dumont and K. Hamann. *J. prakt. Chem.* 139, 162-6 (1934); cf. *C. A.* 27, 1629. In using  $\text{C}_2\text{H}_5\text{N}$  as solvent in the detn. of active H, gas is produced both by the reaction of the substance contg. active H and by the reaction of the  $\text{C}_2\text{H}_5\text{N}$  with the Grignard reagent. A method is given for correcting the vol. for the gas resulting from the  $\text{C}_2\text{H}_5\text{N}$ . C. J. W.

**Organometallic compounds of group II.** Ferdinand Schulze. *Iowa State Coll. J. Sci.* 8, 225 8 (1933). Reactions between RX and Ca produce organometallic compds. with: EtI, BuI,  $\text{C}_6\text{H}_{17}\text{I}$  and PhI. During the formation of these compds. a voluminous white solid,  $\text{Ca}_2\cdot 2\text{Et}_2\text{O}$ , formed. Mols. contg. twice as many Ca atoms as the original mols. were formed. No organo-strontium or organobarium halides were obtained in sealed tubes under temps. varying from room temp. to  $225^\circ$  and treatments lasting as long as 1 year. Dialkyls and diaryls of Ca, Sr and Ba were not obtained though slight visual evidence of it was observed. Organoberyllium halides form above  $80-90^\circ$ . Catalysts for the reaction in order of effectiveness are  $\text{HgCl}_2$ ,  $\text{BeCl}_2$ ,  $\text{Hg} + \text{I}_2$ ,  $\text{I}_2$  and  $\text{Br}_2$ . The usual solvent was  $\text{Et}_2\text{O}$  but MeBeI was prepd. without a solvent. Ether solns. do not fume in the air. BeMe<sub>2</sub> was prepd. from Be,  $\text{HgMe}_2$  and a trace of MeHgI. BePh<sub>2</sub> and Be di-*p*-tolyl were prepd. by heating Be + Hg aryls with a trace of  $\text{HgCl}_2$  in sealed tubes for 6 hrs. at  $225^\circ$ . Be alkyls are most conveniently prepd. by the reaction of anhyd.  $\text{BeCl}_2$  with the appropriate Grignard reagent. BeMe<sub>2</sub>, BeEt<sub>2</sub> and BeBu<sub>2</sub> were prepd. thus. BeMe<sub>2</sub> sublimes at  $200^\circ$  without melting. BeEt<sub>2</sub>, m.  $-13^\circ$  to  $11^\circ$ ,  $b_4$   $93-5^\circ$ ,  $b_{18}$   $110^\circ$ ,  $b$   $180-240^\circ$ . BeBu<sub>2</sub>,  $b_{18}$   $170^\circ$ . Both BeMe<sub>2</sub> and BeEt<sub>2</sub> react with  $\text{H}_2\text{O}$ ,  $\text{CO}_2$  and  $\text{PhNCO}$ . BeR<sub>2</sub> is at least as reactive as Grignard reagents and more reactive than RBeX. Tri-*p*-isomophenylstibine was prepd. in 90% yield by treating  $\text{SbCl}_4$  in  $\text{Et}_2\text{O}$  with an excess of *p*-Br $\text{C}_6\text{H}_4\text{MgBr}$ . An attempt to prep. (*p*-Me $\text{NC}_6\text{H}_4$ )<sub>3</sub>Sb resulted in tars. F. E. Brown

**Organometallic compounds. II. The reaction between fatty derivatives of tin and tetrahalides of tin.** K. A. Kocheshkov. *Ber.* 66B, 1661-5 (1933); cf. *C. A.* 23, 5172. The interaction of  $\text{R}_4\text{Sn}$  and  $\text{SnX}_4$  or  $\text{RSnX}_3$  or  $\text{R}_2\text{SnX}_2$  (where R = Me, Et, Pr and X = Cl or Br) is a practical method of prep.  $\text{R}_4\text{SnX}$  or  $\text{R}_3\text{SnX}_2$ . Me<sub>4</sub>Sn, m.  $148^\circ$ , is obtained as a by-product in the reaction between  $\text{Me}_3\text{SnCl}_2$  and  $\text{SnCl}_4$  in the presence of  $\text{H}_2\text{SO}_4$ . Pr<sub>4</sub>SnBr<sub>2</sub>, m.  $47-8^\circ$ . A. L. Henne

**Organolead compounds.** Edmund B. Towne. *Iowa State Coll. J. Sci.* 8, 229-30 (1933).—When HCl reacts with an unsym. organolead compd., the more neg. or labile group splits off. By this means a negativity or lability series may be arranged. The position of the double bond is a controlling factor in the lability of unsatd. radicals (cf. *C. A.* 28, 124<sup>3</sup>). The introduction of functional groups into organolead compds. was attempted in 2 ways: coupling of organolead halides with substituted halogen compds., and by rearrangement of some diazonium complexes of bi- and quadrivalent Pb chlorides in the presence of Cu bronze and other metals. Diazonium complexes of  $\text{PbCl}_2$  were prepd. for the first time but no substituted organolead compds. were formed. Et<sub>3</sub>PbBr reacted with Mg to produce EtMgBr and Et<sub>3</sub>Pb. This indicated the formation of an unstable Et<sub>3</sub>PbMgBr. Triphenyl-*p*-anisyllead was prepd. F. E. Brown

**Compounds of bivalent carbon. VII. Action of carbon monoxide on sodium ethylate.** Helmuth Scheibler and Gerhard Frikell. *Ber.* 67B, 312-14 (1934); cf. *C. A.*

27, 3196. Dry CO adds to EtOH-free NaOEt under high pressures at  $20^\circ$ , no  $\text{EtCO}_2\text{Na}$  being formed unless the product is heated to  $100-90^\circ$  (*C. A.* 26, 1805). It was suggested that under these conditions there is formed a bivalent C deriv.,  $\text{C}(\text{OEt})\text{ONa}$ . The product has now been analyzed for total Na (30.93%), Na titratable with 0.1 N HCl (23.42%),  $\text{HCO}_2\text{H}$  in the aq. soln. of the neutral Na salts (13.46%), acid (calcd. as  $\text{HCO}_2\text{H}$ ) volatile with steam after decompn. with dil.  $\text{H}_2\text{SO}_4$  (13.50%), EtO content of reaction mixt. (43.07%). In a vacuum desiccator the EtO content gradually decreased, probably as the result of elimination of  $\text{C}_2\text{H}_4$ :  $\text{C}(\text{OEt})\text{ONa} \rightarrow \text{C}_2\text{H}_4 + \text{C}(\text{OH})\text{ONa} \rightarrow \text{HCO}_2\text{Na}$ , a process which presumably begins as soon as the CO excess pressure is removed when the autoclave is opened. The product therefore consists of a mixt. of unchanged NaOEt,  $\text{HCO}_2\text{Na}$  and  $\text{C}(\text{OEt})\text{ONa}$ . Prepn., which had been kept a long time evolved  $\text{CO}_2$  when treated with  $\text{H}_2\text{SO}_4$  (3% after a few days, increasing on longer standing in dry air and at higher temps.; in an expt. in summer (av. temp.  $25^\circ$ ), the  $\text{CO}_2$  evolved after 3 weeks was 8%). The  $\text{CO}_2$  is probably produced from  $\text{C}(\text{OEt})\text{ONa}$ , resulting from the autoxidation of  $\text{C}(\text{OEt})\text{ONa}$ . VIII. Action of ethyl formate on triphenylmethyl sodium. Helmuth Scheibler and Heinz Cobler. *Ibid.* 314 17. When  $\text{HCO}_2\text{Et}$  is added to  $\text{Ph}_3\text{CNa}$  in ether the dark red soln. is at once decolorized with formation of a cryst. ppt., the filtrate from which yields  $\text{Ph}_3\text{CH}$  on evapn. The water soln. of the ppt. contains NaOH,  $\text{HCO}_2\text{Na}$  and  $\text{NaHCO}_2$ . The NaOH is probably formed from NaOEt, resulting from the decompn. of part of the  $\text{HCO}_2\text{Et}$  into CO and EtOH, the EtOH then giving with  $\text{Ph}_3\text{CNa}$ , NaOEt and  $\text{Ph}_3\text{CH}$ .  $\text{HCO}_2\text{Na}$  is probably formed from  $\text{C}(\text{OEt})\text{ONa}$  resulting from the reaction  $\text{Ph}_3\text{CNa} + \text{HCO}_2\text{Et} \rightarrow \text{C}(\text{OEt})\text{ONa} + \text{Ph}_3\text{CH}$ .  $\text{NaHCO}_2$  is formed by the hydrolysis of  $\text{C}(\text{OEt})\text{ONa}$  produced by autoxidation of  $\text{C}(\text{OEt})\text{ONa}$ . The reaction may also proceed without the intermediate formation of a bivalent C compd.; the  $\text{HCO}_2\text{Et}$  may react directly with  $\text{Ph}_3\text{CNa}$  to form  $\text{C}_2\text{H}_4$  and  $\text{HCO}_2\text{Na}$ . This is to be tested by using  $\text{HCO}_2\text{Ph}$  instead of  $\text{HCO}_2\text{Et}$ ;  $\text{C}(\text{OPh})\text{ONa}$  should be materially more stable than  $\text{C}(\text{OEt})\text{ONa}$ . C. A. R.

**Amide and imide chlorides of nonaromatic acids. VIII. Preparation of  $\alpha,\beta$ -unsaturated aldehydes.** Julius v. Braun, Walter Rudolph, Hugo Kröper and Walter Pinkernelle. *Ber.* 67B, 269-81 (1934); cf. Heymons and Rohland, *C. A.* 26, 2739. The labile imide chlorides,  $\text{RCOCl}:\text{NR}'$ , of nonaromatic acids are not adapted to such reactions as reduction with  $\text{SnCl}_2$  and HCl to the Schiff bases,  $\text{RCH}:\text{NR}'$ , with subsequent conversion into aldehydes,  $\text{RCHO}$ . One reason for this is that they undergo a rapid autodecompn., consisting primarily in an intramol. shifting of the II,  $>\text{CHCCl}:\text{NR}' \rightarrow >\text{C}:\text{CClNHR}'$ , and further condensations of the primary product through the newly formed reactive NH group. Anything that impedes the migration of the H should therefore increase the stability of the imide chloride. One such "stabilizing" factor should be a double bond immediately adjacent to the  $\text{CCl}:\text{NR}'$  group, for in this case the migration,  $>\text{C}:\text{CHCCl}:\text{NR}' \rightarrow >\text{C}:\text{C}:\text{CClNHR}'$ , would produce 2 cumulated double bonds, a grouping which in general is not easily formed. The first attempts to confirm this view, with the imide chlorides of  $\alpha$ -hexenic and  $\alpha$ -nonenic acids, were disappointing, although the imide chlorides were not appreciably decompd., since hydrolysis yielded the corresponding amides. Nor was campholic acid, in whose imide chloride any autodecompn. hindering the reduction is excluded, reduced by  $\text{SnCl}_2$  and HCl. It was concluded that the Dimroth reducing agent is not sufficiently powerful, and after a long series of expts. the desired reduction was effected with  $\text{CrCl}_3$ . Because of the sensitivity of the imide chlorides toward water, the easily prepd. blue aq. soln. of  $\text{CrCl}_3$  could not be employed, and suspensions of dry  $\text{CrCl}_3$  in neutral solvents (in the presence of HCl gas) proved unreactive. Success was finally attained by adding the imide chloride in ether or benzene directly to the ppt. obtained by digesting  $\text{Cr}(\text{OAc})_3$  with HCl

in ether, without removing the ether contg. AcOH and a little water. The reduction in the direction of the aldehyde proceeds rapidly, although not quantitatively, as the moisture in the ether hydrolyzes part of the imide chloride before it is reduced; the yields of aldehyde do not exceed 50% and are generally less, but perhaps better conditions can be discovered by further work. Imide chlorides of aromatic acids, and also of PhCH:CHCO<sub>2</sub>H, which are reduced by SnCl<sub>2</sub>, are of course reduced by CrCl<sub>3</sub> also, but aliphatic imide chlorides with no adjacent double bond are not. A small part of the imide chloride undergoes the intramol. shifting of H during the CrCl<sub>3</sub> reduction; this is impeded by selecting an *o*-substituted Ph radical, such as *o*-MeC<sub>6</sub>H<sub>4</sub>, for R', which increases the yield of aldehyde a few %. In this way were prepd. 2-hexen-1-al (I), 2-nonen-1-al (II), atropaldehyde (III), 3,7-dimethyl-3-octen-1-al (IV), 3-methyl-4-cyclopentenyl-2-buten-1-al (V) and 5,9-dimethyl-2,4,8-decatrien-1-al (VI). These aldehydes show interesting differences in their odors; VI, especially, has an unusually powerful, persistent and pleasing odor with a pronounced similarity to that of lilies of the valley. IV, V and VI are mixts. of *cis* and *trans* isomers. PhCCl:NPh and PhCH:CHCl:NPh smoothly yield more than 80% BzH and PhCH:CHCHO, resp., while BzCl and PhCH<sub>2</sub>CH<sub>2</sub>COCl under the same conditions are unchanged. The *N*-phenyl- or *N*-*o*-tolylimide chloride of PhCH<sub>2</sub>CH<sub>2</sub>CO<sub>2</sub>H (hydrocinnamic *o*-toluide, m. 123°) develops the odor of PhCH<sub>2</sub>CH<sub>2</sub>CHO but the aldehyde could not be isolated in detectable amt. (The amidine PhCH<sub>2</sub>CH<sub>2</sub>C(NHPh):NPh, from PhCH<sub>2</sub>CH<sub>2</sub>CNCl:NPh and PhNH<sub>2</sub>, m. 212°). Equally resistant to reduction are campholyl chloride and the *N*-ethyl-, b<sub>12</sub> 125°, and *N*-phenylimide chloride, b<sub>10</sub> 163°. *α*-Hexenyl *o*-toluide, m. 125°; *o*-tolylimide chloride, light yellow, b<sub>0-10</sub> 120°. I (yield, 50%), b<sub>12</sub> 43°, d<sub>4</sub><sup>20</sup> 0.8491, n<sub>D</sub><sup>20</sup> 1.4462; *p*-nitrophenylhydrazones, m. 137°; semicarbazone, m. 173°. *α*-Nonenyl chloride, b<sub>0-1</sub> 70-2°; anilide, light yellow, b<sub>1</sub> 182-4°, m. 50-1°. II (yield, over 50%), b<sub>12</sub> 92°, d<sub>4</sub><sup>20</sup> 0.8439, n<sub>D</sub><sup>20</sup> 1.4542; *p*-nitrophenylhydrazones, m. 109°; semicarbazone, m. 163°. *α*-Nonenic nitrile, obtained in 85% yield from the amide and POCl<sub>3</sub> in benzene at 80°, b<sub>12</sub> 100-2°, is not attacked by SnCl<sub>2</sub> and HCl. Atropyl chloride, b<sub>0-10</sub> 87-8°; anilide, m. 134°. III, b<sub>12</sub> 96°, d<sub>4</sub> 1.0406; semicarbazone, m. 148°. The ester iso-AmCH<sub>2</sub>CMc(OH)CH<sub>2</sub>CO<sub>2</sub>Et, obtained in 80% yield from iso-AmCH<sub>2</sub>COMe, Zn and BrCH<sub>2</sub>CO<sub>2</sub>Et, b<sub>11</sub> 131°; free acid, b<sub>11</sub> 172°, is converted by boiling 6 hrs. with 3 mols. Ac<sub>2</sub>O and 0.5 mol. NaOAc almost quantitatively into dihydrogeranic acid, b<sub>11</sub> 145-7°; the chloride of the latter, b<sub>0-10</sub> 90°; *o*-toluide, b<sub>0-1</sub> 165-6°, m. 60-74°; anilide, b<sub>0-1</sub> 190-2°, m. 36-54°. 5,6-Dihydrocitraol (IV), b<sub>12</sub> 96-8°, d<sub>10</sub> 0.8664, n<sub>D</sub><sup>20</sup> 1.4600; semicarbazone, m. 111-5°; *p*-nitrophenylhydrazones, orange-yellow, m. 104-9°. The ester CH<sub>2</sub>:CH<sub>2</sub>:CH:CH CHCH(CO<sub>2</sub>Et)COMe (65% from

2-chlorocyclopentene and AcCHNaCO<sub>2</sub>Et), b<sub>12</sub> 130°, converted by boiling aq. 10% KOH into cyclopentenylacetone (90% yield), b<sub>12</sub> 67° (semicarbazone, m. 150°); oxime, b<sub>0-10</sub> 86-7°, which gives with Zn and BrCH<sub>2</sub>CO<sub>2</sub>Et 75% of the ester C<sub>6</sub>H<sub>7</sub>CH<sub>2</sub>CMc(OH)CH<sub>2</sub>CO<sub>2</sub>Et, yellowish, b<sub>12</sub> 151°; the corresponding free acid b<sub>0-1</sub> 170° and with boiling Ac<sub>2</sub>O-NaOAc gives 83% β-methyl-γ-cyclopentenylcrotonic acid (VII), b<sub>12</sub> 160-1°, d<sub>4</sub><sup>20</sup> 1.0336, n<sub>D</sub><sup>20</sup> 1.5082, whose chloride b<sub>0-1</sub> 82-5°; Et ester, b<sub>12</sub> 123°; anilide, b<sub>0-1</sub> 157°, m. 34-41°; anilide, b<sub>0-10</sub> 193-5°, m. 72-5°. VII with Pd and H in acetone gives the tetrahydro acid, C<sub>6</sub>H<sub>11</sub>O<sub>2</sub>, b<sub>12</sub> 150°, d<sub>4</sub><sup>20</sup> 0.9740. VII is unchanged by 70% H<sub>2</sub>SO<sub>4</sub>; with concd. H<sub>2</sub>SO<sub>4</sub> it becomes, after 24 hrs. in the cold, deep brown and, when poured into ice water, gives somewhat more than 50% of the lactone C<sub>6</sub>H<sub>7</sub>CH:CHMe.CH<sub>2</sub>.CO.O, which is isomeric with

VII, m. 39°, insol. in Na<sub>2</sub>CO<sub>3</sub>, sol. in hot NaOH and reprecipd. unchanged by acids, and yields with Pd and H in acetone a dihydro deriv., b<sub>12</sub> 144°. V (30% yield), b<sub>12</sub> 108-10°; semicarbazone, m. 139-45°; *p*-nitrophenyl-

hydrazones, red, m. around 140°. Cetylidenecetic acid, from the Et ester and aq. alc. KOH, b<sub>0-1</sub> 158-62°; anilide, b<sub>0-1</sub> 210°. VI was not obtained in sufficient amt. to det. its m. p.; the semicarbazone, a mixt. of isomers, was sepd. by crystn. from 70% MeOH into fractions, sintering 125°, m. around 150° and m. 93-102°.

C. A. R.

The action of hydrogen peroxide on acetone. H. Lecoq. *Bull. soc. chim. Belg.* 42, 531-6(1933).—1) slightly acid media, Me<sub>2</sub>CO treated with H<sub>2</sub>O<sub>2</sub> gives acetone triperoxide, which easily depolymerizes into acetone peroxide.

A. L. Henne

Some tertiary alcohols derived from mesityl oxide. René Jacquemin. *Compt. rend.* 198, 483-4(1934).—Me<sub>2</sub>C:CHCOMe (I) treated with RMgI gave Me<sub>2</sub>C:CHC(OH)MeR where R=Et, b<sub>2-3</sub> 48-50°, d<sub>4</sub> 0.8747, d<sub>15</sub><sup>20</sup> 0.8600, n<sub>D</sub><sup>20</sup> 1.4480; Pr, b<sub>2-3</sub> 60-68°, d<sub>4</sub> 0.8611, d<sub>15</sub><sup>20</sup> 0.8508, n<sub>D</sub><sup>20</sup> 1.4500; Bu, b<sub>2-3</sub> 78.5-80.5°, d<sub>4</sub> 0.8603, d<sub>15</sub><sup>20</sup> 0.8447, n<sub>D</sub><sup>20</sup> 1.4507.

Julius White

Esterification by dilution in inert media performed on new series of substances with anhydrides and also with mineral acids and hydrated organic acids instead of anhydrides. Victor Boulez. *Ind. chim. belg.* [2], 5, 3-5(1934); cf. C. A. 27, 3915. Acetylation of plant products is carried out in xylene. [B. fails to give any useful directions.]

Albert L. Henne

The saponification velocity of the methyl esters of the two crotonic acids. Reaction velocity and configuration. Anton Skrabal and Walther Stockmair. *Monatsh.* 63, 244-54(1933).—Both the acid and the alk. hydrolysis velocities for the Me ester of α-crotonic acid exceed those for the Me ester of β-crotonic acid. A comparison with the sapon. velocities of acrylic acid esters, and the disocn. const. of acrylic acid, indicates the *trans* configuration for the α-ester, and the *cis* configuration for the β-ester. For reaction in aq. solns., the sapon. const. (time in min.) with acid at 25° and 45°, and with alkali at 25°, were for the α-ester 0.000114, 0.000907 and 1.46, resp.; and for the β-ester 0.0000942, 0.000668 and 0.877, resp. Data on the sapon. of esters are used to illustrate the general relation between velocity and configuration.

L. E. Steiner

Butenic nitriles. G. Heim. *Bull. soc. chim. Belg.* 42, 461-6(1933).—This lists the phys. const. of extremely pure *cis*- and *trans*-crotonic nitriles (I and II) and of vinylacetic nitrile (III). I, b<sub>78-8</sub> 107-40°, b<sub>78-8</sub> 107.46°, d<sub>4</sub> 0.84376 at 0°, 0.82890 at 15.00°, 0.81401 at 30.00°, n<sub>D</sub> 1.41021, n<sub>D</sub> 1.41335, n<sub>D</sub> 1.42112, n<sub>D</sub> 1.42852, n<sub>D</sub> red 1.40968, yellow 1.41343, green 1.41982, violet 1.42633 at 30.00°, 1.41736, 1.42065, 1.42887, 1.43590, 1.41683, 1.42072, 1.42718 and 1.43376 at 15.00° for the same rays. II, b<sub>78-8</sub> 122.05°, b<sub>78-8</sub> 122.05°, d<sub>4</sub> 0.84046, 0.82586 and 0.81135; n 1.41438, 1.41775, 1.42617, 1.43349, 1.41400, 1.41791, 1.42460, 1.43146, 1.42140, 1.42480, 1.43337, 1.44074, 1.42097, 1.42190, 1.43180 and 1.43877. **Ethylene nitriles.**  $\alpha$ -Methyl- $\alpha,\beta$ -hexenenitriles and  $\alpha$ -butylacrylic nitrile. A. Craen. *Bull. soc. chim. Belg.* 42, 410-18 (1933).— $\text{NCCHMeCHClPr}$ ,  $b_p$  84.0-4.2°, has  $d_4^{20}$  0.99083,  $n$  1.44143, 1.44374, 1.44929, 1.45397 for  $\alpha$ ,  $\beta$ ,  $\gamma$  and  $\delta$  at 20°;  $\text{NCCH}(\text{CH}_2\text{Cl})\text{Bu}$ ,  $b_p$  94.0-4.6°,  $d_4^{20}$  0.98904,  $n$  1.44146, 1.44319, 1.44724, 1.45385 at 20°;  $\text{NCCCIMeBu}$ ,  $b_p$  62-3°,  $d_4^{20}$  0.95301,  $n$  1.42711, 1.42936, 1.43483, 1.43939 at 20°. Treatment with pyridine yields therefrom: *cis*- $\text{NCCMe:CHPr}$ ,  $b_p$  46-7°,  $d_4^{20}$  0.82218,  $n$  1.43011, 1.43318, 1.44066, 1.44712 at 20°; *trans*-isomer,  $b_p$  59.4-9.6°,  $d_4^{20}$  0.82993,  $n$  1.43793, 1.44111, 1.44885, 1.45557;  $\text{NCCBu:CH}_2$ ,  $b_p$  65.8-6.0°,  $d_4^{20}$  0.820017,  $n$  1.42928, 1.43172, 1.43947, 1.4571 at 20°. The amides of the 3 ethylene nitriles:  $m$  74.2°, 55.7° and 76°, resp.

A. L. Henne  
**Some vinylacetic derivatives** L. Falaise and R. Frogner. *Bull. soc. chim. Belg.* 42, 427-41 (1933).—Exptl. directions to ameliorate the production yield of vinylacetic nitrile, vinylacetic acid and Et vinylacetate.

A. L. Henne  
**Degradation of  $\alpha$ -brominated acids to aldehydes and ketones.** Julius v. Braun, E. Anton, F. Fischer, W. Keller and G. Manz. *Ber.* 67B, 218-25 (1934).— $\alpha$ -Bromo acids can be easily and rapidly degraded to aldehydes or ketones with 1 fewer C atom by the series of reactions:  $\text{R}_2\text{CBrCO}_2\text{H}$  (where 1 of the R's may be H)  $\rightarrow$   $\text{R}_2\text{CBrCOCl}$   $\rightarrow$   $[\text{R}_2\text{CBrCON}] \rightarrow \text{R}_2\text{CBrCON} < \rightarrow [\text{R}_2\text{CBrN}] < \text{O} \rightarrow \text{R}_2\text{CBrNH}_2 \rightarrow \text{R}_2\text{C:O}$ . If it is not desired to isolate the intermediate isocyanate, the acid chloride is gently warmed in a suitable solvent with a slight excess of  $\text{NaN}_3$ , cooled, treated with alc. KOH to hydrolyze the product to the amine, then with dil. acid to effect the degradation to the C:O compd., and extd. with ether or distd. with steam. In 5 of the 6 cases studied, the yield was 60% or better; with  $\alpha$ -bromocyclopentylacetic acid (I), it was only 30% but perhaps it can be improved by varying the solvent (benzene or PhMe can often be advantageously replaced by dry pyridine) or by choosing other temp. conditions for the hydrolysis. Tech.  $\text{NaN}_3$  can hardly ever be used, even when carefully mud, but rubbing with a little  $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$  (cf. *C. A.* 27, 5715) suffices to make it quite reactive.  $\alpha$ -Bromohexahydrobenzoic acid,  $b_p$  120-2°,  $m$  61°, gives through its chloride,  $b_p$  105-7°, in benzene, PhMe or pyridine 52-7% cyclohexanone. *Dibutyl- $\alpha$ -bromosuccinic acid*,  $b_p$  168-71° (chloride,  $b_p$  126-8°), yields 71-7%  $\text{Bu}_2\text{CO}$ ,  $m$  89°.  $\alpha$ -Bromodicyclopentylacetyl bromide (70% from the acid with P and Br),  $b_p$  175°,  $m$  32°, gives 60% dicyclopentyl ketone,  $b_p$  110-12°, purified through the semicarbazone,  $m$  158-62°, which depresses to 126-37° the  $m$ . p. (170°) of the semicarbazone of the ketone  $\text{C}_{11}\text{H}_{18}\text{O}$  obtained from the bicyclic naphthalenic acid  $\text{C}_{12}\text{H}_{16}\text{O}_2$  (*C. A.* 27, 1613); *oxime*  $m$  92°, reduced with Na and alc. to the amine,  $b_p$  120-2°, whose *HCl salt*  $m$  193-4° and *picrate*  $m$  127°. The amine can be obtained from  $(\text{C}_5\text{H}_9)_2\text{CHC(O)H}$  by (1) treating the acid in concd.  $\text{H}_2\text{SO}_4$  with  $\text{HN}_3$  in the usual way (yield 70%), or (2) converting it with  $\text{PCl}_5$  into the chloride,  $b_p$  143-1°, and treating the latter in benzene with activated  $\text{NaN}_3$  and then adding HCl; this gives, along with 36% of the amine, the urea,  $\text{CO}(\text{NHCH}(\text{C}_5\text{H}_9)_2)_2$ ,  $m$  288°, nonvolatile with steam. *Di- $\beta$ -heximalonate*, from  $\text{C}_6\text{H}_{11}\text{Br}$  and  $\text{NaCH}(\text{CO}_2\text{Et})_2$ ,  $b_p$  150-5°, the free acid,  $m$  103-5°, is brominated in ether at 0 to the  $\alpha$ -bromo acid,  $m$  119-21° (evolution of  $\text{CO}_2$ ), which is decarboxylated *in vacuo* at 130° to  $\alpha$ -bromocyclopentylacetic acid,  $b_p$  118-21°, the chloride of the latter,  $b_p$  112-14°, gives with  $\text{NaN}_3$  and then alc. KOH and HCl about 30% each of enanthal,  $b_p$  150-60°, and its product of autocondensation, enanthylideneenanthal,  $b_p$  260-90°. I,  $m$  50°,  $b_p$  121-3°, gives through its chloride,  $b_p$  130-2°, 30% cyclopentylformaldehyde (semicarbazone,  $m$  124°).  $\text{Ph}(\text{CH}_2)_3\text{CHBrCOCl}$ ,  $b_p$  172°, gives 58-9%  $\text{Ph}(\text{CH}_2)_3\text{CHO}$ ,  $b_p$  120-2° (semicarbazone,  $m$  105°).

C. A. R.  
**Splitting of glycol ethers with acetyl bromide.** Conrad Bergsdahl. *Finska Kemistisamfundets. Medd.* 42, 76-84 (1933). By combining unlike radicals with  $(\text{CH}_3\text{OH})_2$  and treating with AcBr, the relative reactivities of Et,

$\text{C}_6\text{H}_5$ , and  $\text{PhCH}_2$  have been found to be 1, 1.05 and 2.6, respectively.

H. C. Duus

**Action of trimethylamine on hexamethyldiaminoisopropanol diiodide.** L. Gorini. *Gazz. chim. ital.* 63, 751-6 (1933).—Equimol. parts of  $(\text{IH}_2\text{C})_2\text{CHOH}$  (I) and  $\text{NMe}_3$  (II) combine directly to  $(\text{Me}_2\text{NH}_2\text{C})_2\text{CHOH}$  (III), as is already known. If, however, either I or III is heated in a hydrolyzing medium (water or EtOH) with excess II in an autoclave at 100° for 18 hrs., a 2nd reaction takes place between III and II, thus:  $2 \text{ II} + \text{III} \rightarrow (\text{Me}_2\text{NH}_2\text{C})_2\text{CHOH}$  (IV) +  $2 \text{ NMe}_3\text{I}$  (V). The yields are smaller with EtOH than water, and the quantity of II has considerable influence. Thus with the theoretical proportion of II in 95% EtOH, i. e., 2 mols. per mol. of III, the yield of V is 10% (based on III). With 3 mols. of II, the yield is 15%, with 7 mols. of II in 80% EtOH it is 25%, and with 7 mols. of II in 50% EtOH it is 35%. In water 3 mols. of II yield 26% of V, and 7 mols. yield 35%. V is obtained directly by pptn. on cooling, IV from the mother liquor by acidification, evapn., alkalization with NaOH, extn. with Et<sub>2</sub>O and further purification of the ext. with HCl, which yields *tetramethyldiaminoisopropanol dichloride* (VI),  $m$  256°, very hygroscopic. Refluxed with  $\text{Ac}_2\text{O}$  (5 parts), VI yields *tetramethyldiaminoisopropyl- $\beta$ -acetate dichloride*,  $\text{C}_8\text{H}_{18}\text{O}_4\text{N}_4\text{Cl}_2$ ,  $m$  247°. VI is also formed by refluxing II (2 mols.) with  $(\text{CH}_2\text{C})_2\text{CHOH}$  in 33% EtOH, and in an analogous way refluxing alc. II (2 mols.) with I yields *tetramethyldiaminoisopropanol diiodide*, lustrous,  $m$  225°. When the reaction between II and I or III is carried out in  $\text{C}_6\text{H}_6$  or anhyd. Et<sub>2</sub>O, no V is formed, and in general the yield of V depends on the hydrolyzing power of the solvent and on the magnitude of the excess of II. The excess II functions as an alkali, and the drop from a hexa- to a tetra-Me compd. is analogous to the removal of an alkyl group from halides of tetrasubstituted amines, with formation of trisubstituted amines. On the other hand, III and  $\text{NH}_4\text{OH}$  in various proportions (up to 25 mols. of III) heated in an autoclave at 100° left the III unaltered. Contrary to data of Berend (*Ber.* 17, 510 (1884)) on IV, it is separable from 30% aq. NaOH; it  $b_p$  46°, without decompn., and its  $d_4^{20}$  is 0.887.

C. C. Davis

**Synthesis of dulcitol and allodulcitol.** Robert Lespiau and Joseph Wiemann. *Compt. rend.* 198, 183-4 (1934); cf. *C. A.* 28, 1663<sup>4</sup>.—When 4 g. of *cis*-ethyleneerythritol (I),  $[\text{CHCH}(\text{OH})\text{CH}_2\text{OH}]_2$ , was oxidized with  $\text{AgClO}_4$  with  $\text{OsO}_4$  as a catalyst, 0.55 g. of crystals was obtained. The major portion of these  $m$  142-9° and were shown to be allodulcitol. A small portion did not melt below 160° but could not be sepd. because of lack of material. I was obtained by reduction of the corresponding acetylene compd. (II), but only crystd. if II was pure. To avoid loss of II, crude II was reduced, giving a sirup rich in I. This was acetylated with  $\text{Ac}_2\text{O}$ , giving a pure *tetra-Ac deriv.* of I,  $b_p$  190-1°,  $d_{20}$  1.186, and  $n_D^{20}$  1.462. This was oxidized with  $\text{AgClO}_4$  and  $\text{OsO}_4$  to give a sirup. This was acetylated and gave *hexaacetyldulcitol*,  $m$  166-6.5° from MeOH. This was checked by analysis and a mixed  $m$ . p.

John E. Milbery

**Autoxidation of amino acid derivatives. III. Dehydrogenation of  $\alpha$ -N-methylaminoisobutyric acid.** F. Bergel, K. Bolz and R. Wagner. *Z. physiol. Chem.* 223, 66-70 (1934); cf. *C. A.* 27, 5343. —In dehydrogenation reactions  $\text{Me}_2\text{C}(\text{NHMe})\text{CO}_2\text{H}$  occupies an intermediate position between  $\text{Me}_2\text{C}(\text{NH}_2)\text{CO}_2\text{H}$  and  $\text{Me}_2\text{C}(\text{NMe}_2)\text{CO}_2\text{H}$ , in that it is slowly oxidized by  $\text{O}_2$  in the presence of charcoal but not by quinone or glucose. The substance was prepd. by heating  $\text{Me}_2\text{CBrCO}_2\text{H}$  with liquid  $\text{MeNH}_2$  and successive treatments of the reaction mixt. with  $\text{Ba}(\text{OH})_2$ ,  $\text{H}_2\text{SO}_4$ ,  $\text{Ag}_2\text{O}$  and  $\text{H}_2\text{S}$ .

A. W. Dox

**The mechanism of sulfur oxidation.** James C. Andrews and Kathleen C. Andrews. *Am. J. Med. Sci.* 187, 146 (1934).—The properties of certain cyclic sulfonic acid derivs. of cystine, such as cysteic acid hydantoin and cysteic acid phenylhydantoin, were studied. These compds. are very unstable, and on neutralization with dil. alkali at ordinary temps. they yield inorg. sulfate

directly. The Ph deriv. yields about 15% of its S as inorg. sulfate, the simple hydantoin about 10%. Other evidence points to 2 simultaneous methods of decompn., one involving loss of  $H_2SO_4$  and the other a split in the hydantoin ring, producing an open-chain compd., the S of which remains stable as a sulfonic acid. R. C. W.

Glucosonic acid (2-ketogluconic acid). III, with a contribution to the constitution of the *o*-phenylenediamine compounds of the sugars. Heinz Ohle. *Ber.* 67B, 155-62 (1934); cf. *C. A.* 24, 3757. It had been reported in the earlier paper that the Na salt of glucosonic acid (I) seps. without water of crystn. when the aq. soln. is concd. Repetition of the work has shown, however, that the substance was the glucosaccharonate; the salt of the true I seps. with 1  $H_2O$  and shows mutarotation ( $[\alpha]_D^{25}$  -83.0° → -75.24° (water, *c* 4.519; equil. in 30 min.), -95.2° → -72.2° (MeOH +  $H_2O$  (1:3), *c* 4.886; equil. in 3 hrs.). The Me ester of I, repeatedly crystd. from 80% MeOH, m. 187°,  $[\alpha]_D^{25}$  -80.39° → -70.03° (MeOH +  $H_2O$  (1:3), *c* 4.250; initial value 30 min. after soln., equil. in 80 min.). Since the mutarotation is in the same direction as that of fructose, the salt and ester are probably the  $\beta$ -forms with pyroid structure. The highly purified salts of I reduce cold Fehling soln. only after a considerable length of time; they neither decolorize I in acid soln. nor react in the cold with hypiodite. The Na or K salt in 5-10 parts water contg. 1 equiv. HCl gives with 1 mol. *o*- $C_6H_4(NH_2)_2$  at 15-20°

80% of a compd.  $C_6H_4 \begin{matrix} \swarrow N:COH \\ \searrow N:C(CHOH)CH_2OH \end{matrix}$ , which,

to designate the configuration of the side chain, is called 3-(*d*-arabotetrahydroxybutyl)-2-hydroxyquinoxaline (II). II m. 199-200° (decompn.),  $[\alpha]_D^{25}$  -87.5° (*N* NaOH, *c* 2.0), easily dissolves in cold 5 *N* HCl with yellow color and is reprecip. by neutralization with  $NH_3$ , is sol. in alkalis and  $Na_2CO_3$  and reprecip. by  $CO_2$ , decomposes when heated in either acid or alk. soln., and turns Fehling soln. green and, after short boiling, ppts.  $Cu_2O$ . With  $Ac_2O$  in pyridine it gives a *tetraacetate*, m. 170.5-1.5°,  $[\alpha]_D^{25}$  -17.38° ( $CHCl_3$ , *c* 2.02). On oxidation with hypiodite by the Willstätter-Schudel-Goebel method, II consumes practically 1 mol. I, and in boiling water with  $KMnO_4$ - $H_2SO_4$  it gives dihydroxyquinoxaline. The reducing power is not due to the quinoxaline nucleus but to the breaking off of the side chain; refluxed in water with  $PhNHNH_2$ , II gives 80% 2-hydroxyquinoxaline-3-aldehyde phenylhydrazone (III), red, m. 278-9°, and glycerol (identified as the tribenzoate (IV)). The structure of III was established by the synthesis of III from 2-hydroxy-3-dibromomethylquinoxaline, m. 103° (prepd. from  $CHBr_2$ ,  $COCO_2H$  and *o*- $C_6H_4(NH_2)_2$  and  $PhNHNH_2$ ). The crude III contained another  $PhNHNH_2$  deriv. which could not be purified, and the IV was also contaminated with an impurity which reduced Fehling soln.; H. believes that the main cleavage into 2-hydroxyquinoxaline-3-aldehyde (V) and glycerol is accompanied by a cleavage, to a small extent, into 2-hydroxy-3-hydroxymethylquinoxaline and glyceraldehyde. The cleavage probably takes place even in boiling water alone, the role of the  $PhNHNH_2$  being merely to remove the V from the field of action and protect it from further reaction with the other cleavage fragments. Fructose with *o*- $C_6H_4(NH_2)_2$  gives 3-(*d*-arabotetrahydroxybutyl)quinoxaline, needles with 1  $H_2O$ , m. 187-8° (decompn.),  $[\alpha]_D^{25}$  -75.2° (5 *N* HCl, *c* 2.006), identical with the product obtained from glucose; *tetraacetate*, m. 120°,  $[\alpha]_D^{25}$  -30.32° ( $CHCl_3$ , *c* 3.258). The compd. obtained by Griess and Harrow from *l*-arabinose and *o*- $C_6H_4(NH_2)_2$  (*Ber.* 20, 2205, 3111 (1893)) is not a quinoxaline but  $\mu$ -(*l*-arabotetrahydroxybutyl)-benzimidazole, m. 234° (decompn.),  $[\alpha]_D^{25}$  51.96° (5 *N* HCl, *c* 1.636); it does not lose in wt. at 100° *in vacuo* over  $P_2O_5$ , reduces neither Fehling soln. nor hypiodite and does not react with  $PhNHNH_2$ ; *tetraacetate*, m. 141-2°. The above facts show clearly that the case with which II is broken down is not due solely to the C:N double bonds but chiefly to the acid HIO group on C atom 2 of the quinoxaline ring. It may therefore be ex-

pected that the introduction of a neg., ionizable group on C atom 1 of fructose will also materially increase the tendency of the latter to break down. C. A. R.

*d*-Glucosaccharosonic acid, an isomer of ascorbic acid. I. Preparation and properties. Heinz Ohle, Hermann Friebach and Herbert Carls. *Ber.* 67B, 324-32 (1934). Systematic investigation of the sapon. of Me glucosonate with  $Na_2CO_3$ , which is accompanied by an anomalous change in rotation (*C. A.* 24, 3794), has shown that along with the normal sapon. there occurs another reaction yielding a new acid, glucosaccharosonic acid,  $C_6H_{11}O_7$  (I), isomeric with and extraordinarily similar to ascorbic acid. I has a linear structure (cf. *Angew. Chem.* 46, 399 (1933)) and therefore the constitutions discussed for ascorbic acid can also be considered for I. With the data at hand, it is not yet possible to decide which of these is correct. In water I is formed in max. yield when the Et glucosonate is sapon. by slow addn. of alkali, so that the reaction of the soln. to neutral red appears to be neutral. In order to secure sufficiently rapid reaction, it is well to work at 60-70°. The best results are obtained by making use of the buffer principle, i. e., by using the alkali in the form of salts of weak acid ( $H_2CO_3$ ,  $H_3PO_4$ ) or weak tertiary bases (pyridine); the most satisfactory is  $NaHCO_3$ . The extent of the formation of I can be detd. by I titration, as I reduces an equiv. amt. of I in acid soln. Neither glucosonic acid nor long standing or boiling in water nor its salts on treatment with alkali yield I, which is formed only from the ester or the lactone of glucosonic acid. The lactone, which as yet unknown, was tested in the form of its triacetate, the yield of I on treatment with  $NaHCO_3$  in aq. alc. is very small, probably because the opening of the lactone ring is considerably more rapid than the splitting off of the Ac groups, and much larger amts. of I are obtained with  $NaOMe$ . Pyridine catalyzes the formation of I only in aq. soln.; the reaction does not take place in abs. pyridine or EtOH- $C_6H_5N$  mixts. Nor is I formed from the glucosonic ester with *o*- $C_6H_4(NH_2)_2$  in water or alc.; this would indicate that I is formed through the keto form of the ester, which, in the presence of  $C_6H_4(NH_2)_2$ , is removed as fast as it is formed.  $NaOMe$  gives no homogeneous product with I; the part sol. in MeOH has a compn. corresponding to the Na salt of the endiol of the ester, although the MeO values are far too low; conversely, the insol. part contains some MeO but much more Na than corresponds to the endiol salt. Both dissolve in water with considerable evolution of heat and an initially alk. reaction which soon becomes neutral, and yield the Na salt of I. The triacetylglucosonic lactone with  $NaOMe$  gives, after catalytic removal of the Ac groups according to Zemplén, at least 50% I, which is identical with the product obtained by Maurer and Schiedt by a modification of this method (*C. A.* 27, 4777), and which, like their product, has an antiscorbutic action (Dalmer and Molt, *C. A.* 28, 1076<sup>3</sup>). Neither I nor its salts give cryst. Ac derivs.; the results of esterification with MeOH or EtOH have thus far been neg. in helping to establish the structure of I; methylation with  $CH_3I$  gives only a sirup; I forms no trityl deriv. or acetone condensation product. It is assumed, therefore, that the 5-HIO group has been replaced by a ring O atom. I is strikingly resistant to very dil. acids; only on boiling with 5 *N* HCl or  $H_2SO_4$  does it slowly split off  $CO_2$  (about 0.8 mol. in 2 hrs.), with formation of furtural. The rotation of the Na salt varies in different preps. from 94° to 100° and is greatly increased by alkali, the max. (150°) being attained in *N* NaOH. The I-reducing power of such solns. gradually diminishes and finally disappears completely on standing at 20°. I forms well crystd. brucine and cinchonine salts and an amorphous Pb salt,  $C_6H_6O_6Pb$ , which is very sensitive to heat. Catalytic hydrogenation with Pd-BaSO<sub>4</sub> of I in water or AcOH or of the Na salt in water could not be effected. Oxidation with  $H_2O_2$  or  $KMnO_4$ , unlike that with I or quinine, is not specific; after 1 atom O has been used up the product still has considerable I-reducing power. Whereas in

acid soln., only 1 mol. I is considered, in alk. soln. (under the conditions of the Willstätter-Schudel-Goebel titration) 2 mols. NaOI react, and the power to reduce Fehling soln. is completely destroyed; in higher concns. considerably less hypiodite is used up and only about 0.4 mol. oxalic acid is formed. Oxidation with  $\text{Ag}_2\text{O}$ , which is quite violent in concd. soln., gives 2 mols.  $\text{CO}_2$ , oxalic, glycolic and acetic acids and small amts. of nonreducing but still optically active substances. I, m.  $106^\circ$ ,  $[\alpha]_D^{25}$   $18.5^\circ$  (water,  $c$  5.897),  $[\alpha]_D^{25}$   $7.66^\circ$  (acetone,  $c$  1.632).

**Brucine salt**, needles with apparently 1  $\text{H}_2\text{O}$ , m.  $220^\circ$  (decompn.),  $[\alpha]_D^{25}$   $6.25^\circ$  (water,  $c$  3.998). **Cinchonine salt**, m.  $221-2^\circ$  (decompn.), is very slightly sol. in water and well adapted to the characterization of I. C. A. R.

**New methods of preparation of diethoxyacetone and  $\beta$ -substituted  $\alpha,\alpha'$ -diethylines  $(\text{RC}(\text{OH})(\text{CH}_2\text{OEt})_2)$ .** G. Darzens and Maxence Meyer. *Compt. rend.* 198, 478-80 (1934).— $\text{EtOCH}_2\text{CO}_2\text{Et}$  (2 mols.) is added to  $\text{NaOEt}$  (1 mol.) covered with PhMe (I) and allowed to stand 24 hrs. The EtOH formed and I are distd. off and the residue is again covered with I. AcOH and  $\text{H}_2\text{O}$  are then added and the PhMe layer is sepd., dried and distd.  $\text{EtCO}_2\text{CH}(\text{OEt})\text{COCH}_2\text{OEt}$  (165 g.) (II) is obtained and on sapon. with aq.  $\text{K}_2\text{CO}_3$  gives  $\text{CO}(\text{CH}_2\text{OEt})_2$  (III). III with  $\text{RMgBr}$  gives  $\text{RC}(\text{CH}_2\text{OEt})_2\text{OH}$  where  $\text{R} = \text{Me}$ ,  $b_p$   $73-4^\circ$ ; iso-Bu,  $b_p$   $110^\circ$ ; PhCH<sub>2</sub>,  $b_p$   $154^\circ$ ; anisyl,  $b_p$   $149^\circ$ ; cyclohexyl,  $b_p$   $100^\circ$ . Julius White

**Addendum concerning the acidity and reducing power of ascorbic acid.** P. Karrer and G. Schwarzenbach. *Helv. Chim. Acta* 17, 58 9(1934); cf. C. A. 27, 5104.

A recalc. of the disson. const. of  $\alpha$ -D-galacturonic acid (I), allowance being made for the mol. of  $\text{H}_2\text{O}$  of crystn., gives  $-\log K = 3.491$  at  $23.6^\circ$  (instead of 3.565). A repetition of the detn. gave  $-\log K = 3.488$  at  $19^\circ$ . In a soln. contg. 0.00406 mol. of I and 0.00200 mol. of NaOH per l., a  $\text{H}_2$  electrode at  $19^\circ$  and 721 mm.  $\text{H}_2$  showed a potential of 0.5440 v. against a 0.1 N calomel electrode. Measurement of the 2nd disson. const. of ascorbic acid (II) (C. A. 27, 4564) gave  $\log K_2 = 11.79$  and 11.80 at  $16^\circ$ . In a soln. contg. 0.00608 mol. MeOH and 0.00406 mol. of II per l., a  $\text{H}_2$  electrode registered a potential of 0.9783 v. against 0.1 N calomel. The more neg. values for the reduction potentials of II found by Green (C. A. 28, 810) are explained as due to polarization effects in alk. solns. The concept of the non-reversibility of the reduction-oxidation system of II is maintained, contrary to the opinions of Georgescu (C. A. 26, 5470) and Wurms (C. A. 27, 4468). C. R. Addinall

**New use of magnesium in organic syntheses. I. Malonic ester syntheses.** Hakon Lund, A. Uch Hansen and A. F. Voigt. *Kgl. Danske Videnskab. Selskab. Math.-fys. Medd.* 12, No. 9, 23 pp. (1933).—Mg, catalyzed with  $\text{I}_2$ , after an induction period reacts rapidly with 1 or 2 mols. of  $\text{CH}_2(\text{CO}_2\text{Et})_2$  (I) in EtOH. In the 1st case, the compd.  $\text{MgC}(\text{CO}_2\text{Et})_2 \cdot 2\text{EtOH}$  (II) crystall. on cooling. II loses EtOH at  $80^\circ$ , forming  $\text{EtOMg}\cdot\text{CH}(\text{CO}_2\text{Et})_2$  (III).  $\text{Me}_3\text{CHCH}(\text{CO}_2\text{Et})_2$  also reacts with Mg, forming  $\text{EtOMgC}(\text{CHMe})(\text{CO}_2\text{Et})_2$  (IV).  $\text{CH}_2(\text{CO}_2\text{Me})_2$  and  $\text{CNCH}_2\text{CO}_2\text{Et}$  react only slightly with Mg. Aluminum-malonic ester was also prepd. but could not be used successfully in syntheses with alkyl halides. III is sol. in most org. solvents and undergoes many of the classic reactions of sodiomalonic ester. The advantages of III over the latter are the ease of introduction of 2 groups simultaneously into I and the readiness with which a 2nd group can be substituted into mono-substituted malonic esters. Alkyl chlorides and bromides react slowly or not at all with III, but iodides give good results. Only 1 sec. or tert. group can be substituted into I through the use of III. With III in ether, acyl halides form acylmalonic esters.  $\text{EtI}$ , allyl bromide,  $\text{PhCH}_2\text{Cl}$ ,  $\text{ClCH}_2\text{CO}_2\text{Et}$  and  $\text{PhCH}_2\text{COCH}_2\text{Cl}$  formed disubstituted malonic esters in good yields. With III in EtOH,  $\text{MeCHBrCO}_2\text{Et}$  and III gave 1,1,2-tricarboethoxypropane. III gave no reaction with  $\text{ClCH}(\text{CO}_2\text{Et})_2$  or  $\text{I}_2$ . III in ether and  $\text{BzCl}$  after decompn. of the product with  $\text{H}_2\text{O}$  formed  $[\text{BzC}(\text{CO}_2\text{Et})_2]_2\text{Mg} \cdot 3\text{H}_2\text{O}$ , m.  $120.5^\circ$ , which produced  $\text{BzCH}(\text{CO}_2\text{Et})_2$  in 70% yield by treat-

ment with dil.  $\text{H}_2\text{SO}_4$ . With III in  $\text{Et}_2\text{O}$ ,  $\text{AcCl}$  (with 88% yield) and  $\text{Ac}_2\text{O}$  gave acetylmalonic ester (Cu compd., m.  $124^\circ$ ; semicarbazone, m.  $104-5^\circ$ ; 2,4-dinitrophenylhydrazone, m.  $147^\circ$ ). In  $\text{Et}_2\text{O}$ , III and  $p$ - $\text{O}_2\text{NC}_6\text{H}_4\text{COCl}$  formed the Mg salt of  $p$ -nitrobenzoylmalonic ester, m.  $238^\circ$ ; III and  $o$ - $\text{C}_6\text{H}_4(\text{COCl})_2$  gave  $\text{C}_6\text{H}_4(\text{CO})_2\text{C}(\text{CO}_2\text{Et})_2$  or  $\text{O} \cdot \text{CO} \cdot \text{C}_6\text{H}_4 \cdot \text{C} \cdot \text{C}(\text{CO}_2\text{Et})_2$  (75%

yield), m.  $74.5^\circ$ ;  $\text{Ph}_2\text{CCl}$  and III formed triphenylmethylmalonic ester, m.  $133^\circ$ , in 86% yield. IV in EtOH reacted with allyl bromide giving 90% allyl-isopropyl malonic ester, and with  $\text{BzCl}$  to form benzoyl-isopropyl malonic ester, m.  $66.5^\circ$  (75% yield). IV and  $\text{Ph}_2\text{CCl}$  did not react. F. W. Scott

**A case of easy rupturing of the carbon chain of a succinic acid derivative.** K. v. Auwers and O. Ungemach. *Ber.* 67B, 249-52 (1934); cf. *Ber.* 29, 1543 (1896); Komppa, *Ibid.* 1548, 1620.—That the compd. m.  $157^\circ$

(I), obtained by heating  $\text{Me}_3\text{C}-\text{CO}-\text{NC}_6\text{H}_4\text{Me}$  (II),  $\text{MeC}(\text{OAc})\cdot\text{CO}$

m.  $131^\circ$ , with alc. alkali is  $\text{MeC}(\text{OH})(\text{CO}_2\text{H})\text{CMc}_2\text{CO}\cdot\text{NHC}_6\text{H}_4\text{Me}$  has been confirmed, for I is also obtained from the Ac-free analog, m.  $187^\circ$  (III), of II and regenerates III on heating. The change I  $\rightarrow$  III already occurs to some extent on mere recrystn. from benzene (b.  $120-30^\circ$ ). The Ac group in II is therefore quite loosely held; in fact, when II is treated in ice with only 1 mol. KOH it yields I and III, together with unchanged II, and with excess of  $p$ -toluidine in dil. benzene soln. at  $15-20^\circ$  it gives I. If, however, equimol. amts. of II and toluidine are cautiously brought together in cold benzene, only the ring is opened and there is obtained the  $\beta$ -acetate, m.  $145-6^\circ$ , of I, which is readily hydrolyzed to I by alkali and regenerates II on heating. When II is boiled with 20% NaOH, there is obtained, along with I, a compd., m.  $108^\circ$ , which has been identified as *isobutyric p*-toluide,  $\text{Me}_2\text{CHCONHC}_6\text{H}_4\text{Me}$ ; it is also obtained from I, II or III with 10% alc. alkali on the water bath. C. A. R.

**Photopyridine reaction.** F. Reigl and V. Anger. *J. prakt. Chem.* 139, 180-2 (1934).—The so-called photopyridine is the  $\text{NH}_4$  salt of glutaric aldehyde,  $\text{OHC}\cdot\text{CH}_2\text{CHCH}:\text{CHONH}_4$ . With  $m$ - $\text{O}_2\text{NC}_6\text{H}_4\text{NH}_2 \cdot \text{H}_2\text{SO}_4$  it yields a condensation product,  $(m$ - $\text{O}_2\text{NC}_6\text{H}_4\text{N}:\text{CHCH}:\text{CHCH}:\text{CHNHC}_6\text{H}_4\text{NO}_2$ )<sub>2</sub>  $\cdot \text{H}_2\text{SO}_4$ , red, m.  $116^\circ$ . The Na salt of the aldehyde is stable and may be used in the test for primary aromatic amines. C. J. West

**Thiocyanic acid.** The chloride of thiourea, M. Battagay and E. Hégazi. *Helv. Chim. Acta* 16, 999 1008 (1933); cf. C. A. 27, 2939.— $\text{NH}_4\text{CSCl}$  (I) is obtained by the interaction of dry HSCN in ether with dry  $\text{HCl}$  gas. I decomps.  $75-80^\circ$  and is split by  $\text{H}_2\text{O}$  and passes into HSCN and  $\text{HCl}$ . It is not an addn. compd. of HSCN and  $\text{HCl}$ , as indicated by its reaction with alics. to form the corresponding alkoxythiourethans,  $\text{ROCSNH}_2$ . I probably exists in equil. with HSCN and  $\text{HCl}$  in MeOH since some  $S$ -methylthiourethan is also formed. An excess of I with EtOH yields Et dithioallophanate. I reacts with phenol to give phenoxythiourethan,  $p$ -hydroxythiobenzamide (II), and some of the  $o$ -isomer of II. II m.  $175^\circ$  (decompn.) to give  $p$ - $\text{HO}\cdot\text{C}_6\text{H}_4\text{CN}$ . L. F. A.

**The action of boric acid as accelerator of the mutarotation of glucose.** G. Aurisicchio. *Industria chimica* 8, 1369-70 (1933).—Addn. of  $\text{H}_3\text{BO}_3$  does not alter the final value of the rotation of a soln. of glucose, but does markedly shorten the time required for attaining this value.  $\text{H}_3\text{BO}_3$  is, therefore, considered to be a catalyst in the mutarotation of glucose solns. A. W. C.

**Constitution of lignin. XVII. Tetraconiferylaldehyde.** Peter Klason. *Ber.* 67B, 302 3 (1934); cf. C. A. 26, 3237.—Freudenberg (*Tannin, Cellulose, Lignin*, C. A. 27, 4924) believes that the no. of  $\text{SO}_3\text{H}$  groups in the formation of "tetralignosulfonic acid,  $4(\text{Cl}_6\text{H}_4\text{O}_6)\cdot\text{H}_2\text{SO}_4$ ," in the sulfite cooking of pine wood under certain conditions has no stoichiometric significance. If this

were true, sulfonic acids with more than 4 coniferylaldehyde groups should be capable of existence. The present work shows that such is not the case. Wood was cooked with  $\text{NaHSO}_3$  at 96–8° until it was completely defibered (1.5 weeks), then treated with dil.  $\text{HCl}$ , the  $\text{HCl}$  completely removed and the lignosulfonic acid extd. hot with pure water; after 12 hrs. the soln. had become yellow and gave with  $\beta\text{-C}_{10}\text{H}_7\text{NH}_2$   $\text{HCl}$  a yellow ppt.,  $4(\text{C}_{10}\text{H}_7\text{O}_2)_2 \cdot \text{H}_2\text{SO}_4 \cdot \text{C}_{10}\text{H}_7\text{N} - \text{H}_2\text{O}$  (found, C 65.6, H 5.6, S 1.6, N 1.5, MeO 12.2%), which did not soften in boiling water. The tetraconiferylaldehydesulfonic acid is therefore the  $\alpha$ -sulfonic acid which is primarily formed in the sulfite cooking. On the other hand, the compn. of the  $\alpha$ -sulfonic acid obtained in practical cooking is  $3(\text{C}_{10}\text{H}_7\text{O}_2)_2 \cdot \text{H}_2\text{SO}_4$ , so the mol. wt. of  $\alpha$ -lignin in wood can hardly be  $4 \text{C}_{10}\text{H}_7\text{O}_2$  but must be at least 3 times as high, or  $12 \text{C}_{10}\text{H}_7\text{O}_2$ . If it is assumed that lignin consists of 1174 parts  $\alpha$ - to 644 parts  $\beta$ -lignin (1 mol. of each), the lowest possible mol. wt. for wood lignin is 3640. Wood (in the form of a wool-like mass) was heated about 20 hrs. at 96–8° with 0.2%  $\text{H}_2\text{SO}_4$  in a sealed vessel; this dissolved only the hemi-cellulose in appreciable amt. (about 15%). The lignin content of the product was 36.1%. Schweizer soln. took up only a very small amt. of cellulose. The mass gave an intense reaction for lignin. Heated a short time with  $\beta\text{-C}_{10}\text{H}_7\text{NH}_2 \cdot \text{HCl}$ , it gave a product which, after washing with hot water and drying at 100°, contained 0.7% N, corresponding to  $3 \text{C}_{10}\text{H}_7\text{O}_2 \cdot \text{C}_{10}\text{H}_7\text{N} - \text{H}_2\text{O}$ . The reaction is therefore the same in principle as that occurring when the wood is first cooked with sulfite and then pptd. with  $\text{C}_{10}\text{H}_7\text{NH}_2$ ; the product then has the compn.  $3 \text{C}_{10}\text{H}_7\text{O}_2 \cdot \text{H}_2\text{SO}_4 \cdot \text{C}_{10}\text{H}_7\text{N} - \text{H}_2\text{O}$ . In both cases the  $\alpha$ -lignin reacts normally in the aldehyde form:  $\text{RCHO} + \text{C}_{10}\text{H}_7\text{N} = \text{RCH}:\text{NC}_{10}\text{H}_7 + \text{H}_2\text{O}$ . Since by the action of  $\text{SO}_2$  on lignin tetra-, tri-, di- and monoconiferylaldehydesulfonic acids are formed, depending on the intensity of the reaction, the coniferylaldehyde complexes must be linked together in the same type of chain as the simple sugars in polysaccharides. C. A. R.

**Tetraconiferylaldehydesulfonic acid.** Peter Klason. *Svensk. Kem. Tid.* 45, 221 (1933).—A discussion of the chem. constitution of compds. derived from lignin.

A. R. Rose

**Cyclobutane-1,2-dicarboxylic acids.** Hans Bode. *Ber.* 67B, 332–5 (1934).—Kuhn and Wassermann report (C. A. 22, 4484) that they were unable to obtain Perkin's *cis*-cyclobutane-1,2-dicarboxylic acid (I), m. 137°; besides the *trans* acid, m. 130°, they obtained a compd. m. 98° which they believed to be the *cis* acid but they could not convert it into an anhydride. A repetition of P.'s work, however, has fully confirmed his results. Decarboxylation of the 1,1',2,2'-tetracarboxylic acid and subsequent treatment of the product with  $\text{AcCl}$  give the anhydride, m. 77–8°, of *cis*-I, which is hydrolyzed by hot water to *cis*-I, m. 138–9°, and this is rearranged by concd.  $\text{HCl}$  into *trans*-I, m. 130–1°. Potentiometric detns. at 20° of the dissociation consts. gave  $-\log K_1 = 4.20$  and  $-\log K_2 = 6.56$  for the *cis*, and 3.77 and 5.63 for the *trans* acid. C. A. R.

**Slow oxidation of some cyclopentane hydrocarbons with one lateral chain at temperatures below their boiling points.** P. Dupont and G. Chavanne. *Bull. soc. chim. Belg.* 42, 537–43 (1933).—The oxidation of ethylcyclopentane with  $\text{O}$  gives  $\text{HCO}_2\text{H}$ ,  $\text{EtCO}_2\text{H}$ ,  $\text{EtCO}(\text{CH}_2)_2\text{CO}_2\text{H}$  and  $\text{EtCOBu}$ ; butylcyclopentane yields  $\text{BuCO}_2\text{H}$ ,  $\text{PrCO}_2\text{H}$ ,  $\text{BuCO}(\text{CH}_2)_2\text{CO}_2\text{H}$  and an unidentified nonanone; phenylcyclopentane oxidizes to  $\text{Bz}(\text{CH}_2)_2\text{CO}_2\text{H}$ ,  $\text{BzOH}$  and  $\text{PhCOBu}$ . The consts. of 1-phenyl-1-cyclopentanol are  $b_D^{20} 1.510$ ,  $d_4^{20} 1.0693$ ,  $d_4^{20} 1.0530$ ,  $n_D^{20} 1.5435$ ,  $n_D 1.5479$ ,  $n_D 1.5590$ ,  $n_D 1.0530$  at 20°; it makes a glass at  $-78^\circ$ . A. L. Henne

**Determination of constitution by melting-point lowering: the configuration of the polymers of cyclopentadiene.** Josef Pirasch. *Ber.* 67B, 101–4 (1934).—M. ps. of acenaphthene,  $\text{PhN}:\text{NPh}$ ,  $\beta\text{-C}_{10}\text{H}_7\text{OMe}$ ,  $\text{NHPh}$  and  $\beta\text{-C}_{10}\text{H}_7\text{OH}$  were taken, with  $\alpha$ -dicyclopentadiene, dihydro- $\alpha$ -dicyclopentadiene and tetrahydro- $\alpha$ -dicyclopentadiene

as solvents. The mol. depressions were high in all cases, averaging 46.2, 45.4 and 35, resp. This is taken to support the Diels-Alder theory of the polymerization of cyclopentadiene, which postulates the formation of polymer of the isocamphane type. J. H. Reedy

**Stereoisomeric 1,2-diethylcyclopentanes.** Gregoire Chiurdoglu. *Bull. soc. chim. Belg.* 42, 347–58, 41. (1933).—Pure 1,2-diethyl-1-cyclopentanol m.  $-23^\circ$ ,  $b_D^{20} 82.0$ – $2.6^\circ$ ,  $b_D^{20} 98.4$ – $0.0^\circ$ ,  $d_4^{20} 0.9237$ ,  $d_4^{20} 0.9059$ , viscosity at 15° 0.12994, at 30° 0.05077,  $n_D^{20} 1.4551$ ,  $n_D^{20} 1.4575$ ,  $n_D^{20} 1.4629$ ,  $n_D^{20} 1.4673$  for  $\alpha$ , D, He yellow,  $\beta$  and  $\gamma$  at 20.00°; it is quantitatively dehydrated by refluxing for 2 hrs. with 90%  $\text{HCO}_2\text{H}$  to 1,2-diethyl-1-cyclopentene, b. 149.20–9.30°,  $d_4^{20} 0.8252$ ,  $d_4^{20} 0.8088$ ,  $n_D^{20} 1.4484$ ,  $n_D^{20} 1.4512$ ,  $n_D^{20} 1.4514$ ,  $n_D^{20} 1.4582$  and  $n_D^{20} 1.4640$  at 20.00°. This is quantitatively hydrogenated at 18° over Pt black in  $\text{AcOH}$ , to a mixt. of *cis*- and *trans*-1,2-diethylcyclopentanes, b. 149.54°,  $d_4^{20} 0.8042$ ,  $d_4^{20} 0.7888$ ,  $n_D^{20} 1.4300$ ,  $n_D^{20} 1.4321$ ,  $n_D^{20} 1.4374$  and  $n_D^{20} 1.4419$  at 20.00°, crit. temp. of soln. in aniline 52.9°. The mixt. is sep'd. by fractional distn. into a *trans* isomer, m.  $-95.6^\circ$ , b. 147.53–7.54°,  $d_4^{20} 0.79858$ ,  $d_4^{20} 0.78318$ ,  $n_D^{20} 1.42738$ ,  $n_D^{20} 1.42960$ ,  $n_D^{20} 1.43487$  and  $n_D^{20} 1.43920$  at 20.00°, viscosities at 15° and 30° 0.00723 and 0.00605, resp., crit. temp. of soln. in aniline 56.6°; and a *cis* isomer, m.  $-118.7^\circ$ , b. 153.55–3.58°,  $d_4^{20} 0.81167$ ,  $d_4^{20} 0.79599$ ,  $n_D^{20} 1.43343$ ,  $n_D^{20} 1.43562$ ,  $n_D^{20} 1.43572$ ,  $n_D^{20} 1.44100$  and  $n_D^{20} 1.44538$  at 20.00°, viscosities at 15° and 30° 0.00815 and 0.00669, crit. temp. of soln. in aniline 50.9°. A. L. Henne

**1-Cyanocyclohexene.** R. Van Conlic. *Bull. soc. chim. Belg.* 42, 419–20 (1933).—Cyclohexanone cyanohydrin, m. 26°,  $b_D^{20} 119.5^\circ$ ,  $b_D^{20} 120.5^\circ$ ,  $b_D^{20} 132^\circ$ ,  $d_4^{20} 1.01723$ ,  $n_D^{20} 1.46057$ ,  $n_D^{20} 1.46285$ ,  $n_D^{20} 1.46847$ ,  $n_D^{20} 1.47313$  for  $\alpha$ , D,  $\beta$  and  $\gamma$  at 30°, treated with  $\text{SOCl}_2$  gives a mixt. of *trans*- and *cis*-1-cyanocyclohexene, m.  $-8^\circ$ ,  $b_D^{20} 110^\circ$ ,  $d_4^{20} 1.08390$ ,  $n_D^{20} 1.47418$ ,  $n_D^{20} 1.47663$ ,  $n_D^{20} 1.48303$ ,  $n_D^{20} 1.48816$  at 30°, and of the *cis* isomer, m.  $-23^\circ$ ,  $b_D^{20} 121^\circ$ ,  $d_4^{20} 1.10195$ ,  $n_D^{20} 1.47721$ ,  $n_D^{20} 1.47967$ ,  $n_D^{20} 1.48577$ ,  $n_D^{20} 1.49089$  at 30°. This mixt. and pyridine or 10%  $\text{NaOH}$  yield 1-cyanocyclohexene,  $b_D^{20} 73.8$ – $4.2^\circ$ ,  $d_4^{20} 0.94725$ ,  $n_D^{20} 1.47769$ ,  $n_D^{20} 1.48231$ ,  $n_D^{20} 1.48967$ ,  $n_D^{20} 1.49712$  at 20°, in only 1 of its 2 possible stereoisomeric forms. A. L. Henne

**(p-Aminocyclohexyl)acetic acid.** Erwin Ferber and Paul Leonhardt. *Ber.* 67B, 245–9 (1934).—Because of the 2 possible positions of the substituents with respect to the plane of the ring (*p*-aminocyclohexyl)acetic acid (I) can exist in a *cis* and a *trans* form. If, in accordance with Aschan (*Ber.* 35, 3389 (1902)), to bring out the complete symmetry of the position of the 2 substituents (1,3 substitution) with respect to the plane of the ring,

$\text{xyly}$  is used to represent the *cis* form and  $\frac{x}{y}$  the *trans* form, it is evident that the *trans* form should be optically inactive and the *cis* form resolvable into 2 active mirror images. All the theoretically possible forms have been prepd. and, with the exception of the *l*-*cis* form, their properties detd.  $p\text{-O}_2\text{NC}_6\text{H}_4\text{CH}_2\text{CO}_2\text{Et}$  (II), m. 65–6°, was obtained (1) by nitrating  $\text{PhCH}_2\text{CN}$  with  $\text{HNO}_3$  (d. 1.5) to the *p*-nitro deriv., m. 116° (60–72%), and simultaneously hydrolyzing and esterifying the latter by satg. it in 77%  $\text{EtOH}$  with  $\text{HCl}$  and heating on the water bath (yield of II, 91%); or (2) by nitrating  $\text{PhCH}_2\text{CO}_2\text{H}$  (97% yield) and sepg. the resulting isomers through the  $\text{Et}$  esters (yield of II, 82%). II is reduced with  $\text{SnCl}_2$  in alc. and  $\text{HCl}$  gas to the amino ester, m. 49.5° ( $\text{HCl}$  salt, m. 215°), which, because of its high soly., is obtained in only 58% yield. In the subsequent work the reduction of the  $\text{NO}_2$  and hydrogenation of the benzene nucleus were effected simultaneously with  $\text{H}$  and colloidal Pt in 5%  $\text{HCl}$  under 2.5 atm. at 60°. The resulting crude product (70% yield) consisted chiefly of I and its ester (which is hydrolyzed with extreme ease) and on benzoylation yielded an oil (III) which gradually deposited crystals of *Et trans*-(*p*-benzoylamino)cyclohexyl)acetate (IV), m. 142°, mol. wt. in camphor 268; free acid, from IV and 0.5 mol. hot aq.  $\text{Ba}(\text{OH})_2$ , m. 190–1°. On further standing, III yielded another crop of crystals m. around 35°

which could not be recrystd.; when they were heated to 200° the viscosity of the melt increased and on cooling it deposited IV, an indication that a transformation *cis* → *trans* had occurred. The crude I with hot alc. *d*-tartaric acid yielded *cis*-*d*-I acid tartrate,  $C_{12}H_{21}O_6N$ , m. 153–5°,  $[\alpha]_D^{25}$  40° (water, *c* 1), sol. to the extent of 0.144% in acetone, 0.05% in  $CHCl_3$ , 0.55% in abs. alc. and easily sol. in water, and converted by  $Ba(OH)_2$  into *cis*-*d*-I, m. 289.5° (decompn.),  $[\alpha]_D^{25}$  11° (water, *c* 1), react. neutral to litmus. The mother liquors from the tartrate yield crystals whose rotation ranges from 12.5° to 3.5° and which yield a I m. 289.5°,  $[\alpha]_D^{25}$  –2°. *trans*-I, from IV with  $Ba(OH)_2$  in boiling 50% MeOH, m. 308–10°.

C. A. R.

**Preparation of hydrocarbons with a hemicyclic double linking.** N. K. Aleksandrovich. *J. Gen. Chem.* (U. S. S. R.) 3, 48–51 (1933).—Cyclonoxylcarbinol is converted by Na and  $CS_2$  in  $Et_2O$  into *Me cyclohexylmethylcarbinolate*,  $C_{12}H_{21}CH_2OCSSMe$ , m. 165° (amide, m. 75–6°), pyrolyzed above 200° to *methylencyclohexane*. 4-Methylcyclohexylcarbinol similarly affords *Me 4-methylcyclohexylmethylcarbinolate* (amide, m. 104–5°), pyrolyzed to 1-methylene-4-methylcyclohexane.

B. C. A.

**Inositolphosphoric compounds.** Compounds of ferric inositolphosphate with ammonia and amines. S. Otolski. *Rozniki Chem.* 12, 621–30 (1932); cf. C. A. 27, 5763. Amines react in aq. soln. with  $C_6H_5O_3P_2Fe$  to yield compds. with:  $NH_3$ ,  $NH_4Et$ ,  $NH_4Et_2$  (6 mols., 8  $H_2O$ ),  $NMe_3$ , piperidine (6 mols., 12  $H_2O$ ),  $(NH_4CH_3)_2$ , and piperazine (4 mols., 12  $H_2O$ ).  $NH_3Ph$ ,  $C_4H_9N$ , quinoline, 2-aminopyridine and hexamethylenetetramine do not yield compds.

B. C. A.

**Action of hypochlorous acid on active 1-methyl- $\Delta^2$ -cyclohexene.** Marcel Godchot, Max Mousseron and Robert Grauer. *Compt. rend.* 198, 480–2 (1934).—1-Methyl- $\Delta^2$ -cyclohexene treated with  $HOCl$  gave a mixt. of 4 isomers of  $C_7H_{13}OCl$ . These were sep'd. by fractional distn. and gave the following consts., resp.:  $b_D^{25}$  79°, 91°, 93°, 95°;  $d_4^{25}$  1.120, 1.113, 1.107, 1.110;  $n_D^{25}$  1.4852, 1.4839, 1.4861, 1.4848;  $n_D^{20}$  0.0323, 0.2292, 0.5557, 0.5960;  $[\alpha]_D^{25}$  20.14°, –6.32°, 4.21°, 11.15°;  $[\alpha]_{20}^{25}$  33.89°, –10.42°, 6.91°, 18.50°;  $[\alpha]_{400}^{25}/[\alpha]_{540}^{25}$  1.682, 1.647, 1.643, 1.659. It is suggested that these represent the *cis* and *trans* forms of 1-methyl-4-chloro-3-cyclohexanol.

Julius White

**The preparation and investigation of some cyclic unsaturated ketones and hydrocarbons.** Hermann Berge, Curt Wittfeld and E. Wildt. *Ber.* 67B, 238–44 (1934).—In agreement with Cook and Hewett (C. A. 27, 5335), the authors find that phenacetylcyclohexene (I) has no tendency to change over with  $SnCl_4$  or  $AlCl_3$  into a ketophenanthrene, and they have proved that the product of the action of  $PhCH_2COCl$  on cyclohexene in the presence of  $SnCl_4$  is really I by converting it through the unstable dibromide into stilbene. I, m. 47°,  $b_D^{25}$  171–6°, can also be obtained from 3,4,5,6-tetrahydrobenzonitrile and  $PhCH_2MgCl$ ; oxime, m. 124°; semicarbazone, m. 175–6°. Tetrahydropropiophenone (oxime, m. 76°) was likewise obtained from  $C_6H_5CN$  and  $EtMgBr$ . Tetrahydroacetophenone (oxime, m. 60–1°; given in the literature as 99°; probably the 2 forms are stereoisomers) forms a well crystd. dibromide which, however, also decomps. readily on gentle heating. In the conversion of phenethylcyclohexanol through the hexene into octahydrophenanthrene, the authors obtained practically the same results as C. and H.  $PhCH_2CH_2Cl$  (14 g.) with Mg and the 3-methylcyclohexanones gave, resp., 7.0 g. 1-phenethyl-2-methyl-1-cyclohexanol,  $b_D^{25}$  181–3°, 10 g. of the 3-Me isomer,  $b_D^{25}$  171–2°, and 9.0 g. of the 4-Me compd.,  $b_D^{25}$  179°; with  $\alpha$ -tetralone it gave 9.5 g. 1-phenethyl-1-tetralol,  $b_D^{25}$  212–14°.

C. A. R.

**Highly unsaturated compounds containing the  $\beta$ -ionone ring.** H. P. Karrer and R. Morf. *Helv. Chim. Acta* 17, 3–7 (1934); cf. C. A. 26, 5088.—The chloride of the unsatd. acid (I) described in the earlier paper was prep'd. from 135 g. of I and 30 g.  $PCl_5$  and was dissolved in 140 cc. of dry PhMe. To this constantly shaken, cooled soln. was added drop-wise a cold soln. of  $MeZnI$ ,

1 prep'd. by heating a mixt. of 140 g.  $MeI$ , 30 g.  $AcOEt$ , 60 g.  $PhMe$  and 145 g. of Cu-treated Zn for 2 hrs. at 110°. The reaction mixt. was decompd. with ice, washed with  $H_2O$ , aq.  $(NH_4)_2SO_4$ , dil.  $NaOH$  and aq.  $Na_2S_2O_3$ , filtered and dried. The  $PhMe$  was removed under diminished pressure and the residue was distd. in a high vacuum. The Me ester of I remaining in the crude distillate was removed by sapon. and  $Et_2O$  extn. of the unchanged desired product from the alk. aq. soln. The ext. gave 2-methyl-4-[1',1',3'-trimethyl-2'-cyclohexen-2'-yl]-butadienyl Me ketone ( $\beta$ -ionone) (II),  $b_D^{25}$  105–6°,  $d_4^{25}$  0.9456,  $n_D^{25}$  1.54302, M. R. 77.38 (calcd. 72.490), F. 4.89. This extreme exaltation is an expression of the presence of the several conjugated double linkages. By reduction with (iso- $PrO$ ) $_3Al$  in abs. iso- $PrOH$  II was converted into the corresponding alc. with 3 double linkages, 2-methyl-4-[1',1',3'-trimethyl-2'-cyclohexen-2'-yl]-butadienylmethylcarbinol (III),  $b_D^{25}$  105°,  $d_4^{25}$  0.9223,  $n_D^{25}$  1.51956, M. R. 77.15 (calcd. 74.000), E. 3.14. II undergoes the Reformatski synthesis with  $BrCH_2CO_2Et$  and Zn, but the first formed hydroxycarboxylic acid ester is very unstable and splits off  $H_2O$  to yield IV, an ester with 4 double linkages. The synthesis was carried out according to the procedure employed for the lower homolog (C. A. 26, 5088), by using benzene as solvent and treating 30 g. of II with 33 g. of  $BrCH_2CO_2Et$  and 20 g. of Zn. Distn. of the reaction product gave 25 g. of a bright yellow oil, *Et* 2,4-dimethyl-6-[1',1',3'-trimethyl-2'-cyclohexen-2'-yl]-hexa-1,3,5-triene-1-carboxylate (IV),  $b_D^{25}$  142–3°,  $d_4^{25}$  0.97605,  $n_D^{25}$  1.52834, M. R. 95.40 (calcd. 92.143), E. 3.26. The free acid was converted into the chloride and an attempt was made, by the action of  $MeZnI$ , to obtain the corresponding Me ketone. The product was contaminated with cleavage or polymerization products. II, III and IV are mixts. of *cis*-*trans* isomers. They give intensive color reactions (orange-brown, deep red-brown and reddish brown, resp.) with  $SbCl_5$  in  $CHCl_3$ . Part of their mol. structure is related to that of vitamin A but none of them is a substitute for the vitamin in producing growth in exptl. animals. II has an odor similar to that of  $\beta$ -ionone, but finer and of more practical value.

C. R. Addinall

**The purification of aromatic hydrocarbons.** S. N. Popov and S. I. Polonskaya. *Neftyanoe Khozyaistvo* 25, 93–5 (1933).—Expts. which are described in detail indicate that  $ZnCl_2$  when pptd. on a porous mass (bricks) does not yield a standard colorless  $C_6H_6$  and  $PhMe$  from their crude solus.  $ZnCl_2$  may be used for a preliminary treatment whereby the  $H_2SO_4$  treatment requires 40% less acid, provided that the polymers are removed by distn. Up to 20% of reagents can be saved in the  $H_2SO_4$  refining process by using an intermediate steam distn. One-fifth of the acid may be replaced by treatment with benzene-toluene acid sludge and another fifth by using the intermediate steam distn., this producing a refining effect equiv. to a combined  $H_2SO_4$ - $ZnCl_2$  treatment.

A. A. Bochtlingk

**The preparation of *p*-iodophenol and some of its derivatives.** F. B. Dains and Floyd Eberly. *Trans. Kansas Acad. Sci.* 36, 114–17 (1933).—Of various methods tried for the prep'n. of *p*-iodophenol (I), the authors chose a modification of the method of Nolting and Wrzesinsky (cf. *Ber.* 8, 820 (1875)): 70 g.  $NaNO_2$  in 200 cc. of water was added with const. stirring to 110 g. *p*- $NH_2C_6H_4OH$  in 800 g. of water and ice contg. 120 g. concd.  $H_2SO_4$  and maintained at 0°. After 30 min. 20 cc. concd.  $H_2SO_4$  was added and the soln. poured into 200 g.  $KI$  in 200 cc. water. After stirring 20–30 min. the temp. was raised to 75–80° and maintained there until  $N$  ceased to be evolved. The soln. was neutralized with  $Na_2CO_3$  and steam-distd. To decrease the soly. of the product, the distillate was sat'd. with  $NaCl$  and the solid I filtered off. Yield 65–70%. The following ethers were prep'd. by the same general method: *Benzyl p*-iodophenyl ether, m. 62°: To a soln. of 3 g.  $Na$  in 50 cc. alc. was added 22 g. I and then 15 g.  $PhCH_2Cl$ . After refluxing 2 hrs. the mixt. was dild. with water. *p*-Nitrobenzyl *p*-iodophenyl ether,

m. 145°, was obtained from  $\text{NO}_2\text{C}_6\text{H}_4\text{CH}_2\text{Br}$  and  $\text{IC}_6\text{H}_4\text{ONa}$  (II). *Methylene di-p-iododiphenyl ether*, m. 114°, from  $\text{CH}_2\text{Br}_2$  and II. *Ethylene di-p-iododiphenyl ether*, m. 175-7°, from  $\text{CH}_2\text{BrCH}_2\text{Br}$  and II. *Trimethylene di-p-iododiphenyl ether*, m. 149°, from  $\text{Br}(\text{CH}_2)_3\text{Br}$  and II.

W. A. Moore

**Aristole and the production of iodophenols.** C. V. Bordeianu. *Arch. Pharm.* 272, 8-22(1934).—The chief procedure used was the action of I in AcOH soln. on the mercurized phenolic deriv. (substitution of the  $\text{AcOHg}$  complex by I according to Dimroth). Thus, from 6-iodothymol was prepd. 2,6-diiodothymol (I), quite unstable in the presence of alkalis. For the formation of "aristoles," iodophenols in which the positions immediately adjacent to the OH are occupied by alkyl and I, resp., may receive the I in the *p*-position. By virtue of the alkali-insol. of aristole and of the role of oxidizing agents in aristole formation, this substance is believed to possess the constitution of a tetraalkylated diiodo-biphenyl

quinone:  $1,2,4,3,6-(\text{HO})\text{I}_2\text{Me}(\text{iso-Pr})\text{C}_6\text{H} \rightarrow (\text{CH}_3\text{C}(\text{iso-Pr})\text{CO}\cdot\text{Cl}:\text{CMe}\cdot\text{C})_2$ .

The I content of aristole from iodothymol, as also of that made directly from thymol, is in complete agreement with this formula. The same is likewise true of the aristole deriv. from *p*-xylenol and diiodoxylenol, resp., for which in the above biphenylquinone formulation Me takes the place of the iso-Pr groups. The biphenylquinone structure permits the anticipation of polymer formation; indeed the mol. wt. of aristole (as also of xylenol aristole) corresponds to a dimer of the above biphenylquinone. The following substances were prepd.: 2,6-Diiodothymol by the action of iodized KI soln. on 2,6-bis(acetoxymethyl)thymol or on 6-iodo-2-acetoxymethylthymol. Freshly prepd. diiodothymol is yellowish, viscous, easily sol. in org. solvents and sinks in  $\text{H}_2\text{O}$ . It gradually darkens and after long standing becomes permeated with colorless crystals, without, however, becoming completely solid. The cryst. mass after pressing on unglazed pottery m. 45-7°. These crystals may well represent desmotopic modifications, e. g., phenol and pseudophenol form:  $1,2,4,3,6-(\text{HO})\text{I}_2\text{Me}(\text{iso-Pr})\text{C}_6\text{H} \rightleftharpoons$

$\text{CHI}\cdot\text{CH}:\text{C}(\text{iso-Pr})\text{CO}\cdot\text{Cl}:\text{CMe}$ . Both liquid and solid preps. have the same I content and mol. wt. and yield the same acetylation product and with  $\text{CrO}_3$  the same iodothymoquinone. Characteristic for this diiodothymol is its ready transformation in alk. soln. into aristole. 2,6-Diiodothymol acetate, m. 72-3°. 2-Iodo-6-bromothymol, reddish yellow oil splitting off Br with alkali with formation of aristole. 2,6-Diiodo-*p*-xylenol, m. 63° (acetate, prisms, m. 102-3°). 6-Iodothymol, m. 60°, in agreement with that reported by Wilgerodt. Iodothymoquinone, m. 61°. 2,6-Bis(acetoxymethyl)-*p*-xylenol. 2-Acetoxymethyl-6-bromothymol. W. O. E.

**Transpositions of anilides.** II. A. Giacalone. *Gazz. chim. ital.* 63, 761-3(1933); C. A. 27, 80.— $\text{PhN}(\text{CHO})\text{H}$  (I),  $\text{PhNH}_2$ ,  $\text{PhNH}_2\text{Cl}$  and  $\text{ZnCl}_2$ , heated 24 hrs. at 170°, excess NaOH added, steam-distd., and the residue purified by HCl and  $\text{NH}_4\text{OH}$ , yield *p*-leucaniline (II). The mother liquor yields a small quantity of an unidentified yellow compd., m. 261°, which gives a red color with hot alc. chloranil. The reaction probably involves the initial transformation:  $\text{I} \rightarrow \text{p-H}_2\text{NC}_6\text{H}_4\text{CHO}$  (III), which reacts with 2 more  $\text{PhNH}_2$  mols., thus:  $\text{III} + 2\text{PhNH}_2 \rightarrow \text{II} + \text{H}_2\text{O}$ . Under the same conditions,  $\text{PhNHAc}$  yields  $\text{PhN}:\text{CMe}\cdot\text{NHPh}$ , and  $\text{PhNHBz}$  gives a very low yield of  $\text{PhN}:\text{CPh}\cdot\text{NHPh}$ , so that in these last 2 cases there is no initial transposition. C. C. Davis

***p*-Methoxy- and 3,4-dimethoxyphenylurethans.** Otto Brunner and Rolf Wöhr. *Monatsh.* 63, 374-84(1933).—The following figures are the m. ps. of the *p*-methoxy- and 3,4-dimethoxyphenylurethans: Me, 90°, 81°; Et, 65°, 78.5°; Pr, 69°, 62°; iso-Pr, 63°, 88°; Bu, 45°, 58°; iso-Bu, 71°, 68°; Am, 53°, 67°; hexyl, 60°, 67°; heptyl, 78°, 67.5°; octyl, 77.5°, 67°; decyl, 78°, 73°; dodecyl, 80°, 83°; tetradecyl, 83°, 79.5°; hexadecyl, 88.5°, 85°; octadecyl, 92°, 87°; docosyl, 98°, 92.5°; tetracosyl, 102°, 96.5°; allyl, 41°, 68°; Ph, 151°, —; benzyl, 99.5°, 108°; cholesteryl, 152°, 160°. Bis(*p*-methoxyphenyl)urea, m. 237°; bis(3,4-dimethoxyphenyl)urea, m. 215°. The prepn. of the isocyanates from the azides is described. C. J. West

96.5; allyl, 41°, 68°; Ph, 151°, —; benzyl, 99.5°, 108°; cholesteryl, 152°, 160°. Bis(*p*-methoxyphenyl)urea, m. 237°; bis(3,4-dimethoxyphenyl)urea, m. 215°. The prepn. of the isocyanates from the azides is described. C. J. West

***p*-Dimethylamino- and *p*-diethylaminophenylhydrazine.** R. Stollé and K. Th. Gunzert. *J. prakt. Chem.* 139, 141-61(1934).—*p*- $\text{H}_2\text{NC}_6\text{H}_4\text{NMe}_2$  (I) (3.2 g.) through the diazo reaction yields 2.2 g. *p*-dimethylaminobenzene-diazonium borofluoride, light yellow-green, m. 150° (decompn.); it gradually decomp. in the light. The diazonium chloride of I, added to  $\text{NaHSO}_4$  soln. (d. 1.33) or to satd.  $\text{Na}_2\text{SO}_4$ , gives the Na salt of II, orange-yellow leaflets, with 3 mols.  $\text{H}_2\text{O}$ ; from EtOH it sep. as egg-yellow needles; the salt is sol. in 15 parts cold  $\text{H}_2\text{O}$ ; reduction with Na-Hg,  $\text{SO}_2$  or  $\text{N}_2\text{H}_4\cdot\text{H}_2\text{O}$  gives only I; the  $\text{NH}_4$  salt of II, red, decomp. 200°; HCl gives *p*-dimethylaminodiazobenzenesulfonic acid (II), yellow needles, decomp. 118°, d<sub>4</sub><sup>20</sup> 1.41, if filtered in 0.5 hr., on standing 12 hrs., there result red-violet prisms, decomp. 118°, d<sub>4</sub><sup>20</sup> 1.562; crystallographic data are given for the 2 forms. Passing  $\text{H}_2\text{S}$  through 5 g. of the Na salt of II in 250 cc.  $\text{H}_2\text{O}$  for 5 hrs. gives about 2.5 g. of *p*-dimethylaminodiazobenzenesulfide hydrazine sulfide,  $\text{C}_6\text{H}_4\text{N}_2\text{S}\cdot\text{H}_2\text{S}$ , red with green surface luster, decomp. 78°. Reduction of the Na salt with  $\text{Na}_2\text{S}_2\text{O}_4$  gives *p*-dimethylaminophenylhydrazinesulfonic acid (III), m. 179° (decompn.) (Na salt); heating the acid in  $\text{H}_2\text{O}$  until soln. results gives *p*-aminodimethylaniline *p*-dimethylaminodiazobenzenesulfonate, yellow, m. 149° (decompn.);  $\text{AgNO}_3$  gives the Ag salt of II; the *p*-aminodimethylaniline deriv., yellow-green, m. 158° (decompn.). Benzal-*p*-aminodimethylaniline, light yellow, m. 93°; III in EtOH, satd. with HCl gas, gives *p*-dimethylaminophenylhydrazine di-HCl, m. 161° (decompn.); the free base is very unstable; BzH gives benzal-*p*-dimethylaminophenylhydrazine, light yellow-green, m. 138° (decompn.); salicylidene deriv., yellow, m. 185°; the  $\text{N,N'$ -di-Bz deriv. m. 199° (HCl salt, decomp. 196°); mono-Bz deriv., m. 145°, results from the di-Bz deriv. and  $\text{N}_2\text{H}_4\cdot\text{H}_2\text{O}$  in EtOH; either deriv. with  $\text{Ca}(\text{OCl})_2$  gives *p*-dimethylaminophenylazobenzoate ( $\text{Me}_2\text{NC}_6\text{H}_4\text{N}:\text{NBz}$ ), red, m. 124°. *p*-Diethylaminobenzene-diazonium borofluoride, yellow, decomp. 113°. Na *p*-diethylaminodiazobenzenesulfonate, crystals with 6 mols.  $\text{H}_2\text{O}$ ; from EtOH, egg-yellow; K salt, yellow;  $\text{NH}_4$  salt, yellow-brown *p*-Diethylaminophenylhydrazinesulfonic acid, m. 132° (decompn.); HCl gives *p*-diethylaminophenylhydrazine di-HCl, decomp. 164°. *p*- $\text{MeC}_6\text{H}_4\text{CHO}$  gives a *p*-diethylaminophenylhydrazine-HCl, decomp. 165°.  $\text{N,N'$ -Di-benzoyl-*p*-diethylaminophenylhydrazine, m. 159°. *p*- $\text{NC}_6\text{H}_4\text{NPh}_2$  and BzCl give a mono-Bz deriv., m. 200°; BzH gives a benzal deriv., yellow-green, m. 145°. *p*-Diphenylaminobenzene-diazonium borofluoride, brick-red, decomp. 162°. Na *p*-diphenylaminodiazobenzenesulfonate, yellow, decomp. 120°; the reduction product could not be purified. C. J. West

**Synthesis of organometallic compounds of titanium.** G. A. Razuvaev and I. F. Bogdanov. *J. Gen. Chem.* (U. S. S. R.) 3, 367-8(1933).—Attempts to synthesize org. compds. of Ti by the action of  $\text{TiCl}_4$  on  $\text{HgPh}_2$ ,  $\text{PhMgCl}$  and a mixt. of Na and  $\text{PhCl}$  produced neg. results. Chas. Blane

**The influence of the phenyl group in the reaction of sulfonyl chloride on primary aliphatic alcohols.** P. Carré and D. Libermann. *Compt. rend.* 198, 274-6(1934).— $\text{PhCH}_2\text{CH}_2\text{OH}$  (1 mol.) and  $\text{PhCH}_2\text{CH}_2\text{CH}_2\text{OH}$  (1 mol.), reacting at room temp. for 24 hrs. with  $\text{SOCl}_2$  (1 mol.), give  $\text{PhCH}_2\text{CH}_2\text{OSOCl}$  (I) and  $\text{PhCH}_2\text{CH}_2\text{CH}_2\text{OSOCl}$  (II), with some  $\text{PhCH}_2\text{CH}_2\text{Cl}$  (III) and  $\text{PhCH}_2\text{CH}_2\text{CH}_2\text{Cl}$  (IV). I decomp. at 87° to III; II at 90° to IV. I with BuOH in  $\text{C}_6\text{H}_6\text{N}$  gives  $\text{SO}(\text{OBu})\text{OCH}_2\text{CH}_2\text{Ph}$ , b<sub>m</sub> 191-3°.  $\text{SOCl}_2$  (0.5 mol.) added slowly to  $\text{PhCH}_2\text{CH}_2\text{CH}_2\text{OH}$  (1 mol.) in  $\text{C}_6\text{H}_6\text{N}$  gives  $\text{SO}(\text{O}-\text{CH}_2\text{CH}_2\text{CH}_2\text{Ph})_2$ , b<sub>m</sub> 248-54°. W. J. Peterson

**Reaction of chlorobenzene with sodium sulfide and sodium hydrosulfide.** N. N. Vorozhtov, Jr. and S. P. Mitzenzengler. *Compt. rend. acad. sci.* (U. S. S. R.)

[N. S.], 1933, 291-4 (in German 294-5).—On heating PhCl with 0.5 mol. of 8% aq.  $\text{Na}_2\text{S}$  at 350-60° and 180 atm. 71.8-2.3% of the theoretical yield of  $\text{Ph}_2\text{S}$  and 15.6-15.8% of a mixt. of PhSH and PhOH is formed. With 6 mols. of  $\text{Na}_2\text{S}$  under the same conditions 2.8-5.5%  $\text{Ph}_2\text{S}$  and 84-92% of a mixt. of PhSH and PhOH is formed. The latter are formed thus:  $\text{Ph}_2\text{S} + \text{Na}_2\text{S} \rightarrow 2 \text{PhSNa}$ ;  $\text{Ph}_2\text{S} + 2 \text{NaOH} \rightarrow \text{PhSNa} + \text{PhONa} + \text{H}_2\text{O}$  from the previously formed  $\text{Ph}_2\text{S}$ . Similar results are had with NaSH.

Howard A. Smith  
Preparation of salts of tris(hydroxyaryl)sulfonium derivatives of *p*- and *o*-substituted phenols and the arylsulfonium bases. D. Libermann. *Compt. rend.* 197, 1425-7 (1933); cf. C. A. 28, 752<sup>1</sup>.— $(\text{BzOC}_6\text{H}_4)_3\text{SOBz}$ , m. 35°,  $[\text{Me}(\text{BzO})\text{C}_6\text{H}_4]_3\text{SOBz}$ , m. 53°,  $[\text{Cl}(\text{BzO})\text{C}_6\text{H}_4]_3\text{SOBz}$ , m. 57-8°, and  $[\text{MeO}(\text{BzO})\text{C}_6\text{H}_4]_3\text{SOBz}$ , m. 51°, have been obtained by heating the corresponding aryl chlorosulfites in pyridine.  $(\text{HOC}_6\text{H}_4)_3\text{SOH}$ , m. 235°, and  $[\text{Me}(\text{HO})\text{C}_6\text{H}_4]_3\text{SOH}$ , m. 264°, were prepd. from the chlorides of the corresponding sulfonium compds. and NaCN in alc. The bases are colorless, insol. in most solvents, but sol. in glycol.

Rachel Brown  
Oxidation products of organic developers. A. Seyewetz and S. Szymson. *Bull. soc. chim.* 53, 1280-8 (1933).—Hydroquinone (I) and pyrocatechol (II) have been oxidized by  $\text{PbO}_2$  and by AgBr in the presence of alk. sulfites and various alkalis or alk. substitutes. Oxidation of aq. I contg.  $\text{Na}_2\text{SO}_3$  in the presence of NaOH or  $\text{Na}_2\text{CO}_3$  gave 50% yields of  $(\text{HO})_2\text{C}_6\text{H}_4(\text{SO}_3\text{Na})_2$  (III), characterized by its beautiful blue fluorescence (C. A. 2, 539) and comparable with the salt made by the direct sulfonation of I. Solns. of I contg.  $\text{K}_2\text{SO}_3$  in the presence of KOH or  $\text{K}_2\text{CO}_3$  gave 75% yields of  $(\text{HO})_2\text{C}_6\text{H}_4(\text{SO}_3\text{K})_2$ . A similar  $\text{NH}_4$  salt was formed. Analogous results were obtained by using AgBr in place of  $\text{PbO}_2$  under the above conditions. Oxidation by AgBr in the presence of alk. sulfite and HCHO or  $\text{Me}_2\text{CO}$  yielded the monosulfonate,  $(\text{HO})_2\text{C}_6\text{H}_4\text{SO}_3\text{Na}$ . The reducing powers of I and its sulfonated derivs. for AgBr were compared and it is shown that III is not a photographic developer. Hypotheses on the oxidation reactions are given and discussed. The oxidation of II was similarly carried out. With  $\text{HgCl}_2$  only the monosulfonate was formed, because of the formation of a cryst. complex which absorbed the alk. sulfite and paralyzed the 2nd stage of the oxidation. The results show that during the use of I and II in the presence of alk. sulfites and alkalis or alk. carbonates to reduce AgBr to Ag, the *p*- or *o*-diphenol is transformed into a monosulfonated deriv. resulting from the action of the alk. sulfite on the quinone, then by an analogous process these are converted into disulfonic derivs. which seem to be the limit of the reaction since these derivs. have no reducing effect on AgBr.

C. R. A.  
Esterification velocity of alcohols in formic acid. III. Anton Kailan and Felix Adler. *Monatsh.* 63, 155-85 (1933); cf. C. A. 26, 5819; 27, 703; 28, 102<sup>1</sup>.—The esterification velocities at 15° of  $\text{BzOH}$ , 2-phenylethan-1-ol, 3-phenylpropan-1-ol, allyl alc., *o*-, *m*- and *p*-nitrobenzyl alcs., 1-phenylethan-1-ol, 1-phenylpropan-1-ol and 1-phenylbutan-1-ol in  $\text{HCO}_2\text{H}$  with varying  $\text{H}_2\text{O}$  content, and with or without HCl, KCl or  $\text{MgCl}_2$  as catalyst, were measured by the increase in f.-p. lowering. Esterification was practically complete. The velocity consts. were calcd. for unimol. reactions. The f.-p. consts. found for the various esters in  $\text{HCO}_2\text{H}$  contg. 0.110 and 1.180 mols.  $\text{H}_2\text{O}/\text{kg}$ .  $\text{HCO}_2\text{H}$  were 2.45 and 2.62, resp. This increase in  $\text{H}_2\text{O}$  content of the  $\text{HCO}_2\text{H}$  decreased the esterification velocity approx. 39% for the primary alcs. and 58% for the secondary alcs. With addn. of HCl, the increase in velocity consts. was approx. proportional to the concn. of HCl, the effect being greater in the water-poor solns. The decrease in consts. due to a Ph or  $\text{NO}_2$  group or to a double bond is greatest when these groups are nearest to the OH group. L. E. Steiner

Nitration of 3,5-dichlorobenzaldehyde and 3,5-dichlorobenzoic acid. Fritz Asinger. *Monatsh.* 63, 385-93 (1933).—3,5- $\text{Cl}_2\text{C}_6\text{H}_3\text{CHO}$  (10 g.) and 100 cc.  $\text{HNO}_3$  (d. 1.48) at room temp. for 3-4 hrs. give 99% (crude

yield) of 2-nitro-3,5-dichlorobenzaldehyde (I), m. 91.5°; oxidation gives 3,5,2- $\text{Cl}_2(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{CO}_2\text{H}$ , m. 194°. I yields an aldoxime, m. 97°, and a phenylhydrazone, blood-red, m. 175°. I and  $\text{PCl}_5$  in  $\text{C}_6\text{H}_6$  give 2-nitro-3,5-dichlorobenzal chloride, m. 45°; this also results by nitration of 3,5- $\text{Cl}_2\text{C}_6\text{H}_3\text{CHCl}_2$ . I, heated with  $\text{Ac}_2\text{O}$  and  $\text{AcONa}$  7 hrs. at 180°, gives 65% of 2-nitro-3,5-dichlorocinnamic acid, pale yellow, m. 227°. I and NaOH in  $\text{Me}_2\text{CO}$  give 97% of 5,7,5',7'-tetrachloroindigo. Reduction of I with  $\text{FeSO}_4$  and  $\text{NH}_4\text{OH}$  gives 84% of the 2- $\text{NH}_2$  deriv., pale yellow, m. 123°; aldoxime, m. 175°; phenylhydrazone, yellow-green, m. 118°. 3,5- $\text{Cl}_2\text{C}_6\text{H}_3\text{CO}_2\text{H}$  and  $\text{HNO}_3$  (d. 1.48) at 70° give 83% of the 2- $\text{NO}_2$  deriv. (II), m. 194°; the Ca salt seps. with 4.6 mols.  $\text{H}_2\text{O}$ ; the Ba salt has 2.5 mols.  $\text{H}_2\text{O}$ ; the Ag salt is anhyd.; acid chloride, m. 94.5°; amide, m. 180°; Me ester, m. 73°; Et ester, m. 69°. Reduction of II gives the 2- $\text{NH}_2$  deriv., m. 230-1° (98% yield).

C. J. West  
Formation of C-phenylanthranils and acridones from o-nitrobenzaldehydes and aromatic hydrocarbons. Kurt Lehmsiedt. *Ber.* 67B, 336 9 (1934).—Reply to Tanasescu (C. A. 27, 4802). In this connection, it has been found that T.'s 3-nitro-6-chloro-9-(*p*-dimethylamino-phenyl)acridine m. 250°, not 235° (the di-Et compd. m. 236°); neither the di-Me nor the di-Et compd. fluoresces in concd.  $\text{H}_2\text{SO}_4$ .

C. A. R.  
Nitration of chalcone. Ioan Tanasescu and Aurel Georgescu. *J. prakt. Chem.* 139, 189-92 (1934).—Chalcone (5 g.) with a nitrating mixt. of 9 g.  $\text{H}_2\text{SO}_4$  (d. 1.48) and 6 g.  $\text{HNO}_3$  (d. 1.42) at 20-35° gives 1.6 g. 2- $\text{NO}_2$  deriv. (I) and 3 g. 4- $\text{NO}_2$  deriv.; the phenylhydrazones m. 163-4° and 148-50°, resp. Boiling 1 g. I with 30 cc. EtOH, 20 cc.  $\text{H}_2\text{O}$  and 5 cc. 30% NaOH for 1-1.5 hrs. gives 0.5 g. pure indigo.

C. J. West  
The condensation of benzylpyruvic acid with benzyl cyanide. Paul Cordier. *Compt. rend.* 197, 1427-9 (1933).—By condensation of benzylpyruvic acid with  $\text{PhCH}_2\text{CN}$  there is formed  $\text{PhCH}_2\text{CH}_2\text{C}(\text{OH})(\text{CO}_2\text{H})\text{CHPhCN}$ . Attempts to hydrolyze this to  $\text{PhCH}_2\text{CH}_2\text{C}(\text{OH})(\text{CO}_2\text{H})\text{CHPhCO}_2\text{H}$  gave an anhydride, m. 74°, either  $\text{PhCH}_2\text{CH}_2\text{C}(\text{O})\text{CPh.CO.O.CO}$  or  $\text{PhCH}_2\text{CH}_2\text{C}(\text{O})\text{CCHPh.CO.O.CO}$ .

C. CHPh.CO.O.CO. By the action of KOH in AmOH

this anhydride is converted to a mixt. of acid and an isomeric anhydride, m. 80°.

Rachel Brown  
Preparation of 3-phenyl-3-(3'-phenyl-3'-hydroxypropionyloxy)propionic acid, 1-phenylpentan-1-ol-3-one and 1-phenylheptan-1-ol-3-one. E. Ditz. *Bull. soc. chim.* 53, 1288-8 (1933); cf. C. A. 25, 4251.—In the course of the prepn. of  $\text{PhCH}(\text{OH})\text{CH}_2\text{CO}_2\text{H}$  (I) by the sapon. of the esters formed in the condensation of BzH with  $\text{BrCH}_2\text{CO}_2\text{R}$  in the presence of Zn (C. A. 3, 1760) the incomplete acidification of the Na salt produced 3-phenyl-3-(3'-phenyl-3'-hydroxypropionyloxy)propionic acid, m. 188°, formed during the acidification by the esterification of I by a 2nd mol. of the same acid. Agitation of  $\text{PhCH}(\text{OH})\text{CH}_2\text{CONH}_2$  with EtMgBr for 1 day and decompn. with ice-cold dil.  $\text{H}_2\text{SO}_4$  gave 1-phenylpentan-1-ol-3-one,  $b_p$  127-30°,  $n_D$  1.528; semicarbazone, m. 168°. Similar treatment with BuMgBr produced 1-phenylheptan-1-ol-3-one,  $b_p$  135° (semicarbazone, m. 133°), in very poor yields.

C. R. Addinall  
*cis*- and *trans*-Cinnamic acids. Steric hindrance. J. Manta. *Bull. soc. chim.* 53, 1277-86 (1933).—The hydrogenation of  $\text{PhC}::\text{CCO}_2\text{H}$  (I) with colloidal Pd on starch gave stable allocinnamic acid (II), m. 68°. The use of Pt black gives a mixt. of *cis* and *trans* forms. Esterification of I in the presence of  $\text{PhSO}_3\text{H}$  with the requisite alc. gave cyclohexyl phenylpropiolates,  $b_p$  190°,  $n_D$  1.5575, and benzyl phenylpropiolates, m. 35°. On hydrogenation with Pd these gave the corresponding allocinnamates,  $\text{C}_{12}\text{H}_{11}\text{O}_2$ ,  $b_p$  180°,  $d_4^{20}$  1.0533,  $n_D^{20}$  1.5410, and  $\text{C}_{10}\text{H}_9\text{O}_2$ , m. 34-5°. The rates of sapon., by 0.025 N NaOH, of the Et, cyclohexyl and benzyl esters of I, II, hydrocinnamic (III) and cinnamic acids were measured in abs. alc. and 96% alc. The ratio  $K_{\text{trans}}/K_{\text{cis}} = 2$  in the 3 different series is the reverse of what would be

expected on the basis of the acid strengths alone and is explained by steric hindrance. The 2 factors, acid strength and the steric factor, are opposed in II (C. A. 3, 2803). The corresponding esters of I and III saponify 100 times and 4 times more quickly than those of II. The rates of all sapon. are increased 6-fold by the use of 96% alc. in place of abs. alc. (C. A. 15, 3017). C. R. A.

The monoamide of salicylacetic acid. E. A. Trofin and K. A. Chkhikvadze. *J. Gen. Chem.* (U. S. S. R.) 3, 17-20 (1933).—Salicylamide (I) and  $\text{CH}_3\text{ClCO}_2\text{Et}$  condense in the presence of  $\text{NaOEt}$  to *Et salicylamidoacetate* (II),  $o\text{-H}_2\text{NCOC}_6\text{H}_4\text{OCH}_2\text{CO}_2\text{Et}$ , m. 130-1°, hydrolyzed with cold alkali to the acid, m. 213-15°, also obtained from I and  $\text{CH}_3\text{ClCO}_2\text{H}$ . II is therefore isomeric with Meriman's compd., m. 304-5° (C. A. 5, 3052; 8, 904), which is shown to be *o*-carbethoxyphenylglycolamide by synthesis from *Et* salicylate and  $\text{CH}_3\text{ClCONH}_2$ . Unlike this compd., II can be allylated to an ester hydrolyzable in the cold to *salicyl-N-allylamidoacetic acid*, m. 120-1°, also obtained from *salicyl-N-allylamide*,  $\text{CH}_3\text{ClCO}_2\text{Et}$  and  $\text{NaOEt}$ . B. C. A.

Action of sulfonyl chloride on unsubstituted amides and imides. Chlorosulfonylphthalimide. Aminosulfonamide. M. Battegay and L. Deniville. *Bull. soc. chim.* 53, 1242 9 (1933); cf. C. A. 25, 2082.—The metallic derivs. of unsubstituted amides do not yield chlorosulfonyl derivs. on treatment with  $\text{SO}_2\text{Cl}_2$  (I) but give evidence of reacting in both tautomeric forms, as amides and imino ams. The Na deriv. of  $\text{AcNH}_2$ , acting as a normal amide, yields  $\text{MeNCO}$  through an unstable intermediate *N*-chlorosulfonylacetamide,  $\text{AcNHISO}_2\text{Cl}$ . On the contrary, the Na deriv. of  $\text{BzNH}_2$ , which acts as an imino alcoholate, forms an *O*-chlorosulfonyl deriv. decompg. to  $\text{PhCN}$ . The instability of these intermediates is attributed to the presence of the II atom remaining after the introduction of the  $\text{SO}_2\text{Cl}$  group, which facilitates the formation of  $\text{HCl}$ . By the action of I on the Na deriv. of phthalimide, chlorosulfonylphthalimide (II) (C. A. 26, 1912), m. 160°, contaminated with chlorophthalimide (III), was formed. III was converted into  $\text{C}_6\text{H}_4(\text{CO})_2\text{NH}$  by treatment with dry  $\text{HCl}$  or  $\text{SO}_2$  and sepd. from II by extn. with benzene. Treatment of II in benzene with dry  $\text{NH}_3$  gave a phthalaminosulfonamide (IV), cleaved by heat or solvents to  $\text{C}_6\text{H}_4(\text{CO})_2\text{NH}$  and  $(\text{SO}_2\text{NH})_2$  (V), hydrolyzed in turn to a mixt. of  $\text{H}_2\text{SO}_4$ ,  $\text{H}_2\text{NSO}_3\text{H}$  and  $\text{H}_2\text{NSO}_3\text{NH}_2$ , m. 92° (C. A. 26, 2184) when crystd. from  $\text{AcOEt}$ . From its stability to  $\text{NH}_3$  and its ready cleavage by solvents and heat it is probable that II is an *O*-chlorosulfonyl deriv. The formation of V implies the migration of a H atom in IV. By treating II with  $\text{PhNHMe}$  there was formed a stable *sulfonamide*,

m. 160°, either  $\text{C}_6\text{H}_4\text{CO.N:COSO}_2\text{NMePh}$  or  $\text{C}_6\text{H}_4\text{CO.N(SO}_2\text{NMePh)CO}$ . C. R. Addinall

$\beta$ -Cyclogeraniol and  $\beta$ -cyclogeraniol  $\beta$ -*D*-glucoside. Richard Kuhn and Max Hoffer. *Ber.* 67B, 357-61 (1934).  $\gamma$ -Cyclogeraniol (I) is readily obtained in 60-g. yield from 100 g. crude cyclocitral (fraction  $b_{11}$  87-97°) with  $\text{iso-PrOH}$  and  $(\text{iso-PrO})_2\text{Al}$ ; it is easily sepd. by crystn. from the accompanying  $\alpha$ -form. It  $b_{11}$  101-2°, m. 43-4°, and has a pleasant eucalyptus-like odor. Bromide, from I in benzene and a little pyridine with  $\text{PBr}$  (74% yield),  $b_{11}$  96-9°; attempts to convert it into the Grignard reagent gave  $\text{MgBr}_2$  and a hydrocarbon  $\text{C}_{10}\text{H}_{16}$ , perhaps *bi-β-cyclogeranyl*, m. 116° (cor.), in 40% yield. With  $\text{KI}$  in acetone the bromide gave 70% of a hydrocarbon  $\text{C}_{10}\text{H}_{16}$  (II),  $b_{11}$  48.5-9°,  $d_4^{25}$  0.843,  $n_D^{25}$  1.4772. The expected iodide therefore breaks down with loss of  $\text{HI}$ ; this is probably preceded by an allyl shifting and II is a 1,1,3-trimethyl-2-methylene-3-cyclohexene.  $\beta$ -*D*-Glucoside tetraacetate of I (62% from I and acetobromoglucose with  $\text{Ag}_2\text{O}$  in ether), m. 104°,  $[\alpha]_D^{25}$  -37.7° (96% alc.), hydrolyzed by  $\text{Ba(OH)}_2$  in aq. alc. to the  $\beta$ -*D*-glucoside, m. 74-5°,  $[\alpha]_D^{25}$  -35.5° to -35.9° (96% alc.), has a strongly bitter taste, is easily hydrolyzed by dil. mineral acids but not by alkalis and therefore does not reduce even boiling Fehling soln. C. A. R.

Santenone. Ossian Aschan. *Svensk Kem. Tid.* 45, 209-21 (1933).—The stereoisomers in santenone (I) obtained by chromic oxidation of santenol were 12 parts  $\alpha$  I to 1 part  $\beta$ -I. The sepn. of the isomers was not successful with I, I phenylhydrazones or I oxime but was accomplished with the semicarbazones (II). II:  $\alpha$ , m. 236°;  $\beta$ , m. 222° soly. in 100 parts alc.,  $\alpha$  0.6 parts at 12°, 3.5 at the b. p.,  $\beta$ , 7.1 at 19°, 12.5 at the b. p.; soly. in 100 parts  $\text{H}_2\text{O}$ ,  $\alpha$  2.5 parts at 20°, 3.5 at the b. p.;  $\beta$  1.5 at 20°, 13.5 at the b. p. Much more steam was required to distil  $\beta$ -II than  $\alpha$ -II. I was prepd. from  $\alpha$ -II and  $\beta$ -II by adding  $\text{H}_2\text{C}_2\text{O}_4$ , steam distg. and  $\text{Et}_2\text{O}$  extn.  $\alpha$ -I m. 55°, b. 191°  $\beta$ -I, m. 46°, b. 190°. I oxime:  $\alpha$ , m. 74°;  $\beta$ , m. 51°. The  $\alpha$ -I acid from  $\text{KMnO}_4$  oxidation m. 171°. The  $\beta$  I acid and I phenylhydrazones were not suitable for m.p. detns. The santenones are good solvents for nitrocellulose, again emphasizing their similarity to camphor. Spatial relations are discussed. A. R. Rose

Configuration determinations in the terpene and camphor series. VI. Julius v. Braun and Peter Kurtz. *Ber.* 67B, 225-30 (1934); cf. C. A. 26, 1246.—In the hope of effecting the series of reactions  $\text{I} \rightarrow \text{V}$ , thereby obtaining a deriv. of camphor in which the 4-C atom had become activated while the configuration of the 1-C atom remained unchanged, and then correlating this deriv. with a  $\beta$ -methyladipic (and hence a methylsuccinic) acid of known configuration, I was treated with  $\text{NaNH}_2$  according to Haller and Bauer (*Compt. rend.* 148, 1644) but the (homogeneous) product proved to be the amide of dimethylcampholic acid (VI), for replacement of the  $\text{CO}_2\text{H}$  group in VI either through the isocyanate (VII) or directly by the  $\text{HN}_3$  method yielded *dimethylcamphylamine* (VIII) which, on elimination of the elements of  $\text{NH}_3$ , gave 1,2,2-trimethyl-3-isopropyl-5-cyclopentene (IX), and this on oxidative degradation yielded not a trace of V but 3-isopropyl-4,4-dimethyl-5-hexanon-1-al (X). Thus, while the original object of the expts. was not attained, X is the 1st known open optically active deriv. of camphor in which C atom 1 has become inactivated while the 4-C atom, it may well be assumed, has retained its original configuration. *Dimethylcamphyl isocyanate* (VII), obtained in 80% yield from the amide of VI with 2 atoms Br and 2 mols.  $\text{KOH}$ ,  $b_{11}$  109-12°,  $d_4^{25}$  0.9470,  $[\alpha]_D^{25}$  16.5° (alc.) (there is also formed a little *bi-(dimethylcamphyl) urea*, m. 154°). VIII,  $b_{11}$  90°,  $d_4^{25}$  0.8746,  $[\alpha]_D^{25}$  22.31° (no solvent), 33.06° (alc.); *picrate*, m. 202°. VI with  $\text{NaN}_3$  in  $\text{CHCl}_3$  in the presence of  $\text{H}_2\text{SO}_4$  gives about 75% of VIII with the same b. p. and d. but with considerably lower rotation ( $[\alpha]_D^{25}$  15.37° without solvent, 22.57 in 29.9% alc.). With 1 l mol. aq.  $\text{H}_2\text{PO}_4$  most of the VIII is pptd. as an insol. salt; both the ppt. and the residu. remaining in the filtrate give on dry distn. about 30% of (basic) original VIII (somewhat racemized) and 61% of non-basic IX, b. 168-70°,  $d_4^{25}$  0.8095,  $n_D$  1.4521.

$[\alpha]_D^{25}$  -15.49° (no solvent), X (90% from IX ozonized in  $\text{AcOH}$  and treated with  $\text{Zn}$  dust in the usual way),  $b_{11}$  117-20°,  $d_4^{25}$  0.9575,  $[\alpha]_D^{25}$  43.39° (no solvent), immediately colors fuchsin- $\text{SO}_2$ ; *p*-nitrophenylhydrazones,

m. 179–80°; semicarbazone, m. 208°. There was also obtained a little of a substance, b<sub>12</sub> 70–80°, which hardly colored fuchsin-SO<sub>2</sub> and the compn. of whose semicarbazone, m. 200°, pointed distinctly to a deriv. of XI.

C. A. R.

**Contact isomerization of pinene.** Yasuji Fujita. *J. Chem. Soc. Japan* 55, 1–5(1934).—Isomerization of pinene (I) to camphene (II) proceeds easily when I and water vapor are passed through active C at 300°; the products of the side reaction are *p*-cymene and a satd. compd., C<sub>10</sub>H<sub>18</sub> (III), b. 164°, d<sub>4</sub><sup>20</sup> 0.8072, n<sub>D</sub><sup>20</sup> 1.4399, M. R. 44.02. Phys. consts. of III are close to those of thujane. The main product of reaction at 200° is dipentene and the products of side reaction are I → II → III + C<sub>10</sub>H<sub>18</sub>.

K. Kitsuta

**Contact changes of isoamyl alcohol.** Yasuji Fujita. *J. Chem. Soc. Japan* 55, 11–14(1934).—iso-AmOH and water vapor are passed through a tube contg. active C and heated at 320–40°. The main product is Me<sub>2</sub>CHCH<sub>2</sub>CHO. The products from the side reactions are isovaleric acid, iso-Am isovalerate, di(iso-Am)<sub>2</sub>O, isoamylene, isobutylene, isobutane, CO and H<sub>2</sub>.

K. Kitsuta

**Isomerization of  $\alpha$ -pinene to an aliphatic terpene. I, II. Examination of the aliphatic terpene.** B. A. Arbuzov. *J. Gen. Chem.* (U. S. S. R.) 3, 21–7, 28–34(1933).—When  $\alpha$ -pinene (I) is passed over Cu chromite (Adkins, C. A. 25, 1797, 1808) at 300°, some 80% of I is recovered and 20% of an aliphatic terpene II. At 375°, 23% of I, 42% of dipentene and 31% of II are produced, and at 400–10°, 20% of I, 23% of dipentene, 20% of II and 36% of an unidentified monocyclic terpene C<sub>10</sub>H<sub>18</sub>. Dipentene is not isomerized under these conditions. II may be identical with the product obtained from I with an Al catalyst. A Co–Th catalyst at 380° gives similar products in comparable yield (cf. C. A. 26, 2582). II, b<sub>16</sub> 87–7.5°, d<sub>4</sub><sup>20</sup> 0.8102, n<sub>D</sub><sup>20</sup> 1.5448, [ $\alpha$ ]<sub>D</sub><sup>20</sup> 0, closely resembles allo-oimene; it is readily oxidized in the air to a viscous product with the properties of a peroxide. II is reduced by Na and EtOH to a dihydro compd., b. 168.5–70°, contg. 2 double linkages (titration with AcO<sub>2</sub>H). Reduction of II over a Cu–Cr catalyst gives 2,6-dimethyloctene, b. 165–6°, and H<sub>2</sub> and Ni give *dl*-2,6-dimethyloctane, b. 159.5°. II combines with maleic anhydride to an anhydride, C<sub>14</sub>H<sub>18</sub>O<sub>3</sub> (III), m. 81.2°, hydrated to an acid, C<sub>14</sub>H<sub>20</sub>O<sub>4</sub>, m. 154.5–5.5°, which is isomerized by HBr to an acid, m. 189–90°, dehydrated by Se to a compd., m. 77.5–80° (III?). II and citraconic anhydride give an anhydride, C<sub>18</sub>H<sub>24</sub>O<sub>4</sub>, m. 82°.

B. C. A.

**Bromination of enols and enol ethers.** T. Fjäder. *Acta Chem. Fennica* 6B, 60–1(1933).—Bromination of the appropriate  $\beta$ -diketone by Toivonen's method (in suspension in cold AcOH in the presence of KOAc) affords the Br derivs. of 4-methyl-, m. 103–4°, 4-ethyl-, m. 40–1°, and 4-isopropyl-, m. 80–1°, -menthone, 4-phenyl-1-methylcyclohexene-2,6-dione, m. 55–6°, and CHAc<sub>2</sub>Me, b<sub>11</sub> 63°, the appropriate enol ethers similarly giving 2-bromo-3-methoxy-, m. 103–4°, -3-ethoxy-, m. 112–13°, and -3-isopropoxy-, m. 89–90°, -5,5-dimethyl- $\Delta^2$ -cyclohexenone.

B. C. A.

**Indirect enol titration.** T. Fjäder. *Acta Chem. Fennica* 6B, 61–2(1933).—The different behaviors of various Br ketones titrated by the Meyer method in the presence of (a) HBr +  $\beta$ -C<sub>10</sub>H<sub>17</sub>OH (I), (b) HBr, (c) I, and (d) I<sub>2</sub>O, HBr + I, indicate that the reaction is complex. Thus with bromomethylmenthone the Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> titer falls rapidly in (a) and much more slowly in (c), (b) and (d) in this order.

B. C. A.

**Some derivatives of 2,2'-dinitrobenzidine.** Dino Ponte. *Giorn. farm. chim.* 82, 328–35(1933).—The nitration of benzidine (Ber. 23, 795(1890)) gives, in addn. to 2,2'-dinitrobenzidine (I), small quantities of 2-nitrobenzidine (II), m. 143°, and 2,3'-dinitrobenzidine (III), m. 238°. II is obtained when the nitration mixt. is poured into H<sub>2</sub>O as a yellowish brown ppt. III was obtained on concg. the alc. mother liquor from I as a yellow substance, purified by soln. in HCl, decolorization, addn. of NH<sub>4</sub>OH, and recrystn. from EtOH. Diazotization with 6 g. NaNO<sub>2</sub> in 15 cc. H<sub>2</sub>O of 10 g. I in 25 cc. concd.

HCl and 100 cc. H<sub>2</sub>O at 0° with mech. stirring gave a product which was filtered and poured slowly into a soln. of CuCN, maintained at 60–70°. The mixt. was heated 1 hr., aerated, cooled and the dark yellow product dried and extd. with Et<sub>2</sub>O in a Soxhlet app. The Et<sub>2</sub>O ext. was washed with dil. NaOH and H<sub>2</sub>O, and dried with CaCl<sub>2</sub>. Evapn. of the Et<sub>2</sub>O gave 0.5 g. of a new compd., 2,2'-dinitro-4,4'-dicyanobenzidine, m. 208–9° (decompn.), from EtOH. I (5 g.) on diazotization and reaction with CuCl in HCl at 70–80° in CO<sub>2</sub> gave a solid which by extn. with Et<sub>2</sub>O, neutralization, desiccation, and evapn. of the Et<sub>2</sub>O gave 0.5 g. of 2,2'-dinitro-4,4'-dichlorobiphenyl, m. 139–40°, from EtOH. Similarly 5 g. I with CuBr gave 0.9 g. of 2,2'-dinitro-4,4'-dibromobiphenyl, m. 138°.

Lewis W. Butz

**Di-*p*-substituted derivatives of diphenylmethane and diphenylethane.** T. Reichstein and R. Oppenauer. *Helv. Chim. Acta* 16, 1373–80(1933).—Compds. of the series (*p*-RC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>CH<sub>2</sub> (I) and (*p*-RC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>CHCH<sub>3</sub> (II) (R = CH<sub>2</sub>Cl, CH<sub>2</sub>OAc, CH<sub>2</sub>OH, CHO, CH<sub>2</sub>CN and CH<sub>2</sub>CO<sub>2</sub>H) have been prepd. to serve as intermediates in the formation of compds. contg. 2 benzene nuclei with duplicate linkages in the *p*-position of the type

(CH<sub>2</sub>)<sub>x</sub>.C<sub>6</sub>H<sub>4</sub>.(CH<sub>2</sub>)<sub>y</sub>.C<sub>6</sub>H<sub>4</sub>. With *x* and *y* = 2 and *x*

and *y* = 3 compds. having the formation tendency of the usual 4- and 6-C atom rings should result. For *x* = 1 and 2 and with a relatively large *y* value the free rotation between the 2 nuclei should be annulled with the consequent appearance of optically active forms of derivs. of these systems with a substituent in 1 of the nuclei. By mechanically shaking 200 g. PhCH<sub>2</sub>Cl and 60 g. of polyoxymethylene with 575 g. 84% H<sub>2</sub>SO<sub>4</sub> for 3 hrs. below 20° and extg. with Et<sub>2</sub>O a crude product was obtained which yielded after fractional distn. and distn. in a high vacuum 11.5 g. of 4,4'-dichloromethyldiphenylmethane (III) (I, R = CH<sub>2</sub>Cl), C<sub>18</sub>H<sub>14</sub>Cl<sub>2</sub>, m. 110° (cor.), b<sub>2</sub> 180° (slight decompn.). Reduction of III with Zn dust and AcOH for 6 hrs. under reflux yielded a hydrocarbon, which after vacuum distn., washing in pentane with concd. H<sub>2</sub>SO<sub>4</sub>, distn. over Na and crystn. from MeOH at –40°, proved to be 4,4'-dimethyldiphenylmethane, b<sub>12</sub> 165°, m. 28.5°, identical with a sample prepd. by the reduction of (*p*-MeC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>CO. The 2 CH<sub>2</sub>Cl groups in III show reactivity analogous to that known in PhCH<sub>2</sub>Cl. Boiling with AcONa in AcOH gave the glycol acetate (I, R = CH<sub>2</sub>OAc), m. 50°, hydrolyzed to an 82% yield of the glycol (I, R = CH<sub>2</sub>OH), m. 123° (cor.). A soln. of the glycol in CHCl<sub>3</sub> was oxidized at room temp. with NaO<sub>4</sub> (*J. Chem. Soc.* 71, 1056(1897)) to 93% yields of the di-aldehyde, (I, R = CHO), m. 85.5–6° (cor.); in evacuated tube; the aldehyde oxidizes slowly in the air; dioxime, C<sub>18</sub>H<sub>14</sub>N<sub>2</sub>O<sub>2</sub>, m. 184°. The dioxime was transformed by refluxing with a ten-fold excess of Ac<sub>2</sub>O for 2 hrs. into 4,4'-dicyanodiphenylmethane (I, R = CN), m. 167° (cor.) (Schopf, Ber. 27, 2325(1894)). In contrast to Connerade (C. A. 27, 716), R. and O. did not observe any mentionable amt. of polymerization in this transformation. As starting material for series II, bibenzyl (II, R = H), m. 51°, b<sub>10</sub> 158°, was readily prepd. in 82% yields from PhCH<sub>2</sub>Cl and Et<sub>2</sub>O and iodized Mg. By reduction with HClIO or with (ClCH<sub>2</sub>)<sub>2</sub>O according to Stephen (C. A. 14, 2338) 45–50% yields of 4,4'-dichloromethyldiphenylethane (II, R = CH<sub>2</sub>Cl), m. 95–6° (cor.), b<sub>2</sub> 190°, were obtained. This compd. was reduced by excess Zn dust in AcOH with the addn. of a few drops of aq. CuSO<sub>4</sub> soln. to the known (*p*-MeC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>CH<sub>2</sub>, m. 82° (Moritz and Wolfenstein, Ber. 32, 2532(1899)). In a manner similar to the prepn. of the corresponding members of series I were prepd. the following derivs. of series II: R = CH<sub>2</sub>OAc, m. 123° (cor.); CH<sub>2</sub>OH, m. 161° (cor.), b<sub>2</sub> 192°; CHO, m. 126° (in evacuated tube); CH<sub>2</sub>CN, m. 130°, was prepd. from the di-Cl deriv. by heating with NaCN in alc. The dinitrile was saponified to the corresponding dicarboxylic acid which, as the Ce salt, was dry-distd. *in vacuo*, at 450°. On working up the product some (*p*-MeC<sub>6</sub>H<sub>4</sub>)<sub>2</sub> and a little (*p*-MeC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>)<sub>2</sub> were recovered but no cyclic ketone. The

cyclization expts. will be repeated with acids contg. the  $\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$  group and also with other derivs.

C. R. Addinall

**3,6-Dinitro-2,7-dihydroxyfluoran as a reagent for the detection of reducing sugars.** M. Dominikiewicz. *Roczniki Chem.* 12, 686-92(1932).—2,7-Dinitro-3,6-dihydroxyfluoran yields with KOH-EtOH an orange K salt, an orange-brown K<sub>2</sub> salt, and a violet K<sub>3</sub> salt; the last 2 dissociate on diln. with H<sub>2</sub>O to yield the K salt. 3,6-Dinitro-2,7-dihydroxyfluoran (I) gives an orange-brown K<sub>2</sub> salt, which readily dissociates, yielding an orange K salt, reduced to 2,7-dihydroxyrhodamine by glucose, fructose, mannose, galactose, arabinose, xylose, lactose, and maltose, but not by sucrose, raffinose, starch and inulin or by sorbitol, dulcitol, mannitol, glycerol, glyoxal, glyceraldehyde,  $\text{CH}_2\text{O}$ ,  $\text{HCO}_2\text{H}$  or  $\text{H}_2\text{C}_2\text{O}_4$ . Reducing sugars are detected by adding I to the alk. soln., when a cerise coloration develops, changing to an intense orange fluorescence on acidification. This method serves for the detection of not less than 0.01275 mg. per cc. of sugar. B. C. A.

**Isomeric transformations of hydrocarbons  $\text{C}_{26}\text{H}_{20}$ , isomers of 1,3,1',3'-tetraphenyl-1,1'-dihydorrubene.** Antoine Willemart. *Compt. rend.* 197, 1420-32(1933); cf. Dufraisse, C. A. 27, 1840—PhC·CCPh<sub>2</sub>Cl (I) by the action of metals yields: a colorless compd., m. 250°, loses solvent and m. again 317-8°, sepd. by alternate recrystns. from acetone and EtOAc from a yellow isomer, m. 249°, which corresponds to the yellow  $\text{C}_{26}\text{H}_{20}$  obtained by heating I. These substances are isomers of 1,3,1',3'-tetraphenyl-1,1'-dihydorrubene. R. B.

**Isomeric transformations of the hydrocarbons,  $\text{C}_{26}\text{H}_{20}$ , isomers of the 1,3,1',3'-tetraphenyl-1,1'-dihydorrubene. Description of a new isomer.** Antoine Willemart. *Compt. rend.* 197, 1659-61(1933).—The colorless hydrocarbon  $\text{C}_{26}\text{H}_{20}$ , m. 179° (cf. Moureu, et al., C. A. 21, 1980), heated in xylene with  $\text{K}_2\text{Fe}(\text{CN})_6$  yields a yellow isomer, m. 225°.  $\text{CrO}_3$  oxidation of the yellow hydrocarbon  $\text{C}_{26}\text{H}_{20}$ , m. 249° (preceding abstract), gives  $\text{BzOH}$ ,  $\text{o-BzC}_6\text{H}_4\text{CO}_2\text{H}$ ,  $\text{Ph}_2\text{CO}$  and traces of an unidentified compd., m. 240°.  $\text{KMnO}_4$  in acid soln. gives a quant. yield of  $\text{C}_{26}\text{H}_{20}\text{O}_2$ , m. 277°. W. J. Peterson

**Synthesis of 2-propionyl- and 2,7-dipropionylfluorene.** K. Dziewotński and J. Schweiger. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1932A, 293 9.—Interaction of fluorene,  $\text{EtCOCl}$  and  $\text{AlCl}_3$  in  $\text{CS}_2$  gives the 2-COEt and 2,7-(COEt)<sub>2</sub> derivs., identified by Beckmann rearrangement of their oximes to 2-propionamido- and 2,7-dipropionamidofluorenes and hydrolysis of these to the known amines. The following are described: 2-fluorenyl Et ketone (I), m. 120-1° (oxime, m. 185 6°); phenylhydrazones, m. 155-6°; 2,7-dipropionylfluorene, m. 216-7° (dioxime, m. 219-20°); 2-propionamidofluorene, m. 202-3°, and 2,7-dipropionamidofluorene, m. 286-7°. By oxidation of I with  $\text{Na}_2\text{Cr}_2\text{O}_7$  and  $\text{AcOH}$  2-fluorenyl Et ketone, m. 169-70° (bisphenylhydrazones, m. 186 7°), and fluorene-2-carboxylic acid, m. 340°, are formed. B. C. A.

**Substances related to rubene.** Charles Dufraisse and Paul Chovin. *Compt. rend.* 197, 1127-9(1933); cf. C. A. 27, 716.—Et benzoylpyruvate was treated with  $\text{PCl}_5$ , but the product was not the chlororubene ester analogous to the deriv. of  $\text{CH}_2\text{Bz}_2$  obtained by this reaction. A red nonchlorinated substance (I) was obtained which was fluorescent and gave a characteristic absorption spectrum. The percentage compn. is that of a rubene. A similar compd. was made by a different method by von Pechmann but its constitution was not established. A comparative study will be reported later. Details of the method of prepn. are not given. Yields vary from 3 to 6%. After recrystn. from benzene the red crystals m. 317° and sublime unaltered. Solns. in org. solvents fluoresce like the rubenes. I has two absorption bands (5050 and 5400 Å.) approaching the characteristic bands of the rubenes. However, irradiation of a soln. in contact with air does not cause oxidation, the very slow decoloration being probably due to a secondary reaction with oxidized solvent; the product is not a thermolabile oxide. The empirical formula is  $(\text{C}_{26}\text{H}_{20})_n$ . In rubenes of similar

spectrum  $n$  is 4; the volatility of I would preclude higher values. This formula indicates a loss of  $2\text{H}_2\text{O} + \text{O}_2$  in the reaction. Further study of the loss of  $\text{O}_2$  under non reducing conditions is expected to aid in explaining the mechanism of the reaction as well as the constitution of I. Anne E. White

**Dissociable organic oxides. XIV. A violet chloro compound in the 1,1'-phenylenrubene series.** Charles Dufraisse, Raymond Buret and Raymond Girard. *Bull. soc. chim.* 53, 782-8(1933); cf. C. A. 27, 716.—Dichlorodiphenylrubene, heated 2.5 hrs. in *vacuo* at 200°, yields 75% of 3-chloro-3'-phenyl-1,1'-phenylenrubene (I), violet, m. 274°.  $\text{C}_{26}\text{H}_{19}\text{Cl}$ , fused and heated 1 hr. at 230°, yields 40% of I. I gives an absorption spectrum similar to that of diphenylphenylenrubene (II) and undergoes autooxidation in soln.; this is confirmatory evidence of the structure previously advanced for II. A. F. Shepard

**Electrochemical contribution to the problem of the constitution of triarylmethyl salts.** P. Rumpf. *Compt. rend.* 198, 269 72(1934).—The 2 values  $\text{pK}_\text{H}$  and  $\text{pK}_\text{H}$  have been detd. by electrometric titration in dil. alc solns. for the 1st and 2nd basic functions of some sym aromatic diamines. The values show regularly the effect of constitutional differences. W. J. Peterson

**Condensation of aldehydes with hydrazones. VIII. Heterocyclic nuclei with eight atoms.** A. Giacalone. *Gazz. chim. ital.* 63, 764 6(1933); cf. C. A. 27, 3200. In the previous work, the constitution of the compd  $\text{C}_{24}\text{H}_{20}\text{N}_4$  was identified as either I or II (see below)

$\text{PhHC NN} \cdot \text{CHPh} \cdot \text{NN} \cdot \text{CHPh}$

Further expts. to establish which formula is correct led to the prepn. of I by a different method. BzH condensed with  $p\text{-MeC}_6\text{H}_4\text{NH}_2$  to  $[3,6\text{-Me}(\text{H}_2\text{N})\text{C}_6\text{H}_3]\cdot\text{CHPh}$  (III) (cf. *J. prakt. Chem.* 36, 263(1887)). III, diazotized in HCl with  $\text{NaNO}_2$ , heated with  $\text{Na}_2\text{SO}_3$  at 80°, reduced with Zn and  $\text{AcOH}$  and pptd. with HCl, yields the corresponding hydrazine, viz., 2,2'-dihydrazino-5,5'-dimethyltritylphenylmethane-HCl,  $\text{C}_{24}\text{H}_{24}\text{N}_4 \cdot 2\text{HCl}$ , yellow, m. 190°, stable in dry air. With alc. BzH it ppts. 2,2'-bis(benzylidenetriphenyl)-5,5'-dimethyltritylphenylmethane (IV), pale yellow, m. 88°. A mixt. of IV, BzH and concd.  $\text{H}_2\text{SO}_4$  let stand, eliminates water with formation of the condensation compd. I, yellowish, m. 151 2°. It differs from the condensation product of BzH and  $p$ -tolylhydrazine, and therefore the  $\text{C}_{24}\text{H}_{20}\text{N}_4$  compd. of the previous work (loc. cit.) probably has the constitution II. Attempts to synthesize it directly were unsuccessful. Because of its 2 asym. C atoms, it was thought possible to sep. II into optical antipodes, but since it has no acid or basic function attempts were made to prep. an analogous compd. with such a function. Benzylidenetriphenyl- $p$ -benzoic acid,  $p\text{-PhCH NNHC}_6\text{H}_4\text{CO}_2\text{H}$ , prepd. directly from alc.  $p\text{-H}_2\text{NNHC}_6\text{H}_4\text{CO}_2\text{H} \cdot \text{HCl}$  and BzH, m. 221°. No conditions were found under which it would condense with BzH. C. C. Davis

**Behavior of phenylhydrazones with condensing agents III. A. Giacalone. *Gazz. chim. ital.* 63, 757-80(1933) cf. C. A. 27, 70.**—Hot alc.  $\text{PhHNNH}_2 \cdot \text{HCl}$  (I) and all aromatic aldehydes studied (except  $p\text{-Me}_2\text{NC}_6\text{H}_4\text{CHO}$  and nitrobenzaldehydes) form, sometimes with the intermediate formation of the phenylhydrazone, the corresponding derivs. of  $\text{Ph}_2\text{CH}$ , some of which have already

been described. *o*- and *m*-MeC<sub>6</sub>H<sub>4</sub>NHNH<sub>2</sub>·HCl (II and III) form the corresponding Ph<sub>3</sub>CH derivs. directly, while *p*-MeC<sub>6</sub>H<sub>4</sub>NHNH<sub>2</sub>·HCl forms only the phenylhydrazone, because of the occupation of the *p*-position. The expts. show that HCl, in virtue of its salification of the hydrazine, is sufficient to bring about the condensation. A boiling alc. suspension of I (2 mols.) and BzH (3 mols.) forms transiently PhCH:NNHPh, which is transformed into *di*bensaldihydrazinotriphenylmethane (IV) (cf. C. A. 24, 837). When cold the formation of IV is slower and the yield is lower. Likewise I and anisaldehyde form 4,4'-bis(4-methoxybenzylidenetriphenylmethane) - 4'-methoxytriphenylmethane (cf. C. A. 25, 1507); I and *o*-HOC<sub>6</sub>H<sub>4</sub>CHO form 4,4'-bis(2-hydroxybenzylidenetriphenylmethane) - 2'-hydroxytriphenylmethane (cf. C. A. 25, 1507); I and *p*-MeC<sub>6</sub>H<sub>4</sub>CHO form 4,4'-bis(4-methylbenzylidenetriphenylmethane) - 4'-methyltriphenylmethane (cf. C. A. 27, 70); and I and *p*-HOC<sub>6</sub>H<sub>4</sub>CHO form 4,4'-bis(4-hydroxybenzylidenetriphenylmethane) - 4'-hydroxytriphenylmethane, yellowish, m. 192-3°. II and BzH form an oil which, refluxed with EtOH, yields 4,4'-bis(benzylidenetriphenylmethane) - 3,3'-dimethyltriphenylmethane, reddish yellow, m. 200°. Likewise III and BzH yield an oil which in turn yields 4,4'-bis(benzylidenetriphenylmethane) - 2,2'-dimethyltriphenylmethane, yellow, m. around 180°.

C. C. Davis  
 $\beta$ -Naphthylethyl alcohol and  $\beta$ -vinyl-naphthalene. Denise Sontag. *Compt. rend.* 197, 1130-2 (1933); cf. C. A. 26, 4325. C<sub>10</sub>H<sub>8</sub> is autoclaved with excess PH<sub>2</sub> at 170° to give  $\beta$ -C<sub>10</sub>H<sub>7</sub>Br (I). Mg in ether is added to I, the ether evapd. and enough heat applied to cause formation of  $\beta$ -naphthylethyl alc. (II), b<sub>10</sub> 178-88°, m. 67.5-8°. There is also formed a resinous residue having the properties of the polyvinyl-naphthalene which must be the result of spontaneous dehydration during distn. Three less satisfactory methods of prepn. are recorded. Five g. of II and 7 g. fused KOH are heated together. Much gas is evolved and the solid  $\beta$ -vinyl-naphthalene (III) is obtained, b<sub>10</sub> 135-7°. After recrystn. it m. 66°. III is much more stable than the liquid  $\alpha$ -isomer, and also gives a di-Br deriv. m. 84.5-5°.  $\beta$ -C<sub>10</sub>H<sub>7</sub>Ac was reduced with 2% Na-Hg to a product which might be  $\beta$ -C<sub>10</sub>H<sub>7</sub>CH(OH)Me but it has not been completely identified. A. E. W.

Oxidation products of 5-acetylacenaphthene. K. Dzic-wolski and Sz. Piasecki. *Bull. intern. acad. polonaise, (classe sci. math. nat.)* 1932A, 287-92 (in German). --Oxidation of 5-acetylacenaphthene with Na<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> in AcOH at 85° gives in addn. to other oxidation derivs. 5-acetyl-acenaphthenequinone (I) (C. A. 25, 1518). Purification of the crude oxidation product by coupling it with NaHSO<sub>3</sub> and decompu. with acids, yields I in chem. pure form, without contamination with 5-acetylacenaphthalic anhydride (II), m. 191-2°. Both compds. obtained simultaneously on oxidation of 5-acetylacenaphthene are very similar in their soly. in H<sub>2</sub>O, alkalis and org. solvents. Differentiation is best effected by formation of the red lake dye (III) from I, or the tris(phenylhydrazone) of I. I, C<sub>14</sub>H<sub>8</sub>O<sub>4</sub>, yellow needles, m. 181-2°,

difficultly sol. in hot H<sub>2</sub>O, sol. in EtOH, AcOH and C<sub>6</sub>H<sub>6</sub>. Aq. alk. solns. are dark purple, solns. in concd. H<sub>2</sub>SO<sub>4</sub> dark red. Trioxime, yellowish, m. 242° (decompn.). Tris(phenylhydrazone), brown-yellow needles, m. 222-4°. III, C<sub>14</sub>H<sub>8</sub>O<sub>4</sub>S, by treating I in hot EtOH with  $\beta$ -hydroxythionaphthene and Na<sub>2</sub>CO<sub>3</sub> soln., red needles, m. 260-1°. The alk. hyposulfite lake stains cotton with a reddish tint. Di-Me 5-acetylacenaphthalate, C<sub>16</sub>H<sub>14</sub>O<sub>6</sub>, by heating II in a 10% Na<sub>2</sub>CO<sub>3</sub> with Me<sub>2</sub>SO<sub>4</sub> for 3 hrs., m. 112-14°. Oxime of II, C<sub>16</sub>H<sub>14</sub>O<sub>3</sub>N<sub>2</sub>, m. 275-8°. Bis(phenylhydrazone) of II, red needles, m. 241-2°. 5-Acetyl-

naphthalimide, C<sub>14</sub>H<sub>8</sub>O<sub>3</sub>N<sub>2</sub>, by refluxing II and concd. NH<sub>4</sub>OH for 6 hrs., m. 270-2°. J. Wiertelak

Selective catalytic reduction of ketones. II. N. D. Zelinskii, Kurt Packendorff and L. Leder-Packendorff. *Ber.* 67B, 300-2 (1934); cf. C. A. 27, 3704. --The ease with which ketones having the C=O in the  $\alpha$ -position to a benzene nucleus are reduced is shown by a no. of further examples. The reduction proceeds through the HO group and carbinols with the C(OH) group in the  $\alpha$ -position to a benzene nucleus can likewise be reduced. 1-Indanone yielded indan, b<sub>100</sub> 175°, n<sub>D</sub><sup>20</sup> 1.5352; 1,3-indandione likewise gave indan; from di-Me 1,5-diketophenheptamethylene-2,4-dicarboxylate was obtained an oil, presumably the di-HO ester, which could not be distd. in *vacuo* without decompn.; BzII yielded PhMe; fural yielded silvane, b<sub>100</sub> 63°, n<sub>D</sub><sup>20</sup> 1.4342; PhCH<sub>2</sub>OH gave PhMe; mandelic acid yielded PhCH<sub>2</sub>CO<sub>2</sub>H almost quantitatively and its nitrile gave PhCH<sub>2</sub>CN which on further hydrogenation gave some PhCH<sub>2</sub>CH<sub>2</sub>NH<sub>2</sub>.

C. A. R.

Ochracin, a new metabolic product of *Aspergillus ochraceus*. Teijiro Yabuta and Yusuke Sumiki. *J. Agr. Chem. Soc. Japan* 9, 1284-75 (1933). --The fermentation product of *Aspergillus ochraceus* on extn. with ether yielded ochracin, C<sub>10</sub>H<sub>10</sub>O<sub>4</sub>, prisms m. 58.8-5°. It gives a violet color with FeCl<sub>3</sub>; [ $\alpha$ ]<sub>D</sub> -124.80°. There is no double bond in the side chain. The compd. does not reduce Fehling soln. A mono-Me deriv., m. 88.9°; mono-Ac deriv., m. 126.7°, and mono-Bz deriv., m. 101-2°, were prepd. They give no color with FeCl<sub>3</sub>. A mononitro, m. 184.5°, and dinitro deriv., m. 161.2°, were prepd. They give a red color with FeCl<sub>3</sub>. When ochracin was fused with KOH at 270-80°, 2-methyl-6-hydroxybenzoic acid, m. 170-1°, was isolated. With 90% KOH at 205.10°, a hydroxybenzoic acid, C<sub>8</sub>H<sub>6</sub>O<sub>4</sub>, m. 136.7°, was obtained. Its constitution was not ascertained. Ochracin has no MeO, CH<sub>3</sub>O, or CO group. Methylochracin oxidized with KMnO<sub>4</sub> gave 3-methoxyphthalic acid, m. 172.3°. From these facts the constitution of ochracin is given as

Ochracin is supposed to be identical with mellein which Nishikawa found in the metabolic products of *Aspergillus melleus* Yukawa. Y. Kihara

Anthraflavone derivatives. Henri de Diesbach and Salvador Gil Quinza. *Helv. Chim. Acta* 17, 105-13 (1934). --Both *cis*- and *trans*-forms of  $\alpha,\beta$ -di-2-anthraquinonylethylene (I) are theoretically possible. The formation of diphthalylphenanthrene by the fusion of the 2 anthraquinone nuclei of I has never been accomplished and this failure, together with the tinctorial properties of I, suggests the *cis*-formation for the compds. D. and Q. have attempted unsuccessfully the formation of the isomeric form by transforming the double bond into a single linkage by addn. of 2 halogen or 2 H atoms and by replacing the CH: groups by CO, followed by reestablishment of the double linkage. Chlorination of I by passing Cl through solns. of I in concd. H<sub>2</sub>SO<sub>4</sub> or PhNO<sub>2</sub> gave a mono-Cl deriv., C<sub>20</sub>H<sub>17</sub>ClO<sub>4</sub>, m. 284-6°, from which the Cl atom was not eliminated by powd. Cu, PhNEt<sub>3</sub>, nor by a hyposulfite bath. By heating I in PhNO<sub>2</sub> with SO<sub>2</sub>Cl<sub>2</sub> and a trace of I, a crude compd. contg. nuclear Cl was formed. Elimination of the ring Cl by heating with powd. Cu yielded a di-Cl deriv., (RCHCl)<sub>2</sub> (R = 2-anthraquinonyl), C<sub>20</sub>H<sub>16</sub>Cl<sub>2</sub>O<sub>4</sub>, m. above 320°, which regenerated I on heating with PhNEt<sub>3</sub> or in a hyposulfite bath. A suspension of I in glacial AcOH was not reduced on continued exposure to bright sunlight (C. A. 19, 1570) but reduction with Al-bronze powder and a mixt. of AcOH and HCl or with concd. H<sub>2</sub>SO<sub>4</sub> gave  $\alpha,\beta$ -di-2-anthraquinonylethylene, C<sub>20</sub>H<sub>14</sub>O<sub>4</sub>, m. 330-2° (Maquenne block); mono-Br deriv., C<sub>20</sub>H<sub>17</sub>BrO<sub>4</sub>, m. above 315°, which regenerates I on heating with PhNEt<sub>3</sub>. I is not reduced by Cu and AcOH, HCl or concd. H<sub>2</sub>SO<sub>4</sub> or on catalytic hydrogenation. It is remarkable that the Al-bronze-AcOH-HCl reduction affects only the double linkage and

leaves the anthraquinone nuclei intact. The synthesis of the diketone RCOCOR (II) was carried out analogously to that of dianthraquinonyl ketone (C. A. 27, 287), commencing with (*p*-MeC<sub>6</sub>H<sub>4</sub>CO)<sub>2</sub> (III), prep'd. according to Stierlin (*Ber.* 22, 380(1889)) from *p*-MeC<sub>6</sub>H<sub>4</sub>CHO. The gradual addn. of 8.5 g. of KNO<sub>3</sub> to 10 g. III in 120 g. conc'd. H<sub>2</sub>SO<sub>4</sub> maintained below 40°, gave, after trituration with H<sub>2</sub>O, washing with dil. NH<sub>4</sub>OH and H<sub>2</sub>O and recrystn. from glacial AcOH, 53% of pure *bis*(3,3 - dinitro - 4,4 - dimethyldiphenyl)diketethane, C<sub>28</sub>H<sub>18</sub>N<sub>4</sub>O<sub>8</sub> (IV), m. 181-2°, giving a yellow soln. with H<sub>2</sub>SO<sub>4</sub>, changing through carmine-red to violet on addn. of a trace of thiophene. IV was reduced by SnCl<sub>2</sub> in HCl to the corresponding amino comp'd. C<sub>28</sub>H<sub>22</sub>N<sub>2</sub>O<sub>2</sub>, m. 159°, which was converted through the dinitrile, C<sub>28</sub>H<sub>18</sub>N<sub>4</sub>O<sub>2</sub>, m. 207°, to the dicarboxy comp'd. (V), C<sub>28</sub>H<sub>14</sub>O<sub>6</sub>, m. 318-9°. On heating with PCl<sub>5</sub> in a little benzene V was changed to the acid chloride. After removal by vacuum distn. of the benzene and the POCl<sub>3</sub> formed in the reaction the residue was taken up in benzene and heated with AlCl<sub>3</sub> to give *bis*(3,3 - dibenzoyl - 4,4 - dimethyldiphenyl)diketethane, C<sub>40</sub>H<sub>22</sub>O<sub>4</sub>, m. 143°. Cl was passed through a soln. of this ketone in C<sub>6</sub>H<sub>5</sub>Cl at 180-90° for 3 hrs. On addn. of Et<sub>3</sub>O to the cooled soln. *bis*(*ms*-dichloro-2-anthryl)-diketethane, C<sub>20</sub>H<sub>14</sub>Cl<sub>2</sub>O<sub>4</sub>, m. 185°, was formed. This was transformed by heating with conc'd. H<sub>2</sub>SO<sub>4</sub> into *ds*-2-anthraquinonyldiketethane (VI), C<sub>20</sub>H<sub>14</sub>O<sub>6</sub>, m. 280°. When refluxed in alk. soln. VI turns green, then red and forms a ppt. On exposure to air the soln. is immediately decolorized with formation of anthraquinone-2-carboxylic acid. Evidently the -CO.CO- chain is cleaved by oxidation accompanied by reduction of the original product (green coloration) and of the anthraquinone nuclei (red coloration). The hyposulfite bath similarly changes VI into the carboxylic acid. By heating a mixt. of VI and *o*-(H<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>4</sub>·2HCl in alc. for 10 hrs. was formed 3,3-di-2-anthraquinonylquinoxaline, C<sub>26</sub>H<sub>18</sub>N<sub>2</sub>O<sub>4</sub>, m. 326.5°, in yellow crystals with no tinctorial properties. With N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O in alc. VI gave, on heating for 8 hrs., *ds*-2-anthraquinonylhydrazonoketethane, C<sub>20</sub>H<sub>14</sub>N<sub>2</sub>O<sub>4</sub>, m. 265° (decompn.). This comp'd. gave, when heated in a sealed tube at 160° for 10 hrs. with EtONa,  $\alpha,\beta$ -di-2-anthraquinonyl- $\alpha$ -hydroxyethane, RCH<sub>2</sub>CH(OH)R, C<sub>20</sub>H<sub>14</sub>O<sub>4</sub>, in red-orange crystals colored green by alkalis and giving a green conc'd. H<sub>2</sub>SO<sub>4</sub> soln. C. R. Addinall

The rotatory dispersion of the acyclic terpene alcohols, C<sub>10</sub>H<sub>18</sub>O, from the essences of citronella, geranium and rose. Charles Lagneau. *Compt. rend.* 198, 166-8(1934). - Since there are conflicting views on the constitution of these alcs., L. has tried to learn something from their powers of rotatory dispersion. Five samples were investigated: com. *d*-citronellol (I) from essence of citronella, com. *l*-citronellol (II) from geranium, com. *l*-rhodinol (III) from geranium, c. p. *l*-rhodinol (IV) prep'd. from essence of rose, and pure essence of rose (V). The sp. rotation of each was det'd. by using the yellow, green and indigo lines of Hg. A preliminary chem. test showed that the samples were not all pure. The sp. rotations also varied, but the ratio of the sp. rotation of the indigo line to that of the yellow line did not. This dispersion for I, IV and V was 2.03, an indication that they are optical isomers. The abs. value of I was less than that of IV. This may have been due to the presence of the racemate. The dispersion of II and III was 2.41 and 2.44, an indication that they are the same comp'd. and different from the others. John E. Milbery

Catalytic pressure hydrogenation of decacyclene and rubicene. Julius v. Braun, with Gottfried Manz and Werner Keller. *Ber.* 67B, 214-18(1934). - The pressure reduction of fluoranthene (I) proceeds in well-defined steps, the aromatic rings 1, 3 and finally 2 being successively hydrogenated with formation of tetra-, deca- and perhydrofluoranthene, resp. (C. A. 25, 1244). It was of interest to det. whether decacyclene (II) and rubicene (III), in which the structural elements of I are, so to speak, repeated 3 and 2 times, resp., would behave in the same way. With a Ni catalyst at high temps. and pressures, II and III can be readily hydrogenated and under the

proper conditions it is not difficult to obtain homogeneous products. II in the 1st stage takes up 12 H atoms, i. e., rings 1, 1' and 1'', first add 4 H atoms each, but in the next stage rings 2, 2' and 2'' add 6 atoms H each and the resulting trisdecacyclodecacyclene, C<sub>24</sub>H<sub>24</sub> (IV), resists further hydrogenation. With III the hydrogenation, even when effected cautiously, does not stop with ring 1 and 1'; rings 3 and 3' are also hydrogenated (20 atoms H are taken up) and, in fact, a part of III is even hydrogenated to the perhydro deriv. C<sub>24</sub>H<sub>24</sub> (V). IV, obtained by hydrogenation of II free of all S-contg. impurities, m. 215°, is not attacked in the slightest by conc'd. H<sub>2</sub>SO<sub>4</sub> at 50-60°, gives mellitic acid with HNO<sub>3</sub> in sealed tubes at 160°, b<sub>2</sub> above 360° as a viscous light yellow oil solidifying to a glass which on long standing changes back into the crystals; on distn. from PbO it undergoes deep-seated decompn. Attempts to partially dehydrogenate it with S were not very successful; heated with 7 atoms S at 200° and 20 mm. in N until the evolution of H stopped (about 12 hrs.), it yielded about 20% of a yellow cryst. powder, m. 245° having the compn. C<sub>24</sub>H<sub>18</sub>. By starting with II which still contains about 1% S, the hydrogenation stops with the absorption of 18-20 atoms H and there is obtained 70% of the dodecacyclodecacyclene, C<sub>24</sub>H<sub>20</sub>, golden yellow, m. 303-6°. V, which is also readily obtained from III in boiling AmOH slowly treated with an excess (40 atoms) of Na, m. 55-65°, b<sub>2</sub> 254-6° (apparently with slight dehydrogenation). The dehydrogenation becomes quite distinct when V is heated with O-contg. solvents; e. g., when it is dissolved in hot AcOEt and allowed to cool it gives about 10% of a comp'd. C<sub>24</sub>H<sub>18</sub>, m. 246-8°. With Ni in decalin at 250° under about 200 atm. H pressure, III rapidly absorbs almost 20 atoms H and gives, together with some V, 85% of the comp'd. C<sub>24</sub>H<sub>18</sub>, m. 165-74°, and a little of a comp'd. C<sub>24</sub>H<sub>16</sub>, m. 271-3°.

C. A. R

The production of furfural from concentrated solutions of xylose. Richard Lindley Foster. *Iowa State Coll. J. Sci.* 8, 191-6(1933). - The % of furfural, X, in a soln. in PhMe may be det'd. by the equation,  $S_8 = S_T + [(S_1 - S_T)S_T]/X$ , in which  $S_8$ ,  $S_T$  and  $S_1$  are the sp. grs. resp. of the soln., of PhMe and of furfural. The errors are less than 1%, up to 40% furfural. Benzene and CCl<sub>4</sub> may be substituted for PhMe. Furfural was produced by treating xylose in conc'd. solus. with various acids and salts and removing the furfural as formed, by the use of a solvent for furfural, immiscible with water. Variation of the proportion of PhMe from 20 to 300% of the vol. of the reaction mixt. did not change the yield of furfural. When the concn. of xylose was increased from 1% to 60%, the yield of furfural decreased but the decrease up to 20% was small. Concns. of HCl at 0.25, 0.50, 0.75, 1.00, 1.50 and 2.00 N were used each in the presence of 0, 5, 10, 15, 20, 25, 30, 35, 40 and 45% NaCl for periods of 2 to 10 hrs. The max. yield of xylose was 37 g. from 100 g. of xylose. This yield was produced by the following treatments: 0.50 N HCl, 45% NaCl, 8 hrs.; 0.75 N HCl, 35% NaCl, 6 hrs.; 1.00 N HCl, 35% NaCl, 4 hrs.; 1.50 N HCl, 30% NaCl, 4 hrs. and 2.00 N HCl, 25% NaCl, 2 hrs. The sum of the % increase in activity of the H ion and the % decrease in soly. of furfural due to the presence of the salt is approx. the % increase in yield of furfural during the early part of the run. F. E. B

Furfural and some of its derivatives. George F. Wright. *Iowa State Coll. J. Sci.* 8, 235-6(1933). - This paper is an

abstr. of a thesis and contains no detailed information. It deals with nuclear substitution on the furan ring. Precautions are necessary in working with positively-substituted furans in acid solns. Nitrofurans are especially sensitive to alkalis. All furans are thermally unstable. No attempt at sulfonation was successful. Nitrofurans can be formed by direct addn. of acetyl nitrate.  $\alpha$ -Bromo- or iodofurans could not be nitrated to form  $\beta$ -nitrofurans. The stability of halogenated furans is discussed especially with regard to the Grignard reagent.

F. R. Brown

The Grignard reaction with *l*-proline and *l*-hydroxyproline esters and with diketopiperazines. J. Kapfhammer and A. Matthies. *Z. physiol. Chem.* **223**, 43-52 (1933).—*l*-Proline Et ester (I) loses EtOH spontaneously at room temp., more rapidly when heated under pressure, to form the *anhydride* (II) or diketopiperazine deriv., m. 149°,  $[\alpha]_D^{25}$  -147.2°. I reacts with PhMgBr to form *pyrrolidylidiphenylcarbinol*, m. 83° (HCl salt, no m. p. up to 240°; *Bz* deriv., m. 183°), and with EtMgBr to form *pyrrolidylidethylcarbinol* (HCl salt, m. 158°). On account of its insol. in Et<sub>2</sub>O, II was added in PhOMe to the PhMgBr reagent, and *pyrrolidylidiphenylmethane-N-pyrrolidyl Ph Ketone* obtained, isolated as the *picrate*, m. 174-5°. *l*-Hydroxyproline Et ester HCl salt reacts with PhMgBr to form *hydroxypyrrolidylidiphenylcarbinol*, m. 187.8°. Like I, the hydroxyproline ester readily loses EtOH and goes into the corresponding *anhydride*, m. 245.6° (charring),  $[\alpha]_D^{25}$  -153.44°. Sarcosine anhydride in PhOMe reacts with PhMgBr yielding *methylaminoacetophenone* (*picrate*, m. 145.6°; HCl salt, m. p. not stated), and *sarcosylmethylaminoacetophenone*, analyzed as the *picrate*; and with EtMgBr yielding *2,5-tetraethyl-N,N'-dimethylpiperazine*, analyzed as the *picrate* and HCl salt.

A. W. Dox

Natural coumarins. X. Synthesis of osthole. Ernst Spath and Herbert Holzen. *Ber.* **67B**, 264-5 (1934); cf. *C. A.* **27**, 3712.—From 2,4-HO(MeO)C<sub>6</sub>H<sub>3</sub>CHO, refluxed in benzene with 1 atom Na and then boiled to neutral reaction with 1.1 mols. Me<sub>2</sub>C:CHCH<sub>2</sub>Br, is obtained 19.6% 3-isoamylmethylresorcyllaldehyde 4-Me ether, b<sub>10</sub> 118-22°, 2.5 g. of which, subjected to the Perkin coumarin synthesis, yields 0.165 g. osthole, m. 82-3° when crystd. from petr. ether or ether and not depressing the m. p. of the natural product. When osthole distd. in a high vacuum solidifies, it m. 62-3°, but on long standing, seeding or heating to 50-60°, it changes into the higher-melting dimorphous form.

C. A. R.

Synthesis of dihydroosthole from a degradation product of rotenone. Ernst Späth, Sankichi Takei and Shikuro Miyajima. *Ber.* **67B**, 262-3 (1934).—On the basis of the Späth and Pesta formula for osthole (*C. A.* **27**, 3712), dihydroosthole (I) should be 8-isoamyl-7-methoxycoumarin (II). Attempts to synthesize II from tetrahydrotubanol, 2,6-(HO)C<sub>6</sub>H<sub>3</sub>CH<sub>2</sub>CH<sub>2</sub>CHMe<sub>2</sub> (III), were unsatisfactory, and tetrahydrotubajic acid 4-Me ether, 2,4,3-HO(MeO)(iso-Am)C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>H, was accordingly decarboxylated at 220-30° *in vacuo* to the *Me* ether of III, b<sub>10</sub> 120°, which gave no color with FeCl<sub>3</sub> and which with malic acid and concd. H<sub>2</sub>SO<sub>4</sub> over a free flame yielded II, m. 85-5.5°, identical with I prepd. by partial hydrogenation of natural osthole with Pd-charcoal in AcOH.

C. A. R.

Isatogen and indole. XII. A new oxidation splitting of indoxyl derivatives by atmospheric oxygen in alkaline solution. Paul Ruggli, Arthur Zimmermann and Otto Schmid. *Helv. Chim. Acta* **16**, 1249-56 (1933); cf. *C. A.* **27**, 4782.—Air is sucked through 2-phenyl-6-nitroindoxyl in alc. NaOH. The resulting ppt. is *Et* 4-nitrobenzoylanthranilate (I), m. 179-80°; the *free acid* (II), m. 251° (rapid heating) or 240-6° (slow heating), is obtained from the mother liquor, or by sapon. of I. The constitution is proved by independent synthesis: The Ac deriv. of *p*-nitro-*o*-toluidine is oxidized with KMnO<sub>4</sub> to the corresponding acid; the Ac group is then replaced by a *Bz* group. The oxidation of 2-phenyl-5-styryl-6-nitroindoxyl by air in an alk. solution yields 4-nitro-5-

styrylbenzoylanthranilic acid, m. 279°. XIII. Acetyl derivatives of 2-phenyl-6-nitroindoxyl. *Ibid.* **17**, 9-22 (1934).—If the exptl. conditions are properly adjusted, the acetylation of a compd. contg. an OH and an NH group takes place on the OH or the NH, or on both. By adequate sapon., it is possible to revert from the *O,N*-di-Ac deriv. to either the mono-*O*- or mono-*N*-Ac deriv. The following new *derivs.* have been made of 2-phenyl-6-nitroindoxyl: *O*-Ac m. 191°; *O,N*-di-Ac m. 178°; *N*-Ac, m. 178-80°; *O*-Bz, m. 229°; *O,N*-di-Bz, m. 204°; *N*-acetyl-*O*-benzoyl, m. 184°; *N*-benzoyl-*O*-acetyl, m. 187-8°; *O*-phenylurethan, m. 214°; 3-carbethoxy, m. 170°; 2-phenyl-3-acetyl-6-acetamidindoxyl, m. 210-12° (*picrate*, m. 188°, Ac deriv. m. about 100°); 1-acetyl-2-phenyl-6-acetamidindoxyl, m. 217-19°, blackening about 210°.

Albert L. Henne

Acyl compounds of polymeric indoles. Consideration of the method of determining active hydrogen atoms. O. Schmitz-Dumont and K. Hamann. *J. prakt. Chem.* **139**, 167-79 (1934).—The Ac *derivs.* may be divided into 2 classes,  $\alpha$ - or *N*-Ac *derivs.*, which contain 1 less active H atom than the parent compd., and  $\beta$ -*derivs.*, which contain the same no. of active H atoms as the original compd. The  $\beta$ -*deriv.* does not result by a rearrangement of the  $\alpha$ -*deriv.* If the  $\beta$ -*deriv.* contained the acyl group on the  $\beta$ -C atom, they should behave as ketones; such ketone character could not be demonstrated; other possible structures for the  $\beta$ -*derivs.* are discussed. Diindole and Ac<sub>2</sub>O at room temp. give the  $\alpha$ -Ac *deriv.*, m. 158.5°; ClCO<sub>2</sub>Et gives the  $\alpha$ -carbethoxy *deriv.*, m. 130-1°; BzCl in PhMe gives at -8° the  $\alpha$ -Bz *deriv.*, m. 178-9°; Bz<sub>2</sub>O gives the same compd. but on heating at 160° there results the  $\beta$ -*deriv.*, m. 197.8°, while the former yields diindole on hydrolysis, the latter reacts very slowly with EtOH-KOH and yields no diindole. Tollylsulfonyldiindole, m. 186-7° (90% yield); this is probably an  $\alpha$ -*deriv.*  $\alpha$ -Benzoyldiindole, m. 212°;  $\alpha$ -carbethoxy *deriv.*, m. 155.6°;  $\alpha$ -tolylsulfonyl *deriv.*, m. 188-9°;  $\beta$ -carbethoxytriindole, m. 163.4°. A table gives the results of the active H detns.

C. J. West

Some azo derivatives of methyleneindolines. Elisa Ghigi. *Gazz. chim. ital.* **63**, 701-8 (1933).—The work is an extension of that of Rosenhauer in synthesizing indoline (cf. *C. A.* **18**, 2896; **19**, 61). *o*-MeC<sub>6</sub>H<sub>4</sub>NNH<sub>2</sub> and iso-PrCOMe (I), heated at 100°, yield the *o*-tolylhydrazones of I, iso-PrMeC:NNHC<sub>6</sub>H<sub>4</sub>Me-*o* (II), b<sub>10</sub> 176°. Prolonged heating of II with anhyd. ZnCl<sub>2</sub> in abs. EtOH in a current of N yields *bs-o*-methyl-*pr*-2,3,3-trimethylindoline (III), b<sub>10</sub> 135°. III and MeI, refluxed, yields the *MeI* *deriv.* (IV) of III, m. 245° (cf. 212° of a compd. thought to be this by Alois, *Monatsh.* **26**, 833 (1905)). When heated, IV and PhNIINH<sub>2</sub> react violently with evolution of NH<sub>3</sub>, and formation of PhNH<sub>2</sub> and a red compd., C<sub>19</sub>H<sub>23</sub>N<sub>3</sub>, m. 232° (decompn.). Decompd. with NaOH and treated with picric acid (V), it forms a *picrate*, C<sub>28</sub>H<sub>29</sub>O<sub>7</sub>N<sub>3</sub>, dark red, m. 208°. *bs-o*-Methyl-*pr*-1,3,3-trimethyl-2-methyleneindoline in dil. AcOH and PhN<sub>2</sub>Cl at 0° ppt., by addn. of AcONa, a *basic compd.*, C<sub>19</sub>H<sub>23</sub>N<sub>3</sub>, red-yellow, m. 146°. Refluxed in C<sub>6</sub>H<sub>6</sub> with V, it yields VI. Prepd. in an analogous way to II, the *m*-tolylhydrazones of I is a pale yellow oil, b<sub>10</sub> 190°. Prepd. like III, *bs-m*-methyl-*pr*-2,3,3-trimethylindoline (VII), m. 61-2°, b<sub>10</sub> 140°. *Picrate*, C<sub>19</sub>H<sub>21</sub>O<sub>7</sub>N<sub>3</sub>, yellow, m. 169°; *Bz* *deriv.*, C<sub>19</sub>H<sub>21</sub>ON<sub>3</sub>H<sub>2</sub>O, m. 186°. Refluxed with MeI, VII forms a *MeI* *deriv.*, C<sub>19</sub>H<sub>21</sub>N<sub>3</sub> (VIII), m. 230°. With PhNHNH<sub>2</sub>, the action is violent, as with IV, with formation of NH<sub>3</sub>, PhNH<sub>2</sub>, and a red compd., C<sub>19</sub>H<sub>23</sub>N<sub>3</sub>, m. 250°. Decompd. with NaOH it forms with V a *picrate*, C<sub>28</sub>H<sub>29</sub>O<sub>7</sub>N<sub>3</sub> (IX), dark red, m. 200°. *bs-m*-Methyl-*pr*-1,3,3-trimethyl-2-methyleneindoline and PhN<sub>2</sub>Cl at 0° ppt. the compd. C<sub>19</sub>H<sub>23</sub>N<sub>3</sub>Cl, orange-yellow, m. 240°. Decompd. with NaOH and extd. with Et<sub>2</sub>O, it yields the *free base*, m. approx. 90°, which with V forms IX. 1,3,3-Triethyl-2-methyleneindoline (X) and PhN<sub>2</sub>Cl at 0° give a pitchy product (XI) which, after decompn. with NaOH, yields a *picrate*, C<sub>27</sub>H<sub>29</sub>O<sub>7</sub>N<sub>3</sub>, lustrous red, m. 168°. The syntheses verify

the conclusion reached by Rosenhauer (*loc. cit.*) and by König (C. A. 18, 85, 8055) that elimination of *N*-alkyl groups in indoline bases does not take place, since the products formed by coupling and by the action of  $\text{PhNH-NH}_2$  on Mel derivs. of indolenines are the same. The ready formation of XI by coupling of X is contrary to the assertion of König (*loc. cit.*) that coupling is difficult with derivs. contg. Et groups in the 3-position. C. C. Davis

**Benzoyl derivatives of indigo.** II. Henri de Diesbach, Edouard de Bic and Fritz Rubli. *Helv. Chim. Acta* 17, 113 28(1934); cf. C. A. 27, 2149.—The melt from the alk. fusion of 20 g. of Ciba yellow (I) in 100 g. NaOH at 270–320° in a Cu or Ni crucible was poured onto a metal plate. The cold mass from 5 such operations was powd. and digested with 500 cc. of cold  $\text{H}_2\text{O}$ . The residue was extd. with 2 l. of cold  $\text{H}_2\text{O}$ , centrifuged and washed (voln. II). The insol. portion was digested with dil. HCl, yielding a mother liquor (III) and 52 g. of an acid-insol. residue (IV). On acidification II pptd. 22 g.  $\text{BzOH}$ , 8 g.  $\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2$ , and 4 g. of a yellow product (V). Neutralization of III with excess  $\text{NH}_4\text{OH}$  gave 11 g. of a substance (VI). There were also present as by-products 0.5 g. of  $\text{o-H}_2\text{NC}_6\text{H}_4\text{CO}_2\text{H}$  (VII) and 0.5 g. of an unknown alkali-sol. base. VI,  $\text{C}_{11}\text{H}_{10}\text{N}_2$ , m. 332° (mononstro deriv.,  $\text{C}_{11}\text{H}_9\text{N}_2\text{O}_3$ ), is probably a 3,4-indoloquinoline since on oxidation with  $\text{CrO}_3$  in glacial AcOH it gives 3,4-pyrroloquinoline-2',3'-dicarboxylic acid,  $\text{C}_{11}\text{H}_8\text{N}_2\text{O}_4$ , m. 325° (decompn.), decarboxylated by sublimation *in vacuo* at 325° to 3,4-pyrroloquinoline (VIII),  $\text{C}_{11}\text{H}_8\text{N}_2$ , m. 293–4°. Oxidation of VIII by  $\text{KMnO}_4$  gave a good yield of oxalylanthranilic acid, transformed by alk. sapon. into VII, proving that all the above derivs. have a quinoline nucleus in which the benzene ring is unsubstituted. Oxidation of VIII with  $\text{HNO}_3$  (d. 1.4) yielded 4-hydroxy-3-quinolinecarboxylic acid and thus the junction of the C atoms between the quinolinic and pyrrole nuclei is in position 3. The main product IV, 3,4-(*N*-hydroxyindolo)-2-hydroxyquinoline,  $\text{C}_{11}\text{H}_{10}\text{N}_2\text{O}_3$ , in. above 430°; dinitro deriv.,  $\text{C}_{11}\text{H}_8\text{N}_4\text{O}_6$ , was oxidized by  $\text{KMnO}_4$  to oxalylanthranilic acid and on treatment with  $\text{PCl}_5$  in  $\text{PhNO}_2$  yielded 3,4-(*N*-chloroindolo)-2-chloroquinoline, transformed by heating with a little  $\text{PhNH}_2$  in benzene to 3,4-(*N*-anilinoindolo)-2-chloroquinoline,  $\text{C}_{21}\text{H}_{14}\text{N}_2\text{Cl}$ , m. 195°, and on boiling in  $\text{PhNH}_2$  to 3,4-(*N*-anilinoindolo)-2-anilinoquinoline,  $\text{C}_{21}\text{H}_{16}\text{N}_4$ , m. 284°. The verity of these formulations is based on the well-established structure of VIII. The different results obtained by Hope and Richter (C. A. 27, 506) are attributed to the use of a steel tube in making the fusion, provoking a reduction of I to Höchst yellow which on alk. cleavage gives VII. The results of H. and R. are valuable since they demonstrate the smallness of the differences between the various products of the reaction of  $\text{BzCl}$  on indigo. Höchst yellow R (IX), m. 354°, prepd. by the action of cold  $\text{H}_2\text{SO}_4$  on the Dessoulay compd. was fused at 255° with NaOH. The cold mass was dissolved in  $\text{H}_2\text{O}$ , filtered and acidulated with HCl. The cryst. HCl salt in  $\text{H}_2\text{O}$  was neutralized with  $(\text{NH}_4)_2\text{CO}_3$  and the base on crystn. from alc. gave the 3-hydroxy-2-phenylquinoline-2'-carboxylic acid lactone (X),  $\text{C}_{16}\text{H}_{12}\text{NO}_3$ , m. 248°, which on methylation with  $\text{Me}_2\text{SO}_4$  in NaOH gave Me 3-hydroxy-2-phenylquinoline-2'-carboxylate,  $\text{C}_{17}\text{H}_{14}\text{NO}_3$ , m. 189°. Two varieties of IX are known and the interruption of the alk. fusion at 140° gives a 3rd form in which the OH group has migrated from position 4 to position 3 in the quinoline nucleus. Alk. fusion of Höchst yellow U (XI), m. 288 4°, prepd. by heating IX in concd.  $\text{H}_2\text{SO}_4$  on the steam bath, yields 1 mol. of VII and 1 mol. of X. Thus XI differs entirely from I although they have almost identical reactions. Since on alk. fusion XI gives VII and I yields VI it is possible to det. the proportion of a mixt. of the 2 dyestuffs. The above facts permit the provisional establishment of formulas for the different derivs. obtained by the action of  $\text{BzCl}$  on indigo. The monobenzoylindigo formed rearranges in acid soln. to generate with the indoxylated an C atom a new hexagonal nucleus. The nuclei of the quinoline deriv. thus formed are open and at this stage, according to the conditions of the expt., the II

atom attached to the N atom may be benzoylated, eliminated or may migrate. Structural formulas are given for I, its dihydrate and vat, for IX, XI and its vat and for the Dessoulay compd. The formation of VI and IV by alk. fusion of I is explained by a mechanism consisting of an internal condensation followed by elimination of  $\text{H}_2\text{O}$  or by oxidation, and the relation between I with its characteristic double bond and compds. of the Höchst yellow type is demonstrated. C. R. Addinall

**Raman spectra of organic heterocyclic compounds** M. Milone and G. Müller. *Atti accad. sci. Torino Class. sci. fis., mat., nat.* 68, 337–43(1933).—See C. A. 27, 5000.

A. W. Coniery

**The constitution of certain disubstituted thiazolidones** Walter S. Long and F. B. Daus. *Trans. Kansas Acad. Sci.* 36, 119–24(1933)(reprint).—Digestion of 1 mol. KSCN and 1 mole  $\text{ClCH}_2\text{CONHAr}$  (Ar = aryl group) in boiling alc. gives thiazolidones (I). Soln. of I in 20% NaOH followed by refluxing 10 g. of the resulting Na salts with 5 cc. EtI in 75 cc. alc. yields Et derivs. of I,  $\text{S.C}(\text{NEtAr})\text{N.CO.CH}_3$  (II) and, in some cases,

$\text{S.C}(\text{NAr})\text{NEt.CO.CH}_3$  (III). These structures are shown by hydrolysis and identification of the arylamines formed (cf. Wheeler and Johnson, *Am. Chem. J.* 28, 121 46(1902)). Hence the structure  $\text{S.C}(\text{NEt})\text{NAr.CO.CH}_3$  of Beckurts and Frerich (C. A. 10, 888) is incorrect. Thiazolidones (I) and their type II derivs. were prepd with the following Ar groups: *o*-nitrophenyl (Et deriv.) *m*-nitrophenyl, m. 200° (Et deriv.); *p*-nitrophenyl (IV) (Et deriv., m. 126°;  $\text{PhCH}_2$  deriv., m. 135°); 2-nitro *p*-tolyl (V), m. 182° (Et deriv.); 3-nitro-*p*-tolyl, m. 206° (Et deriv., m. 142°); 4-nitro-*o*-tolyl (VI), m. 172° (Et deriv., m. 129°). IV, V and VI also give Type III Et derivs., m. 131–2°, — and 86°, resp. H. A. Beatty

**Derivatives of tetrahydropyran.** R. Paul. *Compt. rend.* 198, 375–6(1934).— $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}(\text{O})\text{CH}_3$  (I) gave with Br at  $-15^\circ$ ,  $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}(\text{Br})\text{CH}_3$  (II); with gaseous HBr, it gave  $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}(\text{Br})\text{CH}_3$ , b<sub>18</sub> 61°, which rapidly undergoes decompn. and resinifies. II on distn. over a long column gave  $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}(\text{Br})\text{CH}_3$  (III), b<sub>22</sub> 63° (cor.). I in contact with air gave  $[\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}(\text{Br})\text{CH}_3]\text{O}$ , m. 110°. Julius White

**$\alpha$ - and  $\beta$ -Cinenic acid.** Constitution of  $\beta$ -cinenic acid. H. Rupe and H. Hirschmann. *Helv. Chim. Acta* 17, 98 105(1934); cf. C. A. 27, 3705.—The oxidation of 75 g. freshly distd.  $\beta$ -cinenic acid (I), carefully purified from the Ca salt, with 4%  $\text{KMnO}_4$  gave 4 g. of a mixt. of lower fatty acids,  $\text{HCO}_2\text{H}$ , AcOH and probably some valeric acid, 7 g. of  $\alpha$ -cinenic acid (II) and 4 g. of a mixt. of higher-boiling acids (III). The remainder of the material seems to have been destroyed. MeAc was detected and identified as the phenylsemicarbazone. By conversion into the Ag salt III was shown to be a mixt. of I and cinogenic acid recognized by its characteristic Co salt (*Ber.* 34, 2199(1901)). More conclusive evidence as to the constitution of I was given by ozonization which generated the lactone of  $\alpha$ -methyl- $\alpha$ -hydroxyglutaric acid ( $\alpha$ -methylparaconic acid),  $\text{O.CO.CH}_2\text{CH}_2\text{CMeCO}_2\text{H}$ , m. 68–70°, identical with the synthetic acid (*Ber.* 14, 1780(1881)). The 2 main degradation products resulting from the elimination of  $\text{CO}_2$  from cineolic acid are cinenic acid (2,6,6-trimethyl-tetrahydropyran-2-carboxylic acid), formerly termed  $\alpha$ -cinenic acid, and 1,5-dimethyl-1-hydroxyheptene-4-carboxylic acid. The designation  $\beta$ -cinenic acid should not be retained since the compd. no longer contains the pyran ring of cineolic acid. C. R. Addinall

**Quinoline derivatives.** XLIII.  $\alpha$ -Alkylated 2-phenyl 4-quinolylaminoacetic acids. Hanns John and Ernst

Pietsch. *J. prakt. Chem.* 139, 183-8 (1933); cf. *C. A.* 28, 1702<sup>2</sup>.—2-(4-Aminophenyl)quinoline (I) (2 g.) and 4.5 g. 126-8% NaCN in 20 cc. EtOH, heated 10 hrs. on the water bath, during which 10 cc. 40% HCHO is added, the soln. evapd. to dryness, taken up in 200 cc. H<sub>2</sub>O, made alk. with 2 N NaOH and acidified with (CO<sub>2</sub>), give 2 g. 2-phenylquinolyl-4'-β-aminoacetic acid, C<sub>14</sub>H<sub>11</sub>NC<sub>6</sub>H<sub>4</sub>NHCH<sub>2</sub>CO<sub>2</sub>H (II), red, m. 218°; *Me* ester, m. 152°; *Et* ester, m. 144°. Heating II above its m. p gives 2-(4'-methylaminophenyl)quinoline, yellow, m. 83°; *picrate*, m. 186°. I (3 g.) and 1 g. MeCH<sub>2</sub>BCO<sub>2</sub>II, heated 6 hrs. at 140°, give 1.1 g. of 2-phenylquinolyl-4'-β-(α-methyl)aminoacetic acid, C<sub>15</sub>H<sub>13</sub>NC<sub>6</sub>H<sub>4</sub>NHCH<sub>2</sub>CHMeCO<sub>2</sub>II, light red, m. 215-7°; *Et* ester, m. 86°; heating gives 2-(4'-ethylaminophenyl)quinoline, light yellow, m. 110°. The α-*Et* deriv. of II, orange, m. 187°; the α-*di-Me* deriv. of II, m. 192-5°; the α-*Pr* deriv., m. 163-5° (*Et* ester, m. 108°); α-*iso-Pr* deriv., m. 180-2°; α-pentadecyl deriv., m. 127-8° (*Et* ester, m. 65°). C. J. West

Some derivatives of acridine. Lydia Monti with Mario Procopio. *Gazz. chim. ital.* 63, 724-30 (1933).—The new compds. were prepd. with a view to their utilization in the treatment of malaria (cf. Frankel, *Die Arzneimitel Syntese*, *C. A.* 22, 1216). It was found possible to prep. by 2 different methods compds. with an acridine (I) nucleus and a basic function in a side chain. *Method 1.*—The CH<sub>2</sub>NH<sub>2</sub> group was introduced in the I nucleus by the condensation reaction of methylolamides with aromatic compds. (cf. *Ann.* 343, 207 (1906); *M.*, *C. A.* 27, 508). Condensation is somewhat difficult because there are no groups in I to activate the reaction, but compds. of the (C<sub>13</sub>H<sub>9</sub>N)CH<sub>2</sub>NHCOR type are obtained, which are readily sapond. in acid medium. I and methylolchloroacetamide in concd. H<sub>2</sub>SO<sub>4</sub> yield chloroacetylacridylmethylamine, (C<sub>13</sub>H<sub>9</sub>N)CH<sub>2</sub>NHCOCH<sub>2</sub>Cl (II), yellowish, m. 172-4°; its solns. in AcOH have a green-yellow fluorescence. Likewise I and methylolbenzamide form benzoylacridylmethylamine, (C<sub>13</sub>H<sub>9</sub>N)CH<sub>2</sub>NHIBz (III), ivory color, m. 162-4°. II or III, refluxed with 20% HCl, gives a product which is unstable in air, but the free base dissolved, immediately after pptn., in dil. AcOH, forms with picric acid (IV) acridylmethylamine monopicrate, (C<sub>13</sub>H<sub>9</sub>N)CH<sub>2</sub>NH<sub>2</sub>(C<sub>6</sub>H<sub>3</sub>O<sub>3</sub>N<sub>3</sub>), lemon-yellow, m. 202-4° (decompn.). In alk. medium, the sapon. of II and III proceeds abnormally, with decompn. to NH<sub>3</sub> and HCHO. The general behavior of II and III is therefore similar to that of other acylamines formed by condensation of methylolamides with hydroxyquinolines (cf. *M.*, *loc. cit.*). Attempts were not made to establish at what point in the I nucleus the CH<sub>2</sub>NH chain enters, but it is probable that it takes place at the 9-position, i. e., at the II atom which is activated by the N in *p*-position. *Method 2.* HCHO and primary and secondary amines are condensed with compds. contg. H atoms rendered mobile by the proximity of special groups, thus: =CH<sub>2</sub> + CH<sub>2</sub>(OH)<sub>2</sub> + RR'-NH → =CHCH<sub>2</sub>NRR' + 2H<sub>2</sub>O. 9-Methylacridine (V) in concd. HCl, aq. HCHO and HNMe<sub>2</sub>, refluxed and poured into water, yield a greenish brown secondary product, while the mother liquor made alk. with NH<sub>4</sub>OH yields an Et<sub>2</sub>O-insol. cryst. *N*-dimethyl-9-acridylethylamine (VI), very unstable in air. With dil. HCl, it forms its *HCl* salt, C<sub>17</sub>H<sub>15</sub>N<sub>2</sub>·2HCl·2H<sub>2</sub>O, canary-yellow, m. 185-90° (decompn.), which with aq. IV forms a *monopicrate*, C<sub>17</sub>H<sub>15</sub>N<sub>2</sub>·C<sub>6</sub>H<sub>3</sub>(NO<sub>3</sub>)<sub>3</sub>·OH, bright yellow, m. 130-5° (decompn.). Likewise V, HCHO and C<sub>6</sub>H<sub>5</sub>NH form *p*-iperidinoacridyl-9-ethylamine (VII), which is also unstable in air. Its *HCl* salt, C<sub>20</sub>H<sub>23</sub>N<sub>2</sub>·2HCl·H<sub>2</sub>O (VIII), canary-yellow, m. 169-70° (decompn.). Addn. of satd. aq. IV to VIII ppts. a *dicpicrate*, C<sub>20</sub>H<sub>23</sub>N<sub>2</sub>[C<sub>6</sub>H<sub>3</sub>(NO<sub>3</sub>)<sub>3</sub>OH]<sub>2</sub>, of VII, lemon-yellow, m. 138-40°.

(VI) C. C. Davis

Polymembered cyclic compounds. VIII. Cyclobis-(tridecamethylene)diimine, and remarks on the preparation of hexamethylenimine. Adolf Müller, Erich Rölz and Michael Wiener. *Ber.* 67B, 295-300 (1934); cf. *C. A.* 27, 701; Ruzicka *et al.*, *C. A.* 28, 1346<sup>1</sup>; Ziegler and Orth, *C. A.* 28, 1019<sup>2</sup>.—Methods of prep. erucic acid, m. 32°, and di-Me brassylate, b<sub>10</sub> 170-210°, are described. The latter is reduced with Na and alc. to tridecane-1,13-diol, m. 74°, from which is prepd. 1,13-dibromotridecane. This, refluxed with 1 mol. *p*-MeC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>NH<sub>2</sub> and 2 mols. KOH in aq. alc., yields 0.8% of a compd. (I) m. 162-3° and 4.7% of a compd. (II) m. 92°. II is *N,N'*-bis(*p*-toluenesulfonyl)-1,13-diaminotridecane and is hydrolyzed by concd. HCl at 160-70° to the bis(*p*-toluenesulfonate), C<sub>17</sub>H<sub>34</sub>O<sub>4</sub>N<sub>2</sub>S<sub>2</sub>, m. 198° (cor.), of 1,13-diaminotridecane, b<sub>10</sub> 172-3°, m. 51° (cor., evacuated capillary), absorbs CO<sub>2</sub> from the air; chloroaurate, yellow, decomp. about 180°; chloroplatinate, light red-yellow, decomp. about 225°; *picrate*, yellow, m. 45-6° (cor.); *N,N'*-di-Bz deriv., m. 124-5° (cor.). Tridecane-1,13-bis(phenylthiourea), m. 118-19°, from the amine and PhNCS in alc. 1,13-Bis(phthalimido)tridecane, from the dibromide and C<sub>6</sub>H<sub>4</sub>(CO)NK, decomp. 321-4°, gives with concd. HCl at 200° the di-HCl salt, decomp. 321-4°, of II. I, which shows a mol. wt. of 654-74 in PhOH, CHCl<sub>3</sub> or pinene dibromide, is probably *N,N'*-bis(*p*-toluenesulfonyl)cyclobis-

C<sub>6</sub>H<sub>4</sub>Me; with HCl at 155° it yields the free diimine, b<sub>0-01</sub> 183-5°, m. about 52°, difficultly sol. in water with strong alk. reaction; the *HCl* salt, chloroaurate and *picrate* crystallize well and have high m. or decompn. points; *N,N'*-di-Bz deriv., m. 95° (cor.), mol. wt. in pinene dibromide 599-608 (like I, it gives a much lower mol. wt. (458) in camphor); *N,N'*-bis(benzenesulfonyl) deriv., is apparently dimorphous, sepg. from aq. acetone in crystals sintering 111°, m. 122-2° (cor.), and m. 111° after rapid cooling. Z. and O. improved the yield of hexamethylenimine by using very dil. solns., but M. had already shown that better yields are obtained in dil. soln. C. A. R.

Alkaloids of Anabasis aphylla. VII. Amination of anabasine and *N*-methylanabasine with sodamide. G. Menshikov, A. Grigorovich and A. Orechov. *Ber.* 67B, 289-92 (1934); cf. *C. A.* 27, 3217. Anabasine in boiling xylene with NaNH<sub>2</sub> gives, together with much resinous material, about 5% aminoanabasine, presumably CH<sub>3</sub>CH<sub>2</sub>C(=O)CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub> (I), m. 111°. Probably

CH<sub>3</sub>NH--CNH<sub>2</sub>NH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub> it is the secondary NH which is responsible for the resinification, for *N*-methylanabasine reacts much more smoothly, giving 45-50% of a mixt. of 2 amino derivs.; II, b<sub>10</sub> 100-2°, m. 95-5.5° (*picrate*, m. 234-5° (decompn.)), and III, b<sub>10</sub> 140-63° (*HCl* salt, rapidly deliquesces in the air; *picrate*, m. 220-1°). That II is the *N*-Me deriv. of I was shown by converting II in HCl with NaNO<sub>2</sub> into α-chloro-*N*-methylanabasine (61% yield), b<sub>10</sub> 145-6°, which with KMnO<sub>4</sub> gave α-chloronicotinic acid, m. 192°. III is probably the α'-amino isomer of II. The amination is accompanied by complete racemization; both the amino derivs. and the parts of the original bases which have not reacted with the NaNH<sub>2</sub> are optically inactive.

C. A. R.  
Cactus alkaloids. XI. A new synthesis of pellotine. Ernst Spath and Friedrich Becke. *Ber.* 67B, 286-8 (1934); cf. *C. A.* 28, 1706<sup>2</sup>.—Gallacetophenone 3,4-di-Me 2-benzyl ether, m. 47-8.5° (all in ps. in evacuated tubes), obtained in 76% yield from 2,3,4-HO(MeO)<sub>3</sub>C<sub>6</sub>H<sub>2</sub>COMe in NaOMe soln. refluxed to neutral reaction with PhCH<sub>2</sub>Cl, gives with a 50% excess of H<sub>2</sub>NCH<sub>2</sub>CH(OR)<sub>2</sub> at 165-73° of the Schiff base, PhCH<sub>2</sub>O(MeO)<sub>3</sub>C<sub>6</sub>H<sub>2</sub>CMc:NCH<sub>2</sub>CH(OR)<sub>2</sub>, b<sub>0-01</sub> 180-200° (bath temp.), 22 g. of which, shaken 2 days at 15-20° with 73% H<sub>2</sub>SO<sub>4</sub>, dild. with water and heated 1 hr. at 50°, yields 1.5 g. 6,7-dimethoxy-8-hydroxy-1-methylisiquinoline, m. 180-2°; the methiodide, m. 188-9.5°, of the latter on reduction with Sn and HCl

gives pellotine, m. 110-12°, identical with the natural product (mixed m. p.). C. A. R.

**Constitution of isochondodendrine.** VI. Franz Faltis and Hermann Dieterich. *Ber.* 67B, 231-8(1934); cf. C. A. 26, 5304.—The various structures of isochondodendrine (I) (doubled mol.) suggested in the earlier paper were all based on the assumption that the  $\text{HO}_2\text{CC}_6\text{H}_4\text{O}(\text{MeO})_2\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2$  obtained in about 33% yield by oxidative degradation of the N-free product of the 2-fold Hofmann degradation of I is the only product of the degradation. The correctness of this assumption is proved by the present work. From 8.5 g. of the inactive methine base,  $\alpha$ -isochondodendrimethine, m. 205°, ozonized in dil.  $\text{H}_2\text{SO}_4$ , shaken with Pt sponge to destroy the  $\text{H}_2\text{O}_2$ , treated with H and Pd-BaSO<sub>4</sub> to reduce the aminoxide or peroxide, made alk. and at once extd. with  $\text{CHCl}_3$  and heated with MeI on the water bath, was obtained 11.13 g. of the *methiodide*,  $\text{C}_{21}\text{H}_{35}\text{O}_5\text{NI}$ , of the expected dimethylaminodialdehyde. The corresponding quaternary chloride is smoothly broken down by boiling 5% alkali into NMe<sub>3</sub> and an oily *o*-vinylaldehyde which in AcOH gives the characteristic indigoblue color with concd.  $\text{H}_2\text{SO}_4$  and with Pd-charcoal takes up 2 atoms O, but attempts to oxidize it to the dicarboxylic acid gave unsatisfactory results. However, when the quaternary chloride was treated in water with excess of  $\text{KMnO}_4$  at 20° and boiled with 5% alkali it gave pure *5-vinyl-2,3-dimethoxy-1,1'-diphenyl ether-6,4'-dicarboxylic acid* (66% based on the methine, 75% based on the methiodide), m. 192°. This yield of far more than 50% proves beyond doubt that the mol. of I is composed of 2 identical parts. Decarboxylation of the acid in boiling quinoline with Naturkupfer C gave 55.5% of oily vinyl-dimethoxydiphenyl ether, which, without further purification, was oxidized in cold acetone with  $\text{KMnO}_4$ , giving 61% *2,3-dimethoxy-1,1'-diphenyl ether-5-carboxylic acid*, m. 161°, whose *Me ester* (prepd. with  $\text{CH}_3\text{N}_3$ ), m. 69°; the structure of the latter was proved by synthesis of the ester from 5-bromoprotocatechuic acid condensed with PhOK in the presence of Cu at 180°. C. A. R.

**Oxidation of thebaine with manganic acetate.** F. Vieböck. *Ber.* 67B, 197-202(1934).—When treated with  $\text{Mn}(\text{OAc})_4$ , bixin very rapidly uses up 1 or 2 atoms O depending on the solvent, 1 HO and 1 AcO group per atom O being added at a double bond. In the presence of  $\text{Ac}_2\text{O}$  with 2 atoms O, only a triacetate is formed; hence 1 of the HO groups is not esterifiable, probably because of its tertiary nature. On further degradation by the Criegee glycol cleavage with  $\text{Pb}(\text{OAc})_4$  after complete hydrogenation and sapon. of the Ac groups, the mol. breaks down in the middle, proof that it is the middle double bond which the  $\text{Mn}(\text{OAc})_4$  has attacked. The work with bixin was discontinued because of lack of material, but thebaine (I), which, according to Schöpf, has 2 conjugated double bonds, behaves in the same way, adding HO and AcO at the 8,14-double bond and forming a cryst. *buse* (II), m. 198° (Cu block). II heated a short time with 20% HCl yields a *base* (III), m. 171° (Cu block), together with a little hydroxycodone (IV); on longer heating both II

and III give IV almost exclusively, which is also formed from III with hot alc. KOH. In spite of its close relationship to IV, III is insol. in alkalis, i. e., it is not a phenol. III, as a 1,2-glycol, should undergo ring cleavage with  $\text{Pb}(\text{OAc})_4$ , but in the expts. thus far made only a little unchanged III has been obtained; the N ring seems also to be split off and no aldehyde reaction with fuchsin-SO<sub>2</sub> can be obtained.  $\text{Pb}(\text{OAc})_4$  reacts like  $\text{Mn}(\text{OAc})_4$  with I, but the working up of the products is more difficult and the yields are poorer. The reaction of  $\text{Mn}(\text{OAc})_4$  with codeine and IV is entirely different; apparently only the N ring is ruptured. *Oxime* of III, m. 212-15°, is sol. in alkalis. C. A. R.

**Oxidation of strychnine.** Preliminary note. Alessandro Bernardi. *Atti IV Congr. nas. chim. pura appl. cala* 1933, 389.—The literature is reviewed. The reactions  $2\text{H}_2\text{CrO}_4 + 6\text{AcOH} + \text{C}_{21}\text{H}_{33}\text{N}_2\text{O}_4 = \text{C}_{21}\text{H}_{33}\text{N}_2\text{O}_4 + 2\text{Cr}(\text{OAc})_3 + 6\text{H}_2\text{O}$ , and  $10\text{H}_2\text{CrO}_4 + 30\text{AcOH} + 6\text{C}_{21}\text{H}_{33}\text{N}_2\text{O}_4 = 3\text{C}_{21}\text{H}_{33}\text{N}_2\text{O}_4 + 10\text{Cr}(\text{OAc})_3 + 28\text{H}_2\text{O}$  are possible. Ultimate analyses of the products of oxidation are given, without wholly conclusive results. K. M. S.

**Resins and resinous substances.** IX.  $\beta$ -Amyrin from Manila elemi resin. 6. Alexander Rollett and Rudolf Petter. *Monatsh.* 63, 311-16(1933); cf. C. A. 26, 4910. The action of  $\text{O}_2$  on  $\beta$ -amyrin benzoate (I) at room temp gives a small yield of a *peroxide*,  $\text{C}_{27}\text{H}_{44}\text{O}_4$  (II), m. 333°; the yields decrease with the time of action of  $\text{O}_2$ . II liberates I from acidified KI-I. Hydrolysis of II gives oxy- $\beta$ -amyrin. I appears to take up 14 atoms of Br, while  $\beta$ -amyrin takes up 12 atoms; there probably result mixts of Br derivs. C. J. West

**Convallarin.** Josef Lindner and Alois Torggler. *Monatsh.* 63, 335-46(1933); cf. C. A. 9, 1760.—Convallarin is a mixt., as shown by its behavior with  $\text{CHCl}_3$ ,  $\text{AcOEt}$  and  $\text{H}_2\text{O}$ .  $\text{AcOEt}$  exts. about 45%,  $\text{H}_2\text{O}$  about 60% of the original material. C. J. West

**Lusitanicoside.** H. Herisev. *Compt. rend* 198, 265-6 (1934).—Hydrolysis of *lusitanicoside* with dil.  $\text{H}_2\text{SO}_4$  gives an *aglucone* (I) and a mixt. (equimol.) of glucose and rhamnose. I gives a cryst. *Br deriv.* and a *Me deriv.* identified as *estrangle*. It is concluded that *lusitanicoside* is  $\text{C}_{21}\text{H}_{38}\text{O}_{10}$ . W. J. Peterson

**Two kinds of saponins of soy beans.** Koji Okano and Iwao Ohara. *J. Agr. Chem. Soc. Japan* 9, 1249-58, *Bull. Agr. Chem. Soc. Japan* 9, 177-80(1933).—An ext. of soy bean, from which the bean oil had been sepd., was mixed with NaCl soln. The ppt. resulting was extd. with ether and the residue was repeatedly recrystd. from 80% alc. Crystals, m. 225-7°, were obtained. The compd. was identified with Sumiki's saponin. From the mother liquor, an amorphous saponin, m. 216-18°, was isolated. The formulas  $\text{C}_{48}\text{H}_{77}\text{O}_{19}$  and  $\text{C}_{48}\text{H}_{75}\text{O}_{19}$ , resp., are given to the 2 saponins. The hydrolytic products of the cryst. saponin were a sapogenin  $\text{C}_{26}\text{H}_{42}\text{O}_8$ , glucuronic acid, galactose and rhamnose. A sapogenin  $\text{C}_{21}\text{H}_{32}\text{O}_4$ , glucuronic acid, galactose and rhamnose were isolated from the amorphous saponin by hydrolysis. Five isomers of sapogenin, viz., a yellow amorphous powder, m. 201°, needles, m. 235°, needles, m. 239°, needles, m. 260°, and prisms, m. 248-9°, were isolated according to the length of the time used for the hydrolysis. Methane and ethane were evolved on heating these saponins and sapogenins with CuO or  $\text{PbCrO}_4$ . These saponins have no hemolytic power. Y. Kihara

**Santonin series.** XIX. Behavior of santonin acid on oxidative degradation. Edgar Wedekind and Irmgard Jackh. *J. prakt. Chem.* 139, 129-40(1934); cf. C. A. 28, 1709.—Santonin acid (I) (3 g.) in 50 cc. 2% KOH and 20 cc.  $\text{H}_2\text{O}_2$  in 20 cc.  $\text{H}_2\text{O}$  gave after 24 hrs. 0.86 g. of *apocantonin acid* (II),  $\text{C}_{14}\text{H}_{20}\text{O}_5$ , m. 164-5°,  $[\alpha]_D^{25} + 98.93^\circ$  (0.8592% in MeOH); *oxime*, decomp. 185-6°. Catalytic reduction of II gives a *dihydro deriv.*, decomp. 205-6°; *oxime*, decomp. 188-9°. Oxidation of 5 g. of II with  $\text{CrO}_3$  in AcOH gives 0.7 g. of a diketolactone,  $\text{C}_{14}\text{H}_{18}\text{O}_4$ , m. 159-60° (*oxime*, decomp. 228°); aq. KOH gives the acid,  $\text{C}_{14}\text{H}_{18}\text{O}_5$ , decomp. 200-2°. Oxidation of 25 g. of I with KBr gives 7.2 g. of a *hydroxysantonin acid* (III),  $\text{C}_{14}\text{H}_{18}\text{O}_6$ , decomp. 215°,  $[\alpha]_D^{25} + 15.63^\circ$  (0.906% in MeOH).

*Me ester*, m. 87–90° (decompn.); *di-Ac deriv.*, decompn. 192° (*Me ester*, m. 142°). With KOH III gives an acid,  $C_{15}H_{10}O_6$ , m. 198°. Oxidation of I with  $O_3$  did not give cryst. products. Santonic acid,  $C_{15}H_{10}O_6$ , distd. with  $Ac_2O$ , gives a ring ketone,  $C_{15}H_{10}O_4$ , m. 203–4°, whose oxime decompn. 223°. The oxime of I and  $NaNO_2$  in  $AcOH$  give hydroxamic santolic anhydride, decompn. 245°, which yields with 1:1  $H_2SO_4$  santolic acid, decompn. 178–80°; this also results from the oxime of I and 25%  $H_2SO_4$ . *Dihydrosantolic acid* decompn. 160°. C. J. W.

**Criteria for the purity of crystalline digitalin (digitoxide).** R. Charonnat and L. Deglaude. *Compt. rend.* 198, 470–8 (1934).—C. and D. suggest the use of rotatory power as a criterion for the purity of digitalin. The values obtained at 10° were: in  $CHCl_3$ ,  $[\alpha]_{D10}^{20}$  18.2°,  $[\alpha]_{D10}^{25}$  21.1°,  $[\alpha]_{D10}^{30}$  28.0°; in  $C_6H_5N$ ,  $[\alpha]_{D10}^{25}$  —5.7°; in dil.  $HCl$   $[\alpha]_{D10}^{25}$  22.5°. Julius White

**Chlorophyll a. V. Its phase-positive derivatives and allomerization.** Arthur Stoll and Erwin Wiedemann. *Helv. Chim. Acta* 16, 739–72 (1933); cf. C. A. 27, 4806.—Polymers against H. Fischer. Chlorophyll a and b, m. 130–3° (decompn.) and 183–5° (decompn.), resp., have Willstätter's formulas. Details are given for the prepn. and previously recorded properties of benzoyl- (I), benzoyl-methyl-, benzylphytyl-, and methyl-pheophorbide a (oxime), allomerized pheophorbide a (II) (oxime), proto-pheophorphyrin a (Bz deriv., also prepd. from I; oxime) [by catalytic reduction of II and  $HI-AcOH$  reduction of allomerized I] and its allomerization product (=pheophorphyrin a) (oxime). New spectroscopic data and the method of obtaining them in test tubes are described. B. C. A.

**Constitution of picrocrocin and its relationship to the carotene pigments of saffron.** Richard Kuhn and Alfred Winterstein. *Ber.* 67B, 344–57 (1934).—See C. A. 28, 1612.

**Rubixanthin, a new xanthophyll with the formula  $C_{42}H_{56}O_6$ .** Richard Kuhn and Christoph Grundmann. *Ber.* 67B, 339–44 (1934).—*Rubixanthin* (I) is the 1st xanthophyll which corresponds spectroscopically to  $\gamma$ -carotene (C. A. 27, 2688). It is found, together with considerable amts. of lycopene and carotenes, in the haws; the ripe fruits of *Rosa rubinosa* are especially well adapted to its prepn. Its sepnd. was made possible by chromatographic adsorption analysis; of all epiphasic carotenoids I is the most easily adsorbed on  $Al_2O_3$  and by virtue of this property it can be sepnd. from  $\gamma$ -carotene as easily as from lycopene and the other carotenes. Its adsorption behavior is very similar to that of kryptoxanthin, and artificial mixts. of the 2 substances cannot be sepnd. quantitatively with either  $Al_2O_3$  or  $CaCO_3$ ; I accumulates in the upper, kryptoxanthin in the lower part of the homogeneously brown-red adsorption zone. I seps. from  $C_6H_5MgOH$  in needles with Cu luster (microphotographs are given), m. 160° (Berl.); the absorption maxima ( $m\mu$ ) are 333, 494, 461 in  $CS_2$ , 509, 474, 439 in  $(CHCl_3)$ , 496, 463, 433 in abs. alc., 495.5, 463, 432 in benzene (b. 70–80°), 494, 462, 432 in hexane; it takes up 12 mols.  $H_2$  on catalytic hydrogenation and gives 0.94 mol. acetone on  $O_3$  degradation. I is therefore probably a *hydroxy- $\gamma$ -carotene*, with the  $HO$  on the C ring; daily doses of 20 $\gamma$  have no growth effect on rats on a vitamin A-free diet. Although the suggested formula contains an asym. C atom, I is optically inactive ( $[\alpha]_{D20}^{25} = 10^\circ$  in benzene). Quant. analysis of various haws showed the following amts. (mg.) of various components in 100 g. of the fresh fruits of *R. canina* and *R. rubinosa*, resp.: xanthophyll esters 3.1, 2.35; carotenes 2.55, 2.3; lycopene 1.6, 2.75; I 1.35, 1.25. C. A. R.

**The pigment of the sunflower. II.** L. Zechmeister and P. Lutzon. *Ber.* 67B, 170–3 (1934); cf. C. A. 25, 2433.—A further investigation of this pigment has confirmed the earlier observations as to the chief constituent (I) except that the rotation is about twice as high as had been reported and agrees well with the value for lutein,  $C_{40}H_{56}O_6$ , from egg yolk. By the Twett chromatographic adsorption method there has also been obtained, along with insignificant amts. of various polyenes (possibly including violaxanthin), relatively much taraxanthin,  $C_{40}H_{56}O_6$  (II),

1 which can be very easily isolated; when the proper chromatographic zone of the sapond. crude ext. is merely elutriated, transferred to ether and concd., almost pure II crystallizes out directly. I m. 183° (cor., Berl block),  $[\alpha]_{D20}^{25}$  136° ( $AcOEt$ ), 162° ( $CHCl_3$ ),  $[\alpha]_{D20}^{25}$  145° ( $AcOEt$ ), absorbs in  $CS_2$  at 517.5–500.5 and 484.5–469  $m\mu$ , seps. from hot  $MeOH$  in ochre-yellow crystals which on cooling change into leaflets with metallic luster. II, brownish yellow prisms or plates, m. 184° (Berl block). C. A. R.

**Nucleic acids. III. The ring structure of ribose in yeast nucleic acid.** Hellmut Bredereck. *Z. physiol. Chem.* 223, 61–5 (1934); cf. C. A. 27, 2156.—The furanose structure of cytidine, adenosine and inosine is demonstrated by the prepn. of trityl derivs. The nucleotides in pyridine soln. condense with  $Ph_3CCl$  to yield cryst. products which are not hydrolyzed by alc. KOH, hence the substitution occurs on the primary  $OH$  of the 5-C atom of the ribose and not on the  $NH_2$  of the pyrimidine. The derivs. described are *tritylcytidine* (1  $KtOH$  of crystn.) m. 255–7°,  $[\alpha]_{D20}^{25}$  —0.7° in pyridine; *trityladenosine*, m. 255–8°,  $[\alpha]_{D20}^{25}$  —8.7° in  $CHCl_3$ , and *tritylinosine*, m. 231–2°. A. W. Dux

**Ring system of sterols and bile acids. IV. Nomenclature of the cholane group.** O. Rosenheim and H. King. *Chemistry and Industry* 1934, 91–2; cf. C. A. 27, 3221.—R. and K. propose a new nomenclature for the sterols and bile acids involving the cholane group. J. White

**Constituents of hornbeam bark.** Otto Brunner and Gertrud Wiedemann. *Monatsh.* 63, 368–73 (1933); cf. Zellner, C. A. 21, 590.—The bark of hornbeam (*Carpinus betulus* L.) (25 kg.), extd. with 96%  $EtOH$ , gave 260 g. of dry ext., which was sapond. with 3 l.  $N EtOH-NaOH$  by heating 12 hrs. on the water bath; 1 l. of  $EtOH$  was distd. off and 3 l. hot  $H_2O$  added; extn. with petr. ether removed the unsaponifiable portion, sepnd. into 2 fractions, easily and difficultly sol. in petr. ether; the latter contained a sterol and a resinol. The sterol m. 132°; its acetate,  $C_{27}H_{48}O_4$ , m. 122°; it does not give a cryst. bromide. The resinol is the same as the betulin from birch bark; it is a dihydroxytriterpene,  $C_{60}H_{100}O_4$ , m. 261°, the crystals with 1 mol.  $EtOH$  m. 258°; the acetate  $C_{60}H_{100}O_4$  m. 221.5–2.0°; boiling with  $HCO_2H$  gives the formate, m. 322°, of allo-resinol, m. 279°. C. J. West

**Bisiminocamphor derivatives with exalted optical activity.** P. C. Guha and S. M. Patel. *Current Sci.* 2, 97–8 (1933).—1,4-Naphthylenebisiminobenzylideneminocamphor (I), contg. 17 conjugated double bonds, has a mol. rotation of 22,050° in pyridine for the Hg yellow line 5780. I was obtained by condensing  $p-AcNHCH_2CH_2CHO$  with  $p-(NH_2)_2C_{10}H_6$ , removing the  $Ac$  groups by dil.  $HCl$  in alc. and condensing the resulting bisaminobenzylidenenaphthylenediamine with camphorquinone. The bisiminocamphor derivs. of  $p,p$ -diaminodiphenylcarbamide and  $p,p$ -diaminodiphenyloxamide show mol. rotations of 8911° and 12,094° in  $CHCl_3$ . R. B.

**Hydrolysis of carbides (Schmahl) 6. Primary photochem. production of some free radicals (Norrish) 3. Covalency, coordination and chelation (Menzies, Overton) 2. The Purans. Compiled by The Purfural Division of Quaker Oats Co. Chicago: Quaker Oats Co. 18 pp. Free.

**Liquid hydrocarbons from ethylene.** Franz Eisenstecken. Ger. 589,914, Dec. 20, 1933 (Cl. 12o. 1.03). Addn. to 588,158 (C. A. 28, 1353<sup>3</sup>). The process of Ger. 588,158 is modified by adding H to the  $C_2H_4$  in addn. to  $SO_2$ , whereby the production of unsatd. liquid hydrocarbons is avoided.

**Purifying hydrocarbons.** Leo D. Jones and Edward M. James (to The Sharples Specialty Co.). Brit. 401,298, Nov. 6, 1933. See Fr. 733,156 (C. A. 27, 730).

**Stabilizing chlorinated aliphatic hydrocarbons.** The Dow Chemical Co. Brit. 401,210, Nov. 9, 1933. See U. S. 1,917,073 (C. A. 27, 4539).

**Hydrogenating hydrocarbons.** Imperial Chemical Industries Ltd. Fr. 756,724, Dec. 14, 1933. Aromatic hydrocarbons, e. g.,  $C_{10}H_8$ , are hydrogenated by passing them in the form of vapor under pressure up to 10 atm. and at 170–300° over catalysts composed of or contg. sulfides of heavy metals, particularly of the 6th group, e. g., W.

**Olefins from saturated hydrocarbons.** Fritz Winkler and Hans Haebler. U. S. 1,945,960, Feb. 6. A gas comprising  $C_4H_{10}$ ,  $C_3H_8$ , and  $C_2H_6$  is passed through an internally tinued Mn-Cu tube heated to about 700° to form olefins such as butylenes and propylenes,  $C_2H_4$ ,  $C_3H_6$ , etc.

**Apparatus for regulated vaporization of liquefied hydrocarbon gases such as propane and butane.** Maurice E. Painter. U. S. 1,947,099, Feb. 13.

**Catalytic conversion apparatus suitable for oxidizing aromatic hydrocarbons, etc.** Alphons O. Jaeger (to Selden Co.). U. S. 1,945,353, Jan. 30. Various structural and operative details of a heat-exchange system, etc., are described.

**Aromatic compounds.** I. G. Farbenind. A.-G. Brit. 401,312, Oct. 30, 1933. See Fr. 730,428 (C. A. 27, 1359).

**Effecting organic reactions.** N. V. de Bataafsche Petroleum Maatschappij. Dutch 31,269, Nov. 15, 1933. The reaction takes place in part of a rectifying column with continuous removal of products. Chlorination of butane is described as an example.

**Soluble organic compounds.** Leó Egger és J. Egger Gyógyszervgyártó Gyár (to József Erdős). Hung. 107,982, Jan. 2, 1934. Insol. compds. are treated with diamines, dioxides, diketones, amides or dihydroxy derivs. of compds. contg. carbonyl groups in presence of water or an org. solvent at ordinary or higher temps. If desired, the vapors of the above substances are led into the suspension of the insol. compds.

**Reduction of organic compounds.** H. Th. Bohme A.-G. (Heinrich Bertsch, inventor). Ger. 591,057, Jan. 16, 1934 (Cl. 12o. 27). Addn. to 577,037 (C. A. 27, 3941). See Brit. 359,188 (C. A. 27, 304).

**Alcohols.** I. G. Farbenind. A.-G. (Wilhelm Lommel and Rudolf Schroter, inventors). Ger. 589,946, Dec. 20, 1933 (Cl. 12o. 5.02). Satd. high-mol. secondary alcs. are prep'd. by reducing ketones from soap-forming fatty acids, with H in the presence of catalysts. Thus, stearic acid and  $AcOH$  are led over  $CaO$  or  $ThO_2$  at 440–60° to form a ketone nuxt. This is treated with H at 40 atm and 100° in an autoclave, with a Ni catalyst to give a secondary alc. b. 197–9° and m. 33–6°.

**Receiver for the synthesis of alcohols.** The Head of the Tokyo Kogyō Shikienjo (Gorō Shima and Meikō Yamamoto, inventors). Japan. 100,101, March 14, 1933. The receiver is a vessel having shelves for fractional purification of alcs. manuf'd. from CO and  $H_2$ .

**Purifying synthetic alcohols.** The Head of the Tokyo Kogyō Shikienjo (Gorō Shima and Kan'ichi Hasumi, inventors). Japan 99,067, Jan. 10, 1933. Addn. to 92,839. Alcs. synthesized from CO and  $H_2$  in the presence of catalysts are purified by treating with an acid or a substance which easily gives an acid and an oxidizing material such as  $KMnO_4$ .

**Aromatic alcohols.** Ludwig Valik and Irene Valik.

U. S. 1,944,958–9, Jan. 30. See Brit. 398,186 (C. A. 28, 1047<sup>7</sup>).

**Aldehydes, acids, anhydrides and esters.** Henry Dreyfus. Brit. 401,269, Oct. 30, 1933. See Fr. 753,165 (C. A. 28, 776<sup>7</sup>).

**Aminoaromatic ketones.** Edgar C. Britton and Fred Bryner (to Dow Chemical Co.). U. S. 1,948,058, Feb. 6. A compd. such as *p,p'*-diaminobenzophenone is made by the reaction of a nuclear halogenated aromatic ketone such as *p,p'*-dichlorobenzophenone with aq.  $NH_3$  under superatm. pressure at a temp. of about 170–300° in the presence of a Cu compd. such as  $Cu_2O$ .

**Cyclic cyano ketimides and ketones.** Schering-Kahlbaum A.-G. (Karl Ziegler, Helmut Ohlinger and Hans Eberle, inventors). Ger. 591,269, Jan. 19, 1934 (Cl. 12o. 25). Nitriles of the formula  $NC(CH_2)_nCN$  are treated with condensing agents contg. the group  $RR'NM$ , where R and R' are alkyl, aryl or aralkyl groups or an alicyclic group, and M is a metal such as an alkali or alk. earth metal, Mg or Al. The products are cyano ketimides of

the formula  $NC\overline{CH_2}(CH_2)_{n-1}\overline{C:NH}$  (I) or  $NC\overline{CH_2}$ .

$(CH_2)_{n-1}\overline{C:NH}.CH(CN).(CH_2)_{n-1}\overline{C:NH}$  (II). They yield cyclic cyano ketones when saponified with mineral acid. Thus, adipodinitrile yields  $\alpha$ -cyanocyclopentanone imide, m. 147°, when treated in  $Et_2O$  soln. below 0° with  $BrMgNEt_3$ , prep'd. from  $BrMgEt$  and  $NH_4Et$ . Sebacadinitrile, treated under similar conditions with  $LiN(C_2H_5)_3$ , yields  $\alpha$ -cyanocycloheptanonimide, which on saponification yields  $\alpha$ -cyanocycloheptanone, b<sub>p</sub> 140–1° (schmiedbarzom, m. 102°). In other examples, (1) azelaic dinitrile yields  $\alpha$ -cyanocyclooctanone, b<sub>p</sub> 150–60°, m. 53°, and (2) dicyanocyclohexadecane-1,8-dione; (2) 1,14-dicyanotetradecane yields I and II ( $n = 14$ ), m., resp., 135° and 192°. Relatively dil. solns. should be used, particularly in prep'g. compds. contg. more than 6 C atoms in the ring. The products are useful as intermediates for perfumes.

**Esters.** Henkel & Cie. G. m. b. H. Brit. 401,117, Nov. 9, 1933. This corresponds to Fr. 746,434 (C. A. 27, 4539) but the hydroxy or mercapto fatty acids are saponified with hydroxy or mercapto aliphatic compds. contg. at least 8 C atoms or with naphthenic or resin alcs. In Brit. 401,120, Nov. 9, 1933, addn. to 401,117, such fatty acids contg. at least 6 C atoms are saponified with hydroxy or mercapto aliphatic compds. contg. less than 6 C atoms.

**Vinyl esters.** I. G. Farbenind. A.-G. (Walter Repp, inventor). Ger. 589,970, Dec. 20, 1933 (Cl. 12o. 19.03). Addn. to 588,352 (C. A. 28, 1357<sup>3</sup>). The process of Ger. 588,352 is applied to the prep'n. of vinyl esters of cyclic carboxylic acids. Examples are given of the prep'n. of vinyl benzoate, b<sub>p</sub> 72–4°, phenylacetate, b<sub>p</sub> 88–90°,  $\alpha$ -naphthoate, b<sub>p</sub> 145–55°,  $\beta$ -naphthoate, b<sub>p</sub> 153°, ethyl phthalate, acetylsalicylate, b<sub>p</sub> 145–50°, and abietate, b<sub>p</sub> 200–25°.

**Esters of higher acids and alcohols.** Geo. D. Graves (to E. I. du Pont de Nemours & Co.). U. S. 1,941,887, Jan. 30. By reaction of the alcs. with the acids, esters are formed such as lauryl caproate, b<sub>p</sub> 205–10°, lauryl laurate, m. 31°, stearyl laurate, m. 37°, oleylstearyl laurate (a light brown solid), oleyl laurate (also a light brown solid), myristyl caproate (a brown oil). Coconut oil acids are esterified with mixed alcs. from hydrogenated coconut oil, and, in general, satd. fatty acids contg. 6 to 13 C atoms may be used for reacting with alcs. contg. 12 to 18 C atoms. The esters thus formed may be used in coating compns., etc.

**Persulfuric acid esters.** H. Th. Bohme A.-G. (Heinrich Bertsch, inventor). Ger. 589,778, Dec. 20, 1933 (Cl. 12o. 23.02).  $H_2S_2O_8$  esters of high-mol. aliphatic alcs. with more than 8 C atoms are obtained by the action of the acid on the alc. or the corresponding olefin, in optional presence of a solvent. Thus, hexadecylene is treated with  $H_2S_2O_8$  to give the ester. The products are used for treating textiles.

**Stable solutions of alkylamino esters of aminobenzoic acid.** I. G. Farbenind. A.-G. (Max Bockmuhl and Willy H. Ludwig, inventors). Ger. 589,519, Dec. 8, 1933 (Cl.

12g. 6.02). Alkylamino esters of *N*-monoalkylated or *N*-monoalkoxyalkylated derivs. of *p*- and *o*-aminobenzoic acids in the form of salts are brought into soln. with hydroxy acids of the aliphatic or hydroaromatic series and in the presence of prolamines and wheat mucous. Thus, 4-butylaminobenzoic acid  $\beta$ -dimethylaminoethyl ester is introduced into quinic acid and water. Wheat mucous, alc. and gliadin alc. are added. Distd. water and acetone bisulfite are then added to give a stable soln. Other examples are given.

Continuous production of esters such as methyl salicylate. Thomas S. Carawell, Ernest T. Stehly and Nicolaas J. G. Alozerij (to Monsanto Chemical Co.). U. S. 1,945,177, Jan. 30. A mixt. comprising an org. carboxylic acid such as salicylic acid which is substantially non-volatile below 120°, an aliphatic alc. such as MeOH the b. p. of which is below 100°, water, and the ester of the acid and alc., is boiled, water is added to the boiling mixt. to effect removal from it of the ester produced by the reaction while more ester is formed simultaneously, and acid and alc. are added in equiv. proportions as consumed in the ester-forming reaction. Cf. C. A. 27, 3482.

Saponification of esters of terpene alcohols. Hajime Ueda and Kyôhei Murakami. Japan. 99,856, March 1, 1933. The saponification of esters of terpene alcohols with aq. alkali is improved by adding salts of alkali or alkali earth metals of higher fatty acids, resin, casein, glue, silica gel, active C or kieselguhr.

Ethers. Henkel & Cie. G. m. b. H. Brit. 401,142, Nov. 9, 1933. See Fr. 751,923 (C. A. 28, 777°).

Purification of ether. Yoshio Konishi. Japan. 99,479, Feb. 10, 1933. Crude ether is purified by passing its vapor through a layer of metallic oxides (oxides of Pb, Cu, Fe, Mn, Al, Ca, etc.) heated above the b. p. of ether.

Preventing decomposition of ether in tin cans or the like. Joseph Rosin (to Merck & Co.). U. S. 1,946,502, Feb. 13. A bundle or "sheaf" of bent iron wire or the like is placed in the receptacle contg. the ether.

Nitrophenol ethers. Shinjirô Aoyama. Japan. 99,202, Jan. 26, 1933. Nitrophenol ethers are prepd. by heating a mixt. of halogenated nitrobenzene, alc., water and caustic alkali, with oxide, peroxide or salt of metals except Cu, as catalysts. The formation of dihaloazoxybenzene is prevented.

Phenols. F. Raschig G. m. b. H. Fr. 756,814, Dec. 15, 1933. PhOH and its homologs are made by treating PhCl and its homologs with steam at a high temp., in the presence of compds. of  $H_3PO_4$  with elements of the 2nd group, e. g.,  $Ca_3(PO_4)_2$ , Cu, Ni, Co, Ag, Au and metals of the Pt group or their compds. may be present. Cf. C. A. 28, 2020°.

Alkylolamine derivatives of aliphatic acids. Jean G. Kern and Charles J. Sala (to E. I. du Pont de Nemours & Co.). U. S. 1,946,079, Feb. 6. By reaction of mono-, di- or tri-ethanolamine or aminopropanediol or methyl-diethanolamine or the like with oleic acid, ricinoleic acid, castor oil, stearic acid, sulfonated castor oil or the like, derivs. are obtained which may be used as sol. oils, solvents, detergents and antiseptics. Several examples with details of procedure are given. U. S. 1,946,080 also relates to products of the same character.

Alkoxy derivatives of phosphorus acid chlorides. Erik Clemmensen (to Monsanto Chemical Co.). U. S. 1,945,183, Jan. 30. Smooth, quantitative reaction is effected by adding MeOH to P oxychloride or to P sulfochloride, to produce methoxy P oxydi- or mono-chloride and methoxy P sulfodichloride, resp., and similar reactions are effected with other alcs. such as BuOH, PrOH, iso-PrOH, sec-butyl alc. or AmOH, etc., under reduced pressure.

Purifying fluorinated aliphatic hydrocarbon derivatives. Herbert W. Daudt (to Kinetic Chemicals, Inc.). U. S. 1,946,195, Feb. 6. Products such as  $CF_3Cl$ , which contain acidic impurities are treated with an amine such as aniline and the purified product is sep'd. from the resulting mixt. (suitably by distn.).

Barbituric acid derivative. Compagnie de Béthune. Ger. 589,947, Dec. 19, 1933 (Cl. 12p. 7.01). The compd. 5,5-allyl- $\Delta^2$ -cyclopentenylbarbituric acid is prepd. by

condensing the ethyl ester of allyl- $\Delta^2$ -cyclopentenylmalonic acid with urea in the presence of condensing agents of the alkali or alk. earth groups. The substance m. 139-40°.

Methyleneanthrone derivatives. I. G. Farbenind. A.-G. (Heinz Scheyer, inventor). Ger. 591,496, Jan. 22, 1934 (Cl. 22b. 2.05). Methyleneanthrone (I) or a nuclear substitution product is treated with a quinone contg. one or more groups —CX: CX—, where X is H or halogen. The reaction may be effected by heating the components to a moderate temp. in an inert solvent. Condensation products useful as vat dyes or intermediates are obtained. Examples are given of the prepn. of products from I and  $\alpha$ -naphthoquinone (II), 2-chloro-II, benzoquinone, toluquinone,  $\beta$ -naphthoquinone and naphthazarin; a product from methylene-2-chloroanthrone and II is also described. Quinones contg. 2 —CX: CX— groups may be condensed with 1 or 2 mols. of I. The quinones may be replaced by compds. which yield them under the reaction conditions, e. g., II-dichloride.

Quinoline derivatives. I. G. Farbenind. A.-G. (Heinrich Jensch, inventor). Ger. 591,480, Jan. 22, 1934 (Cl. 12p. 1.10). New derivs. of quinoline (I), having one  $NH_2$  group in the 2- or 4-position and another in the benzene ring, are prepd. (1) by introducing an  $NH_2$  group into the 2- or 4-position of a *BS*-amino-I by standard methods, or (2) by reducing a *BS*-nitro-2- or -4-amino-I. Alkyl, acyl or urea derivs. of the products may be prepd. by standard methods or from correspondingly substituted starting materials. Examples are given of the prepn. of 2,6-diamino-I, m. 219°; 4,6-diamino-I, m. 215°; 4,6-diamino-2-methyl-I, m. 197°; 4-amino-6-acetamido-2-methyl-I, m. 250°; 4-ethylamino-6-amino-2-methyl-I, m. 195°; 4-amino-6-ethylamino-2-methyl-I, m. 232°; 4,8-diamino-2-methyl-I, m. 168°; 4-amino-6-cinnamoylamino-2-methyl-I, m. 253-4°; 4-amino-8-cinnamoylamino-2-methyl-I, m. 202-3°; *s*-bis(4-amino-6-quinaldyl)urea, m. 255°, *s*-bis(4-amino-6-quinaldyl)oxamide, unmelted at 300°, *s*-bis(4-amino-6-quinaldyl)fumaramide, m. 259°, and *s*-bis(4-amino-6-quinaldyl)malonamide, decomp. 216°. The products are useful as internal disinfectants. The prepn. of the following intermediates is described:

4-chloro-6-acetamido-2-methyl-I, m. 208-9°; 4-chloro-6-amino-2-methyl-I, m. 170°; 4-amino-6-*N*-ethylacetamido-2-methyl-I, m. 221-2°; 4-chloro-8-acetamido-2-methyl-I, m. 119-20°, and 4-chloro-8-amino-2-methyl-I, m. 112°.

Amino compounds. Oswald T. Krefft. Brit. 401,302, Oct. 30, 1933. See Fr. 735,020 (C. A. 27, 1118°).

Hydroxybiphenylene compounds. I. G. Farbenind. A.-G. (Friedrich Muth, Bruno Putzer, and Alfred Carl, inventors). Ger. 591,213, Jan. 18, 1934 (Cl. 12g. 14.02). Hydroxy derivs. of biphenylene oxide, sulfide, sulfoxide and sulfone are prepd. by diazotizing the corresponding amino compds., and heating the diazo compds. to about 200° with  $H_3PO_4$ . The amino compd. may be diazotized in  $H_3PO_4$  soln., and the soln. then heated while superheated steam is passed through. Examples are given of the prepn. of 2- and 3-hydroxybiphenylene oxide, m., resp., 139° and 136°, 3-hydroxybiphenylene sulfide, m. 160°, 2-hydroxybiphenylene sulfoxide, m. 147°, and 3-hydroxybiphenylene sulfone, m. 284°. 3-Aminobiphenylene oxide, m. 128°, used as a starting material, is prepd. by heating 3-bromobiphenylene oxide to 200-220° with an excess of aq.  $NH_3$  in the presence of a Cu salt.

Oxidizing mononuclear aromatic compounds as in the production of maleic acid from benzene. Alphonso O. Jaeger (to Selden Co.). U. S. 1,945,354, Jan. 30. Vapor of a starting material such as  $C_6H_6$  together with an O-contg. gas such as air contg. somewhat more O than required for the desired oxidation are passed at reaction temp. through a series of converters contg. a catalyst (such as Al vanadate on quartz) favoring the oxidation of C atoms of the aromatic nucleus. The converted product is condensed out of the gases after leaving each converter, and uncondensed gases, without addn. of further O-contg. gas, are passed in series through the next converter.

Addition products of fatty acids and camphene. I. G. Farbenind. A.-G. Ger. 589,779, Dec. 14, 1933 (Cl. 12a.

25). In forming the addn. products,  $\text{BF}_3$  is used as the catalyst and the fatty acid is added in equiv. proportions or in excess not exceeding 25%. Thus, camphene, glacial  $\text{AcOH}$  and  $\text{BF}_3$  are stirred together to give a 95% yield of isobornyl acetate.

**Cyclic substitution products of acetaldehyde.** I. G. Farbenind. A.-G. (Angelo Knorr, Emil Laage and Albert Weissenborn, inventors). Ger. 591,452, Jan. 23, 1934 (Cl. 12a. 8). A cyclic aldehyde is treated with a halo-acetic ester in the presence of an alk. condensing agent and a liquid hydrocarbon or halo hydrocarbon. The cyclically substituted glycidic esters so obtained are then decompd. in known manner to yield the corresponding aldehydes. Thus,  $\text{BzH}$  and  $\text{ClCH}_2\text{COOEt}$ , added at  $8^\circ$  to  $\text{EtONa}$  in

xylene, yield  $\text{PhCH}_2\text{OCHCOOEt}$  (I),  $b_{\text{D}}^{20}$  128-30°, which is sapond. with  $\text{NaOH}$  and then heated with  $\text{H}_2\text{SO}_4$  and an org. acid while steam is led through the mixt., this yielding  $\text{PhCH}_2\text{CHO}$  (II),  $b_{\text{D}}^{20}$  80-2°. The following compds. have also been obtained: 4-chloro-I,  $b_{\text{D}}^{20}$  155-60°, and -II, m. 39-40°; 4-methyl-I,  $b_{\text{D}}^{20}$  145-7°, and -II,  $b_{\text{D}}^{20}$  80-2°; 4-ethyl-I,  $b_{\text{D}}^{20}$  155-60°, and -II,  $b_{\text{D}}^{20}$  98-100°; 2,4-dimethyl-I,  $b_{\text{D}}^{20}$  150-5°, and -II,  $b_{\text{D}}^{20}$  95-8°; 4-isopropyl-I,  $b_{\text{D}}^{20}$  165-70°, and -II,  $b_{\text{D}}^{20}$  105°; 4-(1-methopropyl)-I,  $b_{\text{D}}^{20}$  170-5°, and -II,  $b_{\text{D}}^{20}$  105°; 2,4-diisopropyl-I,  $b_{\text{D}}^{20}$  175-85°, and -II,  $b_{\text{D}}^{20}$  129-30°; 4-methoxy-I (unstable), and -II,  $b_{\text{D}}^{20}$  120°; 5,6,7,8-tetrahydro-1-naphthylglycidic Et ester,  $b_{\text{D}}^{20}$  185-90°, and 5,6,7,8-tetrahydro-1-naphthyl-acetaldehyde,  $b_{\text{D}}^{20}$  135-40°.

**Water-soluble condensation products from compounds such as phenol and trichlorobenzyl chloride.** Alfred Thaus, Gustav Mauthé and Arnold Dover (to General Aniline Works). U. S. 1,946,430, Feb. 6. An aromatic hydroxy compd. such as  $\text{PhOH}$  is heated with about the same quantity of a halogenated aralkyl halide contg. no hydroxyl group, such as trichlorobenzyl chloride at a temp. of  $100^\circ$  or lower for 3-15 hrs. in the presence of  $\text{ZnCl}_2$  or  $\text{AlCl}_3$  and the condensation product thus obtained is sulfonated at a temp. of 35-80° to obtain a product which may be used as a resist in treating fabrics, etc.

**Polymerization products of esters of ethylenedicarboxylic acids.** Harry B. Dykstra (to E. I. du Pont de Nemours & Co.). U. S. 1,945,307, Jan. 30. Coating compns. which give clear films comprise polymerization products such as those of esters of fumaric, maleic, citraconic and mesaconic acids which may be used with conjointly polymerized vinyl esters or styrene. Numerous examples are given.

**Polymerizing isoolefins.** I. G. Farbenind. A.-G. Brit. 401,297, Nov. 3, 1933. High mol. polymerization products are made by polymerizing isoolefins in the presence of an inorg. halide, preferably volatile, e. g.,  $\text{BF}_3$ , which may be charged with  $\text{HF}$ ,  $\text{PF}_3$ ,  $\text{AlCl}_3$ , while maintaining the temp. below  $-10^\circ$ . Solvents, e. g.,  $\text{C}_6\text{H}_{10}$ , may be present. Among examples (1)  $\text{BF}_3$  is led into liquid isobutylene cooled in a  $\text{CO}_2$  bath to  $-80^\circ$  and (2)  $\text{Al}$  chips and  $\text{HgCl}_2$  (forming  $\text{AlCl}_3$  *in situ*) are added to a soft paraffin wax-cracking product cooled to  $-60^\circ$  by  $\text{Me}_2\text{CO}$  and  $\text{CO}_2$ , the temp. not being allowed to exceed  $-40^\circ$ .

**Polymerizing olefinic gases.** Wm. B. Plummer (to Standard Oil Co. of Ind.). U. S. 1,947,306, Feb. 13. Olefinic gases are polymerized into higher-boiling liquid hydrocarbons at pressure of 500-3000 lb. per sq. in. and temps. of about 400-675° in a system which comprises a preheating zone, a heating zone, a soaking zone and a recovery system for sepp. liquid hydrocarbons, high-olefin-content gases and low-olefin-content gases. Low-olefin-content gases are passed through the preheating zone, heating zone, soaking zone and recovery app. and high-olefin-content gases are introduced into the system prior to the soaking zone but subsequent to the preheating zone. App. is described. Cf. C. A. 28, 1714°.

**Nonbenzenoid acetylene polymers.** E. I. du Pont de Nemours & Co. Ger. 589,561, Dec. 12, 1933 (Cl. 12a. 19.01). Addn. to 588,283 (C. A. 28, 1360°). See Fr. 41,454 (C. A. 27, 2096°).

**Alkali acetate.** The Head of the Tokyo Kōgyō Shikenjo (Saizō Ueno, inventor). Japan. 100,470, Apr. 7, 1933. An alkali acetate is prepd. in good yield by heating a mixt. of  $\text{EtOH}$  and  $\text{NaOH}$ ,  $\text{KOH}$  or mixed caustic alkalies at 200-450° in presence of water. The alkali should be kept in a fluid state with water. When water is absent, more than 50% of the alkali used changes into a carbonate.  $\text{KOH}$  is used under ordinary pressure; with  $\text{NaOH}$  better results are obtained by carrying out the reaction under pressure.

**Carbamates.** The Mathieson Alkali Works. Fr. 756,-421, Dec. 9, 1933. Alkali or alk. earth metal carbamates are made by bringing  $\text{CO}_2$  into contact with a sol. metal salt in the presence of water and  $\text{NH}_3$ , the amt. of water being 10-100% of the wt. of  $\text{NH}_3$ .  $\text{EtOH}$ ,  $\text{MeOH}$  or acetone may be added to the water. Cf. C. A. 28, 863°.

**Carbamates.** The Mathieson Alkali Works. Fr. 750,-653, Dec. 13, 1933. Alkali and alk. earth metal carbamates are made by the action of  $\text{CO}_2$ ,  $\text{NH}_3$  and a salt of the metal, the  $\text{CO}_2$  being used as a solid compd. of  $\text{CO}_2$  and  $\text{NH}_3$ , e. g., carbamate, sesquicarbonate or bicarbonate-carbamate of  $\text{NH}_4$ .

**Ferric oxalate.** Curtin-Howe Corp. Ger. 588,878, Nov. 30, 1933 (Cl. 12a. 11). See Brit. 393,531 (C. A. 27, 5756°).

**Potassium oxalate.** Rudolph Koepf & Co. Chemische Fabrik A. G. Fr. 756,820, Dec. 15, 1933.  $\text{K}_2(\text{COO})_2$  is made by heating  $\text{HCOOK}$ , taking care to assure the presence of an alkali hydroxide at the start of the process, the amt. being greater as the temp. is lower, and the partial pressure of  $\text{H}$  is regulated according to the temp. of reaction so that this partial pressure remains below the equil. pressure of the reaction and maintained below this pressure during the reaction. The partial pressure of  $\text{H}$  is kept below 1 atm. and constantly lowered during the course of the reaction. The temp. is preferably 300-400°.

**Thorium oxalate.** Chem. Fab. von Heyden A.-G. (Rudolf Zellmann and Richard Muller, inventors). Ger. 591,478, Jan. 22, 1934 (Cl. 12m. 9). Th oxalate, prepd. as described in Ger. 580,216 (C. A. 27, 4818°), is freed from  $\text{H}_3\text{PO}_4$  by digestion with dil.  $\text{H}_2\text{SO}_4$  at atm. or raised temp.

**Nitrosamine salts.** Tatsuo Tokunaga Japan. 100,-312, March 29, 1933. By treating diazo compds. of aromatic amines having many negative groups (such as  $\text{Cl}$  or  $\text{NO}_2$ ) with a neutral sulfate before introducing the diazo compds. into a strong alkali soln., nitrosamine salts are produced in good yield and quality. Examples of 2,5-dichloroaniline, 2-nitro-4-chloroaniline and 2,6-dichloro-4-nitroaniline are given.

**Salts of cresols mercurated in the nucleus.** Philipp Honig. Ger. 589,949, Dec. 19, 1933 (Cl. 12g. 15.02). Conc'd. aq. solns. of cresol-alkalies are heated with  $\text{HgO}$  and alkali chloride, and the resulting paste dried. Thus, *p*-cresol and  $\text{NaOH}$  are dissolved in water. The soln. is heated with  $\text{NaCl}$  and  $\text{HgO}$  to form a salt paste sol. in water. This is dried and pressed.

**Sulfonyl chloride of hydroxynaphthalenecarboxylic acid.** I. G. Farbenind. A.-G. (Georg Kranzlein and Hans Schlichenmaier, inventors). Ger. 589,520, Dec. 8, 1933 (Cl. 12g. 30). The compd. 2-hydroxynaphthalene-3-carboxylic acid-6-sulfonic acid chloride is prepd. by treating 2-hydroxynaphthalene-3-carboxylic acid-6-sulfonic acid with  $\text{PCl}_5$  and heating the reaction product with conc'd.  $\text{H}_2\text{SO}_4$ . The substance decomposes at  $190^\circ$ .

**Crystallization of guanidine salts.** Yōgorō Katō (Kiichirō Sugino, Syōei Koizumi and Yōgorō Katō, inventors). Japan. 99,441, Feb. 8, 1933. Guanidine salts are purified by fusing and gradually cooling below their m. ps. to effect crystn.

**Nitroguanidine nitrate.** Yōgorō Katō (Kiichirō Sugino, Syōei Koizumi and Yōgorō Katō, inventors). Japan. 99,975, Feb. 16, 1933. Nitroguanidine nitrate is prepd. by treating guanidine, guanidine nitrate or substances such as dicyanodiamide with  $\text{HNO}_3$  and  $\text{NO}_2$ .

**Stabilization of mixtures of free strong acids and alkanols, alkenes, alkyl or dialkyl compounds or other polymerizing substances.** N. V. de Bataafsche Petroleum

**Maatschappij.** Dutch 31,611, Dec. 15, 1933. Polymerization of alkyl sulfates and similar compds. in the presence of excess acid is inhibited by addn. of metal cyanides or complex cyanides or sol. Pt, Cu, Fe, Co, Ni or Ag salts.

**Separation of solid and liquid fatty acids by crystallization from a cooling solution.** Ernst A. Mauersberger. Dutch 31,378, Nov. 15, 1933. The mixt. is crystd. by cooling a hot mixt. of the fatty acids stirred continuously with an O-free solvent (aliphatic or aromatic hydrocarbon) in which a H<sub>2</sub>O phase is dispersed. The latter is produced by addn. of H<sub>2</sub>O or of dil. aq. solns. of alcohols, ketones, etc. Cf. C. A. 28, 922<sup>a</sup>.

**Fatty acids from hydrocarbons.** I. G. Farbenind. A.-G. (Max Harder, inventor). Ger. 591,121, Jan. 18, 1934 (Cl. 12a. 11). Crude oxidation products of higher paraffin hydrocarbons, or crude fatty acids obtained from such oxidation products, are freed by distn. from constituents of relatively low b. p., e. g., constituents b<sub>4</sub> up to 200°. The residual acids are then refined by hydrogenation in known manner. Details are given.

**Aliphatic acids.** Henry Dreyfus. Brit. 400,944, Nov. 1, 1933. Aliphatic acids, e. g., AcOH, propionic, butyric, are concd. by extg. with a low-boiling solvent together with an O-contg. liquid of b. p. at least 150° in which H<sub>2</sub>O is insol. or by extg. with a low-boiling solvent and pptg. H<sub>2</sub>O from the ext. by adding the high-boiling O-contg. liquid. The low-boiling solvent is at least 50% of the mixed solvents. Low-boiling solvents are ethers, e. g., Et<sub>2</sub>O, esters, e. g., AcOEt, HCOOBu, and MeEt ketone. High-boiling liquids are ketones, e. g., acetophenone and other alkyl aryl ketones, ethers, e. g., anisole, phenetole, benzyl phenyl ether, and esters, e. g., AcOAm, octyl acetate, butyl butyrate, dimethyl phthalate, benzyl benzoate. Any H<sub>2</sub>O in the ext. may be removed by a dehydrating agent, e. g., Na<sub>2</sub>SO<sub>4</sub>, or as an azeotropic mixt. with 1 of the components of the extg. medium, e. g., AcOEt, or with a suitable added substance. Cf. C. A. 27, 310.

**Carboxylic acids such as acetic or propionic acid.** John C. Woodhouse (to E. I. du Pont de Nemours & Co.). U. S. 1,946,254, Feb. 6. A satd. aliphatic alc. such as MeOH or EtOH which remains substantially undecompd. when vaporized or a compd. such as an alkyl ester or ether which gives a satd. aliphatic alc. upon hydrolysis is treated with CO in the presence of a volatile inorg. acid such as may be formed from steam and Cl (suitably at a temp. of about 375° under 700 atm. pressure). U. S. 1,946,255 relates to the generally similar production of carboxylic acids such as HOAc or propionic acid from a hydrolyzable alkoxy compd. or alc. U. S. 1,946,256 relates to production of a carboxylic acid such as HOAc from an aliphatic alc. and CO with employment of a volatile halide such as HCl and Mn chloride assocd. with activated C as a catalyst.

**Organic acids such as acetic acid.** Gilbert B. Carpenter (to E. I. du Pont de Nemours & Co.). U. S. 1,946,257, Feb. 6. Acids such as HOAc are produced by contacting a monohydroxy aliphatic alc. such as MeOH or an alkyl ether or alkyl ester under high pressure with a halide of an element of group 2 of the periodic system or of Mn, such as ZnI<sub>2</sub> or CdI<sub>2</sub>, and with CO at a reacting temp. (which may be about 300°). U. S. 1,946,259 relates to the use of similar catalysts in the prepn. of acids such as HOAc from MeOH or compds. contg. a hydrolyzable alkoxy group and CO in the presence of a H halide.

**Organic acids such as acetic acid.** Wallace H. Carothers and Gilbert B. Carpenter (to E. I. du Pont de Nemours & Co.). U. S. 1,946,258, Feb. 6. Acids such as HOAc are produced by contacting a monohydroxy aliphatic alc. such as MeOH or an alkyl ether or ester with a complex inorg. oxide contg. a metal of group VI-A of the periodic system such as a silico tungstic acid in the presence of CO at a reacting temp. (which may be about 300°). A high pressure is used.

**Organic acids such as acetic acid from their alkali metal salts.** John C. Woodruff, Grover Bloomfield and Ignace J. Krehma (to Commercial Solvents Corp.). U. S. 1,946,419, Feb. 6. A salt such as NaOAc is subjected to

the action of CO<sub>2</sub> gas in the presence of a homogeneous aq. org. liquid medium such as a mixt. of MeOAc, MeOH and water in which the salt is "at least partially sol."

**Acetic acid.** Usines de Melle (Soc. anon.) and Henri M. Guinot. Fr. 757,155, Dec. 21, 1933. AcOH is made by quantitatively oxidizing alc. with an acid aq. soln. of K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, extg. the AcOH by a solvent, and regenerating the residual aq. soln. by electrolysis, which transforms the chromous to chromic salts.

**Organic dibasic acids such as maleic and tartaric acids by catalytic oxidation.** Heinrich W. Witzel (to Selden Co.). U. S. 1,945,248, Jan. 30. A cyclic org. compd. such as furfural is subjected to vapor-phase oxidation with splitting of the ring, the major portion of the products are removed from the gas stream, the tail gases are treated with water, an alkali is added in sufficient amt. to form a salt of different soly. from the remaining solute, and the product of lowest soly. is sepd.

**Succinic acid and its salts.** Johann A. Bertsch and Arthur H. Krause (to Monsanto Chemical Co.). U. S. 1,945,175, Jan. 30. Maleic or fumaric acid or a maleate or fumarate is hydrogenated and the crude hydrogenation product, in soln. and assocd. with some unreacted raw material, is treated with a water-sol. permanganate or other suitable oxidizing agent which is inert to the hydrogenated product, and the purified product is filtered and crystd.

**Barbituric acids.** F. Hoffmann-La Roche & Co. A.-G. Berlin Chemische Fabrik. Ger. 587,192, Oct. 31, 1933 (Cl. 12p. 7.01). Addn. to 526,854 (C. A. 25, 4893). *N*-allyl- or *N,N'*-diallyl-5,5-disubstituted barbituric acids are obtained by treating 5,5-disubstituted barbituric acids with allyl halides in the presence of a small amt. of Cu. Thus, a soln. of 5,5-diallylbarbituric acid in NaOH is treated with allyl bromide and a small amt. of finely divided metallic Cu to give an 87% yield of *N*-allyl-5,5-diallylbarbituric acid, m. 68-9°. Other examples describe the prepn. of 1,3,5-triallyl-5-isopropylbarbituric acid, b<sub>10</sub> 171-4°, 5,5-phenylethyl-*N*-monoallylbarbituric acid, m. 68-9°, 5,5-benzylethyl-*N*-allylbarbituric acid, m. 77-8°, and 1-allyl-3-phenyl-5,5-diethylbarbituric acid, m. 72-3°.

**Barbituric acids.** Chemische Fabrik von Heyden A.-G. (Rudolf Gehauer, inventor). Ger. 587,428, Nov. 3, 1933 (Cl. 12p. 7.01). Addn. to 573,541 (C. A. 27, 4349). The method of 573,541 for prepg. 5,5-disubstituted barbituric acids from 5-monosubstituted barbituric acids, 1,2,3-substituted pyrazolones and aldehydes in optional presence of a condensing agent, is modified by using *N*-substituted-5-monosubstituted acids. Thus, *N*-methyl-5-ethylbarbituric acid, m. 105° (obtained from ethyl malonate and methyl urea) is condensed with phenyldimethylpyrazolone and paraformaldehyde in the presence of concd. HCl to give a product, m. 221°. Other examples, giving the structural formulas of the products are given.

**Benzoic acid and benzoates.** Jules B. Denant (to Bozel-Malétra (Société industrielle de produits chimiques)). U. S. 1,945,032, Jan. 30. See Ger. 585,429 (C. A. 28, 1304<sup>a</sup>).

**Purifying 2-phenylquinoline-4-carboxylic acid and its salts.** Wm. H. Glahn and Jacob Ehrlich (to Verona Chemical Co.). U. S. 1,945,270, Jan. 30. Crude cinchophen is warmed with an alkali metal hypochlorite or alk. earth metal hypochlorite, and resulting alkali- and water-insol. colored substances are sepd. from the cinchophen.

**Aminoethanesulfonic acids.** I. G. Farbenind. A.-G. (Hans Haussmann, inventor). Ger. 589,948, Dec. 22, 1933 (Cl. 12q. 6.01). Ethane compds. contg. HSO<sub>3</sub> and H<sub>2</sub>SO<sub>4</sub> ester groups are treated with NH<sub>3</sub> or amines. Thus, abs. alc. is treated with gaseous SO<sub>3</sub> and the product with aq. and gaseous NH<sub>3</sub>. Other examples are given. Cf. C. A. 27, 2965.

**1-Iodo-8-hydroxynaphthalenesulfonic acids.** Arthur Stoll, August Binkert and Walter Kussmaul (to Chemische Fabrik vorm. Sandoz). U. S. 1,946,950, Feb. 13. Diazonium iodides of 1-diazo-8-hydroxynaphthalenesulfonic acids are heated in an aq. medium in the presence of Cu.

**Acetic anhydride.** Rudolf Meingast and Martin Mugdan (to Consortium für elektrochemische Industrie). U. S. 1,946,707, Feb. 13. HOAc vapor contg. a small proportion of a volatile weak inorg. acid such as  $H_3PO_4$  serving as a catalyst is heated to 400-800°. Cf. C. A. 27, 311.

**Acetic anhydride.** Consortium für elektrochem. Ind. G. m. b. H. (Martin Mugdan and Johann Sixt, inventors). Ger. 591,195, Jan. 18, 1934 (Cl. 12o. 12). A liquid mixt. of  $Ac_2O$ ,  $AcOH$  and  $H_2O$ , obtained by thermal decompn. of vaporized  $AcOH$ , is treated at a low temp. with a water-insol. solvent for  $Ac_2O$  and  $AcOH$ , e. g.,  $C_2H_2Cl_2$ . The aq. layer is then removed, and the solvent layer is fractionally distd. at atm. pressure to yield a residue of  $Ac_2O$ . A continuous process is described.

**Acetylene.** Floyd J. Metzger (to Air Reduction Co., Inc.). Brit. 401,531, Nov. 16, 1933. See U. S. 1,900,055 (C. A. 27, 2965).

**Purifying acetylene.** Hannus Bueckert, Robert Stadler and Helmut Tanneberger (to I. G. Farbenind. A.-G.). U. S. 1,945,592, Feb. 6. For increasing the concn. of  $C_2H_2$  in a gas mixt. also contg. biacetylene, allene, allylene and butadiene, obtained by a thermal treatment of a hydrocarbon material (such as by use of an elec. arc) above 1000°, the gas mixt. is cooled to about -70° to condense impurities. App. is described.

**Apparatus for producing acetylene and substantially dry calcium hydroxide from calcium carbide and water.** Karl Weibezahn and Felix Walter (to Akt.-Ges. für Stickstoffdünger). U. S. 1,947,120, Feb. 13. Various structural and operative details are described.

**Tetrachloroethylene.** John H. Reilly (to Dow Chemical Co.). U. S. 1,947,491, Feb. 20. An olefin chloride such as ethylene chloride and  $Cl$  in mixt. are heated to about 300-500° in the presence of a porous surface catalyst such as coke or pumice. An arrangement of app. is described.

**Acetone from ethyl alcohol.** Grover Bloomfield, Lloyd C. Swallen and Francis M. Crawford (to Commercial Solvents Corp.). U. S. 1,945,131, Jan. 30. A gaseous mixt. contg.  $KtOH$  under less than atm. pressure and which also may contain  $N$ ,  $CO_2$  or  $H$  is subjected to the action of catalysts such as  $Cr$ ,  $Mn$ ,  $Cu$  or  $Fe$  compds. and  $Ca$  or  $Mg$  compds. at temps. of 250-650°.

**Diacetone alcohol.** I. G. Farbenind. A.-G. (Richard Leopold and Bernhard Schacke, inventors). Ger. 501,316, Jan. 19, 1934 (Cl. 12o. 5.03). Diacetone alc. is manufd. continuously by passing acetone at atm. temp. over solid caustic alkali and distg. the product.

**Methyl formate and methanol by hydrogenation of carbon monoxide.** Norman D. Scott (to E. I. du Pont de Nemours & Co.). U. S. 1,946,918, Feb. 13.  $CO$  and  $H$  are absorbed in a soln. of an alc. contg. a plurality of alcoholsates such as those of  $Na$  and  $Cd$ .

**Methylamine from methyl ether.** Lloyd C. Swallen (to Commercial Solvents Corp.). U. S. 1,946,245, Feb. 6. A mixt. of gaseous methyl ether and  $NH_3$  contg. 1-2 mols.  $NH_3$  per mol. of  $Me_2O$  is subjected to the action of an  $Al_2O_3$  catalyst at 300-450°. Cf. C. A. 27, 1012.

**Formaldehyde preparation.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler Abteilung Hiag. (Hermann Finkenbeiner, inventor). Ger. 589,776, Dec. 14, 1933 (Cl. 12o. 7.01). A solid  $CH_2O$  prepn. sol. in water is obtained by treating a soln. of  $CH_2O$  in an org. solvent with calcined  $Na_2PO_4$ .

**System for making acetaldehyde by vapor-phase oxidation of ethyl alcohol.** Richard Leiser, Julius Kovačević, and Hugo Bauer. Austrian 135,888, Dec. 11, 1933 (Cl. 12e).

**Furfural.** Georg H. Blomqvist and Bertil S. Groth (to Kemiska Kontrollbyran Aktiebolag and Aktiebolaget A. Heyman). U. S. 1,946,667, Feb. 13. See Ger. 583,324 (C. A. 28, 180<sup>5</sup>).

**Furfural.** Bertil S. Groth and Georg H. Blomqvist (to Kemiska Kontrollbyran Aktiebolag and Aktiebolaget A. Heyman). U. S. 1,946,688, Feb. 13. A raw pentosan-contg. material such as oat or rice husks is lixiviated with an aq. soln. such as a 0.1  $N$  soln. of  $H_2SO_4$  at such a

temp. (suitably about 80-110°) that the pentosans are substantially transformed into pentoses; the pentose soln. thus formed is sepd. and the pentoses in it are converted into furfural by heating to 130-200° and the furfural is recovered by distn. App. is described.

**Racemic phenylaminopropanol.** I. G. Farbenind. A.-G. (Max Bockmühl, Gustav Ehrhart and Leonhard Stein, inventors). Ger. 588,880, Nov. 29, 1933 (Cl. 12q. 32.21). 1-Phenyl-2-amino-1-propanol is obtained in racemic form by the catalytic reduction of 1-1-phenyl-2-keto-1-propanol with metals of the  $Ni$  group in the presence of  $NH_3$  or primary amines. Thus, 1-phenylacetylcarbinol is dissolved in alc.  $MeNH_2$  soln. and hydrogenated by treatment with  $Ni$  and  $H$  to give racemic phenylpropanolmethylamine- $HCl$ , m. 188°. Other examples describe the prepn. of racemic phenylbenzylaminopropanol- $HCl$ , m. 192-3°, and phenylaminopropanol- $HCl$ , m. 193-4°.

**Ethylene glycol phthalate.** Charles L. Gabriel and Lloyd C. Swallen (to Commercial Solvents Corp.). U. S. 1,946,202, Feb. 6. A neutral reaction product is obtained from ethylene glycol and phthalic anhydride, by heating together with  $H_2SO_4$ , and may be used as a plasticizer with nitrocellulose, etc.

**Urea.** Max Hofszász (to N.-V. de Bataafsche Petroleum Maatschappij). U. S. 1,945,314, Jan. 30. An ammonia-carbon dioxide compd. is heated with an inert viscous liquid such as a viscous oil (suitably under a pressure of 100 atm. and to a temp. of 150-200°) to form urea.

**Glycol chloro- or bromo-hydrins.** N. V. de Bataafsche Petroleum Maatschappij. Dutch 31,306, Nov. 15, 1933.  $HClO$  or  $HBrO$  esters of tertiary alcs. react in the presence of  $H_2O$  with org. compds. having 1 or 2 double bonds. The tertiary alc. is regenerated and a di- or bromo-hydrin soln. is obtained.

**Nuclear chlorination of benzene and its derivatives.** Wesley C. Stoesser and Frank B. Smith (to Dow Chemical Co.). U. S. 1,946,040, Feb. 6. Chlorination of compds. such as  $C_6H_6$ ,  $PhCl$ , biphenyl, etc., is effected by treatment with free  $Cl$  in the presence of a chlorination catalyst comprising a mixt. of  $S$ ,  $SbCl_5$  and  $Pb$ .

**2,4-Dimethoxy-1-propenylbenzene.** Zyunzō Arima and Takeo Takahashi. Japan. 100,534, Apr. 12, 1933. *m*-Methoxyphenol is converted by allyl chloride to *m*-methoxyallyloxybenzene, which is converted to 2-hydroxy-4-methoxy-1-allylbenzene by heating with dimethylaniline in an autoclave. This compd. is methylated with  $Me_2SO$ , and then heated with alc.  $KOH$ , to produce 2,4-dimethoxy-1-propenylbenzene.

**Nitrotoluene.** Nippon Sekiyū K. K. (Masakichi Mizuta and Teidi Yoshimura, inventors). Japan. 99,749, Feb. 23, 1933. Toluene is mixed with 10-80% solvent, which is inactive to nitrating reagent, according to its purity. The mixt. is treated with  $H_2SO_4$ , alkali soln. and Japanese acid clay, by which the toluene is purified. Then the mixt. is nitrated as usual and pure nitrotoluene is sepd.

**Chloronaphthalenes.** I. G. Farbenind. A.-G. (Rudolf Engelhardt, inventor). Ger. 548,260, Jan. 23, 1934 (Cl. 12o. 2.01). Naphthalene is chlorinated at a temp. below 140° in the presence of a catalyst, e. g.,  $Sb$ ,  $P$ ,  $S$  or  $I$ . Products of a waxy consistency, contg. less than 60% of  $Cl$ , are obtained.

**4,5-Dimethyl-7-chlorohydroxythionaphthene and its indigoid derivatives.** Norbert Steiger (to General Aniline Works). U. S. 1,945,923, Feb. 6. The sulfate of 4-amino-1,2-dimethylbenzene (formed by nitrating *o*-xylene and reducing the nitro product) is transformed into 1,2-dimethyl-4-aminobenzene-5-sulfonic acid by the "baking process"; the amino group is then replaced by  $Cl$  according to Sandmeyer's method, and the 4-chloro deriv. is transformed, through the sulfonyl chloride and followed by reduction, into the 1,2-dimethyl-4-chlorobenzene-5-mercaptan; this mercaptan, by the action of monochloroacetic acid, yields 1,2-dimethyl-4-chlorobenzene-5-thioglycolic acid which by ring closure is transformed into 4,5-dimethyl-7-chlorohydroxythionaphthene, m. 160°, and which when condensed with cyclic diketones

or their derivs. such as isatins or naphthoisatins, their chlorides or arylides, etc., yields mixed thioindigoid dyes giving pink-red to blue dyeings from the vat of good brightness and fastness to kier boiling. When treated with an oxidizing agent, the 4,5-dimethyl-7-chloro-hydroxythionaphthene yields the sym. thioindigo deriv. which dyes reddish violet. Various examples and alternative procedures are given.

**Camphor.** Nippon Syōnō K. K. (Seiichi Yamada and Hiroshi Ogata, inventors). Japan. 99,469, Feb. 9, 1933. Camphor is prepd. from borneol or isoborneol in an atm. not contg.  $O_2$  by catalytic oxidation at 300–400°. As catalyst reduced Cu or Ni is used. The Cu is prepd. by reducing  $Cu_2O$ , obtained from  $CuOH$  prepd. from  $CuNO_3$  and NaOH.

**Camphane.** Hajime Ueda and Kyōhei Murakami. Japan. 99,167, Jan. 25, 1933. Camphane is manufd. in good yield by agitating a mixt. of pinene-HCl, an acidic org. solvent (such as phenol or cresol), NaOH and a catalyst (such as Japanese acid clay or active C) and distg. the product.

**Indene.** Rütgerswerke-A.-G. and Leopold Kahl. Ger. 589,560, Dec. 9, 1933 (Cl. 12o. 1.04). Indene is obtained by fractionating tar oil till a product contg. 80% indene is obtained. This is cooled to –25° and the crystal. indene sepd. by centrifuging at about this temp.

**Chlorothymene.** The Head of the Tokyo Kōgyō Shikenjo (Harushige Inoue and Hiroshi Horiguchi, inventors). Japan. 100,570, Apr. 13, 1933. Chlorothymene is prepd. in good yield by treating thymene with  $Cl_2$  gas at 40–79°, in the presence of a mixt. of Fe powder and anhyd. halides of Fe, Ni, Al, Zn, P or S.

**Purifying crude coumarin.** Erik Clemmensen (to Monsanto Chemical Co.). U. S. 1,945,182, Jan. 30. See Fr. 722,406 (C. A. 26, 4069).

**Purifying crude coumarin.** Erik Clemmensen (to Monsanto Chemical Co.). U. S. 1,945,184, Jan. 30. In purifying crude coumarin contg. org. impurities, an aq. soln. is formed of a sulfite addn. product of coumarin, impurities are extd. from the soln. by use of an immiscible solvent such as  $C_6H_6$  or  $CCl_4$  and the coumarin is subsequently regenerated.

**3-Menthone.** Walter Schoeller, Erwin Schwenk and Erich Borgwardt (to Schering-Kahlbaum A.-G.). U. S. 1,940,115, Feb. 6. 3-Menthene oxide is heated to about 250° in contact with a surface catalyst such as pumice or silica gel.

**4,8-Dihydroxy-1,2,5,6-dibenzophenazines.** I. G. Farbenind. A.-G. (Arthur Zitscher, inventor). Ger. 589,071, Dec. 22, 1933 (Cl. 12p. 10). 2-Amino-3-hydroxynaphthalene, in which the H of the OH group is substituted, is converted into the phenazine and the substituent in the OH group is split off. Thus, 2-amino-3-[(3'-carboxybenzene-1'-sulfonyl)hydroxy]naphthalene is heated with  $CuO$  and  $C_6H_5Cl$ . The reaction mixt. is treated with water, NaOH and steam to split off the acyl group. The substance 4,8-dihydroxy-1,2,5,6-dibenzophenazine, m. 375–80° (uncor.), is obtained. The prepn. of 4,8-dihydroxy-*Bs*-2',2''-dimethoxy-1,2,5,6-dibenzophenazine, m. 380°, 4,8-dihydroxy-, and 4,8-dimethoxy-*Bs*-2',2''-dibromo-1,2,5,6-dibenzophenazine, m. 385° and 382–5° (uncor.), resp., is also described.

**Anthraquinone.** I. G. Farbenind. A.-G. (Hermann Hagenest, Erich Reiche and Emanuel Blümel, inventors). Ger. 589,777, Dec. 14, 1933 (Cl. 12o. 10). Anthraquinone and  $CrCl_3$  are prepd. by reducing aq. solns. of chromates contg. HCl, with anthracene.

**Benzanthrone-1-aldehyde.** Otto Bayer (to General Aniline Works). U. S. 1,946,829, Feb. 13. See Ger. 581,239 (C. A. 27, 5083).

## 11—BIOLOGICAL CHEMISTRY

PAUL E. HOWE

### A—GENERAL

ARTHUR W. DOX

**Presence in cells of adipose tissues of a dehydrogenase acting on higher fatty acids.** G. Quagliariello. *Atti accad. Lincei* 16, 552–4 (1932).—The adipose tissue of the dog contains a dehydrogenase which acts on higher fatty acids, causing either oxidation of existing double linkings or formation of new double linkings (cf. C. A. 27, 2461).

B. C. A.

**Action of different kinds of light on glucolysis.** E. Keeser. *Arch. expl. Path. Pharmacol.* 170, 500–4 (1933).—Irradiation (red light) for 30 min. of 0.1% glucose soln. (buffered with  $PO_4^{III}$ ) in presence of yeast cells accelerated the decrease in reducing power (I); white, green or blue light has little effect. Similar results were obtained with fructose as well as in the glucolysis of glucose or fructose by guinea-pig serum. Irradiation (5 hrs.) of ox serum with visible light did not alter its I or its content in inorg. P (II), but ultra-violet irradiation increased I but did not change II. Rabbits irradiated with visible light exhibited a reduction in the no. of white blood corpuscles, but apart from a temporary eosinophilia no change in the differential count occurred. B. C. A.

**Cytolysis by fat solvents and the importance of calcium and lecithin in the physicochemical behavior of protoplasm.** B. Hlučovský and B. Sekla. *Protoplasma* 18, 130–40 (1933).—The antagonism of fat solvents with respect to their cytolytic action is discussed. In the structure of the protoplasm there is a Ca-lecithin equil. which is disturbed by the differential action on the components of the various solvents examd. B. C. A.

**Physicochemical properties of proteins separated from serum by the acetone method.** A. Boutaric. *Protoplasma* 18, 286–98 (1933); cf. C. A. 27, 4552.—The viscosity and optical properties of proteins and their influence on the flocculation of  $Fe(OH)_3$  are discussed.

Seprn. of proteins at low temp. by the  $Me_2CO$  method does not involve the disturbance of mol. structure. B. C. A.

**The enzymic cleavage of the lecithins.** A. Contardi. *Boll. chim. farm.* 73, 3–12 (1934); cf. C. A. 27, 4258.—A lecture.

Lewis W. Butz

**Chemical synthesis of hormones.** Max Eitel. *Süddeut. Apoth.-Ztg.* 74, 63–5 (1934).—The synthesis of hormones, as adrenaline, thyroxine hypophysis and reproductive principles, is discussed.

W. O. E.

**Colorless crystals of hemoglobin.** Alfred Teitel-Bernard. *Compt. rend. soc. biol.* 115, 303–4 (1934).—Under certain conditions rhombic crystals of hemoglobin from human blood partly changed to monoclinic crystals exhibiting a marked dichroism. The new crystals appeared either colorless or violet red, depending upon the angle from which they were viewed. Their absorption spectrum was that of reduced hemoglobin.

L. E. Gilson

**Application of capillary analysis to the study of the constitution of alexin.** Otto G. Bier. *Compt. rend. soc. biol.* 115, 349–50 (1934).—Some expts. on the adsorption of alexin from serum by strips of filter paper are described.

L. E. Gilson

**Ovalbumin and conalbumin.** Guy Bruynoghe. *Compt. rend. soc. biol.* 115, 441–4 (1934).—Precipitin reactions with serums of sensitized rabbits showed that ovalbumin from hen eggs is quite distinct from the proteins of hen blood serum. Conalbumin is more complex and reacts to some extent like ovalbumin (perhaps because of incomplete seprn.) and also like hen serum protein; the latter fact suggests that it may be derived from one of the serum proteins.

L. E. Gilson

**Oxidation-reduction potentials of cytochrome c.** David E. Green. *Proc. Roy. Soc. (London)* B114, 423–35 (1934).—Cytochrome c forms a reversible oxidation-reduction system; the change from the reduced to the oxidized form involves a single equiv. During a study of the variation of the potential of cytochrome with change in

H-ion concn. between  $pH$  4.59 and 9.20, it was found that within the physiol.  $pH$  range, cytochrome lies on the oxidation-reduction scale intermediate between methylene blue and the indophenols.

Joseph S. Hepburn

**Osmotic pressures in the hen egg.** Edward J. Baldes. *Proc. Roy. Soc. (London)* B114, 436-40 (1934).—In "fresh" chicken eggs, the white and the yolk differ in vapor pressure and in osmotic pressure. In the yolk, an osmotic pressure gradient exists with a low value near the surface and a high value in the interior. Only a small, if any, difference of osmotic pressure exists across the vitelline membrane. Mixts. of white and yolk react with each other in some as yet not understood manner to produce a ppt.; the deid. osmotic pressure of the mixt. is less than the calcd.

Joseph S. Hepburn

**The mechanism of activation of arginase.** E. Waldschmidt-Leitz and W. Kocholaty. *Naturwissenschaften* 21, 848 (1933).—The activation of arginase by sulfhydryl + heavy metal (Fe, Cu) has been proved (C. A. 27, 1010; Salaskin, C. A. 26, 5110; Edlbacher *et al.*, C. A. 27, 3488). The activation does not take place with either a completely reduced or a completely oxidized system, but only with the labile oxido-reduction system. The activating combination is not required for the splitting of the arginine itself; the presence of arginine blocks the activation of arginase. The activation reaction has only a temporary effect and an optimum at  $pH$  = 5. The Fe-sulfhydryl system can be replaced by Fe-alloxan or oxy-hemoglobin; methemoglobin is inactive. It is probable that the activated enzyme is an oxidized form of arginase.

B. J. C. van der Hoeven

**Natural activation of vegetable tissue protease.** K. Mothes. *Naturwissenschaften* 21, 883 (1933).—The mechanism of  $O_2$  action on papain (tissue protease) was studied further (cf. C. A. 26, 3820; 27, 4271; 28, 504<sup>2</sup>; Ber. Botan. Ges. 51, 31 (1933); *Forsch. u. Fortschr.* 9, 438 (1933)). Sol. sulfhydryl substances are among the natural activators for papain (from yeast, barley, onion or leaves); however, they do not occur as such in higher plants. Only reversibly inactivated enzyme preps. can be activated; quinone oxidation is partly destructive; dil.  $H_2O_2$ ,  $O_2$  in the presence of plant pulp (dehydrogenase) or colloidal noble metal oxidizes reversibly. For air oxidation  $pH$  7 is more favorable than  $pH$  5. Reactivation takes place by plant pulp in the absence of  $O_2$ , by several undefined  $H_2O$ - or  $Me_2CO$ -sol. plant exts. and by  $Pd-H_2$ . All active papain preps. give the SH reaction; inactive ones have disulfide characteristics.

B. J. C. v. d. H.

**Peroxidase activity of hematin.** C. A. Johnson. *Arch. Path.* 16, 667-9 (1933).—Pure hematin was prepd. from blood by Elvehjem's modification (C. A. 25, 5907) of older methods and its peroxidase activity in various dilns. compared with that of blood. In every trial the peroxidase activity of hematin was equal to that of blood; this confirms the conclusions of others that hematin is responsible for the peroxidase activity of blood.

H. F. II.

**Amylosynthase.** XIX. Toyosaku Minagawa. *J. Agr. Chem. Soc. Japan* 9, 1198-201 (1933); cf. C. A. 28, 1062<sup>2</sup>.—Isolichenin was proved in some varieties of the lichens produced in Japan, such as *Alectoria ochroleuca*, *A. sulcata*, *A. japonica*, *Ramalina geniculata* and *Usnea trichodea*. It is not present in *Cladonia bellidiflora*, *Gyrophora vellea*, *Loharia pulmonaria*, *Parmelia tinctorum*, *Ramalina pollinaria*, *Usnea japonica*, *U. montis*, etc. Isolichenin was decompd. into a product without l reaction by malt amylase or heating with glycerol. The product could not be polymerized by amylosynthase. Isolichenin closely resembles amylose. Though glutinous rice starch gives a red color with I-K soln., it was sepd. into glutinous amylose and glutinous amylopectin. XX. *Ibid.* 1202-6.—The action of amylosynthase was retarded by  $Al(NO_3)_3$ ,  $AlCl_3$ ,  $Cd(NO_3)_2$ ,  $Ph(NO_3)_3$ ,  $Fe(NO_3)_3$  and  $FeCl_3$ . It is, however, reactivated by the addn. of  $(NH_4)_2SO_4$ . When amylosynthase was damaged by the salts of Ag, Cu, Hg, Zn and Pt, it could not be reactivated.  $MnCl_2$  and  $BaCl_2$  gave no effect on the action of amylosynthase.

Y. Kihara

**Phosphatase and phosphatase of *Rhizopus tritici*.**

Fumio Hemmi and Norimasa Tsukitani. *J. Agr. Chem. Soc. Japan* 9, 1382-93 (1933).—The mold filament or the ext. of *Rhizopus tritici* was added to glucose soln. contg.  $Na_2HPO_4$ ,  $NaHCO_3$  and  $PhMe$  at 37°. No decrease of free phosphoric acid nor change in the reducing power could be observed. Phosphatase, an enzyme forming phosphoric ester, could not be proved. Na glycerophosphate, K hexosediphosphate and K sucrosephosphate were split by the mold filament or the ext. of *Rhizopus tritici* into  $H_2PO_4$ . Phosphatase may be present. The optimum  $pH$  of phosphatase was at 6.0-6.2.

Y. K.

**Succinic acid from the cadaver.** A. Verdino. *Deut. Z. ges. gericht. Med.* 22, 384-6 (1933).—Succinic acid in large quantities was isolated in 2 cases. The yields were 60 mg. from 807 g. of organs and 190 mg. from 1886 g. of cadaver. The distribution of succinic acid in the individual organs, and even in the stomach and intestinal contents, in the liver, kidneys, lungs and brain was detd. The appearance of such large amts. of succinic acid can only be explained as having resulted from putrefaction of the organs.

Frances Krasnow

**The decomposition of lactic acid by yeast enzyme.** Amandus Hahn, E. Fischbach and H. Niemer. *Z. Biol.* 94, 58-66 (1933).—Lactic acid is quickly decompd. by yeast ext. in the presence of either methylene blue or dinitrobenzene as H-acceptor, yielding pyruvic acid and AcH. In the absence of acceptors this reaction does not occur.

Frances Krasnow

**Mass action and albumin decomposition in the living organism.** Otto Krummacker. *Z. Biol.* 94, 119-34 (1933).—An attempt is made to show that the law of mass action applies to reactions in the organism.

F. K.

**Barley diastase.** R. H. Hopkins, G. J. Cope and J. W. Green. *J. Inst. Brewing* 39, 487-93 (1933); cf. *J. Inst. Brewing* 824 (1933).—Alc.-pptd barley diastase, optimum  $pH$  4.5-4.7, stable over  $pH$  4-8, converts 60.5% starch or 42-44% glycogen over the  $pH$  range 4.3-7.5. This limit is increased by 20% or more by living yeast but not by activators prepd. from yeast (Meyerhof's activator, C. A. 21, 2280; Pringsheim's complement, C. A. 18, 1507). Lintner's sol starch was degraded to 97% by successive treatments.

Quick Landis

**Normal absorption and excretion of lead.** I. Lead absorption and excretion in primitive life. Robert A. Kehoe, Frederick Thamann and Jacob Cholak. *J. Ind. Hyg.* 15, 257-272 (1933).—Exptl. observations made in primitive regions in Mexico demonstrated that Pb is a natural constituent of the soil and the vegetation and that Pb occurs in the blood, the urine and the feces of human beings who live naturally on local agricultural and animal products. Analytical methods are described for detg. Pb in food, tissues, urine and feces. Twenty two references. II. Lead absorption and lead excretion in modern American life. *Ibid.* 273-288.—The Pb intake and output under normal environmental conditions were studied. It is concluded that the normal adult American excretes Pb at a rate of 0.02-0.08 mg. per l. of urine, and at a rate of 0.03-0.1 mg. per g. ash in the feces; that the mean daily Pb output for various groups of normal individuals varies from 0.25 to 0.38 mg.; that the Pb intake in the food of selected subjects was approx. equiv. to the Pb content of their feces; that from direct analytical observations on the food, and from indirect interpretation of the fecal Pb content of a large group of subjects, the daily intake of Pb in the food is of the order of 0.16 mg to 0.28 mg.; that normal persons whose Pb metabolism is followed for prolonged periods show no evidence of Pb accumulation, but appear to have established an equilibrium with their environment in which excretion of Pb keeps pace with absorption. Twenty-seven references.

III. The sources of normal lead absorption. *Ibid.* 290-300.—The amt. of Pb was detd. in certain common foods and beverages. The amt. of each material examd. was equiv. to that consumed by one subject in a week, so that the quantity of Pb found constitutes a definite proportion of the total weekly Pb intake of a normal individual. The investigation demonstrated the general occurrence of small amts. of Pb in these materials. Certain classes of foods

frequently contain more than av. amts. of Pb. Among these in the order of increasing importance are, bread-stuffs, meats, processed meats, ice cream, candy, leafy green vegetables and certain fruits. The comparison of primitive Mexican and American foods indicates that a factor in the higher Pb content of the latter is the general use of Pb-contg. insecticides. Eighty-six references. IV. Lead absorption and excretion in infants and children. *Ibid.* 301-5.—Random samples of the urine and feces of patients from a children's hospital were analyzed. The results showed Pb in the urine in amts. varying from 0.02 to 0.18 mg. per l., with a mean excretion of 0.08 mg. per l. The mean Pb excretion in the feces was 0.08 mg. per g. of ash. The Pb excretion of a group of Mexican children living under essentially primitive conditions varied from nil to 0.03 mg. per l. of urine, with a mean of 0.015 mg.; their mean fecal Pb excretion was 0.04 mg. per g. of ash of feces. Analyses made on large amts. of human milk from normal mothers with neg. histories in respect to occupational Pb exposure yielded Pb in amts. varying from nil to 0.05 mg. per l. Four of 5 premature or still-born human fetuses showed the presence of small amts. of Pb in their tissues, despite the absence of maternal Pb exposure; the Pb was found in the bones of 3, in the liver, brain, and skin of 2, and in the intestinal tract of one. The largest total amt. was 0.41 mg. of Pb in a still-born fetus at term. Eight references. E. G. Meiter

**Morphology and fine structure of collagen fibers.** A. Kuntzel and F. Pranke. *Biochem. Z.* 267, 243-95 (1933).—Collagen fibers from tendon are about 10  $\mu$  wide while those of skin are 2  $\mu$  wide. All collagen fibers consist of fibrillae, which can be mechanically sepd about 0.5  $\mu$  in width. The fine structure can be detd not only by means of the polarizing microscope and x-ray analysis but also by swelling reactions. Swelling in H<sub>2</sub>O of the dried fibers leads not only to their thickening but also lengthening, the absorption of the H<sub>2</sub>O being chiefly intamicellar, but there is also intermicellar absorption as shown by the changes in the form of the fibers. Acid swelling leads to thickening and shortening of the fibers, with a considerable increase in vol. The effect is reversible with tendon fibers, but with the skin fibers it occurs only under stretching. The acid swelling results from osmotic action because of unequal distribution of ions inside and outside the fibers, the osmotic effect being exerted only at definite points of the lattice structure. Shrinkage of water swollen fibers either through heating to 62-70° or through the action of strong electrolyte solns. results from a very rapid shortening of the fibers to 1/5-1/4 of their original length. This consists of a reversible and irreversible process, the latter being eliminated by preliminary treatment of the fibers with HCOH. The contraction can thus be made reversible and is merely a tendency of the mol. lattice to attain a more stable form. Shrinkage of the collagen fibers is assoc. with a loss of water, probably from the lattice structure. The form change of the shrunken fibers is not apparently assoc. either with a buckling in of micelles or of principal valence chains, the original micellar arrangement remaining unaltered. S. Morgulis

**The response to enzymes of glucuronides and glycyrrhizic acid.** F. Bergmann. *Biochem. Z.* 267, 296-308 (1933).—Glycyrrhizic acid or rheticic acid according to Karrer (*C. A.* 16, 2427) has the formula C<sub>42</sub>H<sub>60</sub>O<sub>22</sub>(OH)<sub>8</sub>·COOH, [ $\alpha$ ]<sub>D</sub><sup>20</sup> = 146°, a C:H:O ratio = 23:36:3, but a mol. wt. of only 360 instead of 704 according to Karrer, so that the probable compn. is C<sub>24</sub>H<sub>36</sub>O<sub>12</sub>. It contains only CO<sub>2</sub>H (prepn of the ester) and since the ester is hard to saponify the C to which the COOH is attached is probably combined only with C atoms. The presence of a OH group is also substantiated by the mono Ac deriv., but apparently there are no double bonds. Neither  $\beta$ -naphtholglucuronic nor rhizinic acid were attacked by hydrolyzing enzymes (emulsin, taka-diastase, *Aspergillus niger*, baccalinase, *Saccharomyces fragilis*, maltase). S. M.

**Emulsion of Rosa canina.** Ed. Hofmann. *Biochem. Z.* 267, 309-12 (1933).—The tips of the wild rose, dried, powd., extd. with ether and treated with 0.05 N NH<sub>4</sub>OH,

yield an enzyme prepn. having practically no action on  $\beta$ -glucosides but strongly hydrolyzing  $\beta$ -galactosides. The emulsin of the wild rose thus differs from that obtained from related sources (almonds, apricots, plums) in that not only is the relation between the  $\beta$ -glucosidase and  $\beta$ -galactosidase reversed, but the enzyme consists almost entirely of  $\beta$ -galactosidase. The optimum H-ion concn. for its action with  $\beta$ -phenolgalactoside is at pH 5. S. Morgulis

**Electrophoresis of trypanosomes and spirochetes.** F. P. Fischer and Viktor Fischl. *Biochem. Z.* 267, 403-4 (1933).—Contrary to reports in the literature, both types of microorganism, in the natural medium or in saline solns., whether alive or dead, always move to the cathode in the elec. field. This cathodic migration is especially marked in the presence of erythrocytes which migrate to the anode. The charge is affected by changes in the pH but has nothing to do either with life or virulence of the organisms. S. Morgulis

**Comparative studies on the biochemical formation of optically active phosphoglyceric acid from different sugars.** Tamezi Baba. *Biochem. Z.* 267, 452-5 (1933).—Formation of optically active phosphoglyceric acid from glucose, fructose, sucrose and maltose increases with the concn. of organically bound P, and was shown to diminish in expts. with decreasing amts. of hexosediphosphate. A somewhat greater yield was obtained with maltose than the other sugars. S. Morgulis

**Constitution of ovomucoids.** Toshinori Isaki. *J. Biochem. (Japan)* 19, 1-5 (1934).—Two-hundred g. purified ovomucoid was digested for 250 days at 37° with 40 g. trypsin. The soln. was filtered, pptd. with HgCl<sub>2</sub> and the filtrate freed from Hg with H<sub>2</sub>S. The filtered soln. was aerated, neutralized with dil. NaOH and concd. under diminished pressure. The soln. was now pptd. with Pb(OAc)<sub>2</sub>, and to the filtrate NH<sub>4</sub>OH was added as long as a ppt. was formed. The Pb ppt. was washed several times with H<sub>2</sub>O and decompd. with H<sub>2</sub>S, the soln. aerated, evapd. to a sirupy condition and poured into abs. alc. A white ppt. of a hygroscopic substance (45 g.) was thus obtained which was washed with abs. alc. and ether. The substance contains only traces of ash, no amino acids, and about 49.5% chitosamine. On the basis of tests the presence of an at. grouping =C(—NH<sub>2</sub>)—CHOH— is thought to be established. S. Morgulis

**Electrical phenomena on the cuticle. I. Potential difference between the cuticle and electrolyte solutions.** Katsuzo Hayashi. *J. Biochem. (Japan)* 19, 145-63 (1934).—The expts. were made with enucleated cow's eyeballs. These were placed in one arm of a U-shaped vessel filled with the electrolyte soln., touching the soln. with the outer surface over a diam. of about 1 cm. The interior of the eyeball is connected to a calomel electrode through an agar syphon dipping in a satd. KCl soln. A similar syphon, placed in the other arm of the U vessel, connects the electrolyte soln. to another calomel electrode. The cuticle membrane tends to make the potential of the more dil. soln. more pos. in a diffusion chain of chlorides of the alkalis and earthy alkalis, but in the case of chlorides of bivalent (Cu<sup>++</sup>) or trivalent cations (Al<sup>+++</sup>) the effect of the membrane is practically nil. In the case of the H<sup>+</sup> cation the membrane effect becomes strongly neg. KSCN, KNO<sub>3</sub> or KBr also exerts a pos. effect, which is even stronger for NaOH. In the case of bivalent anions (SO<sub>4</sub><sup>==</sup>) or trivalent anions (Fe(CN)<sub>6</sub><sup>==</sup>) the membrane effect is again nil. Further studies on the potentials of cuticle. *Ibid.* 165-72.—In these expts. instead of the enucleated eyeball, carefully dissected pieces of the cuticle were tied over the free end of a glass tube, with the epidermal layer on the outside. The epithelial layer was sometimes in contact with the more dil. and at other times with the more concd. soln. In all respects the membrane effects on the diffusion potential were similar to those obtained in the preceding series of expts. Expts. were also made with membranes treated with formal. These expts. show the series of the ion effects more strikingly. Swelling has no dominant influence on the electromotive phenomena of the cuticle. S. Morgulis

The isotopic fractionation of water by physiological processes Edward W Washburn and Edgar R. Smith. *Science* 79, 188-9(1934).—A quantity of branches and leaves from a young willow tree (*Salix nigra*) was treated in such a way as to obtain the sap  $H_2O$  and the  $H_2O$  from combined H. Roth showed an increase in  $H^2$  which is apparently due to preferential selection during the process of growing. No isotopic fractionation occurs during the passage of the  $H_2O$  into the tree through the root membranes. G. M. Murphy

Uroflavin, maltoflavin and reduction-oxidation potentials of lyochromes Kurt G. Stern. *Nature* 133, 178-9 (1934).—Uroflavin (I) has been obtained from normal human urine and maltoflavin (II) from malted barley. The procedure is similar to that for the prepn. of heptoflavin. With a quartz monochromator it has been found that visible light of the blue-violet region and not ultra-violet radiation is responsible for the fluorescence of lyochromes. Both lyochromes yield  $CHCl_3$ -sol. "lumiflavins" on strong irradiation in soln. I and II possess sharp absorption bands in the ultra-violet, at 281 and 255  $m\mu$ , resp. W. J. Peterson

Microheterogeneous catalytic decomposition of hydrogen peroxide by cholesterol sols. Igor Remezov. *Ber.* 67B, 134-40(1934); cf. *C. A.* 28, 7937.—The previous report that the decompn. of  $H_2O_2$  is catalyzed by colloidal cholesterol is confirmed. Molecularly dispersed cholesterol, and also cholesteryl esters and lecithin are inactive. With 10%  $H_2O_2$ , the reaction is unimol., though more complicated relations were met when the catalyst: $H_2O_2$  ratio was varied. The action seems to be similar to that of catalases and Pt sols, only weaker. The speed of the reaction is detd. by the rate of adsorption of the  $H_2O_2$  upon the particles of the catalyst. The activity of the catalyst shows a max. for a  $pH$  range of 6.4 to 8.04. The catalyst is not affected by  $CN^-$ , but its action is strongly inhibited by Hg and Hg compds. J. H. Reedy

Absorption of pepsin by crystalline proteins. John H. Northrop. *J. Gen. Physiol.* 17, 165-94(1933).—Cryst. proteins (edestin, melon globulin) remove pepsin from soln. The pepsin protein is taken up as such by the foreign protein, the amt. being equiv. to the peptic activity of the digestive soln. The formation of the protein-pepsin complex depends upon the  $pH$ , reaching a max. at 4.0. An insol. complex is formed which ppts. when pepsin and edestin sols. are mixed, the max. pptn. occurring at  $pH$  4.0. Compn. of the ppt. varies with the relative quantity of pepsin and edestin. As much as 75% of this complex may consist of pepsin; its activity may be equiv. to  $1/4$  of the activity of cryst. pepsin itself. The pepsin may be extd. from the complex with 0.25 N  $H_2SO_4$  soln.; if dissolved in the acid soln. at  $pH$  2.0, the foreign protein is rapidly digested, leaving the pepsin protein which may be isolated and identified by its tyrosine + tryptophan content, basic N content, cryst. form and sp. activity. C. H. R.

The theory of diffusion in cell models. Lewis G. Longworth. *J. Gen. Physiol.* 17, 211-35(1933).—In a cell model, with water and a salt as the only substances whose diffusion requires consideration, Osterhout (*C. A.* 27, 3381) showed that the results are in qual. accord with the kinetics characterizing 2 consecutive unimol. reactions. I. believes, however, that the mechanism more nearly corresponds to that of 2 simultaneous and mutually dependent processes. The differential equations that describe the simultaneous diffusion of water and a salt in a cell model were formulated and solved. These equations are derived from the general laws for diffusion processes. The theoretical time curves of diffusion of the 2 substances agree with those detd. experimentally. C. H. R.

The nature of lysozyme action. Karl Meyer, Richard Thompson, John W. Palmer and Deborah Khorazo. *Science* 79, 61(1934).—The authors believe that lysozyme is an enzyme or enzyme mixt. which splits a reducing sugar from certain mucoids and from the polysaccharides derived from them. "Its occurrence in tears, nasal, bronchial and gastrointestinal mucus, egg white and semen can thus be understood, the bacteriolytic action being incidental." J. J. Willaman

The nature of the osmotic effect of solutions of non-electrolytes on the erythrocyte. M. H. Jacobs. *Am. J. Med. Sci.* 187, 147(1934).—Expts. indicate that while an escape of salts from the erythrocytes of the ox into a surrounding sucrose soln. undoubtedly occurs in expts. of sufficiently long duration, this change is much less striking than an earlier one, which begins almost instantly and is practically complete within a few min. This change, unlike the later one, is readily reversible and is believed to be due to an exchange of anions from the cell for  $OH$  ions from the soln., the resulting increase in the base bound by hemoglobin causing a decrease in the osmotic pressure of the cell contents. Calcns. indicate that the expected osmotic effect of such an ionic shift is of the order of magnitude of that actually observed. R. C. Willson

Some characteristics of intestinal lactase. F. A. Cajori. *Am. J. Med. Sci.* 187, 295(1934).—A lactose-splitting enzyme was invariably found in aq. exts. of the mucosa of the duodenum and jejunum of adult dogs. Juice from a Thiry loop of the colon did not contain the enzyme. Jejunal juice showed feeble lactase activity. Intestinal lactase showed max. activity at  $pH$  5.4-6. Its activity was inhibited by glucose but not by galactose. The Michaelis const. was  $K_m = 0.0056$ . Lactase was adsorbed readily from slightly acid soln. by  $Al(OH)_3$  or  $Fe(OH)_3$ . Aq. exts. of the liver showed lactase activity about  $1/4$  that of intestinal mucosa exts. The lactase activity of intestinal exts. and intestinal juice accounted for less than  $1/2$  of the lactose that disappeared from a jejunal loop during absorption trials with this sugar in the intact animal. R. C. Willson

Biochemistry and manuf. of fine chemicals (Carr) 17  
Ring system of sterols and bile acids (Rosenheim, King)  
10. S oxidation (Andrews, Andrews) 10. Pectate  
(Tserevitinov, Rozanova) 12

Fearon, Wm. R.: An Introduction to Biochemistry. London: Wm. Heinemann, 323 pp. 10s. 6d.

Marinesco, N.: Equilibre de membrane. Paris: Hermann & Cie. 69 pp. F. 15.

Lecithin. I. G. Farbenind. A.-G. Fr. 750,952, Dec. 18, 1933. Pure lecithin is obtained by extg. lecithin from a substance contg. it by means of an org. solvent and adding an inorg. oxide sol to the resulting soln. and sepg. the ppt. Examples are given of the use of EtOH sols of oxides of Si, Al and Fe.

## B—METHODS AND APPARATUS

STANLEY R. BENEDICT

The determination of glucose and uric acid in alcaptonuric urines. Corrado Cassata. *Diagnostica tec. lab* (Napoli) *Riv. mensile* 4, 394-6(1933).—The homogentisin and trihydroxyphenylpyruvic acids present in alcaptonuric urines are extd. with  $Rt_2O$  before applying the usual quant. procedures for glucose and uric acid. L. W. B.

Studies on the mineral composition of the bones. I. Analytical technic. Mario Coppo. *Diagnostica tec. lab* (Napoli) *Riv. mensile* 4, 465-87(1933).—A procedure is described which permits the detn. of Ca, P, Mg, Na and K; only 1.2-1.5 g. of bone is used.  $^{45}Cl$  is detd. in a sep. 0.5 g. sample. Lewis W. Butz

The microdetermination of phosphorus (inorganic, acid-soluble, lipid and total) in the blood and excretions. F. Ferranti and O. Giannetti. *Diagnostica tec. lab* (Napoli) *Riv. mensile* 4, 664-82(1933).—The Bell and Doisy method is modified to decrease the quantity of acid present in the liquid after destruction of the org. matter. This is accomplished by adding 5 cc. of a 45% aq. soln. of  $AcONa$  for each cc. This modification makes it unnecessary, in the detn. of total and lipid P, to convert the sample into ash by the dry method, thus permitting the use of the Neumann wet method. Blood phosphorus in normal adults. *Ibid.* 845-54.—The P content of the erythrocytes does not vary even under the most diverse physiol. and pathol. conditions. That of the plasma, however, varies considerably; it is influenced, e. g., by slight changes in the erythrocyte

vol. Therefore the plasma P should always be detd. F. and G. found the following values (mg. P per l.) for plasma, serum and erythrocytes, resp., using their modifications of the Bell and Doisy method: inorg. P 34.75, 16.3, 25.12; acid-sol. P 42-53, 425, 240; lipid P 65-70, 170, 119; total P 107-121, 608, 364. L. W. H.

The determination of fibrinogen in the blood. Guido Boehm. *Diagnostica lec. lab. (Napoli) Riv. mensile* 4, 683-8(1933).—A new biol. method is described which requires the use of a table given in the original. It consists essentially in the addn. of  $\text{CaCl}_2$  soln. to a series of dilns. of oxalated and centrifuged blood and subsequent observation of fibrin formation. Lewis W. Butz

Determination of  $^{35}\text{Cl}$  in biological substances. Ernest Kahane and M. R. Dumont. *Bull. soc. chim. biol.* 15, 1247-55(1933).—Several methods are discussed and an improved method is described by which Cl and some other element, such as Na, can be detd. in the same sample of tissue even though  $\text{HClO}_4$  is used for the final destruction of org. matter. L. E. Gilson

The determination of blood glucose. Adolfo Escudero. *Rev. facultad cienc. quim. (Univ. La Plata)* 8, Pt. 2, 37-45(1933).—Methods are discussed. L. E. G.

Technic and methods in the study of climatic factors in connection with biological investigations. J. J. de Gryse. Quebec Soc. Protection Plants, 23rd & 24th Ann. Rept. 1930-1932, 38-86(1932).—A detailed discussion of methods and app. for the measurement of temp., atm. humidity, pptn. and pressure, light and evapn. with special reference to biol. problems. K. D. Jacob

Determination of skin polarization with the tube voltmeter. Hans Schaefer. *Z. Biol.* 94, 11-38(1933).—In the presence of  $\text{AlCl}_3$ ,  $\text{HCl}$  (0.001 N) and  $\text{NaH}_2\text{PO}_4$  the anodic current effects an increase in resistance and polarization. 0.001 N  $\text{NaOH}$  also aids polarization. Inhibition of polarization is obtained under the cathode with 0.1 N  $\text{HCl}$ , under the anode with 0.001 N  $\text{NaOH}$ . Frances Krasnow

Comparison of total nitrogen analyses of urine for one- and four-day periods. Bernice L. Kunerth. *Trans. Kansas Acad. Sci.* 36, 157-8(1933).—Results show that unless it is necessary to know the daily fluctuations in the urinary N, analysis of a composite sample may be used to calc. the daily N excretion. W. A. Moore

Determination of reduced glutathione content in blood. Fumio Murata. *Sei-i-kwai Med. J.* 51, No. 10, 92-5 (English Abstract 4-5)(1932).—The Perlzweig-Detruer method is so modified as to give more accurate results with blood. Three cc. of blood is added slowly and while shaking to 10 cc.  $\text{H}_2\text{O}$ . Then immediately 10 cc. 1%  $\text{CCl}_3\text{COOH}$  is added to prevent decompn. of reduced glutathione. The protein is then pptd. with 10 cc. 30%  $\text{CCl}_3\text{COOH}$  and by shaking the mixt. 3 times. With this modification, F. obtained 0.0201-0.0264, av. 0.023% reduced glutathione in the normal rabbit blood. S. T.

Dixon, Malcolm: Manometric Methods as Applied to the Measurement of Cell Respiration and Other Processes. New York: The Macmillan Co., Ltd. 122 pp \$1.75.

Determination of oxygen consumed and carbon dioxide produced in respiration of men or animals. Géza Mansfeld. *Hung.* 107,112, Sept. 1, 1933. Details of the method and app. are given.

## C—BACTERIOLOGY

CHARLES B. MORREY

Fermentation of glucose by legume bacteria. A. I. Virtanen, M. Nordlund and E. Hollo. *Acta. Chem. Fennica* 6B, 62(1933).—Fermentation is of the  $\text{PrCO}_2\text{H}$  type. B. C. A.

Fermentative properties of the *Zymosarcina* group. J. Smit. *Ann. inst. Pasteur* 50, 675-94(1933).—This group can be regarded as allied to the bacilli of lactic fermentation and is frequently found in the stomach in cases of pyloric ulcer. In the presence of  $\text{HCl}$  the optimum  $p_H$  for growth is 0.9.  $\text{H}_2\text{C}_2\text{O}_4$  will not allow growth below  $p_H$  3.4, nor will  $\text{AcOH}$  below  $p_H$  4.1. *Z. ventriculi* (I) is the only

member of the group which contains catalase; none contains tyrosinase or will liquefy gelatin. From a glucose medium I produces  $\text{CO}_2$  and  $\text{EtOH}$ , and *Z. maxima* yields  $\text{CO}_2$  and  $\text{BuOH}$  with a trace of  $\text{EtOH}$ . All of the group are sensitive to antiseptics and to heating at 55°; they remain viable for long periods in the ground in some unknown form. B. C. A.

Activity of nonpathogenic bacteria utilizing mineral matter in the thermal water of Aix-les-Bains and Aix-Burtscheid. I. A. Schloemer. *Z. Unters. Lebensm.* 65, 470-6(1933). The content of Fe is 1000 times, of Ca and  $\text{SiO}_2$  many times, higher in the slimy sediment of the Kaiserbad spring at Aix than in the  $\text{H}_2\text{O}$ . This is due to the action of Fe-, Ca- and Brucella's  $\text{SiO}_2$ -bacteria. The sediment is also richer in Al, which was not found by Feder (*C. A.* 18, 1886) in the  $\text{H}_2\text{O}$ , but is now shown to be present. B. C. A.

The action of lipolytic bacteria on some simple triglycerides and some natural fats. Mervyn A. Collins. *Iowa State Coll. J. Sci.* 8, 187-9(1933).—The Nile-blue sulfate technic was used. Hydrolysis of simple triglycerides by bacteria becomes more difficult as the mol. wt. increases. Tristearin is unaffected by bacterial action. Any common natural fat or oil is a good material for the detection of lipolytic bacteria. There is a close agreement between lipolytic and proteolytic abilities of the 159 cultures of bacteria studied, but not all of the lipolytic bacteria are proteolytic in litmus milk. There were no lipolytic bacteria in aseptically drawn milk or in salted butter, but they were present in large nos. in ordinary milk, cream and butter. They cause rancidity and decrease in no. as strong rancidity is reached. The organisms which produce the odor of lower fatty acids in butter fat produce tallowiness in corn oil, olive oil, tributyrin and triolein. F. E. Brown

The metabolism of some nitrogen-fixing clostridia. W. Hillman Willis. *Iowa State Coll. J. Sci.* 8, 231-3(1933).—Anaerobic N-fixing clostridia growing in  $\text{N}_2$  on N-free media whose initial  $p_H$  ranged from 6.5 to 9.5, produced 4.0-4.3 mg. of fixed N per 50 cc. of media in 3 weeks. In a similar medium whose initial  $p_H$  was 5.0, 3.2 mg. of N was fixed.  $\text{CaCl}_2$  and especially  $\text{CaCO}_3$  promoted the fixation of N. If peptone  $(\text{NH}_4)_2\text{SO}_4$  or  $\text{NaNO}_3$  was added to the medium glucose was utilized more rapidly but little or no N was fixed. The  $\text{CaCO}_3$  might act as a neutralizer of acid or as an acceptor for H in anaerobic fermentations. F. E. Brown

Bacterial phosphatases. I. The decomposition of phosphoric acid esters by *Clostridium acetobutylicum* Weizmann. Robert D. H. Heard and Arthur M. Wynne. *Biochem. J.* 27, 1655-59(1933).—Na hexosediphosphate (I) in 1.2% concn. is not fermented by living *Clostridium acetobutylicum*. When present in 0.75% concn. the diphosphate completely inhibits the fermentation of glucose in an otherwise favorable medium. A similar concn. of Na  $\beta$ -glycerophosphate (II) inhibits the fermentation of glucose. In active glucose-peptone cultures of the organism, both I and II are appreciably hydrolyzed. The hydrolysis of I proceeds most rapidly during the second phase of the fermentation following the time at which max. acidity is attained. II. The phosphatases of *Clostridium acetobutylicum* Weizmann and *Propionibacterium jensenii* van Niel. Lionel B. Pett and Arthur M. Wynne. *Ibid.* 1860-71.—These phosphatase systems have been investigated in expts. in which Na glycerophosphate, Na hexosediphosphate and Na pyrophosphate were employed as substrates. Mg appears to stand apart from all other ions as an activator of the phosphatase systems investigated. Benjamin Harrow

A chlorophyll-like bacterial pigment. K. Noack and E. Schneider. *Naturwissenschaften* 21, 835(1933).—Bacteriochlorine of S-free purple bacteria was studied by the methods of chlorophyll chemistry. It is violet in the bacteria and in ether, green in  $\text{EtOH}$  or on oxidation by peroxides or quinone; it does not crystallize; it contains Mg removable by acid and the "bacteriopheophytine" is spectroscopically related to pheophytin. The Stoll process for recovery of pheophorbide yielded 2 substances

sol. in 0.01 N KOH; one, the *b* modification,  $C_{48}H_{88}O_{10}N_4 \cdot \frac{1}{2}H_2O$ , has an OMe group and gives a di-Me ester  $C_{48}H_{88}O_{10}N_4$ . The *a* modification present in small amts. has not as yet been obtained in pure state. Further details are given. The principal difference between bacteriochlorophyll and plant chlorophyll lies in its spectrum.

B. J. C. van der Hoeven

**The metabolism of sulfur bacteria.** O. v. Deines. *Naturwissenschaften* 21, 873-8(1933).—The droplets in the interior of the cells of S bacteria consist of H persulfide not of elementary S (C. A. 27, 5017), probably from  $H_2S + SO_2$ , the latter by biol. oxidation (C. A. 27, 2080). The role of S bacteria in the formation of sulfidic ores is discussed; it is shown for Vulcano Island that direct volcanic  $H_2S$  action is responsible for the sulfide formation and that bacterial influences will generally be rare.

B. J. C. van der Hoeven

**Direct spectroscopic detection of the oxygen-transporting enzyme in Azotobacter.** E. Negelein and W. Gerischer. *Naturwissenschaften* 21, 884(1933).—The O-transporting enzyme of respiring *Azotobacter* cells (as well as that of acetic acid bacteria) can be observed spectroscopically. The bands of reduced enzyme (ferrous) lie at 632  $m\mu$ , those of oxidized enzyme (ferric) at 647  $m\mu$ ; CO causes change of the former to 637  $m\mu$ ; HCN causes the bands of the oxidized enzyme to disappear. The cytochrome spectrum also is visible, but is unaffected by the different reagents.

B. J. C. van der Hoeven

**Tryptophan and the growth of bacteria.** P. Fildes and B. C. J. G. Knight. *Brit. J. Exptl. Path.* 14, 343-9 (1933).—Tryptophan is essential for the growth of certain bacteria, but some of these can be trained to grow without it. All organisms which normally grow without added tryptophan or can be trained to do so synthesize tryptophan under these conditions. Tryptophan is a constituent of all bacterial protoplasm. There appears to be a relation between inability to synthesize tryptophan and pathogenicity.

Harriet F. Holmes

**Bacteria associated with the manufacture of soy.** Yoshio Ishimaru. *J. Agr. Chem. Soc. Japan* 9, 859-904, 953-1004, 1143-83(1933).—Sixteen kinds of aerobes and 12 kinds of anaerobes were isolated from the soy mash and investigated morphologically and physiologically. Growth occurred in 10% NaCl soln. Half of them grew even in 20% NaCl soln. Optimum temp. was generally 35-40°. Most of the bacteria produced  $RIOH$ , aldehyde, acetone, furfurole, ammonia, fusel oil and  $MeOAc$ . The production of indole or gas was rare. There were many kinds of bacteria that produced lactic acid. The bacteria come mainly from the soy bean and NaCl, rarely from the wheat or the water. In the manuf. of soy, the bacteria accelerated the hydrolysis of protein and polysaccharides by the mold (*Aspergillus*). The following bacteria were especially good in the manuf. of soy: *Bacillus nondiastaticus* var. soya No. 1 and No. 2, *Bacillus megatherioides* var. soya, *Micrococcus flavus lardigradus* var. soya, *Micrococcus periclitreus* var. soya, *Bacillus soya nonliquefaciens* nov. sp., *Pediococcus acidilactici* var. soya  $\alpha$  and  $\beta$ , *Pediococcus albus* var. soya  $\alpha$ , *Bacillus panis* var. soya, *Bacillus delbrückii* var. soya and *Micrococcus acidilactici* var. soya n. sp.

Y. Kihara

**Respiration and fermentation of lactic acid bacteria.** II. J. G. Davis. *Biochem. Z.* 267, 357-9(1933); cf. C. A. 28, 194.—*Lactobacillus casei* has so slight a respiratory function that it is indifferent to the presence of  $O_2$ . Expts. with acetone preps. of *L. delbrückii*, which oxidize only lactate and pyruvate, show that lactate oxidizes to  $CO_2$  with the formation of  $H_2O_2$ .

S. Morgulis

**Activator of the metabolism of propionic acid bacteria.** Claude Fromageot and Edward L. Tatum. *Biochem. Z.* 267, 360-75(1933).—The org. substance of potato ext. furnishes in addn. to its nutritive content also a special activator indispensable for the utilization of dissolved glucose; it also promotes the utilization of starch but not of lactic acid. This activator transforms the glucose mol. into a labile form, i. e., it is a "hexokinase," which can be dispensed with when the glucose is obtained from starch or maltose. The activation is necessary only for making

the glucose labile but not for the fermentation of the lactic acid.

S. Morgulis

**Transformation of optically active phosphoglyceric acid by Escherichia coli.** Claudio Antoniani. *Biochem. Z.* 267, 376-9(1933).—Fresh *Es. coli* changes phosphoglyceric acid to pyruvic acid, as much as 73% of the latter having been isolated, with the formation of small quantities of acetoin and  $EtOH$ . Similar results were obtained also with dry colon bacilli preps. Destruction of *dl*-glyceric acid by *Es. coli* and *Aerobacter aerogenes*. *Ibid.* 390-2.—With *Es. coli* glyceric acid yields a large amt. of  $AcOH$ , some  $HCO_2H$ , very small amts. of  $EtOH$  and no lactic acid. With *Aerobacter aerogenes* the results are similar except that much more  $AcOH$  is formed and also some acetoin.

S. Morgulis

**The physiological youth of bacteria as evidenced by cell metabolism.** H. H. Walker, C. E. A. Winslow, Evelyn Huntington and M. Grace Mooney. *J. Bact.* 27, 22-3 (1934).—In a peptone or glucose-peptone culture of *Es. coli* through which air is continuously bubbled the yield of  $CO_2$  per cell per hr. rises from 40 mg.  $\times 10^{-11}$  during the first hr. to 120 mg. during the second hr. and then falls to 20 mg. during the fifth hr. In a peptone medium through which N is bubbled, lag is produced and the max. yield is 70 mg. during the third hr. with peptone medium; when glucose is added, there is a peak yield of 210 mg. of  $CO_2$  during the fourth hr. Approx. computations suggest that 1 cu. micron of bacterial substance (colon) during the first 4 hrs. of the culture cycle may consume 20-50 mg.  $\times 10^{-11}$  of O per hr. and may produce 20-70 mg. of  $CO_2$  and 3-7 mg. of ammonia N, liberating in the process 30-90 cal. of heat per hr.

John T. Myers

**Production of peroxidase by streptococci and its possible significance.** Michael A. Farrell. *J. Bact.* 27, 24-5 (1934).—Peroxidase was demonstrated in all of 22 strains examined. It is thermostable, withstanding 120° for at least 15 min.

John T. Myers

**The synthesis of carotene by bacteria.** M. A. Ingraham and C. A. Baumann. *J. Bact.* 27, 25-6(1934).—Carotene is produced by many bacteria as demonstrated by chem., spectroscopical and biological tests. Staphylococci, flavobacteria, corynebacteria and mycobacteria produce appreciable amts. It was not found in any anaerobe tested. Vitamin A was not found. One organism gave a yield of 0.58 mg. per g. of dried cells or twice as much as is present in carrots.

John T. Myers

**The bacteriostatic effect of indole and skatole.** Leslie A. Sandholzer and Ralph P. Tittler. *J. Bact.* 27, 27-9 (1934).—All of 179 strains of bacteria were inhibited by indole at 1:1500 and showed growth at 1:5000. The ratio of the inhibiting dilns. of indole to that of skatole was approx. 1:1.5.

John T. Myers

**The effect of certain triphenylmethane dyes on Staphylococcus aureus and Escherichia coli communior.** Marv V. Reed and Elizabeth Genung. *J. Bact.* 27, 29(1934). *Staph. aureus* did not readily adapt itself to inhibiting concns. of crystal violet and was stable in the presence of all the dyes. *Es. coli* adapted itself to inhibiting concns. of brilliant green, and temporary involution forms were induced. These variants disappeared as the alk. of the dye-agar medium increased.

John T. Myers

**A method for distinguishing living from dead cells of Gram-positive bacteria by stained preparation.** Wm. C. Frazier and A. J. Boyer. *J. Bact.* 27, 31-2(1934). Berkefeld filtrates of 10-day milk cultures of *Streptococcus lacticus* grown at 30°, when applied to dried and fixed films of Gram-positive bacteria, made some of the cells Gram negative. A count of the remaining Gram-positive cells agreed with a colony count. The addn. of the lactic filtrate greatly stimulated the growth of lactic acid bacteria.

John T. Myers

**A new medium for the isolation of intestinal pathogens.** Einar Leifson. *J. Bact.* 27, 32-3(1934).—The medium consists of 1.5% beef infusion agar contg. NaCl 0.5%, Na desoxycholate 0.5%; Na citrate 3.0%; ferric N11, citrate 0.2%;  $Pb(AcO)_2$  1:150000; lactose 1.0% and neutral red 1:50000, and having a  $pH$  of 7.2-7.4

John T. Myers

The problem of favorable culture media for the isolation of *Bacterium granulosis*. Ida A. Bengston. *J. Bact.* 27, 34-5(1934).—In the Noguchi horse blood carbohydrate medium, disaccharides were more favorable than monosaccharides. Of the amino acids tested asparagine and tryptophan were best. Horse serum was better than rabbit serum. John T. Myers

The survival curves exhibited by bacterial spores in chlorine disinfection. David B. Charlton and Max Levine. *J. Bact.* 27, 37-8(1934).—The mechanism of disinfection with hypochlorites is probably different from that of disinfection with chloroamines. J. T. M.

The artificial production of a specific lytic agent which behaves like bacteriophage. John D. LeMar and John T. Myers. *J. Bact.* 27, 49(1934).—When 48-hr. broth cultures of various bacteria were autoclaved, permitted to incubate for 48 hrs. longer at 37°, 15 cc. of 3% H<sub>2</sub>O<sub>2</sub> per 100 cc. added and again incubated for 48 hrs., filtrates were obtained that cause lysis of homologous bacteria, which seemed transmissible in series. John T. Myers

The cultivations of organisms concerned in the oxidation of thiosulfate in mineral media. Robert I. Starkey. *J. Bact.* 27, 52-3(1934). The products of oxidation of thiosulfate by bacteria in mineral media. *Ibid.* 53-4.—*Thiobacillus thioparvus* Beij. produces sulfate and elementary S. Another organism studied formed sulfate only. *Th. trautweinii* Bergey causes less complete oxidation, the chief product being tetrathionate, which later breaks into pentathionate, trithionate, sulfate and S. John T. Myers

Strain variation of *Azotobacter* and the utilization of carbon compounds. Nathan R. Smith. *J. Bact.* 27, 54-5(1934). John T. Myers

A serological study of certain butyric anaerobes of soil. Elizabeth McCoy. *J. Bact.* 27, 56 7(1934). J. T. M.

The influence of concentration of soluble calcium on the precipitation of calcium carbonate by microorganisms. F. T. Williams and E. B. Fred. *J. Bact.* 27, 58 9(1934).—CaCO<sub>3</sub> was pptd. without traces of P and was in the crystal form of calcite. John T. Myers

The decomposition of alginic acid by microorganisms. Melvin C. Allen. *J. Bact.* 27, 59 60(1934).—Certain soil bacteria can hydrolyze this acid. John T. Myers

"Black beets," a problem involving stimulation of bacterial growth by iron. E. J. Cameron. *J. Bact.* 27, 60 1(1934).—An organism was isolated which grew much better in the presence of Fe in beet juice and rendered the product more alkaline, the *p<sub>H</sub>* going from about 5.3 to 6.0. The stimulative effect is not related to the change in *p<sub>H</sub>*. John T. Myers

The lipolytic activities of several bacteria causing bitter cream. James T. McGrath and J. A. Anderson. *J. Bact.* 27, 68-9(1934).—Of the glycerides of the higher acids that occur in butter, palmitin is the only one that is rapidly hydrolyzed. John T. Myers

An agar plate method for the detection and enumeration of lipolytic microorganisms. J. A. Anderson. *J. Bact.* 27, 69(1934).—The medium consists of 1% of tributyrin in nutrient agar. Lipolytic colonies are indicated by clearing of the opalescence due to the tributyrin. John T. Myers

The relation of electrical charge of bacteria to their stability. Harold A. Abrahamson. *J. Bact.* 27, 89 (1934).—The charge on the bacterial cell as well as the potential must be held in any attempt to det. the surface chem. factors in the regulation of stability. J. T. M.

The utilization of carbohydrates and salts of organic acids by *Corynebacterium diphtheriae* in the production of strong toxin. George F. Leonard and August Holm. *J. Bact.* 27, 98-9(1934).—Optimum conditions were produced by the addn. of 0.45% maltose and 0.75% NaOAc. John T. Myers

A systematic study of microorganisms which decompose the specific carbohydrates of the pneumococcus. Grace M. Sickles and Myrtle Shaw. *J. Bact.* 27, 100(1934); cf. C. A. 27, 1907. John T. Myers

The fermentation of glycogen by pneumococci. L. A.

Barnes and Benjamin White. *J. Bact.* 27, 106-7(1934). John T. Myers

The chemistry of the cellular constituents of *Brucella*. R. C. Huston, I. Forrest Huddleson and A. D. Hershey. *J. Bact.* 27, 108(1934).—*Brucella* is characterized by the absence of simple sugars, by the occurrence of non-pptg. polysaccharides only, by a large proportion of water-extractable proteins and by cell lipides analogous to the conventional types found in higher organisms. *Brucella* sp. can be differentiated from one another by the relative proportions of 2 biologically inactive polysaccharides, and 2 lipide constituents. John T. Myers

The growth of *Bacillus megatherium* in relation to the oxidation-reduction potential and the oxygen content of the medium. Georges Knaysi and S. R. Dutky. *J. Bact.* 27, 109-19(1934); cf. C. A. 27, 1907.—Normal meat infusion broth of *p<sub>H</sub>* 7 has a potential nearly equal to that of the satd. calomel electrode. In a vacuum that inhibits the growth of *B. megatherium* ( $\geq 10$  mm. of air pressure) the potential drops to -0.160 or less. If Na<sub>2</sub>SO<sub>4</sub> is added to the broth, growth is inhibited when the concn. reaches 0.27%. The potential of this medium is nearly -0.250 v. in the air and does not change in a vacuum. When 0.5% ferric NH<sub>4</sub> citrate is added to broth, growth takes place readily. The potential of such a medium in air is +0.100 v. and about -0.040 in a vacuum that inhibits growth of *B. megatherium*. Even in this relatively high potential the organism does not grow. The O content of the above media after standing 24 hrs. at 30° was as follows in 20 cc. samples: broth of *p<sub>H</sub>* 7, 0.07 cc.; broth plus 0.27% Na<sub>2</sub>SO<sub>4</sub>, 0.0 cc.; broth plus 0.5% ferric NH<sub>4</sub> citrate, 0.12 cc. The limiting factor for growth was O content not oxidation-reduction potential of the medium. John T. Myers

Studies on dissociation of certain paratyphoid bacilli. The role of variants in the precipitation of calcium sulfate. Mary E. Caldwell. *J. Bact.* 27, 121-60(1934).—During the course of studies on disocn. of paratyphoid bacilli, variant cells capable of giving rise to CaSO<sub>4</sub> crystals were found and called thiosomes. Conditions which promote disocn. seem to be conducive to the development of thiosomes, such as age, salts, rapid transfers in broth, compn. of medium and probably activity of bacteriophage. The possibility that certain variants may ppt. Ca may be of significance in the formation of concretions in the animal body. John T. Myers

The differentiation of living from dead bacteria by staining reactions. Frederick P. Gay and Ada R. Clark. *J. Bact.* 27, 175 89(1934).—Death of bacteria as produced by phys. or chem. agents, by bacteriophage, or by serum results in a shift in the staining reaction to the Proca-Kayser differential stain. Gram-pos., Gram-neg., acid-fast bacteria and yeast show a similar shift. The precise nature of the changes in protoplasm at death is not known. It is not simply a crude change in reaction or reversal of elec. charge. John T. Myers

Interchange of bacteria between the fresh water and the sea. Victor Burke. *J. Bact.* 27, 201-5(1934).—Changes in salt concn. affect the characteristics of some species. Suspected new species of fresh water and marine bacteria should be studied in media simulating both environments. John T. Myers

Pneumococcal hemolysin; its extracellular nature, production and properties. S. T. Cowan. *J. Path. Bact.* 38, 61-71(1934).—Hemolysin is found in filtrates of young broth cultures of pneumococci. Its curve of formation resembles that of viable counts rather than total counts indicating that it is the product of living pneumococci rather than the result of autolysis. The titer falls in old cultures, probably as a result of oxidation, since it can be restored by NaHSO<sub>3</sub>. It is antigenic but not type-sp. and is destroyed at 55°. John T. Myers

A blood agar tellurite arsenite selective medium for *C. diphtheriae*. W. James Wilson. *J. Path. Bact.* 38, 114-15(1934). John T. Myers

The meaning of blood pigments to the parasitic flagellates. André Lwoff. *Zentr. Bakt. Parasitenk.*, 1 Abt. 130, 498-518(1934).—The growth of *Stringomonas fascicu-*

lata is proportional to the amt. of blood in an artificial medium. In the presence of blood and peptone, *Stringomonas fasciculata*, *Stringomonas encopelii* and *Leptomonas clenorephali* can synthesize a catalytic respiration system in which 1 g.-atom of Fe can cause the utilization of 4.83 g.-mol. of O<sub>2</sub> at 28°. The rate of synthesis of this respiration system is const. and, within certain limits, independent of blood concn. Protohemin and protoporphyrin were the only hemins and porphyrins found which could stimulate respiration and growth of these flagellates.

John T. Myers

The metabolism of propionic acid bacteria. I. The degradation of phosphoric acid esters by *Propionibacterium jensenii* (van Niel). L. B. Pett and A. M. Wynne. *Trans. Roy. Soc. Can. V* 27, 119-22(1933).—Methylglyoxal-bis-dinitrophenylhydrazine (I) m. 298° cor. was obtained by addn. of 2,4-dinitrophenylhydrazine to the soln. resulting from the action of the dried propionic acid bacteria on a 1% Mg hexosephosphate soln. Similar treatment of Na  $\beta$ -glycerophosphate soln. yielded a mixt. of dinitrophenylhydrazine derivs. of glycerolytic products. The portion insol. in alc., m. 292°, is believed to be I, contaminated by a small amt. of some impurity. The fraction sol. in alc. m. 150° is similar to the dinitrophenylhydrazine of glyceraldehyde and dihydroxyacetone. The derivs. from Na  $\beta$ -glycerophosphate were not obtained in sufficient amt. for further purification or microanalyses.

W. Gordon Rose

The presence of salicylic and phenylacetic acids in the acetone-soluble fat of the tubercle bacillus. Nils Stendal. *Compt. rend.* 198, 400-1(1934); cf. C. A. 27, 5364.—The acetone-sol. fat obtained from the tubercle bacillus after sapon. gave a yellow oil which was partially sol. in petr. ether. The insol. fraction was identified as salicylic acid while the sol. fraction was phenylacetic acid.

THOMAS G. PHILLIPS

The alimentary variations of cultivated plants in the absence of fertilizers under the conditions of practical agriculture. Henri Lagatu and Louis Maume. *Compt. rend.* 197, 1558-60(1933).—Diagrammatic representation of the results of analyses of leaves from grapevines and potato plants grown in unfertilized soil shows that the percentage of the quantity of plant food (N + P<sub>2</sub>O<sub>5</sub> + K<sub>2</sub>O) on the basis of dried material is, in general, inversely proportional to the age of the leaves. The nutrition equilibrium charts of these plants grown under comparable conditions show that N predominates in the leaves of the grapevine and K<sub>2</sub>O in the potato leaves. However, all these relations are greatly affected by exterior factors, particularly meteorological conditions.

J. R. Adams

The biological action of metals at a distance. G. A. Nadson and C. A. Stern. *Compt. rend.* 198, 282-4(1934); cf. C. A. 27, 5366.—Metals placed at a distance of 2-3 mm. from white mustard seeds in a moist chamber retard the germination of the seeds and the growth of the sprouts in the order Pb > Au > Pt > Al.

P. D. A.

Conditions of culture and synthetic power of *Saprolegnia* sp. Carbon, nitrogen and sulfur nutrition. M. Volkonsky. *Ann. inst. Pasteur* 50, 703-30(1933).—A typical basic culture medium contains NaOAc 0.1, K<sub>2</sub>HPO<sub>4</sub> 0.1, MgCl<sub>2</sub> 0.01%, a trace of FeCl<sub>3</sub>, and NaOH to pH 7.0. Muscle peptone supplies complete org. nutriment. AcOH, OHCHMeCO<sub>2</sub>H and AcCO<sub>2</sub>H are poor sources of C; alanine, cysteine and histidine are good sources. Glycine, sarcosine and valine will not support development. In the presence of an unfavorable amino acid a fermentable sugar is essential. Most of the amino acids which are poor sources of C are good sources of N in the presence of glucose. Cysteine is the only source of S which is effective alone; H<sub>2</sub>S and AcSH require the presence of glucose

1 in addn. The synthetic power is greatly modified by the compn. of the nutrient medium.

B. C. A.

Vitamin formation in plants. S. von Hausen. *Acta Chem. Fennica* 68, 62(1933).—The carotene (I) and vitamin C (II) contents of plants are largely dependent on the nature of the N source, high values for both in sand-cultured peas being assocd. with N supplied as KNO<sub>3</sub>, glutamic or aspartic acid. The proportions of N, P and K in the nutrient which produce max. plant growth are also optimal for the formation of I and II. With increasing divergence of N, P and K concns. from the optimum, there was a corresponding decline in I and II in the plants. Changes in the latter were observed where differences in nutrient ratios were too small to produce differences in plant yields. Excessive N supplies did not affect the formation of I and II, but concns. of P and K above the optimum led to reduced production of these.

B. C. A.

Nutrition of higher plants with organic compounds. I. Tanaka. *Japan. J. Botany* 5, 223, 350(1931).—For a no. of plants examd. nitrate proved the best source of N. Urea was assimilated readily, and asparagine, acetamide or glycine to a limited extent. *Sisyrinchium* utilized sucrose, maltose (I), lactose, glucose (II), fructose and galactose (III), but not mannose (IV). I, III and IV had an inhibitory action on *Plantago*. Assimilation of II could not replace the photosynthetic process. Org. acids (butyric, salicylic) were tolerated only in small concn. HCO<sub>2</sub>H and AcOH retarded root development. Lecithin was more easily assimilated than phytin. Among a no. of org. compds. examd. as sources of S only cystine proved at all utilizable.

B. C. A.

Root respiration of young coffee plants. E. Herndlhofer. *Z. Pflanzenernahr. Dungung Bodenk.* 29A, 200(1933).—Respiration increases with light intensity. In darkness respiration is small and tends to maintain a constant rate throughout the day.

B. C. A.

Formation of organic acids in green plants. II. Nitrogen and acid metabolism in *Begonia evansiana* Andr. Mannen Shibata. *Science Repts. Tohoku Imp. Univ.* 4th Ser. 8, 205-48(1933).—Estns. are given of protein, amide, amino and ammonia N, and of acidity in different parts of the plant. The acid content of all parts increases with age. In the flowers and stalks the acidity and amide or ammonia N values run parallel. In the leaves the amide and ammonia N, also the acidity increase at night, and the ammonia N is low compared with the acidity. As the tubers sprout their amino-N content increases at the expense of the amide N.

M. L. C. Berheim

Nature of injury caused by potato leaf-hopper on forage legumes. H. W. Johnson. *Phytopathology* 23, 19(1933).—Symptoms almost identical with the injury caused by *Empoasca fabae* were produced artificially by mechanically severing all but one of the vascular bundles in clover petioles or by girdling with live steam. J. does not believe the leaf-hopper injury results from the injection of a sp. inciting agent but rather from an over accumulation of osmotically active sugars.

R. C. B.

Action of various alkaloids on the metabolism of glucides by *Aspergillus niger*. G. Mezzadrol and A. Amati. *Atti accad. Lincei* 18, 161-5(1933); cf. C. A. 27, 2174.—At 37° in Wehner and Raulin type nutrient solns., strychnine (nitrate), 0.5-2.0%, assists in the consumption of glucose and sucrose, and regulates the metabolism. Quinine (sulfate), 0.5-3%, is even more active. Caffeine, however, retards the action. The compn. and temp. of the nutrient soln. and the kind of carbohydrate do not, in general, affect the action of the alkaloid on the metabolism of the glucide.

A. W. Contieri

Carbohydrate contents of the maple tree. C. H. Jones and Jennie L. Bradlee. *Vt. Agr. Expt. Sta., Bull.* 358, 3-147(1933).—Sucrose is the circulatory medium in the maple tree for elaborated leaf products. Rapid changes to hexoses occur within the living cells from Oct. to Jan. and as rapid decreases from Feb. to May. Enzymes are very active. The earlier change seems stimulated by lowering temp. and the latter by rising temp. The "cut tree temps." need not cover a very wide range above and

below 0° within the tree and are governed by external air conditions. The "periodic bleeding period," occurring at the close of the winter when the surrounding bark is punctured and the wood layers penetrated, represents an outpouring at the point of least resistance. In an untapped tree the internal pressures aid in forcing the water to the extreme upper sections of the tree before transpiration following leaf development begins. The gradual lessening of the starch content in maple wood, beginning at the close of the storage period in Sept. or Oct., is accompanied by accelerated increases in the sucrose and hexose contents of the tree, which are maintained throughout the winter season. These start to decline in Mar. and Apr. when reverse changes occur. Hexoses are present in the fall and winter, and they disappear in the spring. Hexoses appear to be a product of the living cell and serve as a balance wheel in the living medullary ray cells. The hexoses in the living cells can increase within 120 days 12 times in amt. and later, gradually decrease to  $1/18$  of the max. figure in a similar time interval. Extremely small amts. are present in the sap outside of that enclosing living cells. The external air temp. is the one variant of which there is some knowledge and the changes noted (av. of 3 winter and sugar seasons) range from 14° to 7° at the time when the hexoses increase and from 7° to 13.5° at the time when they decrease. This is indicative of a periodic function characteristic of most plant life in temperate zones; but mere chem. data are quite insufficient to explain the complicated action of the agencies which are involved. Forty-four references. C. R. Fellers

**Oxidation zones in plant cell.** Ph. Joyet-Lavergne. *Compt. rend. soc. biol.* 110, 918-20 (1932); *Physiol. Abstracts* 18, 151.—The epithelial cells of the petals of *Crinum powelli* were studied for the observation of oxidation processes. Leuco derivs. of various substances were used. The restoration of color to the reagent is most rapidly effected in the mitochondrial region. This part of the cell possesses the power of restoring the color, the colored reagent afterward diffusing into other regions of the cytoplasm. All the elements of the mitochondria do not have the same oxidizing power. The leuco derivs. employed were those of cresyl blue, methylene blue, methyl green, neutral red, etc. The coloring of neutral red is effected more on the surface than in the mitochondrial mass. Coloration may also appear in the nucleus, especially in the nucleolus when this exists. G. G.

**The deposition of starch in the endosperm cells during the development of the seed [of wheat]** A. Gonçalves da Cunha. *Compt. rend. soc. biol.* 110, 1045-6 (1932); *Physiol. Abstracts* 18, 153.—Sol. sugars have been described in wheat seeds as granules of reserve material which may cause disorganization of the nucleus from compression. The irregularity of outline of these granules is striking. The minute structure of the granules is described. No doubt is entertained of their mitochondrial origin. The sol. sugars are converted into starch by the chondriocotes and remain thus as reserve material until germination begins, when they are hydrolyzed for the benefit of the embryo. G. G.

**Distribution of sugar and nitrogenous substances in wheat grain.** Wacław Kretowitch. *Biochem. J.* 27, 1687-90 (1933).—Sucrose is contained in the germ as well as in the endosperm. The concn. of sugar in the outer layers of the endosperm is about 4.8 times greater than in the inner layers. Wheat bran contains little gliadin. There is no gliadin in the cells of the aleurone layer. Hence flour from the cells of the aleurone layer does not yield gluten. Benjamin Harrow

**Some cell-wall constituents of *Cetraria islandica* ("Iceland moss").** Harold Wm. Buxton and Victor H. Chambers. *Biochem. J.* 27, 1691-1702 (1933).—The cell wall consists mainly of hemicelluloses and cellulose. Pectins, pentosans and lignins are absent. B. H.

**Inhibition of bud development and other functions of growth substance in *Vicia faba*.** Kenneth V. Thimann and Folke Skoog. *Proc. Roy. Soc. (London)* B114, 317-39 (1934).—In *Vicia faba* growth substance is produced in the presence of light by the growing terminal

bud, actively growing lateral buds and leaves; it inhibits the development of lateral buds and causes elongation of the stem; the latter action is greater in the dark than in the light. Joseph S. Hepburn

**The relationship between different physiological aspects of plants and the appearance of pigments in the different parts of the plants. V. The relationship between the presence of anthocyanin pigments and transpiration in some cultivated plants.** Hiroshi Kosaka. *J. Dept. Agr. Kyushu Imp. Univ.* 4, 95-126 (1933); cf. *C. A.* 27, 4535.—Transpiration studies were carried out with *Oryza sativa*, *Perilla nankaiensis* and *Abutilon avicennae*; in each case specimens which had anthocyanin pigments in the leaves, and other specimens which lacked these pigments or contained them only in the stalks and stems were used. Under varied conditions of light intensity the more colored forms show greater transpiration differences than the less highly colored ones. It is believed that the close relationship between the presence of anthocyanins in the leaves and transpiration is, in all probability, connected with heat absorption by the anthocyanin pigments. The exptl. results are given in 19 tables. G. A. Hill.

**Pathology of the fig, *Ficus carica* L. I. The fruit dry-rot problem in Asia Minor.** A. Vassf. *Phytopath. Z.* 6, 589-618 (1933).—On synthetic culture media at 28-32°, the daily rate of growth of the hyphae of *Aspergillus niger*, *A. ochraceus*, *Fusarium moniliforme* and *F. heterosporum*, which are concerned in the dry rot of figs, decreased as the concn. of sugar in the media was increased from 25.23 to 48.13%, no growth being obtained at the latter concn. *Fusarium* species were more sensitive than *Aspergillus* species to sugar concn. At the highest tolerated concn. *Aspergillus* produced numerous normal conidia. At 37.12% sugar *F. heterosporum* produced numerous microconidia, but at 40.3% the hyphae frequently showed signs of disintegration. The limiting sugar concn. for the growth of the 1st 3 varieties was between 45.76 and 48.13%, and for *F. heterosporum* between 43.16 and 45.76%. K. D. Jacob
